Sales billed by the General Electric Company in 1926 amounted to $326,974,104, compared with $290,290,166 in 1925, an increase of more than $36,000,000. The best previous high record was in 1924, when sales totaled $299,251,869. Orders received during 1926 aggregated $327,400,207, an increase of 8 per cent over 1925. The previous high record was $318,470,438 in 1920.

Profit available for dividends on the common stock on the 1926 business was $44,314,884, equivalent to $6.14 a share on the 7,211,481 shares of no par value stock outstanding, as compared with $20.49 a share in 1925 on the 1,802,870 shares of $100 par value common stock then outstanding, which is equivalent to $5.12 per share on the present stock. In August, 1926, four shares of no par value common stock were issued in exchange for each share of the old common stock.

COMPARATIVE STATEMENT OF INCOME AND EXPENSES OF THE GENERAL ELECTRIC COMPANY

	1926	1925
Net sales billed..........	$326,974,103	$290,290,165
Less: Cost of sales billed, including operating, maintenance and depreciation charges, reserves and provision for all taxes..............	289,878,335	257,479,490
Net income from sales..	$37,095,768	$32,810,675
Income from other sources:		
Income from associated companies..........	$4,937,901	$3,411,292
Income from miscellaneous securities......	915,835	751,142
Interest and discount..	3,047,048	2,838,513
Income from U. S. government securities...	2,647,502	2,394,398
Royalties and sundry revenue............	1,013,238	964,720
	$12,561,526	$10,360,067
Total income........	$49,657,294	$43,170,743
Less: All interest payments and, in 1925, premium on debentures retired..............	$436,511	$1,925,696
Addition to general reserve..............	2,548,284	2,603,828
	$2,984,796	$4,529,525
Profit available for dividends...............	$46,672,498	$38,641,217
Less: 6 per cent cash dividends on special stock..	2,357,614	1,735,576
Profit available for dividends on common stock	$44,314,884	$36,905,641
Less: Cash dividends on common stock*........	19,828,896	14,407,544
Surplus for the year......	$24,485,987	$22,498,097
Surplus at January 1.....	85,848,170	72,362,223
	$110,334,158	$94,860,320
Less: Dividends paid in special stock: $1 per share in 1926 (equivalent to $4 per share on old $100 par value stock) and $5 per share in 1925	7,210,810	9,012,150
Surplus at Dec. 31......	$103,123,348	$85,848,170

* At the rate of $8 per share on old $100 par value stock in 1925 and first half of 1926 and at the rate of $3 per share on new no par value stock (equivalent to $12 per share on old stock) in last half of 1926.

This split-up of shares is reflected in an increase in the number of stockholders from 36,697 in December, 1925, to 46,305 in December, 1926. More than 98 per cent of the stock is held in the United States and nearly half of the stockholders are women. Every state in the Union is represented in the list of stockholders.

A striking illustration of the company's contribution to the benefit of the consuming public and of its employees is contained in a statement showing that during the past twelve years, while commodity prices have advanced 54 per cent and the cost of living has risen 68 per cent, General Electric selling prices have increased only 13 per cent and the average earnings of the company's employees have more than doubled.

The export business of the company is conducted by the International General Electric Company, Inc. Those portions of its orders and billing which were for General Electric products are included in the corresponding figures of the General Electric Company at their cost to the International Company. The total of all orders received by the International Company during the year was $20,824,000, compared with $25,710,000 during 1925. The net sales billed were $22,696,577 during 1926, compared with $21,981,951 for 1925. The International Company's business yielded a profit available for dividends of $1,538,306 compared with $2,617,204 in 1925. Dividends of $1,500,000 were paid during 1926, of which the General Electric Company received $1,375,772, which is included in the financial statement as part of "income from associated companies."

Large Bus Shops Proposed at Newark

For purposes of efficiency and economy Public Service Transportation Company, Newark, N. J., will erect a large bus repair shop and remodel the present storage building on the south side of Ferry Street west of and adjoining the Newark railway repair shops. It is intended to make this shop the major repair and overhauling headquarters for all the buses operated by the company in the state.

The proximity of the bus repair shop to the railway shops is expected materially to reduce the time heretofore taken to overhaul buses, as it will be possible to make chassis and body repairs simultaneously by utilizing the facilities of both shops. Another advantage will result from placing the two main storerooms adjacent to each other, as economies can be effected by the delivery of railway and bus supplies to the point of common activity.

All chassis and engine work will be done in the new bus shop and the electrical work, carpenter work and painting, together with spring, radiator and sheet metal work on the buses will continue to be done in the railway shops.

The bus shop will be thoroughly equipped with the latest models of machinery, making it possible to perform any major overhauling job at this point. All minor repairs to buses will continue to be made at the smaller garages in various parts of the territory.

The new bus shop will be 318 ft. long, 102 ft. wide and 26 ft. high, sufficient to accommodate double-deck buses if necessary. The roof will be of glass of special sawtooth design, constructed so that light from the north will be reflected into the working space beneath. The storeroom will be two stories.

Trends in the Metal Markets

BUYERS of the non-ferrous metals have for the most part not responded during the week ended March 30 even when producers were willing to shade prices. Demand for copper has been slightly better than last week, but this is all that can be said for it; demand for zinc subsided and lead and tin show little change so far as volume of business is concerned.

Copper was generally available for Eastern deliveries at 13¼ cents on Thursday, Friday and Saturday, but as early as Friday reports of 13⅛ cents seem to be well authenticated. By Monday the market was generally quoted at 13⅛ cents and that price ruled on business placed March 29 and 30. The copper sold at 13.05 cents was a resale offering. In the Middle West as low as 13.20 cents, delivered, has been done. The volume of business was somewhat greater than last week, but is still much below normal. The total of March sales will be the lowest in months, so the prospect of a good buying wave in the coming week, or possibly in the week after next, seems excellent. The large producers have so far consistently refrained from forcing copper on the market, the depression in price being attributable to the custom smelters, who make a policy of selling current intake. Following recent sales, they are, perhaps, in somewhat improved position. The copper sold has been pretty well distributed. Sheet and tube business is reported active, and brass business good. Wire continues to be the dullest line. Copper prices abroad were reduced on March 29 by the export association from 13.65 to 13½ cents, c.i.f.; there, too, the week has been dull.

The *Engineering and Mining Journal* says that an unusual situation exists in the lead market. The peculiarity lies in the fact that the present dip has taken the price lower than the bottom reached at the end of the long decline, a condition that has not existed for many years. The market is quite clearly in the hands of buyers, and sellers are competing for business. In New York, the limited amount of "outside business" has virtually all been at the Smelting company's price. In the Middle West second-hands have been inclined to undersell the principal interests, some lead being available on March 30 as low as 7.05 cents. Absence of buying in volume by battery makers is an important feature in the situation.

Demands for zinc from galvanizers have been few and sellers have been obliged to make concessions in price. The volume of sales has been smaller than for several weeks. Prompt zinc has been offered for somewhat less than forward. On March 29, for example, early deliveries were available at 6.525 cents without being taken up, whereas a good tonnage for forward delivery sold at 6.55 cents. On March 30 the market was much the same, though some zinc was reported having been offered as low as 6½ cents. Some increase in ore production is reported from the Tri-State district, but smelter production is probably 8 or 10 per cent less than it was a month ago. High-grade metal continues dull at 8½ cents delivered in the East.

Tin has been quiet during the week, with prices fluctuating within narrow limits in the domestic market. An advance in London on March 30 was reflected in some improvement in the domestic market from a quotational standpoint. Future delivery is at a discount of from 1⅝ cents to 2 cents; and 99 per cent, for prompt delivery, commands about a cent less than Straits.

METAL, COAL AND MATERIAL PRICES
F. O. B. REFINING

Metals—New York	March 29, 1927
Copper, electrolytic, cents per lb	12.90
Copper wire, cents per lb	15.25
Lead, cents per lb	7.32
Zinc, cents per lb	6.88
Tin, Straits, cents per lb	68.00
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.425
Somerset mine run, Boston, net tons	1.975
Pittsburgh mine run, Pittsburgh, net tons	2.05
Franklin, Ill., screenings, Chicago, net tons	2.25
Central, Ill., screenings, Chicago, net tons	1.875
Kansas screenings, Kansas City, net tons	2.50
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	$5.50
Weatherproof wire base, N. Y., cents per lb.	16.75
Cement, Chicago net prices, without bags	2.05
Linseed oil (5-bbl. lots), N. Y., cents per lb.	10.70
White lead in oil (100-lb. keg), N. Y., cents per lb	14.50
Turpentine (bbl. lots), N. Y., per gal	$0.69

H. M. Robinson a General Electric Director

Henry M. Robinson, president of the First National Bank of Los Angeles, was elected a director of the General Electric Company at the meeting of the board in New York on March 25. In addition to his position with the First National Bank, Mr. Robinson is president of the First Securities Company, chairman of the board of the Pacific Southwest Trust & Savings Bank, and a director in a number of other large corporations. This is the first time the General Electric Company has gone to the West for a member of its board.

Terms of Purchase of Seattle Cars Under Discussion Again

Negotiations for the purchase of 80 new cars for the Seattle Municipal Railway, Seattle, Wash., are being pushed by Seattle city officials. Only one or two details are yet to be worked out with the St. Louis Car Company, awarded the contract some time ago. A bond issue of $1,875,000 has been voted for the purchase, of which $1,420,000 will go for the cars and the rest for financing track extensions in various parts of the city and for a railway trestle over the West Duwamish waterway.

The car builder desires that there be included in the purchase contract, before the company signs it, a clause making a separate fund of the money to retire the bonds for buying the cars. Its desire is to be reassured that money put aside for the retirement of the bonds will be used for that purpose only. The Council sees no objection to this clause and is ready to include it in the contract as soon as the company which has agreed tentatively to buy the bonds is ready to take them. Operation of the new cars is expected to effect a saving of $260,000 a year.

Mazda Price Cut Again

Effective on April 1, announcement is made by the General Electric Company of another reduction in the prices of Mazda incandescent lamps. This is the third reduction in prices since the new inside-frosted lamps were introduced in 1926. The reduction lowers the price of 25 and 40-watt lamps to 23 cents each, the 50 and 60-watt sizes to 25 cents each and the average price of all Mazda lamps to 49.4 per cent less than in 1914.

"This reduction is made possible by the elimination of waste through the abandoning of about 45 types of lamps and the universal acceptance of the six new types of inside frosted bulbs," the announcement said in part. "The old type of outside frosted lamp, which absorbed approximately 20 per cent of the light and collected considerable dust and dirt with the rough surfaces, sold for approximately three times as much as the new inside frosted lamp."

Great Northern Railway Electrification Progressing

The 7,500-kva. frequency changer at Skykomish, Wash., which will supply part of the current used by the electrified Great Northern Railway has been installed, ready to supply 11,000-volt, 25-cycle, single-phase current to the overhead lines which are now being erected. A similar frequency changer is also to be located at Tumwater. Installation of the equipment for the electrification of the railroad over the Cascade Mountains is progressing rapidly, and train operation with electric locomotives is predicted in the near future.

Two single-phase, motor-generator type locomotives, each weighing 250 tons and being the largest single-unit electric freight locomotives ever built, will be placed in operation this summer. These, as well as the frequency changers, are being supplied by the General Electric Company. The American Locomotive Company has the contract for the mechanical parts of the locomotives.

Power will be supplied to the substations by the Puget Sound Power & Light Company.

Slingluff Goes to Kuhlman Car Company

Eugene Slingluff, well known in the car building industry, has resigned his position with the Cincinnati Car Company to accept the post of general superintendent with the Kuhlman Car Company, Cleveland, Ohio. Mr. Slingluff commenced his career in 1895 with the Baltimore Traction Company in the electrical department. The following year he went to the Westinghouse Electric & Manufacturing Company in its construction department, and a year later was connected with the mechanical department of the Washington Railway & Electric Company. He remained with that company up to 1903, when he accepted a position with the Cincinnati Traction Company, remaining in its employ until 1914. While there he was superintendent of carhouses and superintendent of shops and equipment. Mr. Slingluff went with the Cincinnati Car Company in 1914.

Rolling Stock

Monongahela West Penn Public Service Company, Parkersburg, W. Va., has in contemplation a program of improvements which includes among its items the purchase of eighteen cars and a quantity of buses, the number of which is still to be fixed.

Yellow Cab Company, recently taken over by the Twin City Rapid Transit Company, Minneapolis, Minn., has bought 25 cabs at a cost of $50,000.

Portland Electric Power Company, Portland, Ore., has received all of the eight pay-as-you-enter type buses to be used on the new Ross Island bridge line. The total cost of the buses was $90,000. Seven of them are of the Yellow Truck & Coach Company make and one is a Mack.

Track and Line

Interborough Rapid Transit Company, New York, N. Y., has agreed to proceed at once with the signaling of the elevated tracks on the Astoria and Corona lines in Queens. Frank Hedley, president and general manager of the Interborough, has already directed the preparation of the specifications. Mr. Hedley proposed to make experiments with the automatic block signals on the Third Avenue elevated before installing them on the Queens lines. The Transit Commission's engineers pointed out, however, that no such intensity of traffic exists on the Queens lines as on the Third Avenue "L" and that the present system of signaling which is used on the express tracks of the subway and elevated lines would handle the present traffic on the Queens lines. It has been estimated that the signaling installation will cost in the neighborhood of $690,000 for the local tracks on the Astoria and Corona lines.

Shops and Buildings

Alabama Power Company, Birmingham, Ala., is making extensive improvements to its substation at West Huntsville, Ala. The new work involves an expenditure of $10,000.

Public Service Production Company, which is a subsidiary of Public Service, Newark, N. J., has nearly completed a new bus garage in Union and Gamewell Streets, Hackensack, N. J. The new structure will have a capacity of 40 buses and is already housing rolling stock of the Newark-Hackensack, Hackensack-Little River Ferry, and Hackensack - Rutherford lines. The garage is built of brick and steel with art stone trim, and it has a frontage of about 204 ft. on Union Street, and 91 ft. on Gamewell Street. Inside clearance is 12 ft. from concrete floor to roof tie rods. Roof construction is of the "amellas" type, consisting of a dome-shaped arch made of wood units so assembled as to give the appearance of an immense inverted fishnet. This type of roof construction does away with all interior columns and roof trusses and has been extensively used in Germany.

Rockford Public Service Company, Rockford, Ill., has announced plans for the construction of a two-story brick and concrete car and bus storage barn over the storage tracks on Kishwaukee Street, adjacent to the present carhouses. Ramps and elevators will lift the buses to the second floor.

Trade Notes

Howard E. Oberg has been put in charge of sales engineering in the Middle West by the Billings & Spencer Company, Hartford, Conn. Mr. Oberg's office will be located in Room 5-251, General Motors Building, Detroit, Mich.

Nichols-Lintern Company, Cleveland, Ohio, announces that it is now prepared to furnish the N-L bus heater, which has been under development in practical service.

O. J. Neslage of the St. Louis office sales staff of the Sullivan Machinery Company, for several years past located in the Joplin, Mo., lead and zinc district, has been appointed local manager at Mexico City, Edificio Oliver No. 3. A. W. Oakes, for several years past manager at Mexico City, has been assigned to a post in the United States. C. W. Miller has been appointed special representative of the Sullivan Machinery Company in Cuba and will cooperate with the company's general agents for Cuba, the Purdy & Henderson Trading Company, Habana 55, asquina a Empedrado, Havana, Cuba. Matt Brodie, manager for Asia of the Sullivan Machinery Company, has sailed from San Francisco for Tokyo, following a three months furlough in this country.

Trico Fuse Manufacturing Company. Milwaukee, Wis., manufacturers of Trico renewable fuses, announces the following staff appointments: B. M. Slicting as sales promotion manager, in charge of the company's main office in Milwaukee; J. E. Eldredge of South Windsor, Conn., sales representative for the state of Connecticut and western part of Massachusetts; Arthur E. Bacon, Denver, Col., sales representative for the states of Colorado, New Mexico, Utah and Wyoming.

Haskelite Manufacturing Corporation, Chicago, Ill., reports that so far this year its products Haskelite and Plymetl are being used in the construction of street cars for the following utilities: Gary Street Railways, Gary Ind.; Municipal Railways, San Francisco, Cal.; Grand Rapids Railway, Grand Rapids, Mich.; West Penn Power Company, Connellsville, Pa.; Cincinnati, Hamilton & Dayton Railway, Dayton, Ohio; Virginia Electric & Power Company, Richmond, Va.; Eastern New York Utilities Corporation, Albany, N. Y.; Cincinnati Street Railway, Cincinnati, Ohio; Union Traction Company, Anderson, Ind., and Eastern Massachusetts Street Railway, Boston.

New Advertising Literature

International Steel Tie Company, Cleveland, Ohio, has just issued a handsome calendar for March, April and May, 1927, which has as its decorative feature a colored print of the Rue de Rivoli, Paris.

Condit Electrical Manufacturing Corporation, Boston, Mass., is issuing a descriptive folder of its type D-15C oil circuit breaker. The interrupted capacity of this device is 2,700 amp. at 15,000 volts.

Mitchell-Rand Manufacturing Company, New York City, N. Y., through a circular, announces that it has dissolved its associations with outside mills and is now producing its own line of material under the trademark "Shield Brand." Tapes and webbings are the company's principal products.

Baker-Raulang Company, Cleveland, Ohio, is issuing several new booklets describing bus bodies. No. 105 gives complete specifications for bus bodies adapted to the White chassis models 53 and 18 with a 212-in. wheelbase. Bulletin 106 details bodies for the same chassis models 50-B and 54, while bulletin No. 107 illustrates the bodies mounted on White chassis, special attention being paid to their application to models 50-B, 53 and 54.

A. Gilbert & Sons Brass Foundry Company, St. Louis, Mo., manufacturer of armatures, axle bearings, trolley wheels, solder and line material, is sending out a series of sales letters to the mechanical and purchasing departments of the electric railways. Each letter deals with an individual subject, explaining how the Gilbert company came to adopt the standard composition used. The letters are designed to assist the mechanical departments in adopting standards for their roads, whether it be the Gilbert standard or some other.

Exhibits to Open on Saturday at This Year's Cleveland Convention

WITH the approval of the executive committee an important departure from the practice followed at former annual conventions has been inaugurated by this year's exhibit committee of the American Electric Railway Association. Exhibits will be set up, manned and opened for inspection at noon on Saturday, Oct. 1. Delegates who arrive early will have an oppportunity to inspect exhibits Saturday afternoon and Sunday, before the opening of the convention on Monday. This is in addition to Wednesday of convention week, which, as in former years, has been set aside for visiting exhibits.

An important forward step has been taken. As the convention has grown rapidly in size it has become increasingly difficult for railway men in attendance to view the exhibits thoroughly without neglecting the business sessions. When the practice was started several years ago of setting aside one full day to inspect the exhibits a considerable improvement was made. The new plan of opening them on Saturday is another move in the right direction.

Time spent among the exhibits at the convention is time well invested. Many thousands of dollars are expended each year by manufacturers to bring their equipment to the convention for inspection by operating men. The cost to operating companies for sending executives and employees to the convention is likewise heavy. Unless adequate time is available for thorough examination of manufacturers' products and for attendance at the convention sessions, full value is not derived by the industry from these expenditures.

Of course, the new arrangement will not be productive of improved results unless operating men take advantage of it by getting to Cleveland on Saturday or Sunday. Only through the co-operation of railway executives can this be assured. Get your men to Cleveland early! See to it that they go over the exhibits thoroughly! The time and effort put in will be more than amply repaid in new ideas and new enthusiasm.

A Big Step in Weight Reduction

ENTIRELY new possibilities in car design are opened up by the success which has so far marked the operation of the experimental aluminum car built by the Cleveland Railway and exhibited at the convention last fall. By the use of aluminum alloys as presented in an article elsewhere in this issue, the weight of a large city car more than 51 ft. long and equipped with four motors has been reduced to only slightly more than 30,000 lb. That is indeed light weight with a vengeance! The car was built entirely as an experiment. But after more than four months operation under the severe conditions encountered in Cleveland, it has developed no structural weaknesses.

Before attempting to draw conclusions from the Cleveland experiment it should be understood that this car was designed for steel and not for aluminum construction. When the railway decided to build an aluminum car for exhibit at the convention, time did not permit much more than merely the substitution of aluminum for steel, part for part. It seems reasonable to assume, therefore, that a car designed originally for aluminum would permit more scientific utilization of the lightweight material.

Cleveland has without doubt pioneered a most important experiment. There seems ample reason to look forward to a more general use of aluminum for car construction in the near future. If this becomes practicable, an attractive reduction in operating costs would result from the very large saving in weight that can be made.

Facts in Annual Reports Are Encouraging

OPTIMISM does not exude from the pages of the annual reports of the electric railways for 1926 so far received for digest by the JOURNAL, but it is not difficult to find very encouraging signs in them. Everything considered, the best all-around showing, perhaps, is contained in the statement of the Chicago Surface Lines. That property carried not only the largest number of passengers in its history but made its best financial showing in any year except one. This may be attributed to the determination of the management to carry on just as it had in the past, no matter what the outcome of the franchise negotiations.

One thing that stands out as most heartening is the tendency shown in practically all of the reports toward no lessening in the number of passengers carried. This is true, as before mentioned, of Chicago, and is true in lesser degree in the case of the companies in Cincinnati, Milwaukee and other cities. A striking fact of the Philadelphia report was that the number of passengers carried per trainman in that city increased from 72,405 in 1911 to 151,175 in 1926. Rides per capita in Philadelphia have increased from 329 in 1911 to 480 in 1926.

Not only this, but the reports reflect the good work that is being done in accident prevention. The Louisville Railway's accidents have been reduced from 3,272 in 1922 to 1,157 in 1926, and the number of miles operated per accident has been increased from 3,323 in 1922 to 10,386 in 1926. On the Market Street Railway of San Francisco expenses incident to injuries and damages in 1926 were 30.18 per cent less than in 1925. Statistics indicate that collision accidents per car-mile in San Francisco were reduced 26 per cent.

Both the Market Street Railway and the West Penn

Railways gave important facts in the annual reports about the work being done toward strengthening their financial positions. The conditions surrounding the Market Street Railway are in many respects peculiar, but despite the low fare at which the company is required to operate and other unfavorable conditions, the funded debt in the hands of the public was reduced $634,000 during the year. The West Penn Railways retired $5,548,500 of funded obligations. On Sept. 1, 1926, the company called and retired all of its outstanding three-year 6½ per cent gold debentures due April 1, 1927, aggregating $3,500,000, funds having been made available to its treasury through reimbursements by certain subsidiary companies to which temporary advances had previously been made for construction. In addition, all of the company's outstanding first equipment trust 8 per cent notes of 1921, aggregating $120,000 were retired on Oct. 1, 1926.

The number of reports available in pamphlet form for digest is not so very large and the method of presentation of the data contained in them is so dissimilar that a basis of real comparison between companies is not afforded even if it were deemed advisable, but the conclusion is inescapable from the digests of the reports so far presented that the managements are for the most part thoroughly alive to the opportunity which is presented for the intelligent and determined application of ideas that give promise of furthering the interests of the companies themselves and of constantly increasing the essentiality of the properties to the welfare of the people in the communities in which they operate.

Revival of Brady Award Should Stimulate Safety Work

CONSIDERABLE interest attaches to the announcement just made that the Anthony N. Brady safety award has been revived after remaining dormant since it was awarded to the Connecticut Company in 1916. The American Museum of Safety has taken charge of the contest and the next award of the medals will be for the calendar year 1926.

The conditions have been revised materially. Formerly a rather complicated series of computations was necessary to determine the winner, and the procedure made it difficult for the smaller companies to present their claims. Under the new conditions there will be three medals as before, but they will be given as first prizes to operating companies in three classes, grouped according to the number of vehicle-miles operated. The method of presentation has been modified greatly so that it will be possible for all electric railways, large or small, to present their own cases in the way that will bring out the best consideration of their records and the conditions under which their accomplishments have been made.

The plan under which the contest is to be conducted contemplates the preparation of a brief by each contestant presenting the accomplishments in gaining good will, improvements in maintenance and operating practices and promotion of sanitation and health, as a result of better safety practices. This will permit great latitude in presentations and will allow the committee in charge of the award to judge the work by a definite system of rating each of the six factors outlined in the conditions of the contest. The committee will also take into consideration any other factors or conditions which may in its judgment have a bearing on the relative accomplishments of the contestants in the field of safety.

It is desirable that as many railways as possible enter the competition. The conditions are not onerous and the amount of work that must be done in preparing the presentations should not be a hardship to any company. Separation of the companies into three groups, depending on size, gives the smaller companies an equal chance with the larger ones.

I.C.C. Split on Valuation Issue

COMMENT has been provoked in railroad and financial circles by the majority opinion of the Interstate Commerce Commission in the so-called St. Louis & O'Fallon Railroad valuation case, one in which the principles involve railroad properties valued at billions. It is the first decision of the commission interpreting and applying the so-called recapture clause of the transportation act of 1920. By a vote of six to four, the commission held, in effect, that the value of the property of a railroad for rate-making purposes, as determined by the commission for 1914, approaches more nearly the reasonable and necessary investment in the property than the cost of reproduction of it. The recapture clause provides for the payment to the federal government of one-half of the net railway operating income of a railway system in excess of 6 per cent on its value for any year following the passage of the act. No definite rule of valuation was laid down in the transportation act of 1920. So the commission proceeded on its own initiative.

The majority opinion held that Congress intended to fix values of railroad properties for recapture purposes without awaiting completion of final valuation under the provisions of the valuation act. It also held that, for that purpose, it is warranted in basing its valuation on its tentative valuation figures of 1919 (based on 1914 unit prices) as far as available, plus net additions to property in succeeding years at actual cost, less depreciation, without giving effect to the cost of reproducing the original property at present-day prices.

According to one of the commentators who summarized the long decision, the majority opinion admitted that the "cost of reproduction now at prices current on valuation date" had been laid down as a rule in previous court decisions, but it objected that such a basis of rate making would prevent stability of rates; that in 1920, for instance, valuation at current prices would have required increase of 114.64 per cent in "the element of rates and charges" over the requirements as of 1914, in order to insure the "fair percentage" of return, whereas in 1921 there would have been a reduction of 14.38 per cent, and in 1922 a further reduction of 18.23 per cent. This the majority opinion deemed unjust and unworkable, and between that method and the use of 1914 prices as a base, no intermediate process was "possible which is capable of being applied to any rule independent of the caprice of those who apply it."

It might seem offhand that this case is without interest in the electric railway and utility field, but that is not a fact. In the first place, the commission, as indicated previously, was divided on the basis of a six to four vote, and in the second place the minority opinion rested its conclusion squarely on the "law of the land" as embodied in previous Supreme Court decisions. The minority cited particularly one earlier leading decision, which acclaimed that, in valuing property used in serving the general public, consideration should be given to "present as compared with original cost of construction." Reaffirmation of this principle in the Minnesota rate case was further cited, also the Supreme Court's reversal of a lower court's decision in a public utility value, on the ground that the lower court had failed to accord "any weight to the greatly enhanced cost of material, labor, supplies, etc., over those prevailing in 1913, 1914 and 1916." The minority opinion bluntly declares that the commission's majority "refuse to follow" these clearly enunciated and definitely established principles. The basic use of 1914 prices is not challenged, but there is strong dissent from using them "in determining value in 1923 without application of corrective factors." The minority concludes that "if the law needs change, let those who made it change it. Our duty is to apply the law as it stands."

So the grounds become plain on which the radical divergence of opinion is based. They indicate clearly that the final and proper course of the commission cannot be determined except by the Supreme Court itself. In this respect it is quite clear that the issues were treated as test cases as to the method of ascertaining the value of roads for recapture purposes. The majority recognized that "having in mind the whole railroad situation, the decision is of the greatest consequence from the public and the private viewpoints." Both on that account and on account of the stand which the majority and the minority took in the matter, the case, despite the peculiarities of the terms of the transportation act, are of interest even to those who at first appear to be only remotely concerned with valuation problems.

Those Who Came to Scoff Remained to Ponder

SKEPTICS who think that accidents are an inevitable accompaniment to electric railway operation certainly would have experienced a change of heart had they attended the April meeting of the Metropolitan Section, American Electric Railway Association, reported in this issue. Representatives of three important electric railways gave definite figures showing what had been accomplished by sustained effort on their properties. Since the beginning of an organized safety campaign on the Third Avenue Railway, New York City, fifteen months ago, the number of accidents has been approximately 1,400 less than during the preceding fifteen months. The total number of accidents on the Brooklyn City Railroad during the past eight months was 8,275 as compared with 9,518 occurring during a like period before the inauguration of the present bonus plan. In Louisville, where formerly one accident occurred for every 1,800 car-miles operated, the January, 1927, ratio was one per 19,000 car-miles. Claims paid by the Louisville Railway have been reduced from 7½ per cent of the gross revenue to 4 per cent. Evidence more convincing than these figures could hardly be found to show that the efforts made in accident prevention are thoroughly worth while from an economic standpoint.

While admitting that safety work was first undertaken for economic reasons, James P. Barnes, president Louisville Railway, pointed out that the humanitarian motive is now paramount. Much as his company has accomplished in the way of financial saving, he feels that the saving of life and limb has been of far greater importance. Moreover, united work in accident prevention has created a closer bond between the employee and the officials of the railway. Truly, in the case of this meeting it might be said that those who came to scoff, if any such there were, remained to ponder upon the substantial benefits resulting from organized safety work.

Safety Platforms an Aid to Movement of All Traffic

TO THE prospective passenger waiting for a street car in the midst of a stream of rapidly moving vehicular traffic a raised loading platform is a great boon. Use of such safety platforms in most of the large cities of this country undoubtedly has prevented a great number of accidents. For this reason alone the moderate cost of construction is more than justified.

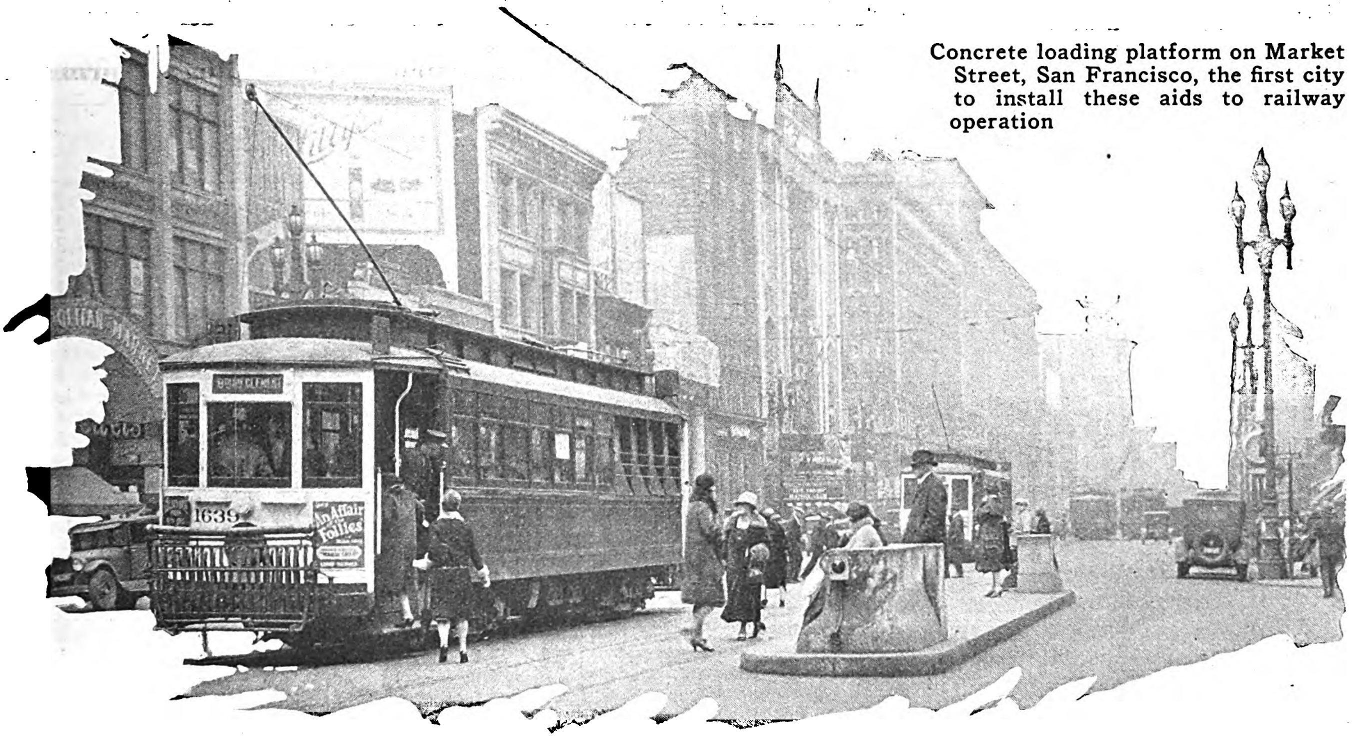
But the safety platform is more than a means of preventing accidents. It is a definite aid to the movement of all traffic. A nation-wide survey made by ELECTRIC RAILWAY JOURNAL, presented elsewhere in this issue, shows that executives of railway companies in cities where platforms are used are practically unanimous in the opinion that they speed up the operation of both cars and other vehicles.

Where loading platforms are used passengers are ready to board the car immediately it comes to a stop. Otherwise many of them wait on the sidewalk and make their way from the curb to the center of the street while the car waits. Moreover, stop-watch checks show that it takes less time for a passenger to board a car from a platform than from the street. Thus, there is a double saving of time, which in the aggregate amounts to many car-hours per day.

Vehicles other than cars should not be allowed to operate on the tracks inside the platforms. Otherwise cars are unable to draw up alongside the platform to their proper position, and one of the chief advantages of the platform is lost. The survey shows that the importance of this regulation is realized in most cities, although a few permit this harmful practice.

Loading platforms facilitate movement of other vehicles nearly as much as that of street cars. Most prospective car riders make their way from the sidewalk to the safety platform while the traffic is halted. Thus when the traffic is moving, greater speed can be attained with equal safety because of the small likelihood of pedestrians dashing out from the curb to reach the car tracks. Passengers alighting from cars have a safe place to stand and it is unnecessary for motor traffic to stop every time the car stops. All this has an important effect in relieving congestion where traffic is dense.

No uniform practice was disclosed by the survey in regard to paying for the construction of safety platforms. In some cities the railway has paid the cost, but in most instances this has been done by the municipality. As the platforms are built on public property and benefit not only the car riders but also the motorists, their construction appears to be a reasonable municipal expense. So favorable has been the experience of cities where these platforms have been used that municipal officials who understand their advantages should be quite willing to authorize their installation.



Concrete loading platform on Market Street, San Francisco, the first city to install these aids to railway operation

Safety Platforms Aid Traffic Movement

Survey shows use of raised loading areas alongside street railway tracks in 30 cities has greatly facilitated operation of cars and all vehicular traffic. Details of construction and lighting are given

By John A. Miller, Jr.
Associate Editor *Electric Railway Journal*

RAISED loading platforms, or "safety isles," alongside street railway tracks have come into use in many of the larger cities of the United States during the past few years. San Francisco, where such platforms were installed 22 years ago, was the pioneer in this development. Today they are used in Chicago, Philadelphia, Detroit, Los Angeles, Cleveland, St. Louis, Baltimore, Pittsburgh, Newark, Washington, Cincinnati, Indianapolis and numerous other cities. In order to secure definite information concerning the construction and use of these platforms a survey has been made by ELECTRIC RAILWAY JOURNAL and the results are given in this article. This shows that officials of railways in 30 of these cities are agreed in thinking that loading platforms are a substantial aid to the expeditious movement of all traffic, as well as a great protection to the car riders and pedestrians.

Dimensions of the loading platforms vary widely in different cities, but the general design usually is much the same. An accompanying table gives the principal dimensions of loading platforms used by 27 railways in 30 cities. Materials used in their construction and the agencies by which they were built also are listed. Except in a few instances the material used is concrete. The Capital Traction Company builds platforms of wood on Pennsylvania Avenue, Washington, D. C., on account of the necessity of removing them during parades. Wood platforms are used also at Cambridge and Worcester, Mass.; Akron, Ohio, and Louisville, Ky. Platforms of precast reinforced concrete slabs are used by the United Railways & Electric Company of Baltimore. These are built in 8-ft. sections at the company's material yard, as shown on page 644.

In length the platforms vary from 18 ft. to 215 ft. Those shorter than 50 ft. are the exception. Lengths between 50 ft. and 100 ft. are the most common. Among the users of platforms more than 100 ft. in length are the Northern Ohio Power & Light Company at Akron, where the platforms are 150 ft.; the Capital Traction Company, 192 ft.; the Worcester Consolidated Street Railway, 200 ft.; the Los Angeles Railway, 215 ft., and the Department of Street Railways, Detroit, 220 ft. Triple or quadruple berthing of large cars is possible at these long platforms, while elsewhere the usual practice is double or single berthing. At the other extreme of size is Seattle, where the platforms are only 18 ft. long. This length has been adopted because all passengers board and alight at the rear end.

Widths of loading platforms vary between 3 ft. and 8 ft. Most common are widths of 4 ft., 4 ft. 6 in. and 5 ft.

Principal Dimensions of Loading Platfo

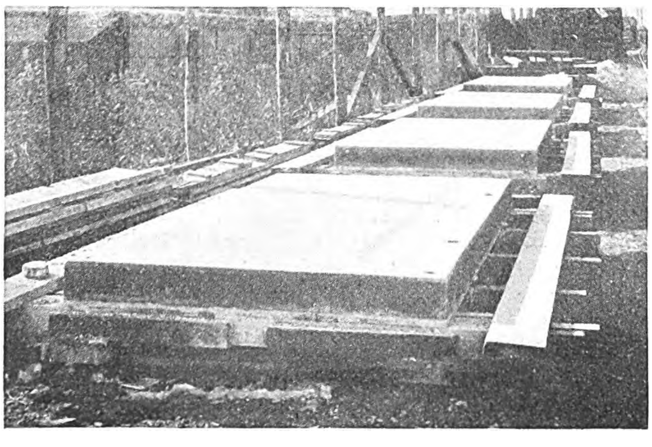
Railway	Length	Width	Height from Pavement	Distance from Rail
Atlantic City & Shore Railroad	50 ft.	4 ft. 0 in.	5½ in.	2 ft. 3 in.
Boston Elevated Railway	100 ft.	5 ft. 0 in.	6 in.	2 ft. 3 in.
Capital Traction Company	48 ft. to 192 ft.	4 ft. 4½ in. and 6 ft. 0 in.	8½ in.	2 ft. 0 in.
Chicago Surface Lines	50, 70 or 100 ft.	4 ft. 0 in.	6 in.	2 ft. 9 in.
Cincinnati Street Railway	50 ft.	4 ft. 6 in.	6 in.	1 ft. 6 in
Cleveland Railway	Various	3 ft. 6 in. and 4 ft. 0 in.	6 to 8 in.	2 ft. 1 in. to 2 ft.
Department of Street Railways, Detroit	Various	8 ft. 0 in.	6 in.	1 ft. 10 in.
Georgia Power Company	100 ft.	4 ft. 6 in.	8 in.	1 ft. 10 in.
Indianapolis Street Railway	108 ft.	6 ft. 0 in.	4 in.	2 ft. 1 in.
Los Angeles Railway	50 to 215 ft.	3 ft. 2 in. to 4 ft. 5 in.	5, 8, 9 in.	2 ft. 6 in. to 2 ft.
Louisville Railway	80 ft.	4 ft. 6 in.	8 in.	2 ft. 0 in.
Market Street Railway & Municipal Railway, San Francisco	60 ft. 2 in.	6 ft. 0 in.	6 in.	2 ft. 8 in.
Morris County Traction Company	35 ft.	4 ft. 0 in.	5 in.	....
Northern Ohio Power & Light Company	50 to 150 ft.	4 ft. 0 in.	5½ in.	2 ft. 4 in.
Pittsburg Railways	50 to 100 ft.	4 ft. 6 in.	5 to 6 in.	1 ft. 4 in.
Philadelphia Rapid Transit Company	80 ft.	Various	4 to 5 in.	1 ft. 10 in.
Public Service Railway of New Jersey	50 to 100 ft.	5, 6, 7 and 8 ft.	4 to 8 in.	1 ft. 10½ in. to 2 ft.
San Diego Electric Railway	30 ft.	6 ft. 6 in.	8 in.	2 ft. 4 in.
Schenectady Railway	80 ft.	6 ft. 0 in.	6 in.	2 ft. 0 in.
Seattle Municipal Railway	18 ft.	6 ft. 0 in.	6 in.	....
Terre Haute, Indianapolis & Eastern Traction Company	80 ft.	5 ft. 0 in.	4 in.	1 ft. 6 in.
United Electric Railways, Providence	4,000 ft.	3 ft. 6 in.	6 in.	2 ft. 6 in.
United Railways & Electric Company, Baltimore	Various	4 ft. 0 in.	6 in.	2 ft. 0 in.
United Railways, St. Louis	100 ft.	4 ft. 7 in.	Slope 2 to 5¼ in.	1 ft. 7 in.
Wilkes-Barre Railway	60 ft.	4 ft. 0 in.	6 in.	2 ft. 1¾ in
Worcester Consolidated Street Railway	80 to 200 ft.	3 ft. 0 in. to 6 ft. 0 in.	8 in.	1 ft. 10 in.

Considerable variation occurs also in the distance from the gage line of the rail to the inside edge of the platform. This distance is governed by the clearance line of the car. To avoid accidents platforms usually are so placed that an unfolded step will not overhang more than a few inches, but this practice is not always followed. At Pittsburgh the distance is 1 ft. 4 in. At Cincinnati and Terre Haute it is 1 ft. 6 in. From these figures the distances range upward to 2 ft. 9 in. at Chicago and 2 ft. 10 in. at Los Angeles. Probably the average distance is about 2 ft.

Height from pavement to top of platform varies from a minimum of 4 in. to a maximum of 9 in. Six inches is the most usual height. A sloping platform is used at St. Louis. On the side nearest the rail its height is only 2 in., while on the outside the height is 5¼ in. A sectional view is shown in accompanying drawing.

MUNICIPALITIES PAY COST OF BUILDING PLATFORMS

Cost of construction of loading platforms is borne by the municipalities in most instances, although there are also a number of cities where the railway has paid the entire expense. At Philadelphia, San Diego and at Worcester the cost is shared by the municipality and the railway. The city of Los Angeles has paid for the building of combination comfort stations and safety isles, but the ordinary loading platforms are paid for by the railway.



Precast slabs for loading platforms built by United Railways & Electric Company, Baltimore

Lighting of safety isles and protection against being overrun by vehicular traffic are prominent features of design. Nearly all of the platforms are provided with some sort of warning lights. In many instances they are placed only at the end toward approaching vehicles, but usually they are to be found at both ends. Often ornamental iron posts are employed as shown in accompanying sketches. Oil lanterns are utilized by the Capital Traction Company, the Louisville Railway, the Terre Haute, Indianapolis & Eastern Traction Company, the Georgia Power Company and the Worcester Consolidated Street Railway to light safety isles in the cities where these companies operate. An advantage claimed for this method is its independence of the general street lighting system. In case of failure of the street lights, the warning lanterns on the loading platforms continue to burn. At Seattle the lamps on the safety isle are tapped from the trolley wire. Gas lights are used on safety isles in some of the New Jersey suburban towns in which Public Service Railway operates. In Atlantic City the concrete loading platforms have mushroom electric lights at both ends. Flashing beacons are used in Chicago, Pittsburgh, Providence, Baltimore and St. Louis. Red reflectors at the end toward approaching traffic serve as auxiliary warning devices on numerous platforms.

PROTECTION AN IMPORTANT ELEMENT

To protect people waiting on the platforms from vehicular traffic, bumpers of various kinds are generally installed. Ordinarily a bumper is placed at only the approach end of the platform, although in some instances bumpers have been built at both ends, as was done in the Wilkes-Barre safety isles shown in an accompanying illustration. Concrete or reinforced concrete is frequently used for this purpose. Pieces of old rail often are buried

Concrete	Railway	Electric lights	Concrete bumper	6 months
Wood	City	Oil lanterns	None	3 months

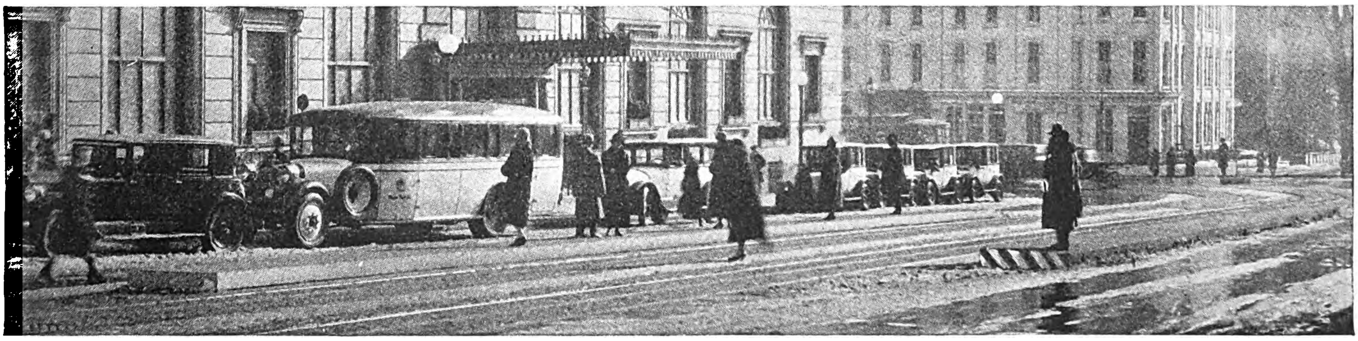
in the concrete to give added strength. At Cincinnati short pieces of vertical rail imbedded in the pavement create a substantial barrier. At Newark the concrete bumper has been extended to form a bench on which waiting passengers may sit. Sometimes these bumpers are painted with black and white stripes to attract attention. The Georgia Power Company in Atlanta utilizes the bumper to carry a list of the car lines passing that point. Pipe stanchions and chains are used by the Boston Elevated Railway and the Northern Ohio Power & Light Company. On the other hand, in a number of cities reliance is placed entirely on the height of the platform above the pavement to prevent encroachment by vehicular traffic.

CONTINUOUS SAFETY ISLE AT PROVIDENCE

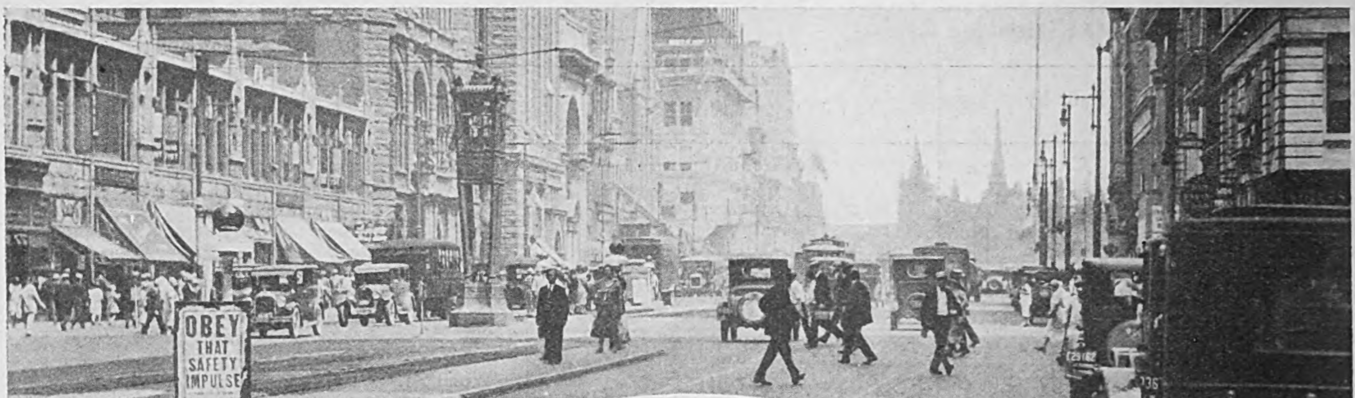
Perhaps the most unusual type of loading platform disclosed by this survey is one located on North Main Street, Providence, R. I. This extends alongside the tracks of the United Electric Railways from Grand View Street to Eighth Street, a distance of 4,000 ft. It is built of concrete, 3 ft. 6 in. wide and 6 in. high. At intersecting streets there are gaps in the platform to permit vehicular traffic to cross from one side of North Main Street to the other. At the end of these platforms and in the middle of the intersecting streets flashing beacons have been placed. The effect of this construction is practically equivalent to providing a reserved strip in the center of the street for railway operation.

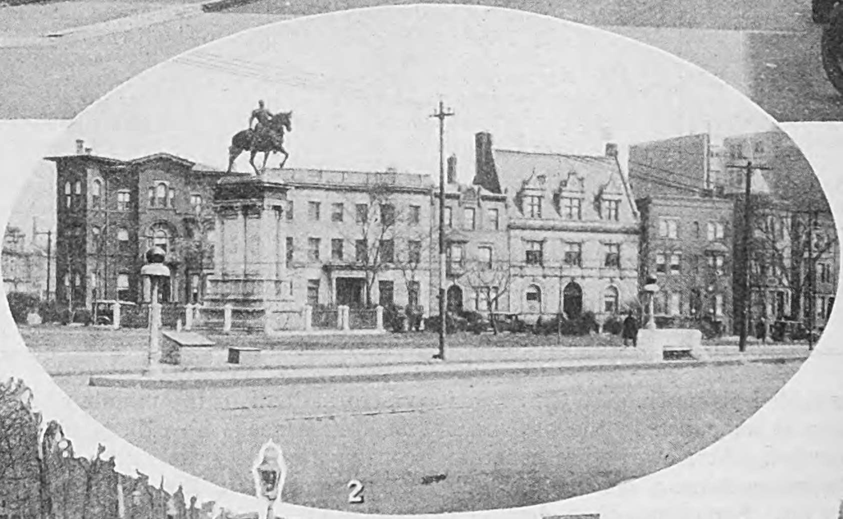
Opinion of railway officials is quite definite that the minimum width of roadway between curbs is **44 ft.** where loading platforms are to be installed alongside double track. Assuming that a double-track street railway utilizes 18 ft. of roadway, there remains 26 ft. for other vehicles, of which 13 ft. will be on each side of the track. If the width of the platform is 4 ft., there remains a 9-ft. lane for vehicular traffic. A few officials consider it desirable to have an even wider roadway between curbs where platforms are used, specifying street widths up to 60 ft. Again, assuming 18 ft. for the railway and 4 ft. for each platform, there remains a vehicular roadway of 17 ft. on each side, which may be considered sufficient for two lanes of traffic.

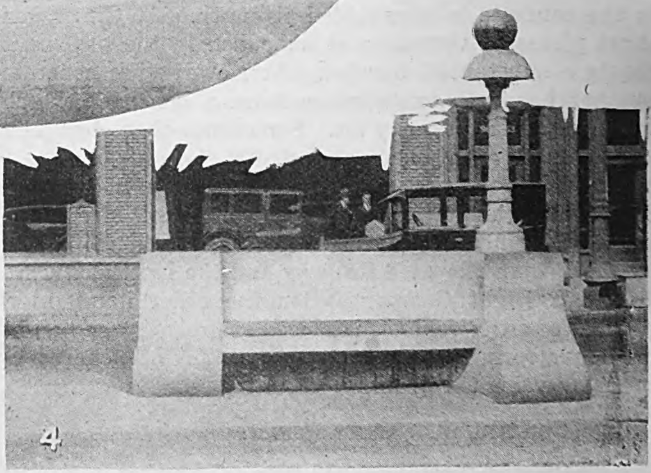
In harmony with this conclusion is the opinion that the roadway should be at least 36 ft. from curb to curb in a street where loading platforms are used alongside a single track. Assuming that 10 ft. is required for the cars and 4 ft. for the platform, there remains a 9-ft. vehicular roadway on each side of the street.

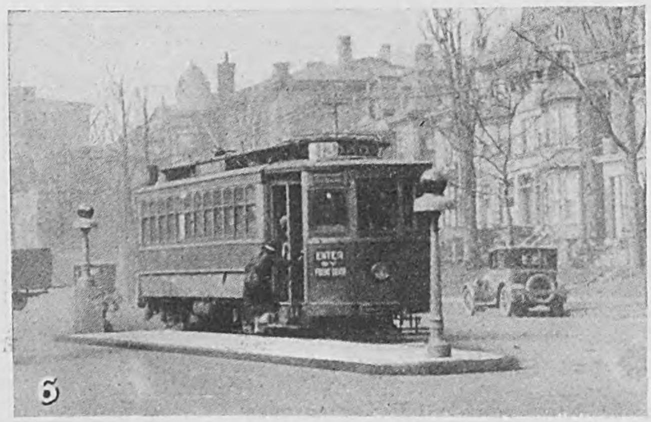


Wood platforms used by Capital Traction Company on Pennsylvania Avenue and Fifteenth Street, Washington, D. C., are built in sections to facilitate removal during parades







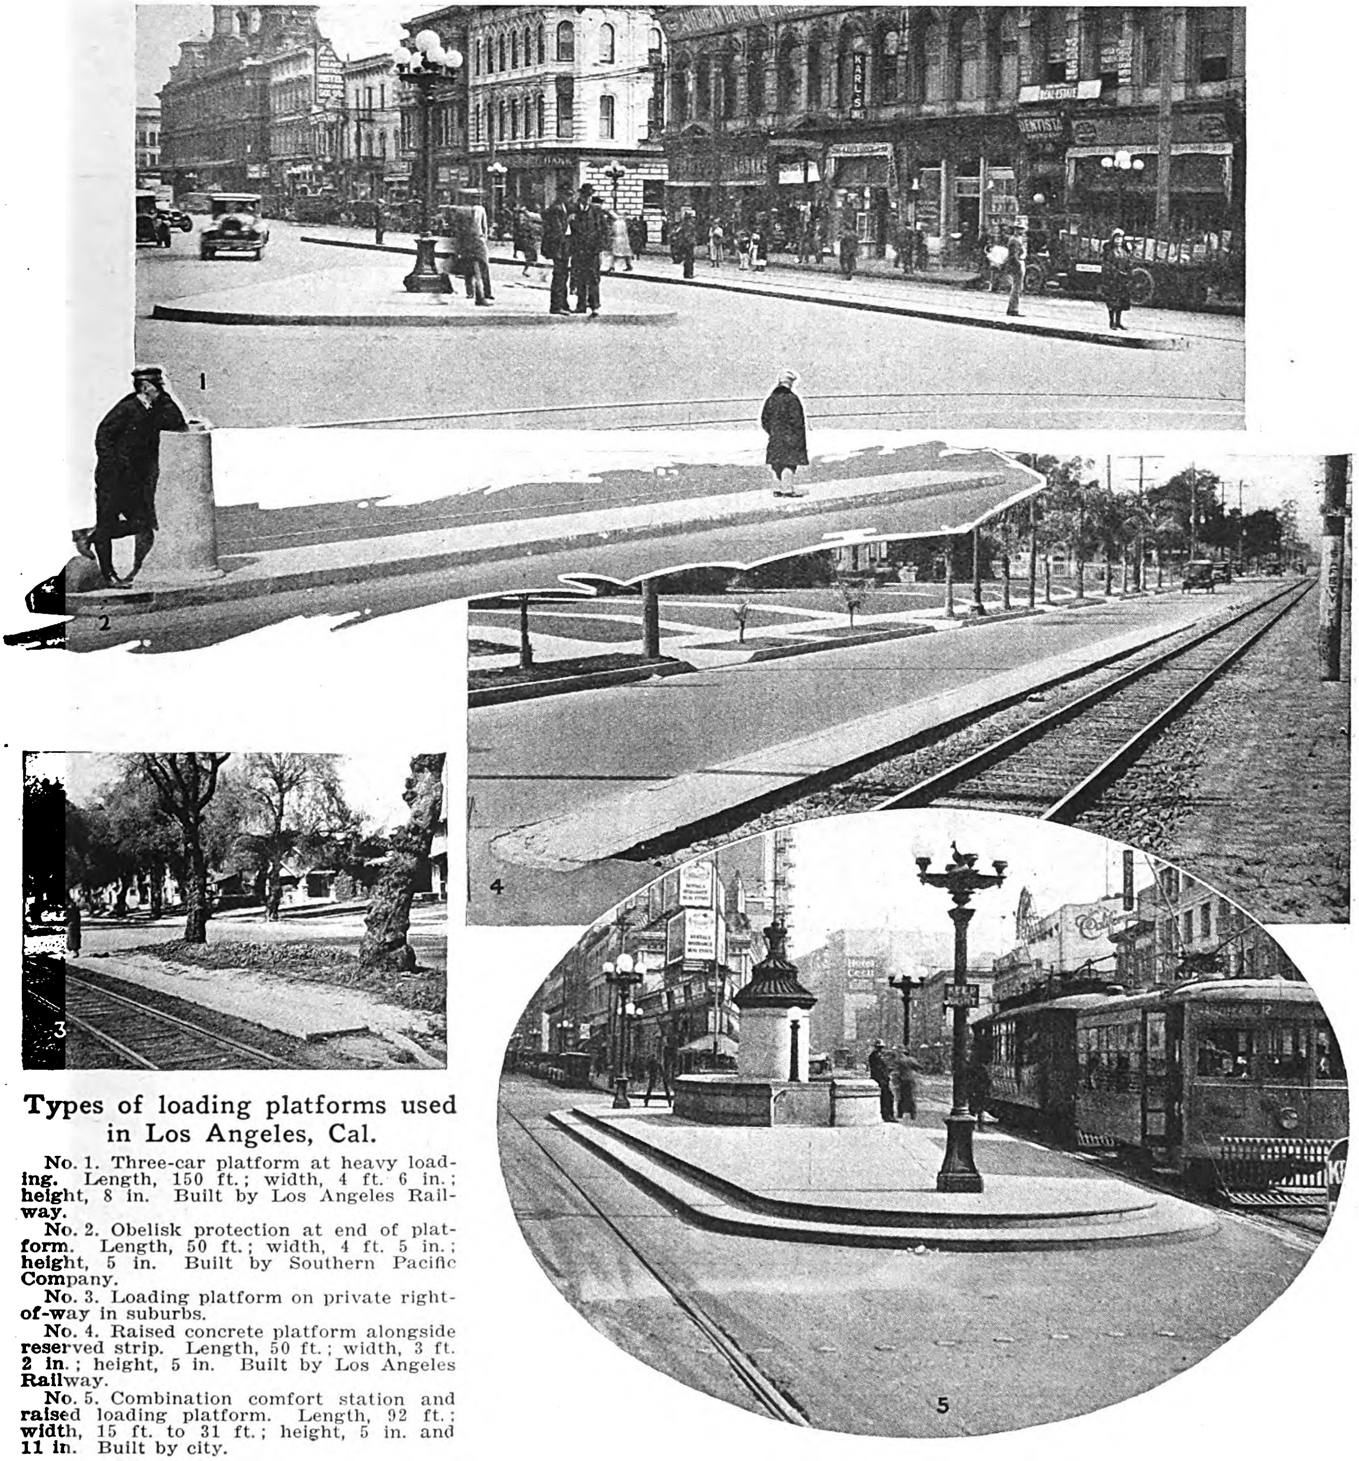


Loading platforms are used extensively along the lines of Public Service Railway, Newark, N. J.

No. 1. Platforms at Broad and Market Streets, the busiest intersection in the city, are 96 ft. in length.
No. 2. Latest type platform, which accommodates two cars.
No. 3. In the suburbs some platforms are lighted by gas.
No. 4. Combination concrete bumper and seat at end toward oncoming vehicles.
No. 5. Lamp post at unprotected end of platform.
No. 6. Passenger boarding front entrance car at platform.

In congested areas loading platforms speed up railway service because they "enable people to be at the boarding point as the cars approach instead of standing on the sidewalk and then threading their way through a maze of traffic to reach the car after it has stopped." Such is the opinion of A. E. Potter, president United Electric Railways, Providence, R. I. A similar opinion is expressed by J. B. Stewart, Jr., general manager Cincinnati Street Railway, who says: "Passengers are on the platform ready to board the car instead of being on the curb, which delays the car while passengers are trying to get across among the automobiles."

According to A. T. Warner, general manager in charge of traffic Public Service Railway, Newark, N. J.,



Types of loading platforms used in Los Angeles, Cal.

No. 1. Three-car platform at heavy loading. Length, 150 ft.; width, 4 ft. 6 in.; height, 8 in. Built by Los Angeles Railway.

No. 2. Obelisk protection at end of platform. Length, 50 ft.; width, 4 ft. 5 in.; height, 5 in. Built by Southern Pacific Company.

No. 3. Loading platform on private right-of-way in suburbs.

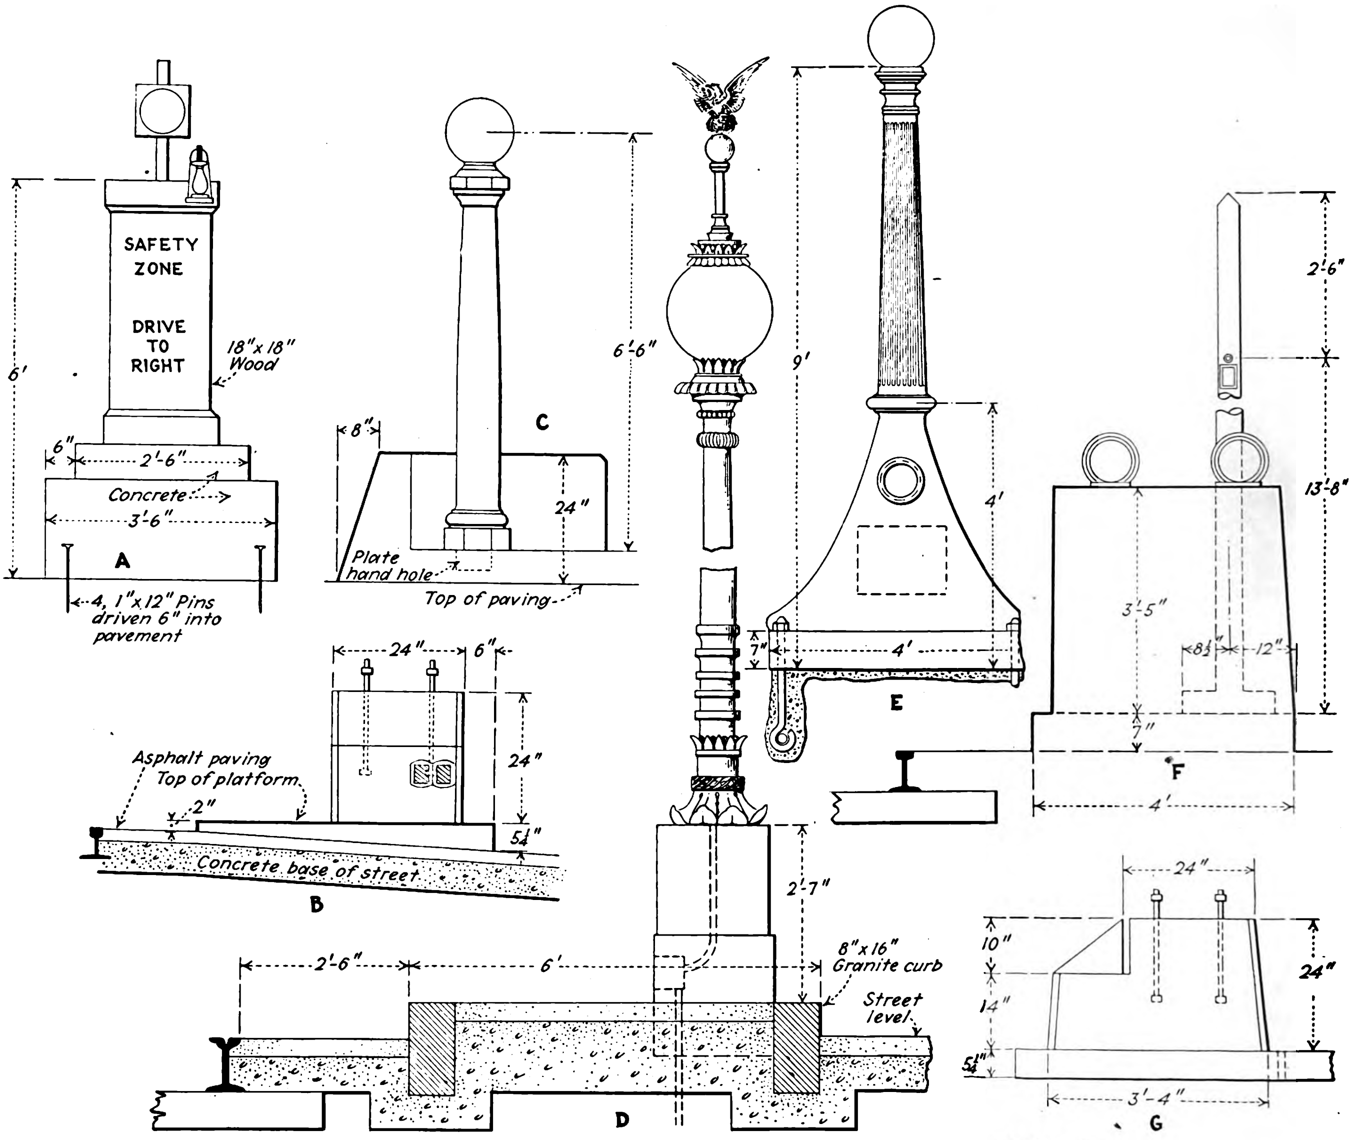
No. 4. Raised concrete platform alongside reserved strip. Length, 50 ft.; width, 3 ft. 2 in.; height, 5 in. Built by Los Angeles Railway.

No. 5. Combination comfort station and raised loading platform. Length, 92 ft.; width, 15 ft. to 31 ft.; height, 5 in. and 11 in. Built by city.

"There is no question but what a safety isle properly located has a number of advantages both from the public point of view and that of the operating company. First, it definitely establishes a point at which the cars will stop. Second, and of equal importance, it provides a haven of refuge adjacent to the track where prospective passengers can rest in safety while waiting for their cars. It also speeds up loading by making it possible for the passenger to be at one point ready to board the car when it arrives there." Stop-watch checks made at Newark show that it takes considerably less time for a passenger to board a car from a platform than the pavement.

Among others who expressed the opinion that the use of loading platforms speeds up railway service are Samuel Riddle, vice-president Louisville Railway; M. McCants, general manager Market Street Railway, San Francisco; T. H. David, principal assistant engineer Terre Haute, Indianapolis & Eastern Traction Company; R. E. Weber, engineer way and structures Schenectady Railway; D. A. Scanlan, general superintendent of railways Northern Ohio Power & Light Company; O. G. Schultz, general manager Morris County Traction Company; S. E. Mason, general manager San Diego Electric Railway; D. W. Henderson, general superintendent of railways, Seattle; A. J. Purinton, general superintendent Atlantic City & Shore Railroad; H. R. Whitney, vice-president Worcester Consolidated Street Railway, and C. A. Smith, superintendent of roadway Georgia Power Company.

On the other hand, doubt was expressed by E. J. McIlraith, staff engineer Chicago Surface Lines, and



Electric lamps, oil lanterns and reflectors used to mark safety platforms

A. At Louisville, Ky., loading platforms are protected by red lanterns as well as standard traffic lights.

B. St. Louis loading platform is lower on side near rails.

C. Arrangement of lamp post and bumper on Seattle, Wash., safety isle.

D. Graceful lamp post used to mark safety isle in San Francisco.

E. Combined lamp post and bumper to be installed at Atlanta, Ga.

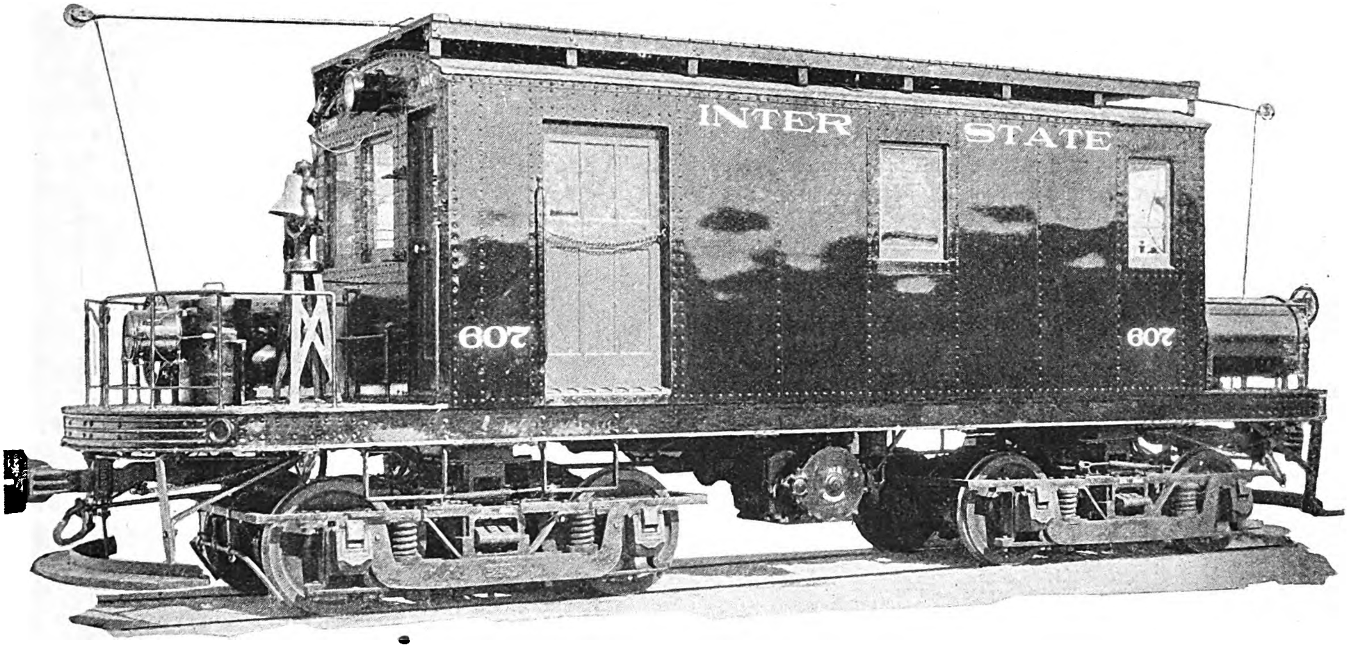
F. End view of loading platform at East Cleveland, Ohio.

G. Side view of bumper on loading platform in St. Louis, Mo.

R. B. Hill, superintendent of operation Los Angeles Railway, concerning increased speed resulting from the use of loading platforms. In Los Angeles, however the difficulty is caused primarily by the use of traffic signal lights, the operation of which nullifies the possible advantages of the loading platform so far as speed is concerned.

Opinion as revealed by the survey was practically unanimous that raised loading platforms are superior to safety zones marked by paint, buttons or stanchions. W. R. Dunham, Jr., executive engineer Department of Street Railways, Detroit, believes that platforms are superior, but not sufficiently so to warrant the additional expense. If stanchions are rugged enough to prevent the encroachment of vehicular traffic the safety zone is as satisfactory as the raised platform, according to C. W. Wilson, research manager Pittsburgh Railways. Safety zones marked by cast-iron buttons set in the pavement are used to a considerable extent. More than 150 such zones have been established in San Francisco, according to M. M. O'Shaughnessy, city engineer. A post type safety zone built in that city at Market and Stockton Streets in 1925 has proved very satisfactory. Detroit, Denver, Terre Haute and San Diego are other cities using buttons or posts to mark safety zones. The majority opinion in favor of raised platforms, however, is well expressed by R. H. Dalgleish, chief engineer the Capital Traction Company, who says: "We consider the platform much more desirable than the painted safety zone as it affords better protection to waiting passengers."

Practice concerning the operation of vehicles other than cars inside the loading platforms is not uniform throughout the country. In some cities it is permitted. At San Francisco it is forbidden on Market Street and permitted elsewhere. In Los Angeles automobiles intending to make a left turn are required to stop inside the loading platforms and wait for the signal light permitting the turn. This practice has resulted in considerable interference to railway operation. In Schenectady buses are permitted to use the space between the platforms, but other vehicles are not allowed to do so. In a majority of cities from which information was secured in this survey general vehicular traffic is not allowed to pass inside the platforms. Opinion of operating officials strongly supports this regulation.



A 40-ton locomotive built by the Interstate Public Service Company from discarded material of two old bridges

Locomotives Constructed Out of Bridge Material

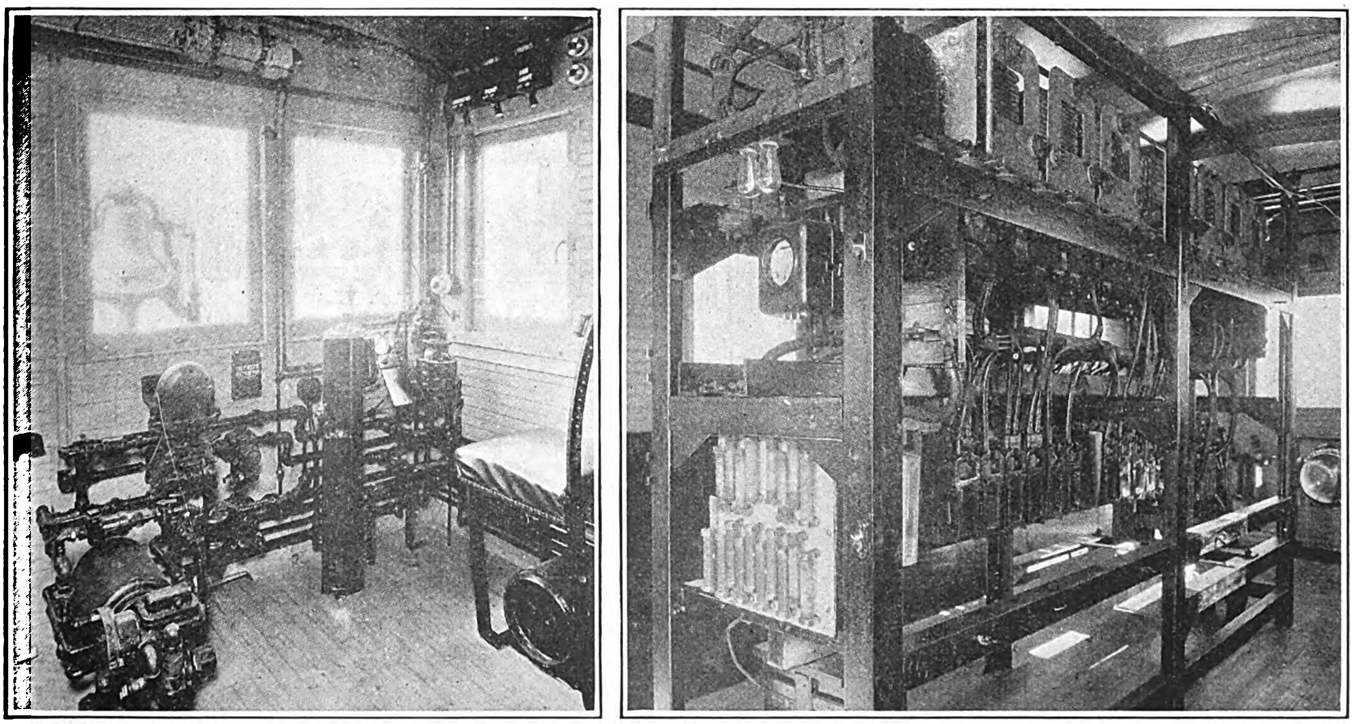
By C. M. Bange
Master Mechanic Interstate Public Service Company, Scottsburg, Ind.

When two large bridges were replaced in southern Indiana considerable steel in good condition was available. Some of this was used by the Interstate Public Service Company in the construction of a high-speed 40-ton locomotive in the Scottsburg shop. The locomotive will be used to haul freight between Indianapolis, Ind., and Louisville, Ky.

Working drawings were first prepared and the work laid out under the direction of the master mechanic. Credit for the splendid construction, however, belongs to the men in the shop.

The engine is 35 ft. long over bumpers, the central cab being 21 ft. in length. Truck centers are 18 ft. and the total height from rail to trolley base is 13 ft. 2 in. The two trucks are equipped with 34-in. rolled steel wheels.

Steel is used throughout in the construction of the cab except the floor and inside sheathing. The roof is steel, except for a wood platform to protect the crew when working on a live trolley. The window and door casings are made of No. 12-gage steel bent to the proper



At left—Motorman's position on one of the Interstate locomotives. At right—Plates removed from the control cabinet show mounting of the control equipment in the Interstate 40-ton locomotive angle and then welded at the joints and riveted to form a watertight job.

All equipment is carried above the floor line except the air compressor and brake cylinder. Reservoir tanks and sand supply are carried on the open platforms. Heavy iron railings guard the platform ends.

Propulsion equipment consists of four Westinghouse 303-A motors, 115 hp. each, geared 16:61. Control equipment is a modification of the General Electric type M, built from material on hand. Two type C6-K ten-point controllers are used, mounted in each motorman's position. All wiring is in metal conduit. Type MS-14 switches are used for control circuits, lighting and air compressors.

Westinghouse type 14-EL straight and automatic air brakes are used with a provision for using straight air on the locomotive alone.

The locomotive has a free running speed of 45 m.p.h. when running light and will haul eight to twelve loaded cars at 22 to 28 m.p.h. The cab arrangement allows full visibility in all directions. With the compressor mounted below the floor the noise is eliminated and comfortable quarters for the train crew are thus provided.

P. R. T. Bus Is Featured at the Philadelphia Home-Building Show

EACH year a home-building show is held in Phildelphia. Each year the Philadelphia Rapid Transit Company stages a comprehensive exhibit at this affair to stress the fact that adequate public transportation is indispensable to the development of a community of homes. During the show this year, which was held in the First Regiment Armory, Feb. 7-12, it was again decided to use one of the company's de luxe gas-electric parlor car type buses for the central element in the exhibit. While in the opinion of the company these units are not the type usually employed to serve newly developed residential sections, they nevertheless have a very beautiful appearance and were well adapted for a public exhibit, the comfort of the seats making them a popular resting spot for the visiting public. To encourage visitors to enter the bus and gain an impression of its roomy and comfortable interior arrangement the scheme was hit on of placing a transparent screen on the front windshield and then throwing moving pictures upon it from a machine placed directly in front of the bus.

Several reels of pictures, filmed by the P. R. T., were used, one of these gripping dramas being entitled "What the Motorman Sees," while another took the spectators on a trip through "Industrial and Historic Philadelphia." The former proved to be the most popular, particularly with the younger visitors, who swayed from side to side and squealed excitedly as the car in which "our hero" was stationed bore down upon careless automobilists and pedestrians. The films were run at frequent intervals throughout the day and evening and the S. R. O. sign had to be hung out at each performance.

Representatives of the street car, bus and Yellow Cab divisions of the company were on hand in uniform to hand out literature to the public and to answer any questions which might be asked. There was also an ex-service man on hand in his army uniform to answer questions concerning the service which the Mitten Men and Management Bank and Trust Company has been rendering to veterans in extending loans on their adjusted service certificates. An added touch of reality was given to the exhibit by the array of baggage placed in the rack on the roof.

Progressive traffic control signals showing red and green lights simultaneously at alternate intersections were put in operation April 5 on Chestnut Street, Philadelphia. They replace the hand semaphores which have been in use recently. Some time ago the same electric signals were in use with a system of synchronized control. Comparisons will be made of traffic flow under the different systems.

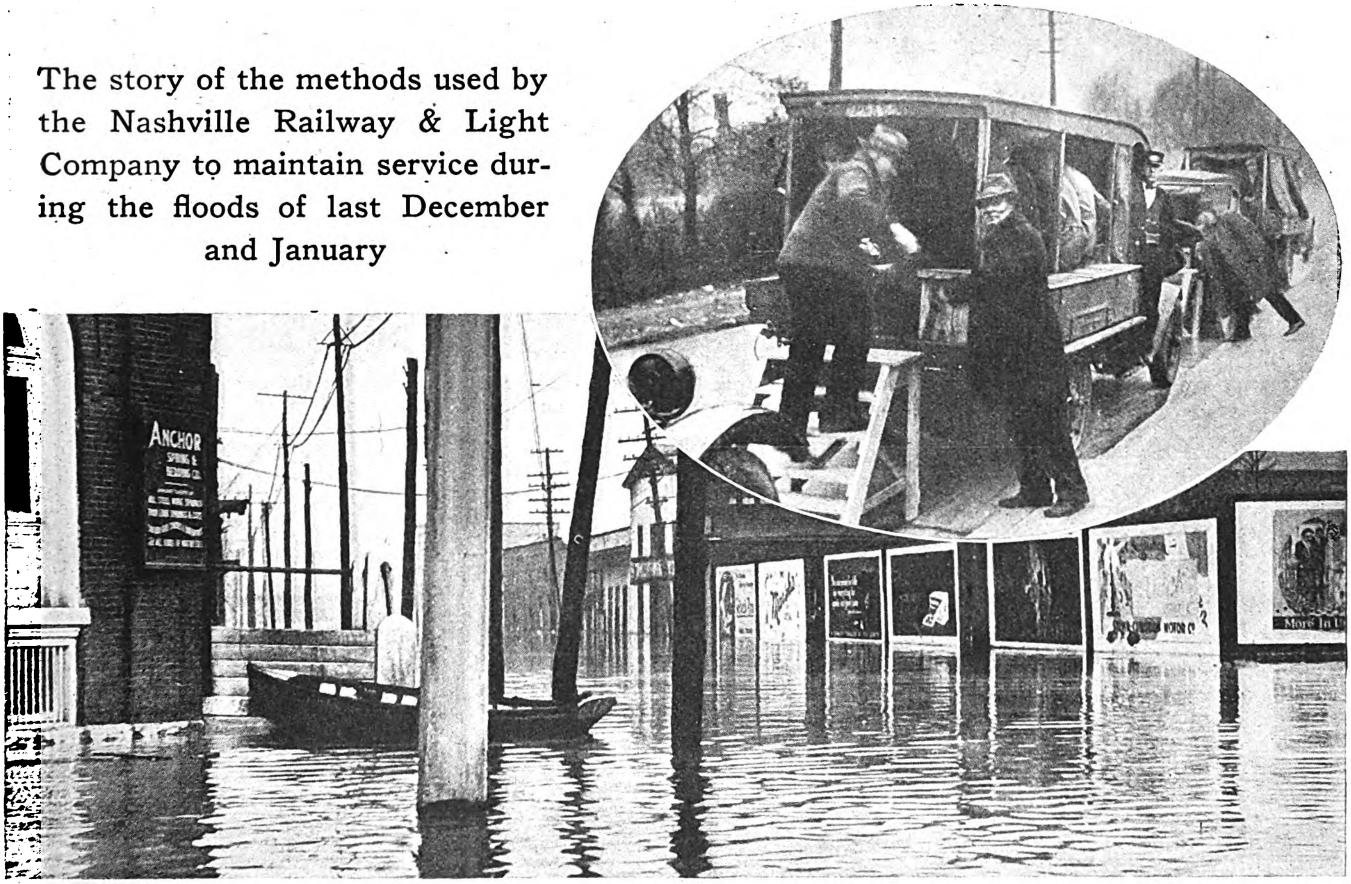
Meeting an Emergency in Nashville

The story of the methods used by the Nashville Railway & Light Company to maintain service during the floods of last December and January



Scene on the North First Street line. The water at this point was about 3½ ft. deep. In oval—Emergency transportation was given by the railway's line trucks and other vehicles, in addition to which other vehicles were rented

CRISES in the operation of transportation lines are relatively rare. Some of the unusual events can be planned for in advance, but when the forces of Nature combine to attack a whole city, as they did Nashville, Tenn., during the flood of the last holiday season, it takes heroic methods to combat them. While it is to be hoped that other transportation companies will not have the opportunity of adopting methods similar to those used by the Nashville Railway & Light Company in keeping up service, the record of the preparations made and the results obtained are of great interest.

A series of terrific rains, reaching a climax during Christmas week, was experienced in the Cumberland Valley and the vicinity of Nashville. The first part of Christmas week there was a 5.5-in. rainfall, but although river traffic was tied up, trains were running late and warehouses were being vacated, it was still hardly more than a high-water story to the newspapers. On Christmas Eve the gage showed a depth of 43 ft., but even then it was expected that the river would recede within 24 hours.

Radio station WLAC went on the air Christmas Day with the first news that people were fleeing in all directions and indicating the seriousness of the situation. The rain lasted until Dec. 28, with a total precipitation of 11.38 in. The water continued to rise until Dec. 29, reaching a height of 56.2 ft. and shattering the previous record of 55.2 ft., registered in 1882. Until Sunday, Jan. 2, the Cumberland clung to its high stage, then fell to 55 ft. the next day, thereafter falling much more rapidly until it was back to something like normal.

The river at one point was more than 3 miles wide. Practically all towns to the east of Nashville became isolated and mail had to be carried to them by airplane. All main highway cities to the east were cut off. When it approached its highest point the flood began to cripple street railway and bus service, with the ultimate result that thirteen of the Nashville Railway & Light Company's lines were under water. It is a matter of record that lines of the company were kept open despite the greatest handicap they ever operated under. This was accomplished only by the greatest effort and sacrifice of the employees. The majority of the men worked day and night, sticking to their cars and seeing that they did not shut down no matter what came. As a typical example, one man who was so zealous in his work actually was on his feet 48 consecutive hours without a wink of sleep.

NEW BUSES PLAYED HEROIC PART

It just so happened that when the flood reached the perilous stage seven new Yellow motor coaches purchased by the company had arrived from Chicago. To start with, the delivery of these coaches was held up about eight hours by floodwaters when 50 miles out of

Nashville. These buses played a heroic part in the emergency, arriving just in time to go into service in order to transfer the very first water-marooned passengers around the flood area to waiting street cars.

In many instances the buses plowed through water right up to the motor. This service was performed under these strenuous conditions without any trouble and without any of the buses having either operating or mechanical difficulties of any kind, even though at times water ran right into the coaches themselves.

The flood situation became so bad that even these new motor coaches were unable to cope with the passenger transfer situation. The company pressed into service its overhead line trucks and every available motor vehicle. In addition outside equipment was rented to facilitate to the utmost the uninterrupted movement of passengers. At some points the car tracks were covered by 12 to 15 ft. of water. The following figures show the depth of water over points on the various routes:

Jo Johnson line	16.48 ft.
Lebanon line	12.31 ft.
First Avenue South line	10.2 ft.
North First Street line	10.82 ft.
Fourth Avenue South line	5.14 ft.
Main Street	5.33 ft.
North Second Street	4.79 ft.
Fourth Avenue North	4.48 ft.
Cedar Street	3.67 ft.
Fatherland Street	1.53 ft.
Woodland Street	.2 in.
Sixth Avenue South	.67 in.
Third Avenue South	.62 in.

Indicative of this condition the illustrations show the great depth of the water. In one will be noticed the car stop sign on the overhead guy line, which is just above the water line, indicating a depth of approximately 15 ft.

The company advertised in the local newspapers to keep its patrons informed from day to day as to the situation and to advise what steps had been taken to furnish them with transportation. One of these advertisements is reproduced herewith.

East Nashville is a distinct part of the town and there are three passenger bridges which connect it with the remainder of the city. Early in the flood, two of these three bridges were closed to traffic on account of the high water and the danger that they might collapse, the water having risen over the roadways on them. This left only one bridge open between the main part of the city and East Nashville, with the water continually rising. At this time the water height had broken a hundred-year record. The remaining bridge was the Woodland bridge, a steel structure,

NOTICE TO STREET CAR PATRONS

SOUTH NASHVILLE

Outbound passengers on the Fairfield and Radnor lines will ride cars bearing those names, but which will be routed out Sixth avenue, south, to Sixth and Ash. At this point transfers will be given, acceptable at Ash and Third avenue, for the remainder of the Radnor or Fairfield trip.

Inbound Radnor and Fairfield passengers will transfer at Third and Ash to cars waiting at Sixth and Ash, for the remainder of the trip to town.

EAST NASHVILLE

Outbound passengers on the Shelby line will ride either Porter Road or Inglewood car to Third and Woodland, at which point transfers will be given, acceptable at Third and Fatherland on Shelby cars, which will complete the outbound trip.

Inbound Shelby passengers will be given transfers at Third and Fatherland, acceptable at Third and Woodland, for the remainder of the inbound trip.

NORTH NASHVILLE

All passengers on inbound St. Cecilia and Buena Vista street cars will transfer at Fourth Avenue and Jefferson street to Jefferson street cars. By street car and motor bus, passengers will be transferred from this point to Twenty-second avenue and Cedar, where inbound West Nashville cars will take them, by way of Church street, to the uptown business district and the Transfer Station. Patrons of the Jefferson street line will be transferred at Sixteenth avenue over to Jo Johnson street cars and on to Twenty-second avenue and Cedar, where West Nashville cars will take them to the uptown business district and the Transfer Station.

Patrons of the Jo Johnson line wishing to reach the business district will ride the Jo Johnson car to Twenty-second and Cedar, transferring there to West Nashville cars for the trip to the business district and the Transfer Station.

Patrons of the Cedar street line wishing to reach the business district will ride the Cedar street car to Twenty-second and Cedar, where they will transfer to West Nashville cars, going to the business district and the Transfer Station.

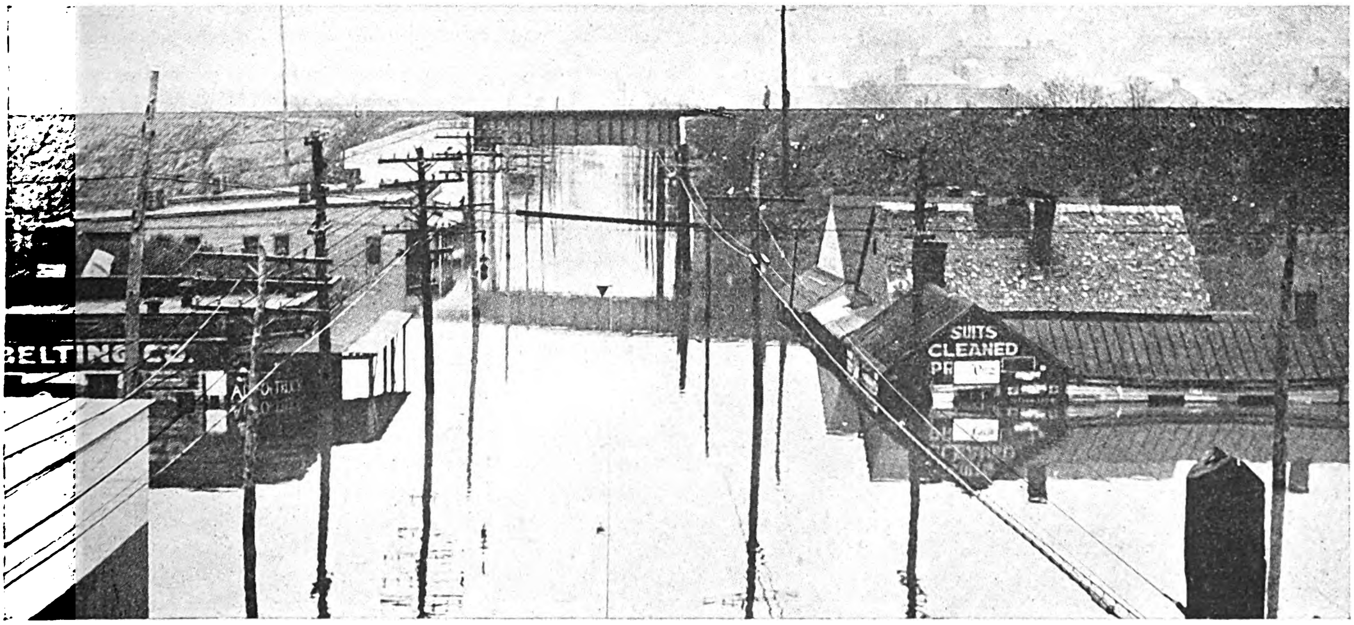
Patrons returning home on all the above lines will ride outbound West Nashville street cars to Twenty-second and Cedar, where they will be transferred to their respective street car lines.

THESE CHANGES IN SERVICE ARE DUE TO FLOOD CONDITIONS

The system of transferring on all other lines in the affected area remains unchanged.

Nashville Railway & Light Company

Advertisements like this one in the Nashville *Tennesseean* kept the public informed of the steps taken by the company to give emergency service



On the North Nashville car line the water was between 5 and 6 ft. deep

What Public Officials Thought of the Railway's Flood Service

CITY OF NASHVILLE
NASHVILLE, TENN., Jan. 21, 1927.

Mr. J. P. W. BROWN, Vice-president
Nashville Railway & Light Company,
Nashville, Tenn.

MY DEAR MR. BROWN: I want to commend publicly your company for the outstanding service it rendered a distressed city during the worst flood in Nashville's history.

I am sure that the public at large sincerely appreciates the service rendered by your company in such an extreme emergency.

With best wishes for you and your company, I am,

Sincerely yours,
HILARY E. HOWSE,
Mayor.

CHAMBER OF COMMERCE
NASHVILLE, TENN., Jan. 21, 1927.

Mr. J. P. W. BROWN, Vice-president
Nashville Railway & Light Company,
Nashville, Tenn.

MY DEAR MR. BROWN: As president of the Nashville Chamber of Commerce, I want to take this opportunity to recognize and to commend the Nashville Railway & Light Company for its splendid service during the recent flood.

I have heard on every hand the most laudatory comment concerning the tireless efforts and splendid accomplishments of your railway, power and lighting departments in the face of a tremendous handicap. Your company not only met the emergency by transferring passengers in buses around the flood area, and by organizing your other departments for flood relief, but it also made a generous contribution to the fund for alleviating distress.

In all of this work, I am sure that you have strengthened your friendship with the people of Nashville, and in this expression I am sure that I reflect the appreciation of all Nashville.

Sincerely yours,
CHAS. M. MCCABE,
President Chamber of Commerce.

---

across which ran every street car line carrying passengers to East and Northeast Nashville. At this point centered the efforts of the railway. When the water started to climb on the east approach of the bridge it was realized that it would be only a matter of a few hours until East Nashville would be completely shut off from the rest of the city.

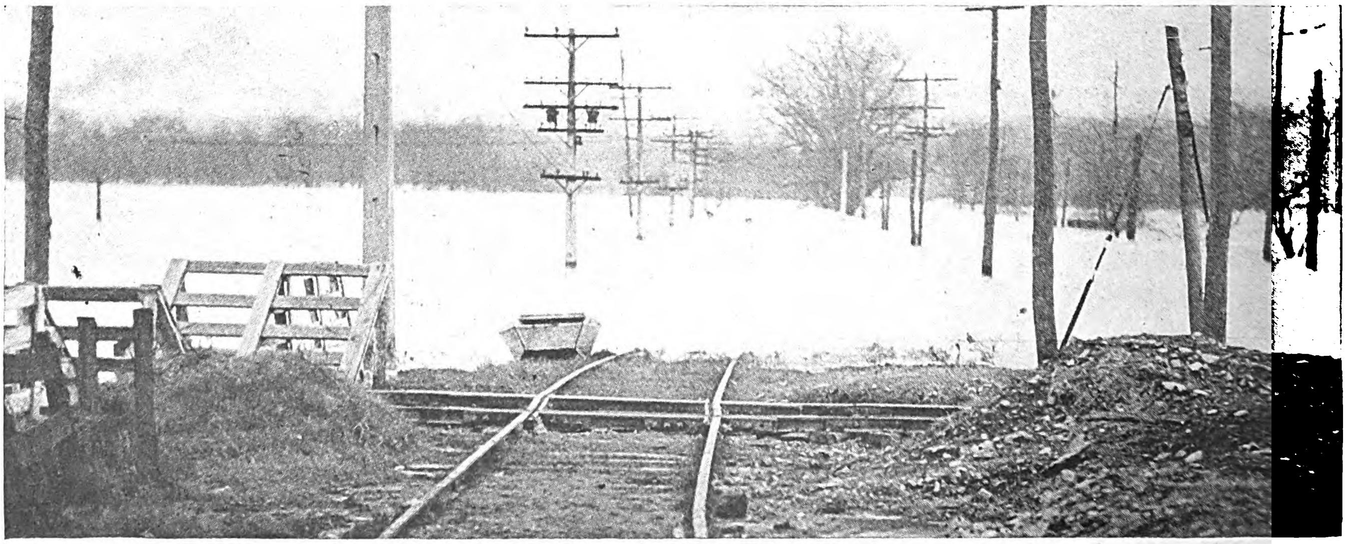
TRESTLE BUILT READY FOR USE

A hurried conference was held called by J. P. W. Brown, vice-president, with the department heads and it was decided to keep the East Nashville lines open at any cost. The shop forces immediately went to work to build a railroad trestle, the material being cut and placed in the carhouse. The trestle was built and the rails actually placed on it in the shop and held there, so that it was all ready to rush to the scene the moment it became necessary to operate the cars through water. The plan was to erect this trestle over the existing tracks and run the trolley cars over it. However, as it was completed the flood started to recede and its use became unnecessary.

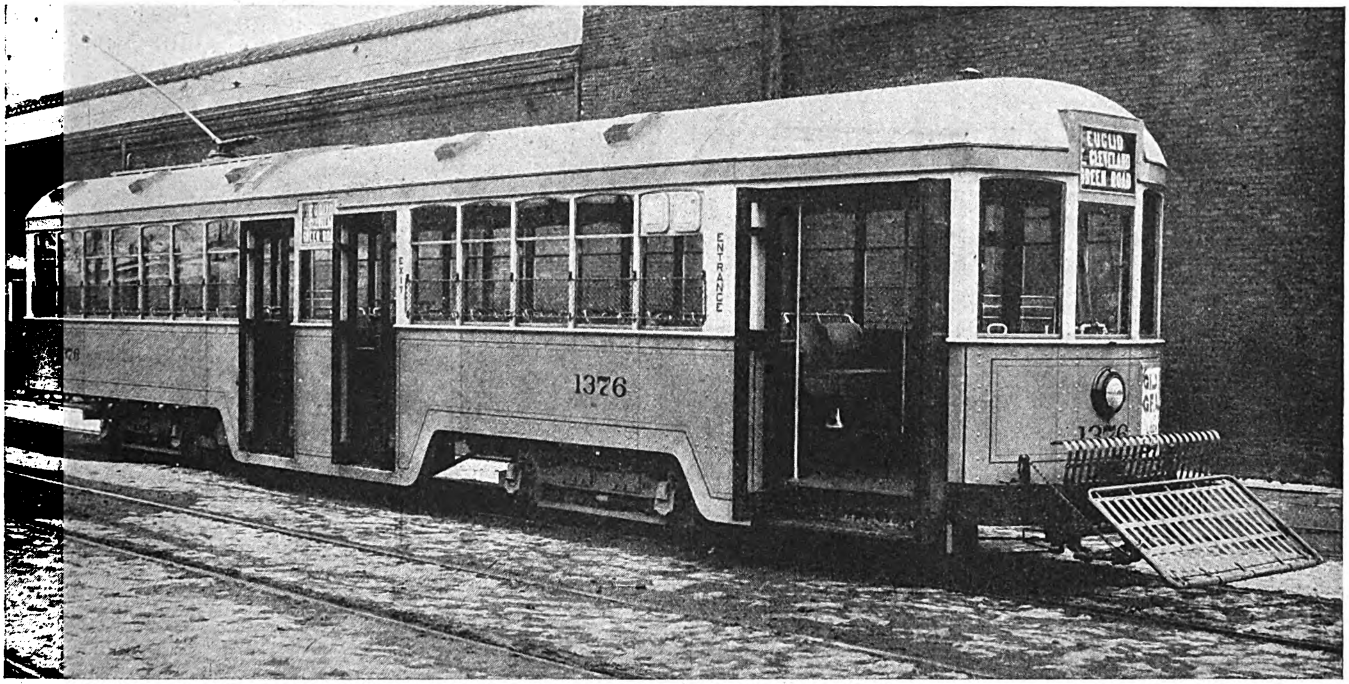
The property damage to the railway company's lines was not very great, but the company suffered a severe loss in revenue and was put to great expense in running the transfer service on the thirteen lines on which railway service had to be discontinued. The flood receded rapidly after passing the crest. Traffic was resumed by Friday, Jan. 7, on all lines.

Many letters were received by the company commending it on its meritorious service during these flood conditions. Outstanding among these were a letter from Mayor Hilary E. Howse and another from Charles M. McCabe, president of the Nashville Chamber of Commerce. Both of these letters are reproduced. They expressed the thanks of the residents of the city for the untiring efforts and the splendid accomplishments of the railway during the flood, although the company was operating in the face of tremendous handicaps.

In addition to the loss of revenue and the enormous expense the company was put to, it made a very generous contribution to the flood relief fund, for which subscriptions were solicited in the city, all of which received very favorable publicity.



The deepest water was on the Greenwood extension. A stop sign on the span wire may be seen in the distance just above the surface, indicating a depth of about 15 ft.



By the use of aluminum alloys for car framing and trucks this 51-ft. Cleveland car was made to weigh 30,300 lb., as compared with 43,200 lb. for the company's standard car of similar dimensions

Cleveland Aluminum Car
Proving Successful

Experimental car built by Cleveland Railway to determine possibilities of using aluminum alloys in car construction develops no weakness after more than four months operation

DURING the annual convention of the American Electric Railway Association at Cleveland last fall keen interest was shown by many delegates in the double-truck "aluminum" car for city service built by the Cleveland Railway. Since then many inquiries have been received by the company's officials from railway men in this country and abroad as to how this sample car has stood up in service. Due to the short time in which the car was built and the extent to which aluminum alloys were used for parts subjected to strains and shocks, even those who conceived the idea of building such a car expected that some weaknesses in the structure might develop after a period of operation under the severe service and loading conditions encountered in Cleveland. But more than four months of operation has failed to develop a single serious evidence of structural weakness.

The material used is duralumin, an alloy of aluminum with various combinations of magnesium, manganese, copper and silicon, to give the desired physical characteristics after heat treatment. This material, which is used extensively in the construction of aircraft, is obtained in form available for forgings, structural shapes, tubing and castings. It is claimed for duralumin that after it has been tempered the strength approaches that of mild steel.

USED STANDARD CAR DRAWINGS

When J. H. Alexander, president of the Cleveland Railway, decided to go ahead with the construction of an experimental aluminum car for exhibit at the convention, time did not permit the structure to be specially designed for the new material. Consequently, the standard Cleveland drawings for a steel car of what is known as the 1300 type were followed, the duralumin being substituted for steel with practically no change in section sizes. The only parts in which the size was increased in aluminum alloys over steel were the body side sheets, the truck side frames and the body bolsters. The car was built in the Harvard shops of the railway company under the direction of Terence Scullen, master mechanic.

Except for the windows, doors, side sill angles, wheels, axles, springs, gears, journal boxes, air tanks, resistor grids, trolley base, motor magnet frames and the main body of the air compressor, the car structure and equip-

ment are built almost entirely of duralumin. The material was furnished by the Aluminum Company of America in standard alloys of various compositions and physical characteristics depending upon the nature of the application. Rolled plates and extruded structural sections are made of what is known as 17-S alloy tempered to an ultimate strength of 55,000 to 60,000 lb. per square inch, yield point 30,000 to 40,000, elongation 18 per cent to 20 per cent, and modulus of elasticity 10,000,000. Standard commercial shapes in duralumin are made by the process of extrusion instead of rolling. In this process the alloy is heated until it has the consistency of jelly, and while in that condition is forced through dies into the desired shapes. The material used in forgings is called 15-S alloy and has practically the same physical characteristics as 17-S alloy except that the elongation is 16 per cent to 18 per cent instead of 18 per cent to 20 per cent. Duralumin tubing is made of 51-S alloy with an ultimate strength of 40,000 to 45,000 lb. per square inch, yield point 30,000 to 40,000 and elongation 10 per cent to 12 per cent. What is known as 195 alloy is used for castings. The normal characteristics of this material are: Ultimate strength, 28,000 to 30,000 lb. per square inch, yield point 15,000, elongation 6 per cent, and Brinell hardness 50. By varying the treatment of 195 alloy it is claimed that the ultimate strength can be increased to 36,000, the

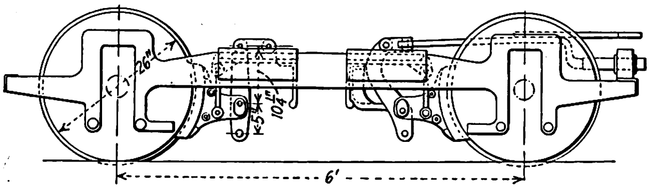
Weights		
Car body without trucks or equipment	18,354 lb.	13,851 lb.
Trucks per pair without gears	12,096 lb.	8,220 lb.
Motor equipment	9,242 lb.	5,720 lb.
Control equipment	1,298 lb.	827 lb.
Air brake equipment and piping	1,764 lb.	1,301 lb.
Heater duct and heater	446 lb.	381 lb.
Total weight without load	43,200 lb.	30,300 lb.
Saving by use of aluminum alloys	12,900 lb.	

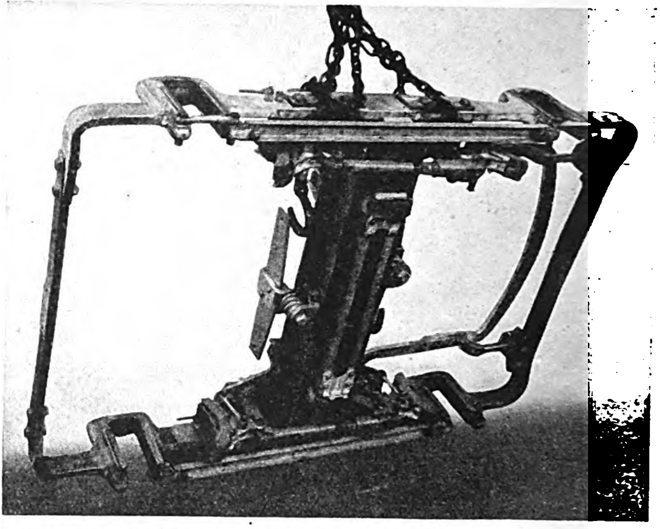
yield point to 27,000 and the Brinell hardness to 80. In this condition, however, there is no elongation and the material is very brittle.

On the body the side sill angles, rear bumper, the left-hand support of the front platform and a few minor parts of the structure are of steel. The duralumin side sheets are 0.125 in. thick in place of the 0.102-in. steel sheets used on the standard cars. The body bolsters are cast of 195 alloy, having a section approximately 20 per cent greater than the steel castings for which they were substituted. The trucks are Brill type 68-E-1 with forged side frames. Here again duralumin was substituted, but the side frame section was made somewhat thicker than normal to allow a greater factor of safety. The truck bolsters are likewise made of forged duralumin. Although the motor magnet frames are necessarily of steel, the motor axle caps, armature bearing housings at both ends and the gear cases are aluminum. All heater ducts, piping, brake levers and pull rods, apparatus hangers and the brake cylinder are aluminum. Although it was not possible to make the entire compressor frame of duralumin, this material was used for the end castings of the frame. Even such parts as the Tomlinson couplers and anchorage castings are aluminum alloy in their entirety with the exception of coupler hooks and springs.



Elevation drawing of Brill 68-E-1 truck. Side frames are made of forged duralumin

The rivets used throughout the body and truck are steel. It was not thought practical within the limited time available in building the car to attempt to develop a successful technique for hot driving and tempering aluminum alloy rivets in shops which were unfamiliar with their use.

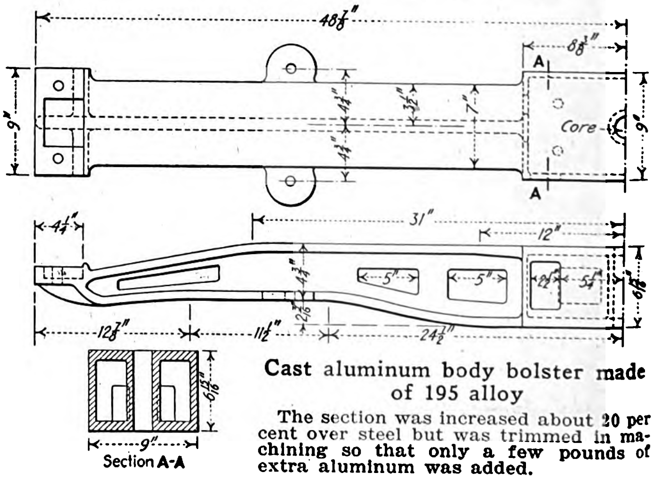


Frames of the Brill 68-E-1 trucks are forged duralumin. Likewise brake rigging, bolster, transoms and spring plank are made of the lightweight material

The car, which is shown in accompanying illustrations, is 51 ft. 2 in. long over the bumpers. Truck centers are 25 ft. 4 in. Height is 10 ft. $9\frac{7}{16}$ in. above rail and the car is 8 ft. $1\frac{15}{16}$ in. wide over side plates. It is of the front-entrance center-exit type with a seating capacity of 49 and an estimated standing capacity of 91, making a total carrying capacity of 140. Four Westinghouse 510-E, 35-hp. motors are used, with K-35-KK control. A Westinghouse DH-20 air compressor is provided. The car is glazed throughout with plate glass ⅛ in. thick.

Since the "aluminum" car was built entirely on an experimental basis, no comparative cost figures are available. In general, the aluminum alloys weigh about one-third as much as steel and the cost per pound in structural form is roughly six times that of steel. For a given structure, then, the cost in duralumin would be about double the material cost in steel. Against this should be credited the scrap value of the aluminum alloy.

Based upon its experiences with the sample car, the Cleveland management has found no serious obstacle to the general application of duralumin to car construction. The saving in weight that is made possible by the use of the lighter material is strikingly shown in the accompanying tabulation, which gives the principal dimensions, specifications, and a comparison of weights for a standard 1300 type car built of steel and the "aluminum" car made from the same drawings.



Cast aluminum body bolster made of 195 alloy

The section was increased about 20 per cent over steel but was trimmed in machining so that only a few pounds of extra aluminum was added.

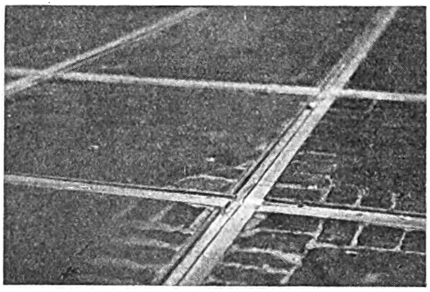
Maintenance Notes

Bearings Heated Over Slow Fire Before Babbitting

IF SUCCESSFUL babbitting of undersized journal and armature bearings is to be done, it is essential, in the opinion of J. W. Gordon, master mechanic Atlantic City & Shore Railroad, Atlantic City, N. J., thoroughly to remove all oil before beginning the process. This is accomplished in the shop of this railway by heating the brasses for one hour over a blacksmith's slow fire. Oil which has worked into the bearings is boiled out by this means. Only genuine babbitt metal is used. Babbitt that has been melted off armature brasses is used on journal brasses and axle bearings. For the armature bearings, however, only new metal is used. Due to the care in preparation of bearings, failures are said to have become practically a thing of the past on this road.

Maintenance Cheaper with Built-Up Special Trackwork

EXTENSIVE use is made of built-up special trackwork by the Market Street Railway of San Francisco for both angle and 90-deg. crossings. This type of special work is considered economical to maintain because it allows for extensive repairs by means of electric welding. The built-up type of crossing is assembled of 9-in., 106-lb. grooved girder rail. One set of rails is carried through the crossing, the head being cut out to allow for the flangeway of the crossing rail. The other rails are in short sections fastened to the through rails by angle plates ⅞ in. thick bolted directly to the short cross rails and through a 1⅛-in. filler block to the through rails. The entire assembly is mounted on a ⅝-in. steel plate 33 in. square. It is anchored by clips held in place with ⅞-in. key head bolts. After the crossing is made up all bolts are spot welded to prevent loosening. As this is a flange-bearing crossing, two steel wheel riders are riveted into the grooves of the rails at the crossing. With this type of construction it is possible to build up by electric welding those portions of the short lengths of rail which have a tendency to wear.



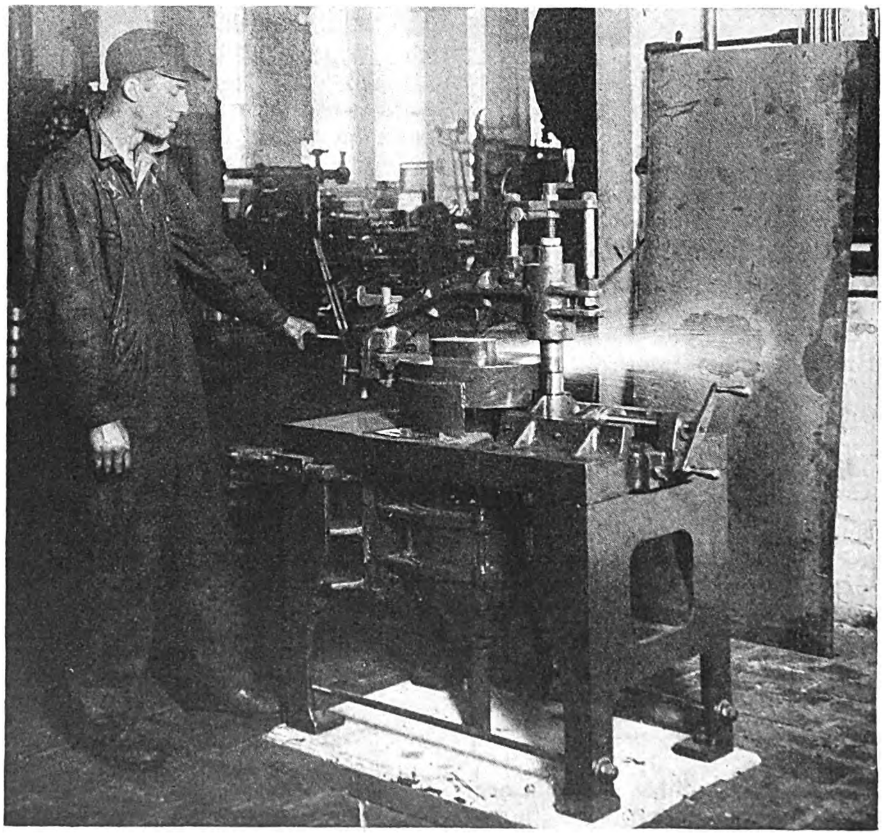
Built-up crossing which has been maintained in satisfactory operating condition by electric welding on the Market Street Railway

Repairs to this type of crossing are made very easily. For instance, in the case of a damaged short section between joints in the crossing, a plug is made up of a section of rail head mounted on a joint plate. The plate is bolted to the web of the rail and the head welded into the cut-out section of the original rail head. It is then built up by electric welding and made a continuous portion of the original rail. Complete rebuilding of an entire double-track crossing costs the company approximately $500.

A "hand to mouth" sustenance, applied to Maintenance, is downright extravagance.

Shoe Heads Ground Quickly

REALIZING that there was room for improvement in the method of grinding shoe heads, the Los Angeles Railway, Los Angeles, Cal., has constructed in its machine shop a very much improved machine for doing this work. One man with the new machine can grind from 150 to 180 shoe heads per day. This is 50 per cent more than by the previous



Grinding a shoe head by means of the new machine method, which used a rocker arm attached to a standard grinding machine. The grinding operation is part of the work done in reclaiming old shoe heads. Worn portions, particularly the tips of old shoe heads, are built up by welding and are then brought to the desired surface by grinding.

The new machine consists of a cast-iron bed 30 in. high, 22 in. wide and 38 in. long. A coarse alundum grinding wheel, 14 in. diameter by 3 in. thick, is mounted at the top of the bed. The wheel is driven by a vertical 5-hp., 1,500-r.p.m. motor which is installed underneath the bedplate.

For grinding the shoe head is held on a radius arm which rotates about a vertical post. This post is 2½ in. in diameter and stands 18 in. above the bed. A feature of the new machine is the simple and quick adjustment so that shoes can be placed in position and removed quickly. A pin placed through the shoe head fastens it to the radius arm. This pin has a tapered key on the top side for quick adjustment. Adjustments are also made by two screws of four-pitch on either side of the pin holding the shoe head. This adjustment is used for grinding the ends so the grinding can be done either vertically or horizontally.

The radius arm is 20¼ in. long, kept constant regardless of the size of the grinding wheel. Adjustment for bringing the shoe head to the grinding wheel is made through a pitch screw that forces the supporting base for the upright post either forward or backward, in guides along the bedplate. In the accompanying illustration this is shown at the right-hand end of the machine. In the grinding work both automatic and hand feed are provided.

To provide against possible accidents the radius arm has a stop pin which comes in contact with a stop plate fastened to the bed of the machine. This prevents the radius arm from swinging too far and endangering the workmen.

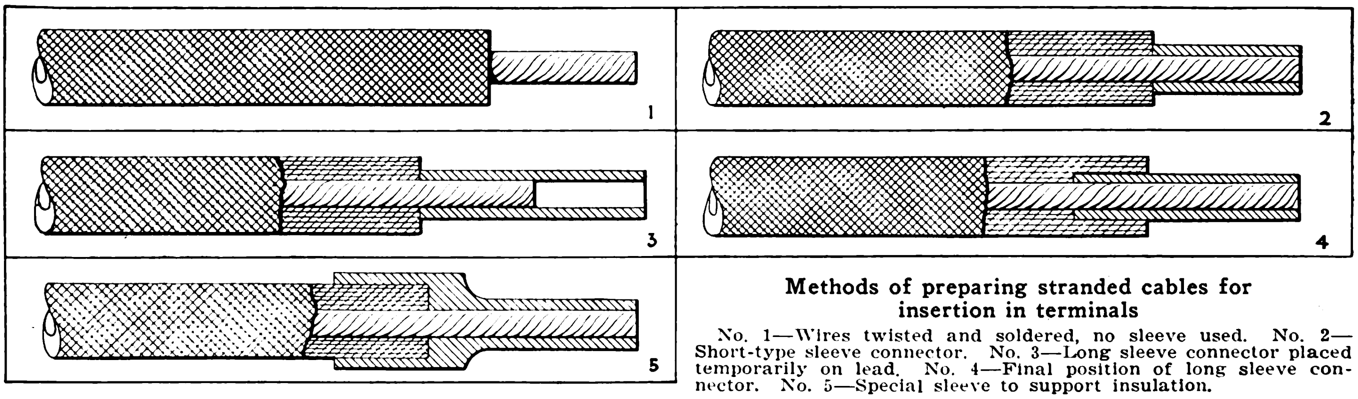
With the old method of grinding the shoe head was held in position by nuts. After one point had been ground down the nuts had to be loosened and the shoe head changed to another point. It was then tightened up again for grinding.

Sleeves for Cable Leads

By J. S. Dean

Renewal Parts Engineer Westinghouse Electric & Manufacturing Company

CONTINUALLY troubles occur in railway motors with the wiring around the frames and with the cable leads outside, due to breaking of the copper wires at the point where the insulation is cut away from the cable. It is almost impossible to remove this insulation without nicking or cutting several of the copper wires. In a comparatively short time these nicks cause the wire conductor to break at this point. Some of the schemes in common use at present and a few new ones suggested to remedy this condition are given in the accompanying illustration.



Methods of preparing stranded cables for insertion in terminals

No. 1—Wires twisted and soldered, no sleeve used. No. 2—Short-type sleeve connector. No. 3—Long sleeve connector placed temporarily on lead. No. 4—Final position of long sleeve connector. No. 5—Special sleeve to support insulation.

The most common method used to finish the ends of the cable leads is shown at the top. Here the strands of wire are soldered together to make a solid conductor. This provides a solid seat for the ends of the screws in the terminal and makes a better joint than if the strands of wire are left unsoldered.

The second method shows the end of the cable with a short sleeve slipped over the strands of copper and soldered in place. This is an improvement over the preceding, as it provides a better contact in the terminal and thus is less liable to heat up in service.

The next two illustrations show how a long copper sleeve can be forced underneath the insulation. The sleeve is first placed temporarily over the copper strands and then is pushed in place under the rubber insulation of the cable. This is done while the sleeve is being heated and soldered to the copper wires of the cable, which in turn softens the insulation. This type of sleeve reinforces the copper wires at the end of the insulation and transfers the strains on these wires back under the insulation on the cable, so minimizing the breakage of wires at this point.

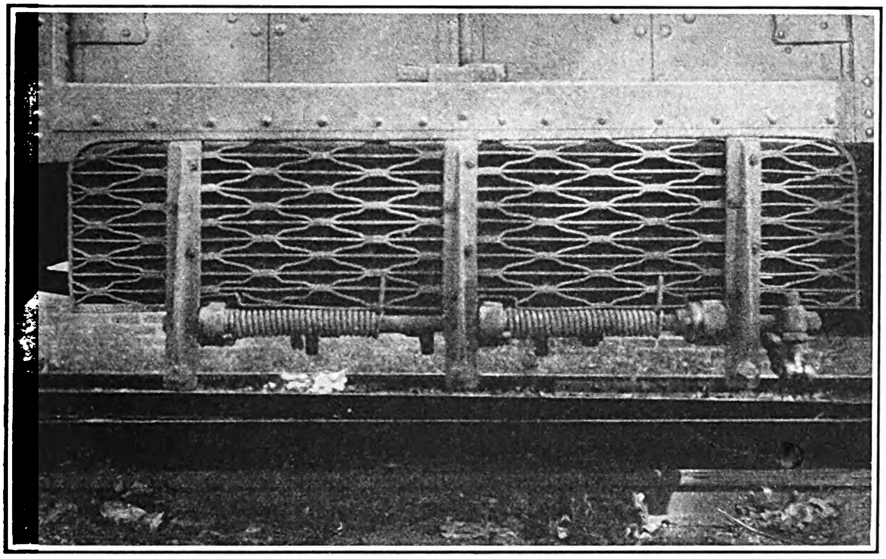
The bottom illustration shows a special type of combined terminal and sleeve which supports the insulation on the cable. This type of terminal strengthens the copper wires of the cable where they may have been damaged by cutting off the insulation. It also transfers the strain on the wires back some distance under the insulation of the cable, so as to increase the life of the connection.

Investigate your troubles, then
Invest-in-a-gate to stop them.

Hot Water Used for Truck Cleaning

WATER at 300 lb. pressure and at 140 deg. temperature is now used by the Market Street Railway, San Francisco, Cal., for cleaning dirty trucks. This is taken from a new high-pressure water system recently installed in the shops and makes the cleaning of dirty trucks a matter of only a few minutes.

Metal Car Steps Reduce Maintenance



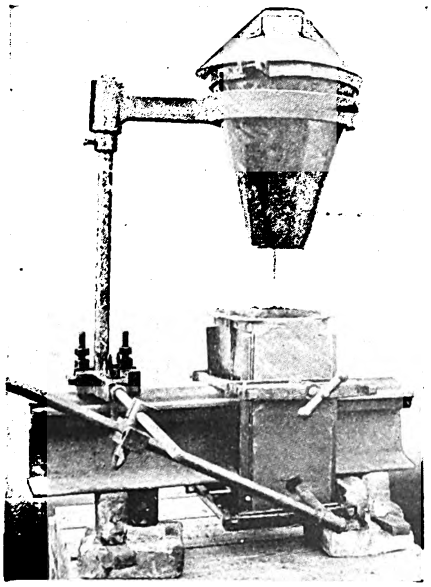
Standard metal step folded up

ONLY a few cars of the Wilkes-Barre & Hazleton Railway, Hazleton, Pa., are operating with wooden steps, as a metal step made by the Irving Iron Works has been adopted which is sanitary, self-cleaning, fireproof, non-slipping and presents a very neat appearance. Wooden step maintenance costs are usually very high due to breakage, splitting and decay. It is claimed that since the metal steps have been installed this item of maintenance costs has practically ceased.

New Equipment Available

Improved Thermit Nozzle Holder

COMBINATION of a crucible stand, base and nozzle holder has been made recently for thermit rail welding. This adaptation simply has used the pedestal type holder with the heavy base replaced with a simple clamping device which is clamped on the rigid crucible stand.



Crucible and preheater holder clamped to rail

This new method of holding the preheater nozzle is an improvement over the pedestal type in which the weight of the base held the nozzle in place against an occasional jar caused by a workman striking or stepping upon the hose leading from the preheater.

Shoe Brake for Crane and Hoist Motors

WITH the purpose of meeting the demand for a shoe brake for crane and hoist motors with long life for the lining and permitting quick removal of motor armature with the brake wheel in place and without the necessity of taking the brake apart, the Electric Controller & Manufacturing Company, Cleveland, Ohio, has brought out the type WB brake. This brake has no levers or rods to pass over the top of the brake wheel. The brake shoe arms are caused to operate in opposite directions by means of a simple lever movement having the connecting links within the base below the wheel. Steel castings machined to a high degree of accuracy and oversize bearing pins are used. The brake shoe linings are of asbestos interwoven with wire and molded to shape under heavy pressure. Linings are ½ in. thick on the smallest size brake and ⅝ in. thick on the largest size. This permits a large amount of wear before replacement is needed.

Convenient Wrench Kit

CHROME-VANADIUM right-angled wrenches are a new style recently introduced by the Bonney Forge Tool Works, Allentown, Pa. These are of the double-end type, but vary from the conventional wrench in that the jaws are at right angles to the handle. The new No. 4 kit is a sample, consisting of three of the most popular sizes. The price of the complete kit is less than would be paid for the wrenches alone if bought singly.

Three wrenches in convenient case

The manufacturer guarantees that these wrenches are stronger than the bolt or nut which they fit and will strip the thread or break the bolt without damage to the wrench.

Disinfectant for Cars

LEINOL pine is now being used by the Market Street Railway, San Francisco, Cal., to disinfect its cars daily. Leinol pine is manufactured by the John F. Leinen Sanitation Company, San Francisco, Cal., and has a pleasing pine odor. Its inoffensiveness makes it possible to apply it daily by means of a simple machine.

American Association News

American Executive

SEVERAL important committee reports were carefully studied nad fully discussed by the American Electric Railway executive committee at a meeting held April 1 at association headquarters in New York. Progress was reported in carrying out the plans started under the leadership of President Sawyer and Managing Director Storrs for improving the association's service to the industry and keeping abreast of changing conditions and modern transportation requirements. Those in attendance at the meeting included the following: W. H. Sawyer, president; R. P. Stevens, J. P. Barnes, J. H. Hanna, L. S. Storrs, F. R. Coates, L. E. Lippitt, C. B. Proctor, Daniel Durie, Harry Reid, C. E. Morgan, E. P. Waller, B. A. Hegeman, Jr., G. A. Richardson, T. A. Kenney, M. B. Lambert, S. J. Cotsworth, C. R. Ellicott, H. L. Brown, T. W. Casey, J. N. Shannahan, C. D. Emmons, W. R. Robertson, W. R. Power, A. E. Reynolds, R. B. Stearns, T. R. Langan, F. B. Bullock representing J. H. Alexander, H. V. Bozell, Paul E. Wilson, Edward Dana, Charles Gordon, J. W. Welsh, G. C. Hecker, J. W. Colton, Leslie Vickers, F. C. J. Dell and Labert St. Clair.

CHANGES IN CONSTITUTION PROPOSED

With the object of making the association representative of all constructive factors in the development of transportation, the committee on revision of the constitution recommended that bus companies not directly affiliated with electric railways be made eligible for membership under definitely defined conditions. This broadening of membership requirements was recommended under the following conditions:

"Company members shall consist of American companies operating any form of organized urban or interurban transportation system, or lessees or individual owners of such systems, or management or holding companies all of whose eligible subsidiary companies are company members of the association, or steam railroads having electrified sections or operating motorized equipment, and of companies, firms or individuals manufacturing or supplying materials or rendering service to such transportation companies.

"Before passing upon applications for membership of operating transportation companies, the executive committee shall cause to be published to the membership in the official publication of the association, or otherwise as the executive committee may direct, a list of such applicants under consideration together with the recommendation of the membership committee.

"Further, in the consideration of such applications as mentioned above the executive committee shall endeavor to secure in writing the advice of all operating member companies in the immediate vicinity of the applicant. Further, one of the essentials to membership shall be that, in the opinion of the executive committee, the applicant shall be fully serving or able in fact and holding itself in readiness fully to serve the transportation needs of the territory in which the applicant is operating, and/or shall be conducting its operations in line with the policies of co-ordinated transportation which the association indorses.

"Further, affirmative action of the executive committee at the time of first consideration of such application shall be only tentative; final affirmative action at a subsequent regular meeting shall be necessary before election of the applicant is effected.

"American, as here used, shall be understood to mean 'located inside the United States of America and Canada.'

"In the ordinary association procedure each company member shall be entitled to one vote, which shall be cast by its properly accredited delegate. Any accredited delegate may demand plural voting on any question, in which case each company member shall be entitled to one vote for each five hundred dollars ($500.00) or major fraction thereof, of annual dues paid to the association, with a minimum of one vote. Plural voting shall always be used in adopting standards of the engineering association. Representatives of company members shall be entitled to hold office in the association. Company members, whether operating, manufacturer or foreign, shall, in general, be entitled to all of the privileges and services of the association. The executive committee may define, from time to time, other privileges of such members and the amount of service which may be furnished and any additional charges necessary."

Other changes contemplated in the constitution were outlined by H. V. Bozell on the request of C. D. Emmons, chairman of the committee on constitution revision. The executive committee discussed the revisions as they were presented. Action was postponed until the next meeting so as to give each member an opportunity to go over the revised draft in detail.

Recommendations by the policy committee for co-ordinating the efforts of the association and other agencies working in the interest of industry development were presented in a report by Chairman R. P. Stevens, which was as follows:

"First—Your policy committee recommends that the magazine *Aera* be continued substantially in its present form, but with the advertising eliminated, cost of publication reduced, and with closer co-ordination with the technical press, to minimize duplication. Also, that the president be authorized to appoint a committee to work out such a plan, with no increase in expense to the association, and report back such plans to the executive committee.

"Second—That there should also be much closer co-ordination between our statistical department and the technical press as to securing, analyzing and publishing statistics, and that the president be authorized to appoint a subcommittee to work out a plan for such co-ordination, with no increase in expense to the association, and report back such plan to the executive committee.

"Third—Your committee recommends that no action be taken just at the present time as to the Washington office."

Discussion of the committee's recommendations brought out the fact that there has been some misunderstanding in the industry as to the purposes of the study which is being made of the association's publishing policy. Chairman Stevens pointed out that the committee's recommendations were predicated on the continuation of the association magazine in a form most useful to the industry and the association. He explained, further, that the object of the committee's recommendation was the co-ordination of the associa-

COMING MEETINGS
OF
Electric Railway and Allied Associations

April 13-14—National Automobile Chamber of Commerce, meeting, Chicago, Ill.

April 20-22—American Society of Civil Engineers, spring meeting, Kenilworth Inn, Asheville, N. C.

April 26-29—Southwestern Public Service Association, convention, New Orleans, La.

April 27-29—American Welding Society, eighth annual meeting, Engineering Societies Building, New York City.

May 6—American Electric Railway Association, Metropolitan Section, Engineering Societies Building, New York City, 8 p.m.

May 31—June 1-2—Canadian Electric Railway Association, annual convention, Winnipeg, Man.

June 6-8—American Association of Engineers, annual convention, Tulsa, Okla.

June 24-25—New York Electric Railway Association, annual meeting, Hotel Champlain, Bluff Point, N. Y.

June 29-30—Central Electric Railway Association, summer meeting, Book-Cadillac Hotel, Detroit, Mich.

July 27-29—Association of Equipment Men, Southern Properties, 12th semi-annual meeting, Atlanta, Ga.

Oct. 3-7—American Electric Railway Association, annual convention and exhibit, Public Auditorium, Cleveland, Ohio.

tion's activities and that of the existing industrial press.

The executive committee passed the following motion by J. N. Shannahan regarding the policy committee's report:

"I move that the president be authorized and directed to appoint a committee of five to devise, if possible, a plan to carry out the recommendations of the policy committee."

President Sawyer, in commenting on the discussion and the action taken, stated some of the reasons for the changes in policy advocated. He said that the association's object should be to encourage rather than discourage every agency working constructively in the industry's interest.

For the committee on membership, C. R. Ellicott, chairman, reported the transfer from associate to operating membership of the Illinois Traction System, Springfield, Ill. In addition, one new associate member, five new manufacturer members and 83 individual memberships were reported. A sub-committee on special assignments has been appointed to co-operate with the membership committee, as follows: C. L. Bardo, vice-president American Brown Boveri Electric Corporation; L. C. Brown, vice-president Elwell-Parker Electric Company; B. I. Budd, president Chicago Rapid Transit Company; C. D. Cass, vice-president Waterloo, Cedar Falls & Northern Railway; A. H. Ehle, vice-president Baldwin Locomotive Works; C. D. Emmons, president the United Railways & Electric Company; C. B. Keyes, district manager railway department, General Electric Company; M. B. Lambert, transportation sales manager Westinghouse Electric & Manufacturing Company; L. H. Palmer, vice-president and general manager Fifth Avenue Coach Company; Paul Shoup, president Pacific Electric Company, and J. N. Shannahan, Old Dominion Land Company, Newport News, Va.

Harry Reid, chairman of the committee on national relations, reported the serious illness of C. L. Henry, who had charge of the work at the Washington office. On motion of Mr. Coates, the secretary was instructed to write a letter to Mr. Henry expressing the committee's regret at his illness and hoping for his speedy recovery.

Concerning the work of the sub-committee on depreciation, J. H. Hanna, chairman, said that one meeting had been held to consider the situation in the electric railway industry. A hearing on the depreciation question before the Interstate Commerce Commission is scheduled for May 22. Mr. Hanna said that a second meeting of the committee would be held in Chicago on April 6, at which time a form of questionnaire will be decided upon and the general policy to be advocated by the committee will be determined.

Regarding the Charles A. Coffin Prize, President Sawyer, speaking as chairman of the committee, said that "Electric Railway Practices, 1926" is just about completed and ready for distribution.

Mr. Vickers, economist of the association, made a brief report for the committee on taxation. He said that progress on the work of the taxation committee is being held up pending determination of the attitude to be taken by the National Electric Light Association and the American Gas Association.

Supplementing the action taken at the last executive committee meeting in Toledo, at which time the presidents or authorized representatives of state and sectional associations were made eligible to meet with the executive committee, F. R. Coates, chairman of the committee on co-operation with sectional associations, suggested that the president of the community section in the locality in which the executive committee meeting is held be invited to attend. This suggestion was adopted.

C. E. Morgan, chairman of the finance committee, read a report by the auditors regarding the association's finances. President Sawyer explained that work of the finance committee is held up to a certain extent pending final decision regarding the policy to be followed in connection with various phases of the association's activities.

EXHIBITS TO OPEN SATURDAY NOON

A report of the exhibit committee outlining the progress of plans for the coming convention at Cleveland was read by F. B. Bullock, representing J. H. Alexander, chairman. There were available for the inspection of the executive committee diagrams prepared by the exhibit committee and showing the space layouts for the Cleveland convention. A proposed new building to be located between the main auditorium and the west wing, just off the esplanade between the two buildings, is expected to be available for the meetings of the American and the Transportation and Traffic Associations. Space is to be provided in exhibit hall for the meetings of the Engineering, Claims and Accountants' Associations. It is expected that this arrangement will make the remaining space in exhibit hall more attractive for exhibit purposes. C. E. Morgan, vice-chairman of the exhibit committee, outlined to the executive committee some of the plans that are being made in connection with the exhibit. He called attention particularly to the recommendation that the exhibits be opened at 12 o'clock noon on Saturday, thus giving early delegates an opportunity of inspecting them before the official opening of the convention on Monday. The executive committee approved this plan, also fixing Wednesday as the day set aside for the inspection of exhibits. The convention will close on Friday noon as heretofore. The rate for inside exhibit space was fixed at 75 cents per square foot. T. W. Casey was appointed by President Sawyer as chairman of a special committee of manufacturers to represent the views of exhibitors and to form an official point of contact with the exhibit committee.

Additional hotel space to be available at Cleveland this year was listed by Paul E. Wilson, chairman of the hotels committee. The procedure followed last year of making all room assignments through this committee is to be followed again. Approval of the contract with the Cleveland convention committee was reported by T. A. Kenney, chairman of the sub-committee on contract.

Regarding the Anthony N. Brady Memorial Medal, Mr. Storrs said that circulars outlining the contest are being sent out to all electric railway companies by the Museum of Safety.

The following were appointed as delegates to the annual meeting of the U. S. Chamber of Commerce to be held in Washington May 3-5: J. N. Shannahan, national councillor; F. R. Coates, Edward Dana, W. A. Draper, C. D. Cass, E. C. Faber, W. F. Ham, R. P. Stevens, S. B. Way and F. H. Wilson.

Alternate delegates who have accepted are as follows: J. H. Hanna, substitute national councillor; H. L. Brown, H. C. Clark, S. J. Cotsworth, C. R. Ellicott, J. W. Hancock and B. A. Hegeman, Jr.

Delegates were also appointed to attend the National Conference on City Planning to be held in Washington May 9 and are as follows: J. H. Alexander, J. P. Barnes, C. D. Emmons, Thomas Fitzgerald, J. H. Hanna, A. T. Perkins, W. W. Wysor.

Presidents of sectional associations in attendance were welcomed by President Sawyer and responded by expressing their desire to co-operate heartily in the work of the American Association.

The next meeting of the committee will be held in New York on Friday, June 3.

Rolling Stock

PROGRESS reports were made at the second meeting of the rolling stock division of the American Electric Railway Engineering Association held in Detroit, Mich., March 10 and 11. Those present at the meeting were: A. T. Clark, chairman; W. S. Adams, C. Bethel, W. C. Bolt, R. S. Bull, J. M. Bosenbury, F. J. Foote, R. W. Cost, R. A. Hutchins, M. R. Hanna, T. H. Nicholl, E. S. Sawtelle, R. B. Smyth, W. G. Stuck and H. S. Williams.

The report of the special committee on revision of manual sections contained an outline of the work accomplished so far. Decisions have been reached in regard to revision of certain dimensions of brake shoes and work is being done looking to the revision of the specification of steel axles and wheels. Information is being tabulated regarding couplers in use by various interurban railways and manufacturers will be invited to submit suggestions for revision of the test specifications.

The committee on improvements in car equipment made a skeleton outline of the work which is being covered by this committee and the committee on lighting submitted a progress report with blue prints covering various methods and tests which will be made.

The chairman of the committee on roller bearings reported that a meeting of this special committee was held March 9, at which very thorough discussion was made on the various phases of roller bearing construction. It was decided to send out a questionnaire to obtain additional information.

Special committee No. 6 on lubrication reported that a questionnaire has been sent out to various electric railway men and so far 52 per cent have answered. A test of lubrication will be made by the use of a dynamometer. Progress reports were also submitted by the committees on suction strainers for air compressors and on motor brushes.

The chairman of the special committee on noise reduction submitted a description of the work done by this committee. It is expected that the noise measuring instruments will be used in connection with several new truck constructions which have been designed to reduce noise.

The committee on gearing is making a study of tolerances with the idea of introducing certain revisions in this specification. A questionnaire has been sent out by the special committee on current collecting devices and work on this subject is going forward. Progress reports were made by special committees on journal boxes and on limits of wear. In regard to this latter committee, it was decided that the limits of wear to be taken into consideration are axle bearing wear, axle bearing housing wear, axle wear, armature shaft wear, armature bearing housing wear and armature bearing wear.

Humanitarian Motive Predominates in Safety Work

PREVENTION of accidents was the theme of a meeting of the Metropolitan Section, A.E.R.A., held on April 1 at the Engineering Societies Building, New York City. More members were present than at any previous meeting this season. James P. Barnes, president Louisville Railway, spoke on the safety methods used by his company and the good results obtained. The difficulties confronting this railway were brought out when he mentioned that his company operates 14,000 cars every day across steam railroad tracks at 84 different locations.

Safety work was first undertaken for economic reasons. At that time the company was spending 7½ per cent of its gross revenue for accident claims. Now this has been reduced to 4 per cent. It is not the economic side of this achievement, however, which is most gratifying to the management, but the humanitarian side.

When it was first decided to inaugurate a definite movement for the reduction of accidents, the principle was accepted that human failure is back of every accident. The first step was the organization of a safety council among the employees of the railway. Following that a challenge was issued by the men at one carhouse to the men at all other carhouses to see which group could operate during one entire month with the fewest number of accidents per 1,000 car-miles. This proposition originated with the employees but secured the immediate approval of the officials. As a result of this challenge and its acceptance it became necessary to decide upon some classification of accidents and the responsibility for them. The company adopted at that time and has since adhered to the definition that any accident which might reasonably have been prevented by the exercise of care on the part of a trainman is to be charged against him.

From this beginning the work of accident prevention has progressed into a comprehensive and continuing program which covers the entire property. At the start one accident occurred for every 1,800 car-miles operated. It was decided that this must be cut down to one-tenth of that figure. The goal was reached in January, 1927, when the company had only one accident for every 19,000 car-miles operated. The high record for a single month last year was one per 76,000 car-miles.

Together with other organizations interested in accident prevention work, the Louisville Railway some time ago sponsored the organization of a Life Savers' Club among the drivers of commercial vehicles. Any one who has operated a commercial vehicle in the streets for an entire year without being involved in a single accident is eligible for membership. At the present time there are 219 railway motormen among the members.

In conclusion, Mr. Barnes emphasized the changed conception of safety work, saying that the program which was undertaken as an economic measure had ended by becoming a humanitarian movement. Nothing does more, he said, to create a bond between the officials and the men than their common interest in safety work.

James J. Duffy, supervisor of the school of instruction Brooklyn-Manhattan Transit Corporation and Brooklyn City Railroad, outlined the accident prevention work of those companies. He explained the bonus plan that has been in effect for the past eight months and said that the total number of accidents had been reduced from 9,518 for a corresponding period the year before to 8,275 under the new plan.

Chester Briggs, a motorman of the New York Railways, spoke on the care necessary in the operation of cars on Broadway, New York City. He emphasized the point that accidents do not "just happen" but are caused by negligence. During the past fifteen months accidents have been reduced 14 per cent on the Third Avenue Railway System, according to William E. Foley, director of claims. Harry C. White, supervisor of industrial relations Edison Lamp Works of the General Electric Company, said that safety is largely a matter of salesmanship by executives. Anything can be accomplished if a sufficiently determined effort is made. He told of certain experiences he had had with Charles P. Steinmetz and stressed the success attained by this great genius in overcoming almost insuperable obstacles.

Before the commencement of the regular program, T. R. Langan, president of the section, introduced W. H. Sawyer, president American Electric Railway Association, and Daniel Durie, president American Electric Railway Engineering Association. Mr. Sawyer told the members that the job before them today is too big to permit telling of hard luck stories. Too much is at hand waiting to be done to waste time in that manner. The complexity of transportation problems today, he said, creates an unprecedented opportunity for the men in the industry.

Brady Safety Medals Again Offered

FOR the first time in ten years the Anthony N. Brady medals are being offered. At the request of the American Electric Railway Association the contest is being conducted by the American Museum of Safety, with headquarters at 130 East Fifteenth Street, New York City. The next award is to be for the year ended Dec. 31, 1926.

A committee on the award has been appointed, consisting of Lewis Gawtry, president the Bank for Savings, chairman; Col. A. B. Barber, James H. McGraw and Lucius S. Storrs. A committee to determine the conditions of the competition has also been named, consisting of Thomas Fitzgerald, vice-president Pittsburgh Railways, chairman; H. K. Bennett and C. H. Evenson. The plan of award has been somewhat modified. There are to be three medals, as formerly, but each to be given as a first prize to railway organizations, as follows: Gold medal, for electric railways operating more than 5,000,000 vehicle-miles; silver medal, for those operating more than 1,000,000 but not over 5,000,000 vehicle-miles; bronze medal, for those operating less than 1,000,000 vehicle-miles. The committee of award may also, in its discretion, make honorable mention of one or more electric railway organizations, based on the same criteria as the award of the medals, or any other factors that may appeal to it as especially worthy of commendation.

The conditions of the award are, in brief, as follows: Every competing company shall include data covering all its electric railway and bus operations without regard to technical ownership. Presentations should cover broadly and as completely as possible all of the factors prescribed. A definite rating will be assigned by the committee to each of these and a grading will be assigned to each company's presentation based upon the relative accomplishments under each heading.

The factors are: (1) The success in gaining good will as indicated by the initiative, skill and enterprise manifested in improved safety conditions; (2) the improved safety conditions that have resulted from original ideas, as well as the extent to which the company has taken advantage of new development of safety in operating and maintenance practice and equipment originating with others; (3) improvements in safety practice that have resulted in reduced maintenance, or greater reliability of service; (4) particular success in conducting a safety program and actually reducing the number and seriousness of accidents; (5) outstanding accomplishments in development of co-operation between management and employees in safety promotion; (6) outstanding accomplishment in measures to promote sanitation and health. All presentations must be in the hands of the American Museum of Safety on or before Aug. 1, 1927. Details may be obtained from the American Electric Railway Association.

The News of the Industry

Enabling Legislation in Philadelphia

A bill has been introduced in the Pennsylvania Senate to empower the city of Philadelphia to take over the Philadelphia Rapid Transit Company's underlying properties under condemnation proceedings, but requiring a vote of the people. The measure has the approval of Charles S. McChord, utility expert engaged to investigate the transit situation by the Public Service Commission. The proposed new legislation is considered necessary. The bill would permit the city to acquire the underlying companies without taking over the Philadelphia Rapid Transit Company, whereas under the existing Hecht law it is said both the franchise holding companies and operating company would have to be taken over under condemnation proceedings.

The recommendations contained in the McChord report were the subject of a brief review in the ELECTRIC RAILWAY JOURNAL for March 26, page 584.

Another Coffin Contest Announced —Grand Rapids

Plans are being made by Vice-President and General Manager DeLamarter to have the Grand Rapids Railway, Grand Rapids, Mich., enter the contest for the Charles A. Coffin award for 1927. In its house organ, the *Token*, for March, the company says in part:

> All of which means that from now until July 15 the Grand Rapids Railway must be one of the best, if not the best, in the United States. Many visitors will be inspecting the property, riding the new coaches to determine their superiority over the old style cars, and also to get first-hand information on the kind of service and courtesy we are giving the public. In fact, it means that all of us must be on our best behavior and give the best service possible to prove our brief.
>
> In trying for this award there must be co-ordinated effort. Each of us must give the best in us to improve the service. By pulling together employees of the Grand Rapids Railway can prove that all of the good things broadcast about us are in everyday practice on our system. And the reward may be establishing our company as the best of its size of any in the United States.
>
> Let's go out and win it!

Baltimore Line Takes Advantage of Gas Rebate

The United Railways & Electric Company, Baltimore, Md., will take advantage of a rebate of 1 cent per gallon on the state gasoline tax which became effective on April 1. Two new laws passed by the Maryland General Assembly add 2 cents to the former 2-cent gasoline tax. Of the increase 1½ cents is for lateral roads in the state and the other ½ cent is to help defray the expense in eliminating grade crossings.

A provision in the law creating the lateral road tax enables the owners of buses, trucks and other vehicles used entirely within the limits of incorporated cities and towns to receive a rebate of 1 cent per gallon on gasoline used by such vehicles. The United Railways & Electric Company operates 50 passenger buses within the limits of Baltimore.

Home Rule Defeated in Chicago

Sight of the local railway problem was largely lost in Chicago's bitterest mayoralty campaign, which ended on April 4. Candidates of both major parties soft-pedaled the issue, but the vote of less than 60,000 for John Robertson, independent candidate, indicates public ownership and 5-cent fare talk was not taken seriously. William Hale Thompson, successful candidate, polled 41,000 more votes than his opponents combined.

The present Mayor, William E. Dever, stood on his record of efforts to win home rule and unify local transportation under a new franchise. Mr. Thompson offered stereotyped promises of a fair deal to all. In his previous administration he sought to cut 8-cent car fares to 5 and in his effort at a political come-back charged that the 1925 city purchase referendum and the present franchise negotiations were evidence of Mr. Dever's subservience to traction interests. Mr. Dever accused Mr. Thompson of displaying favoritism to Mr. Insull by attempting to block the city's fight to lower gas and electric rates and by squelching opposition to the State Commerce Commission's order increasing elevated fares to 10 cents in 1920. Mr. Dever pointed pridefully to his fight on the Barr terminal permit bill and his strong advocacy of the Durso bill, now pending, which would create a local utility commission.

Mr. Robertson flooded the city with sensational literature denouncing New York banker control of the surface line companies and insinuated that the companies had contributed to the campaign of his opponents. He pledged himself to stand by the straphanger and bring about a public ownership referendum.

With the election over it is hoped the City Council will resume consideration of the plans for a franchise settlement, dropped last February. The ray of hope here is not brilliant, for many of the Aldermen seem to be confused by the complexities of the franchise task and a second temporary extension of the franchise of the Surface Lines may be necessary.

Only 15.000 votes stood in the way of adoption of a home rule amendment voted on in Chicago an April 5 on the petition of 260.000 citizens. This amendment would have taken control of all local utilities from the hands of the Illinois Commerce Commission and vested it either directly in the Chicago City Council or in a local commission created by the Council. The measure was fashioned after the state public utilities act and would have taken effect almost immediately.

Paving Relief Bill Defeated in Detroit

The proposed charter amendment designed to relieve the Detroit Department of Street Railways, Detroit, Mich., from the cost and responsibility of paving between the tracks was defeated by an overwhelming majority of the 60,000 voters who went to the polls on April 4. Early returns indicated that the proposition was defeated in at least 75 per cent of the city precincts. The proposed amendment was sponsored by Mayor Smith and the Street Railway Commission.

It was pointed out that the cost of paving between car tracks amounted to between $600,000 and $700,000 annually. The charter amendment as it appeared on the ballot also provided for removing the cost of repaving and watering between the tracks. The measure fixed a rate of fare on the municipal system sufficient to pay:

(a) Operating and maintenance expense exclusive of paving, repaving and watering between tracks.

(b) Taxes on the physical property of the entire railway system the same as though privately owned.

(c) Fixed charges.

(d) A sufficient per cent per annum to provide a sinking fund to pay the principal of the mortgage bonds issued, at their maturity, and such other additional per cent per annum to provide, in the sound discretion of the board, a sinking fund to pay the principle of the general bonds issued as soon as practicable, to the end that the entire cost of the railway shall be paid eventually out of the earnings thereof.

Boston & Worcester Decision in May

The petition of Receiver Miller of the Boston & Worcester Street Railway, Framingham, Mass., in which he seeks to gain authority to operate buses instead of trolleys as he sees fit, was heard a second time before the Supreme Court recently. Representatives of the bondholders of the railway who are seeking to reorganize the road were successful in securing a postponement of the decision in the matter until May 3.

At the hearing it was stated that actual steps in the reorganization proceedings had taken place. The Boston & Worcester Street Railway has bonds outstanding to the amount of $2,460,000, while the Framingham, Southboro & Marlboro line, which is controlled by the Boston & Worcester, has bonds outstanding to the amount of $60,000.

The Boston & Worcester Street Railway reorganization plan proposes formation of a new company to have $252,000 first mortgage 20-year 7 per cent bonds, $756,000 reorganization bonds to be secured by second mortgage,

$756,000 of 6 per cent preferred stock and $1,388,000 common stock. Each depositor, whether a subscriber for first mortgage bonds or not, will receive for each $1,000 bond, plus any accrued interest, $300 face amount of reorganization bonds, $300 par value of preferred stock and $400 par value of common.

Cincinnati's Community Chest Subsidized by Railway

A gold mine of good will was discovered by Hudson Biery, Director of Public Relations of the Cincinnati Street Railway, Cincinnati, Ohio, in the small fare announcement board in the front of the street cars when he converted it into a medium for advertising Cincinnati's social agencies. This board which had established itself in people's minds as the place to find notices of increase in fares, was performing no present service. No change in fares had taken place for more than a year.

Under the heading "Do You Know," a 25-word message is carried in this space for each of Cincinnati's humanitarian enterprises, each one appearing for half a week in all cars. This series of advertisements will last more than a year.

The service-at-cost franchise, under which this system operates, does not permit a cash donation and the advertising, donated to the ninety-two members of the Community Chest, is directed to tell the public what each group is really accomplishing.

A typical message is as follows:

Do You Knbw?

The Salvation Army gave 208,137 meals, supplied 73,854 beds and gave garments, shoes and medical aid to 7,856 in 1926. Individuals helped, 56,045. Aided by the Community Chest.

A small trade mark of the railway appears in the lower right-hand corner as it was the only way of showing that the company was donating the space.

The *Times-Star*, the *Post*, the *Enquirer* and the *Commercial-Tribune* are co-operating by carrying each new message as it appears in the cars.

1928 Calendar Announced by Safety Council

While the present time seems early for 1928 calendars, the National Safety Council has adopted a new policy by producing its calendars ten months in advance in order that its member companies may obtain a supply early.

The calendar is the most artistic ever put out by the National Safety Council. A picture for each month carries a special safety message appropriate to the season. The pictures are by well-known artists and are excellently reproduced. On the reverse side of each sheet is a safety message.

A schedule of prices has been worked out, the price depending on the quantity. Discounts are allowed for early orders and shipment, being greatest at present and reducing monthly until July 1. As is customary, there is a space on the face of the calendar in which the name of the company distributing it may be inserted.

Those desiring further information should communicate with W. H. Cameron, managing director, 108 East Ohio Street, Chicago, Ill.

Corporation Counsel Says Chicago May Bar Downtown Parking

Citing numerous court decisions in which the authority of cities to prohibit the obstruction of the streets by parking has been repeatedly upheld, the law department of the city of Chicago recently presented an opinion on this question to Mayor William E. Dever. A special committee on downtown parking appointed by the Mayor early in January following publication of the $50,000 traffic survey by the Chicago Association of Commerce has had the subject under consideration for several months, but as yet no meetings have been held or other action taken.

It was to ascertain what can be done to restrict parking in Chicago's congested business streets that the opinion was prepared. According to Corporation Counsel Francis X. Busch, who approved the document, "the city council has the legislative power, both in principle and authority, to enact ordinances for restricting in proper cases the use of the streets for parking, standing and storage purposes, where the same is deemed by the Council to impair the use of the streets for the passage and travel of the public, or to interfere with the ingress and egress of abutting property."

Though all such ordinances are subject to judicial review and condemnation when plainly arbitrary or unreasonable, Mr. Busch points out, they must be presumed reasonable and valid until proved to be otherwise, and should therefore be enforced by the administrative and executive officers of the city.

The parking of cars, except for the loading and unloading of persons or goods, is storage and standing, in the opinion of the corporation counsel's office. "Such standing or parking of vehicles upon the streets amounts to the use of the streets for the purpose of storage and not for the purpose of travel," Mr. Busch declared. "It makes no difference whether such periods of storage use continue for a few minutes only or for much longer periods. The character of the use of the streets will not be different whether such vehicles be left unattended or left in charge of a driver or other caretaker awaiting the return of an owner or occupant having general control and direction over the vehicle, nor will the character of that use be changed whether the person so parking shall be the owner or occupant of property abutting on the street, or any other member of the general public."

Among the various authorities quoted by the city attorney was the Illinois Supreme Court.

Legislative Results in New York Considered Disappointing

The day of legislative reckoning in New York State was concluded with Governor Smith's "Finis" on April 7. Some constructive work was done. But the opinion seems to prevail at Albany that the session just closed will go down in history mostly for what it did not accomplish rather than for what it did do. As an instance, all of the gasoline tax bills failed of passage. A measure drawn just before the adjournment of the Legislature imposing a tax of 1 cent a gallon which it was proposed to introduce on the closing day of the session was abandoned by the legislative leaders.

Compulsory motor vehicle insurance for all cars also met with disapproval of the legislative leaders. The bill transferring the provisions of the highway law, in relation to motor vehicles to the tax law, passed by the Legislature, was withdrawn from the Governor due principally to the fact that so many amendments were offered to the highway law which had been passed that to have re-enacted the provisions of the law into a new law might have left a situation whereby the state would have been without any motor vehicle law at all until the Legislature could meet and correct the situation.

Some bills that have become law follow:

Chapter 278 the Bartholomew bill, Assembly print No. 1,456, amending highway law in relation to deposit with commissioner of motor vehicles of number plates of uninsured car.

Chapter 296 the Bartholomew bill, Assembly print No. 1,099, amending highway law in relation to operation of motor vehicle while license is suspended or revoked.

Chapter 271 the Bartholomew bill, Assembly print No. 1,093, amending highway law in relation to motor vehicles carrying passengers for hire.

Chapter 272 the Bartholomew bill, Assembly print No. 1,097, amending the highway law in relation to keeping clean number plates on motor vehicles.

Chapter 274 the Bartholomew bill, Assembly print No. 1,091, amending the highway law in relation to registration fees for trailers.

The Pammenter bill, Assembly print No. 947, as chapter 152, amending the town law authorizing appropriations by the town board for the purchase and maintenance of traffic signals.

Track Space Being Sought for October Convention

Following on the heels of the application of J. R. Blackhall of the Chicago & Joliet Electric Railway for track space to show one of his new cars at the October convention of the American Electric Railway Association, Thomas Conway, Jr., president of the Cincinnati, Hamilton & Dayton Railway, has advised Fred Dell, director of exhibits, that he will also want track space upon which to show at least one or perhaps two of his new cars if traffic conditions permit of the withdrawal of two from service at that time. These care are low-level, high-speed interurbans, designed and equipped for train operation.

By no means does this exhaust the good news. Mr. Dell has also received a letter from H. B. Potter, general manager of the United Railways & Electric Company, Baltimore, making application for track on which he intends again to exhibit one of his articulated cars this year. In addition, and owing to the recent research and development work which the United Railways has been conducting, Mr. Potter has indicated he intends to have inside booth space in which he will show some very interesting models of rheostatic car heaters, automatic slack adjusters, articulated car parts, etc.

These requests for track space at this early date, six months prior to the convention, indicate that the track exhibit will surpass the magnificent showing of 41 car units at Cleveland last year.

Foshay Company Announces the Judges in Advertising Contest

Judges who will decide upon the prize winners in the $5,000 advertising contest of W. B. Foshay Company are B. C. Forbes of *Forbes Magazine;* Col. W. N. Wamsley, manager financial bureau New York *Times;* Edson B. Smith, financial editor Boston *Herald-Traveler;* Harper E. Leech, feature financial writer Chicago *Tribune;* E. C. Hillweg, assistant publisher Minneapolis *Tribune;* Carl W. Jones, general manager Minneapolis *Journal*, and Wilbur B. Foshay, president W. B. Foshay Company.

As announced previously in the ELECTRIC RAILWAY JOURNAL the W. B. Foshay Company, public utility operators, started a contest on Nov. 1, 1926, for the submission of either a series of newspaper advertisements or some other form of advertising such as a folder, single booklet, slogan or other form advertising the W. B. Foshay Company's system of controlling and managing public utilities and selling the securities of these companies. The contest, an open one, closes on April 30 and the prizes will be awarded on June 1, 1927. All advertising material is to be sent to contest editor, W. B. Foshay Company, Foshay Building, 826 Second Avenue, South, Minneapolis, Minn.

Chicago Surface Lines Awards Prizes for Accident Prevention

For the best record in accident prevention of any division of the Chicago Surface Lines during 1926 motormen and conductors at the North Avenue station were awarded first prize at the annual safety dinner of the company in the Congress Hotel, Chicago, on March 3. The award was made by Guy A. Richardson, vice-president, and the large plaque given as first prize was accepted by William Pasche, division superintendent. The second prize, an artistic shield, was won by the Lincoln Avenue division.

The contest, engaged in by all of the twelve divisions of the system, began a year ago and was concluded on March 1. About 500 employees of the company attended the dinner. Among them were the oldest trainmen from the winning divisions, some of whom have been in service for from 25 to 40 years. A new contest was begun to continue throughout the current year.

New Oneida Fares Approved

The city of Oneida, N. Y., having withdrawn its objection to proposed fares on the Oneida line of the New York State Railways, the Public Service Commission on April 1 approved of the following fares on and after May 1:

Between any two points in Oneida, 10 cents.

Between any two points in Sherrill, 10 cents.

Between Oneida and Sherrill and points intermediate thereto, 10 cents.

Between Oneida and Wampsville and points intermediate thereto, 10 cents.

Between Wampsville and Oneida Castle and points intermediate thereto, 10 cents.

Between Sherrill and Oneida Castle and points intermediate thereto, 10 cents.

With the privilege of purchasing three tickets for 25 cents, each to be good between any of the two points named where the fare is 10 cents.

For single trip rides between Oneida and Kenwood, 10 cents.

Fifteen cents per ticket for round trips good between Oneida and Kenwood.

Fifteen cents per ticket for round-trip tickets good between Oneida and Wampsville, but such round-trip tickets to be good only on interurban local cars.

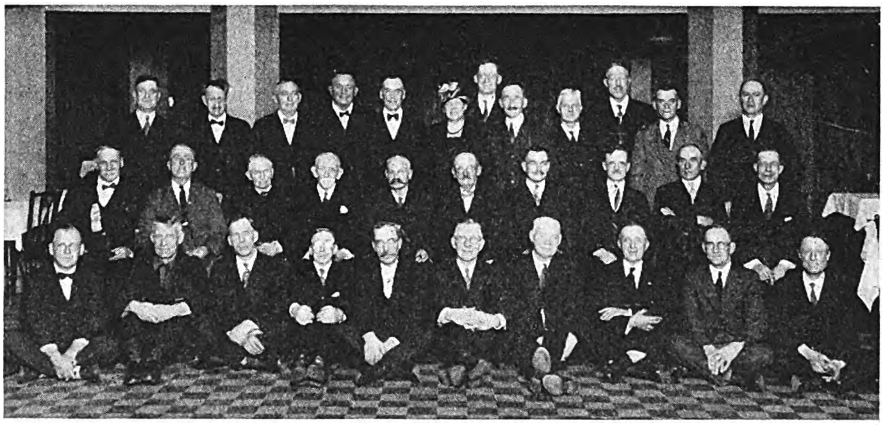
A 30-day 50-trip commutation book for $2.50 between Oneida and Sherrill and also between Oneida and Wampsville, and to cancel the 46-trip school ticket between said points, now sold for $2.75.

Petition for increased fares was filed by the company on April 9, 1926, and hearings held before Commissioners Lunn and Van Voorhis on July 12, 1926, and March 25, 1927. Decision was withheld pending hearings on similar applications filed by the company for increased fares in Rome, Utica and Syracuse. At the hearing on March 25, 1927, the city was represented by Charles R. Coville, city attorney, and at his request the company made certain changes in its proposed schedule. Later the city withdrew its opposition.

Celebrate Twenty-five Years of Service in Salt Lake City

An organization known as the "Quarter Century Club" has been formed by veteran employees of the Utah Light & Traction Company, Salt Lake City, Utah. Every employee with a continuous service record of 25 years or more is eligible to membership, regardless of the department in which he may be employed. Thirty-four members are now enrolled.

The organization of the club was featured by a dinner on the evening of Jan. 28, at which the members were guests of the management. George W. Manning, traffic superintendent of the company, was elected president of the club. G. A. Partridge was chosen vice-president and Miss Flora Manning secretary.



Salt Lake City company honors veterans

Tax Commissioner Renews His Plea for Relief

Electric railways should be absolved from paying costs of paving between car tracks and 2 ft. outside. So said State Tax Commissioner John Merrill on March 9 at the winter meeting of the State Conference of Mayors.

Mr. Merrill spoke somewhat along the lines of his recent utterance in New York, reviewed in the ELECTRIC RAILWAY JOURNAL for Feb. 5, page 260.

Awards to North Shore Employees for 1926 Business Tips

More than 500 employees of the Chicago, North Shore & Milwaukee Railroad gathered at the Hotel Sherman in Chicago recently to celebrate with a dinner and appropriate speechmaking the successful completion of the company's Better Business Campaign conducted during 1926.

This event was unusual in the annals of the electric railway industry inasmuch as the North Shore line is believed to be the first transportation organization to enlist its employees in an organized effort to obtain new business. Those present included the individual prize winners, members of the leading teams and their wives and friends.

At the time the campaign was started in January, 1926, the North Shore line management offered $5,000 prize money for those individuals and teams making the best record in securing new passenger and freight business during the year. In the course of the drive a total of 7,714 tips were turned in to the traffic department by 647 employees. Cash prizes ranging from $250 to $10 were awarded 76 employees at the big banquet, which was the award for the leading teams.

The entire North Shore line personnel was organized into teams and each team was assigned a quota of new business each month. The excellent results attained are shown by the fact that the highest team averaged 430 per cent of its quota for the year.

Recent expansion of the company's facilities, including service over the new $10,000,000 Skokie Valley route, purchase of electric refrigerator cars and flat car-trailer equipment, 20 new passenger cars and three new diners and construction of new passenger stations and a $125,000 garage, was the incentive for the increased traffic drive.

As a result of the success attending the first campaign and the splendid effect upon employee morale another drive has been launched for the present year and is already witnessing the establishment of new high records.

A similar campaign of traffic solicitation by employees of all departments was initiated last month by the Chicago, South Shore & South Bend Railroad under the active leadership of Charles H. Jones, general manager.

Increased Wage Sought in New York State

A straight increase of 9 cents an hour for employees of the New York State Railways in Rochester, Syracuse and Utica, N. Y., is demanded by the union in the first negotiations for a new wage and working agreement for the year starting May 1. The demands of the employees, as framed by a joint board of union executives, were read at a meeting of the men in Rochester on April 1. In replying to the demand, James F. Hamilton, president of the railways, said that the increased cost of improvements in the three cities will prevent the granting of the pay boost at this time. Chief among the increased expenses was cited the mounting cost of paving improvements.

The union contends that the recent fare increases in the three cities justify an increase in wages. In Rochester the fare was raised from 7 to 8 cents on Jan. 1, 1925; in Syracuse and Utica the fare has been increased to 10 cents within the past few months.

The present scale for motormen and conductors in cents per hour on two-man cars is 55 cents, on affiliated interurban lines 57 cents and for operators of one-man cars 60 cents.

Further negotiations are under way, with a conference between railway and union officials scheduled for April 20. The contract calls for arbitration.

Rapid Transit Measure for St. Louis Is Dead

The rapid transit enabling act for St. Louis, Mo., died with the Missouri General Assembly on April 2. Major C. E. Smith, consulting engineer for the city, has stated that if the bill was not passed it was virtually useless to talk of constructive steps toward building a rapid transit system for St. Louis until the next meeting of the Legislature in January, 1929. The rapid transit system contemplated would cost upward of $100,000,000.

Under the bill as originally drawn the people of the city were empowered to decide at the polls the way in which they desired to pay for a rapid transit system. As amended the bill requires financing looking toward higher fares.

Downtown property owners were the principal objectors. They claimed that the measure as drawn would have given the Board of Aldermen unlimited authority to assess special benefits against property for the payment of the subway. These property owners want 40 per cent or less assessed against downtown property, the city at large to pay the balance of the estimated $200,000 needed to build a complete rapid transit system.

P.R.T. Consolidates Its Business and Executive Offices

The Philadelphia Rapid Transit Company, Philadelphia, Pa., has leased more than half of the floor space in the new Equitable Building, located at the corner of Broad and Locust Streets. Twelve office floors will house the office forces of the parent company and of its various subsidiaries, while the mezzanine floor will be converted into a bus ticket office and waiting room. In addition Mitten Management has leased the entire twentieth floor for its executive offices. Heretofore the executive offices of P.R.T. and of Mitten Management have been located at 1520 Spruce Street, while the general business offices were at Eighth and Dauphin Streets. Other offices were located in the Land Title Building, the Liberty Building and the *Bulletin* Building. It is understood that all of these are to be relinquished at the time the move to the new location is effected.

Under the new arrangement all officials of the companies will have their offices in the Equitable Building, save for the actual operating supervisors. The transfer to the new building will be made during the current year. The company believes that considerable economies can be effected through the centralization of general and executive office functions.

Louisville Award Presented

The Anthony F. Connelly award for 1926 was presented to Lewis Elmore, motorman, Fourth Avenue carhouse, at the February safety dinner held in Safety Hall of the Louisville Railway, Louisville, Ky., on March 15. Mr. Elmore was selected from among some 50 men of the company as the employee qualified to receive the designation "best public servant." James P. Barnes, president, presented to Mr. Elmore the Connelly award, consisting of the Gold Award Medal, $75 in gold and an invitation to be the guest of the company at the annual convention of the American Electric Railway Association to be held at Cleveland next October. Mr. Elmore has been employed by the company for the past eight years.

Transfers Simplified in Houston

A simplified form of transfer will hereafter be used on the street cars and buses of the Houston Electric Company, Houston, Tex. Carl B. Frazier, superintendent of traffic, says the new transfer has the names of the street car and bus lines grouped into six divisions, exclusive of South End, Kensington, shuttle and car to car changes. Under the new plan the operator will punch the name of the car line upon which the transfer is issued and it will be good on any of the other lines in the city except those named in the same group as the line from which it is issued. It will be good on cars in the same group as the line from which it is issued at the first point of intersection.

Operators will have only to punch the name of the line on which they are working, the time, and if inbound or outbound. Under the old system they punched the line to which the passenger wished to transfer, the line from which the transfer was issued, the date and the time. Each transfer had to be punched as it was called for. Under the new plan the operator can punch a number of transfers at the end of his line sufficient to last him on his inbound trip, and on the outbound trips all he will have to punch is the designation that the transfer was issued while the car was operating outbound.

New Disposition for Lost Articles in Atlanta

A new method of disposing of unclaimed articles found originally on its cars has been adopted by the Georgia Power Company, Atlanta, Ga. The wives, mothers and daughters of the employees are organized into a women's auxiliary, which is again divided into six groups. Each month unclaimed articles are turned over to one of the women's auxiliary circles, which holds an "old hoss" sale. The money thus secured is placed in a special fund for charitable purposes giving the organization a definite and considerable sum for welfare work.

The company found that the old method of keeping the articles for 30 days at the office of the starter resulted in an accumulation of stock which every month or two had to be given over to the Salvation Army or some other organization. Although the honest trainman frequently became the unexpected owner of an unbrella for himself or a bag for his wife, it is said he, too, lost interest in the arrangement.

News Notes

Seek Wage Increase.—Employees of the Sioux City Traction Company, Sioux City, Iowa, members of the Amalgamated Association, are asking a 10 per cent increase in their wage scale, which expired March 1. The scale is now 56 cents an hour maximum down to 51 cents. The company recently increased its fare from 7 cents to 8 cents. One-man cars are used exclusively.

Franchise Law in Missouri Killed.—The proposed perpetual franchise law for Missouri died with the General Assembly on April 4, being on the calendar of the Senate when the final adjournment was taken. The bill had been reported favorably by the Senate judiciary committee, but amended so as not to apply to St. Louis or Kansas City. Public utilities of the state had favored the measure, which was also supported by the Missouri utilities, including the North American Company, the Studebaker organization and many others.

Hearing in Council Bluffs on April 11.—Hearing in the fare case of the Omaha & Council Bluffs Street Railway, Council Bluffs, Iowa, has been adjoined until April 11, giving the city time in which to prepare its side of the case. Four weeks time has been consumed in presenting the railway testimony before Special Master Claude R. Porter in Council Bluffs. The value of the property used in giving service is to be determined and also the rate of return. Then a fare rate will be decided.

Madison Tries Free Ride.—The Madison Railways, Madison, Wis., in conjunction with the city's leading department store, has solved the problem for the store of increasing the number of shoppers during the quiet morning hours. This difficulty was successfully overcome when the store leased the railway system between the hours of 9 and 12 a.m. on March 29. Approximately 2,000 persons were carried free by the company's cars during these three hours. Store officials declared the success of the plan fully merited the expense involved.

Council Approves Rate Increase.—An ordinance raising rates on the Iowa Southern Utilities Company in Burlington, Iowa, from 7 cents to 10 cents for cash fares and the purchase of tickets in blocks of three for 25 cents has been passed by the City Council.

Upholds Paving Order.—The Appellate Division of the Supreme Court at Albany, N. Y., has upheld the order of the State Public Service Commission directing the International Railway, Buffalo, to pave a 2-ft. strip along its tracks in Walden Avenue and in Grant Street and to reconstruct its roadbed in these two streets. The International appealed from the order of the commission, issued in December, 1925.

Applies for Fare Increase.—The Kansas City, Clay County & St. Joseph Railway, Kansas City, Mo., has applied to the Missouri Public Service Commission for an increase in rates from 2½ cents to 3 cents per mile effective on May 1. This company operates an interurban between Kansas City and St. Joseph, a distance of 50 miles, and a branch between North Kansas City and Excelsior Springs, a distance of 32 miles. If increased fares are not granted officials of the company state it will not be possible to pay even interest on the outstanding bonds. The estimated receipts for 1927 are $759,279 under the 2½-cent fare and $843,615 under a 3-cent fare. The former figure would fall short by $14,000 of paying interest on bonds.

Ten Cents in Macon.—A 10-cent fare with the privilege of selling four tickets for 30 cents was allowed the Macon Railway & Light Company, Macon, Ga., by a recent decision of the City Council. The old fare was 7 cents. The company was also relieved from paying further paving assessments and permitted a complete change in the routing of its cars so that practically all will have terminals in the downtown district instead of operating from one side of the city to the other. The request in the petition, filed by the company on March 15, looking toward relief of a gross income tax, now amounting to 2 per cent, was denied.

Rebate Slips for Dilatory Coin Dropper.—Because of numerous complaints from passengers who inadvertently or accidentally drop more change than is necessary in the Johnson fare boxes, the Southern Colorado Power Company, Pueblo, Col., is using a rebate slip. Inasmuch as one of the mottoes of the Byllesby organization is "Never forget that your company is a public servant that wants no dollar it does not fairly earn," a system has been devised wherein the operator punches the amount of overpayment, which is collectible by the bearer at the company's offices. Heretofore there has been no practicable way in which the operator could repay the customer as he was charged with all coins registered. The new system protects the operator and avoids ill feeling on the part of the customer.

Recent Bus Developments

Bus Regulatory Measure Before Missouri Governor

The Missouri Senate has passed the amended House bill providing for the regulation of bus lines in the state. The measure is now before Governor Baker, who has stated he will sign it.

The bill places the People's Motorbus Company, St. Louis Bus Company and other lines of the United Railways, St. Louis, under the control of the Missouri Public Service Commission, but the strictly city lines will not be compelled to pay the special bus taxes, nor is the city deprived of the right to control the use of its streets and regulate the use of buses operating within the corporate limits. However, if a St. Louis bus company sought to extend or change its routes it would be compelled to obtain a certificate of convenience and necessity from the Public Service Commission. That body is also given jurisdiction over the fares to be charged by bus companies.

The bill also provides that the Public Service Commission in considering applications for certificates of convenience and necessity for a bus company to operate or extend its lines shall take into account the transportation service being furnished by any railroad, street railway or motor carrier and shall pass upon the likelihood of the proposed service being permanent and continuous.

Oil-Electric Bus Developed in Philadelphia

Experiments in the use of fuel oil in driving gasoline-electric buses are being carried on by Mitten Management in Philadelphia, according to a recent announcement. Apparatus has been devised by which the changeover can be made at an approximate cost of $50 per bus, it is said.

Double-deck bus No. 300 of the Philadelphia Rural Transit Company has been operating on a regular city route for several months equipped with the fuel-oil apparatus. It has run more than 15,000 miles and its mileage per gallon of fuel oil is reported to be slightly in excess of the average miles per gallon of gasoline. The official statement declares that the use of fuel oil will not only effect a substantial saving, due to the fact that its cost per gallon is about one-half that of gasoline, but that it will provide a greater factor of safety because oil is less inflammable than gasoline.

In a report to T. E. Mitten on the subject, J. A. Queeney, vice-president of Mitten Management, under whose direction the fuel oil feature has been developed, had this to say:

> The work has now progressed to the point where we feel confident that our gasoline-electric buses can be successfully operated with fuel oil. The first bus so equipped—a double-deck—is now in regular daily service on Broad Street and up to date has made approximately 15,000 miles. Its general performance is satisfactory.
>
> The engine of the oil-electric bus is started with gasoline and thereafter operates on fuel oil. The change from oil to gasoline is made automatically, no action by the driver being necessary.
>
> While I am not yet ready to recommend that the engines of all our motor buses be arranged for operation with fuel oil, as we still have a number of refinements to make, nevertheless sufficient progress has been made to demonstrate to our satisfaction that it is thoroughly practical to operate on fuel oil, and this work will be carried forward as rapidly as possible.

Blue Goose and Purple Swan End Hostilities

The Purple Swan Safety Coach Lines discontinued its St. Louis to Alton, Ill., service on April 1, abandoning the field to the East St. Louis & Suburban Railway and its subsidiary bus line, the Blue Goose line. To the same railway and bus properties it had previously given a monopoly of the trade between St. Louis and Belleville.

The Purple Swan company opened service between St. Louis and Alton on Aug. 1, fixing its rates at 75 cents for one way and $1.25 for the round trip. The electric railway at that time was charging $1.86 for the round trip. When the competition began to cut heavily into the receipts of the car lines the Blue Goose bus line entered the field as an auxiliary to the street cars. At the same time the round-trip rate on the electric line was slashed to $1, while the service was greatly speeded up.

Following the abandonment of the Purple Swan line from St. Louis to Belleville, the East St. Louis & Suburban Railway on March 27 put into effect a new schedule of street car and bus fares between these two cities. The rates are practically the same as were charged prior to the competition of the Purple Swan line with the Blue Goose Bus Line, operated by the railway. The new rates are: Street cars, 39 cents one way and 60 cents round trip on date of sale and 70 cents for round trip with fifteen-day limit. The bus fare is a flat 45 cents for one way.

Buses Will Supply Service.—Discontinuance within the next 60 days of the interurban line which the Wisconsin Public Service Corporation has been operating at a loss for many years between Two Rivers and Manitowoc was agreed upon at a joint meeting of railway officials and representatives of the two city governments held at Two Rivers on March 24. Four new interurban buses of 25 passenger capacity will be purchased at a cost of $48,000 to supply 30-minute service between the two cities. Bus fares between the cities will remain the same as charged by the interurban, while city fares on buses in Manitowoc will be 10 cents. Interchangeable transfers will be issued to city and intercity patrons without charge. The interurban tracks between Manitowoc and Two Rivers will be replaced with a 30-ft. concrete highway at the expense of the county.

Financial and Corporate

Sale Date at St. Louis Set

Property of Railway There to Be Sold Under Foreclosure Probably by May 12

United States District Judge Faris of St. Louis, Mo., on April 1 ordered the public sale of the United Railways, which went into receivership in April, 1919. He approved the recommendation of Special Master Williams that the property be foreclosed and appointed former Congressman William L. Igoe to conduct the sale. The date for the sale was not fixed by the court, but it is likely it will occur about May 12.

It is almost certain that the only bidder at the sale will be the St. Louis Public Service Company, formed by the reorganization committee to take over and operate the system upon the termination of the present receivership. If the property is sold to the reorganization committee Judge Faris would then be called upon to approve the plan of reorganization.

Under the reorganization plan the common stock will be wiped out, but the preferred stock holders will have the right to purchase the common stock of the St. Louis Public Service Company at $12.50 a share.

Judge Faris has fixed an upset price of $46,600,000 for the property. This is sufficient to cover the entire issue of United Railways general 4 per cent bonds and $2,300,000 of suburban consolidated bonds. There is $30,300,000 of the United Railways general bonds outstanding.

Negotiations between the city officials and J. K. Newman of Newman, Saunders & Company, agents for the reorganization committee, relative to a service-at-cost franchise for the railway were resumed on March 31. Little was accomplished at the March 31 meeting as Mayor Miller told Mr. Newman further conferences would be useless until the Public Service Commission hands down its decision on the company's application for an 8-cent fare.

The reorganization committee desires to earn 7 per cent on a valuation of $60,000,000 for the first five years under a 30-year franchise, but Mayor Miller has been contending the company should accept 6 per cent on a valuation of $51,781,348 as of 1919 fixed by the Missouri Public Service Commission plus additions and betterments of about $6,000,000 since that date. This would make the final valuation about $58,000,000.

It is expected that the Public Service Commission's decision on the 8-cent fare application may also include a recommendation as to whether the city should allow a 6 or 7 per cent return.

Recently when Receiver Rolla Wells went into the federal courts in an attempt to obtain an 8-cent fare at once he contended that the real valuation of the railway property is $75,000,000.

That move indicated that if the city is not willing to accept the $60,000,000 valuation and grant the reorganized company a 30-year blanket franchise under the service-at-cost plan, it is probable the company may enter the courts for the right to obtain a reasonable return upon a valuation of $75,000,000.

Traffic Fare and Wage Figures

While there was a slight increase in the electric railway passenger traffic in February, 1927, compared with February, 1926, the increase was much less than has been generally reported in recent months. This is attributed to the extraordinarily good weather conditions during the month, compared with February last year, when there were a number of severe snowstorms.

The number of revenue passengers, including bus passengers, reported to the American Electric Railway Association by 216 companies is as follows:

February, 1927	781,891,790
February, 1926	779,296,724
Increase, per cent	0.33

Average cash fare in cities of 25,000 population and over:

	Cents
March 1, 1927	7.8194
February 1, 1927	7.7827
March 1, 1926	7.65432

Average maximum hourly rates paid motormen and conductors in two-man service by companies operating 100 or more miles of single track:

	Average Hourly Rate, Cents	Index Number 1913=100% Per Cent
March 1, 1927	56.97	209.06
February 1, 1927	56.94	208.95
March 1, 1926	56.66	207.93

$279,075 Received from Ottawa Electric in 1926

In the thirteenth annual report of the Ottawa Traction Company, Ltd., Ottawa, Canada, T. Ahearn, president, stated that the amount received from the Ottawa Electric Railway for the year ended Dec. 31, 1926, was $279,075, with which was paid the usual quarterly dividends of 1 per cent and a bonus of 1 per cent.

Following the signing of the new agreement with the city of Ottawa in January, 1924, the company had successfully carried on the rehabilitation and modernizing of its railway system. Every department has been carefully scrutinized and its assets put into first-class condition. With the exception of eighteen cars, all the passenger rolling stock is either new or has been rebuilt along modern lines.

A bus department was organized in 1924 and, the report states, consists of nine 21-passenger Reo buses and an up-to-date garage. Mr. Ahearn states that this department is making steady progress and has already justified its creation.

The new car shops were constructed after a careful study of the latest shops in the eastern part of Canada and the United States and embody the latest ideas in shop design. With the shops is carhouse accommodation for about 50 cars, the whole building being arranged so that as more shop accommodation is required with the growth of the system it can be taken from that part of the building which is now used for housing cars.

The entire construction program, entailing an expenditure of $2,250,000, was carried out without interruption.

Mr. Ahearn says that the efforts of the company during 1926 were directed toward the maintenance of the plant and equipment in an efficient condition.

Character of Missouri Interurban Road's Business Changing

Total gross earnings of the Kansas City, Clay County & St. Joseph Railway, St. Joseph, Mo., for 1926 from operation were $828,176, representing a decrease of $46,239 in comparison with the year 1925. Total net earnings available for interest charges, reserves, etc., for the year 1926 were $222,318, or $35,680 less than in the previous year. After providing for interest on the company's bonds and miscellaneous deductions aggregating $157,358 the year's operations showed net income available for reserves and surplus of $64,959. Of this amount, $17,359 was appropriated for the reserve for depreciation.

During the year $102,000 principal amount of the company's bonds were retired through operation of the sinking fund. There remains in that fund a balance of $50,036 which may be used for the retirement of additional bonds or withdrawn for capital additions to the property.

Approximately 23 per cent of the gross revenues were derived from freight transportation. The character of the freight traffic handled by the road is undergoing a change. There has been a decrease in the less-than-carload or package business due to sharp competition from motor trucks. However, the carload movement has greatly increased. Intensive work is being done to increase joint rates and routes with more of the steam railroads of this territory and to locate along the property of the company active industries productive of carload traffic. The company has physical track connections with the Chicago Great Western, Chicago, Burlington & Quincy and the Chicago, Rock Island & Pacific Railway and indirect connections with all other steam railroads at Kansas City and St. Joseph. Through these facilities approximately 3,500 carloads of freight moved inbound or outbound to or from points on this company's line in 1926. Approximately half of the movement was line haul, and the remainder was handled in switch movement.

Approximately 14,000 cross ties and 170 cedar trolley poles were renewed. More than 400 trolley poles were treated with hot creosote. All track bonding was rehabilitated and twelve passenger cars were overhauled and repainted. In this latter respect a con-

INCOME AND SURPLUS ACCOUNT OF THE KANSAS CITY, CLAY COUNTY & ST. JOSEPH RAILWAY FOR YEAR ENDED DEC. 31, 1926

INCOME ACCOUNT

Gross Earnings from Operations:		
Revenue from transportation		$815,34
Revenue from operations other than transportation		12,828
Total gross earnings from operation		$828,176
Operating Expenses and Taxes:		
Operations		$439,472
Maintenance		159,547
Taxes		22,326
Total operating expenses and taxes		$621,346
Net earnings from operations before depreciation		$206,829
Add non-operating income		$15,489
Total net earnings before depreciation		$222,318
Interest deductions		$157,358
Surplus net income before depreciation		$64,959

SUMMARY OF SURPLUS ACCOUNT

Balance, Jan. 1, 1926		$807,93[illegible]
Add:		
Surplus net income before depreciation	$64,959	
Less depreciation of rolling stock	17,395	
Net income after depreciation	$47,563	
Refund of federal income tax for years 1917 to 1921	2,953	
Discount on $102,000 of first mortgage bonds purchased and canceled	51,527	
Total additions		$102,044
		$909,978
Deduct:		
Portion of unamortized bond discount and expense written off	$11,230	
Premium on United States Treasury notes written off	1,218	
Normal tax withheld at source	2,086	
Materials and supplies inventories adjusted	9,344	
Advertising and purchasing expense on canceled bonds	397	
Total deductions		$24,277
Balance, Dec. 31, 1926, per balance sheet		$885,700

siderable saving was effected by substituting a cellular lacquer in lieu of the former paint and varnish method.

The passenger train service furnished by the railroad was substantially the same as that during the past few years, except that on the St. Joseph Division four limited trains were operated, of which two displaced local trains.

The Kansas City, Clay County & St. Joseph Auto Transit Company, which operates bus lines connecting with the company's railroad lines, now has four separate routes, to wit: Kansas City to Excelsior Springs, Kansas City to St. Joseph, Kansas City to Parkville, and, since Dec. 9, 1926, a touring car line between Platte City and the company's railroad line at Ferrelview. Its gross revenues for the year were $120,105. They covered operating expenses, taxes and reserve for depreciation, but provided no return on the capital investment. The details of the revenues of the Auto Transit Company were not included in the income account of the railway.

The company explains that the improvement of the highway between Kansas City and St. Joseph has resulted in a substantial increase in the use of the private automobile, and that as a consequence the railroad suffered from a reduction of 118,971, or 14.4 per cent, in the number of revenue passengers carried on the St. Joseph division. The Excelsior Springs Division, however, recovered some of the loss of passenger business which it has previously suffered from a similar cause, with the result that the total number of revenue passengers carried by the two divisions decreased only 2 per cent.

Net in Duluth Lower

Under New Fare Passenger Revenues Increase in 1926—Improvement Noted in Bus Operation

The net income of the Duluth-Superior Traction Company, Duluth, Minn., for the year ended Dec. 31, 1926, transferred to profit and loss showed a decrease of $23,064 compared with the year previous. This disclosure was made in the annual report to the stockholders. The gross revenues for the year showed an increase of $14,448, and operating expenses, including all taxes, showed an increase of $38,799.

Previous to Oct. 15, 1926, at the 6-cent fare the passenger revenue showed a decrease of $50,867 compared with the corresponding period during 1925. On Oct. 4, 1926, the Railroad and Warehouse Commission of Minnesota filed its order fixing the value of the property of the company in the city of Duluth as of Dec. 31, 1925, at $5,291,710 and the rate of return which the company was entitled to receive on such valuation was fixed at 7½ per cent. The rate of fare which was authorized in the city of Duluth was fixed at 8 cents cash, five tickets or tokens to be sold for 35 cents. The new rate of fare became effective on Oct. 15, 1926. From Oct. 15 to Dec. 31, 1926, under the new rate the passenger revenue shows an increase of $25,342 when compared with the corresponding period in 1925.

STATISTICAL STATEMENT OF THE DULUTH-SUPERIOR TRACTION COMPANY

(Street railway only)

	1926	1925
Total revenue	$1,888,303	$1,905,001
Total operating expense including depreciation	1,508,472	1,494,898
Net revenue	379,831	410,102
Revenue passengers carried	29,254,508	30,638,092
Transfers redeemed	5,031,592	5,309,085
Operating, per cent of revenue, taxes included	86.73	85.58

COMPARATIVE STATEMENT OF RAILWAY OPERATING REVENUES*

1917	$1,621,952
1918	1,665,909
1919	1,937,142
1920	1,919,579
1921	1,777,330
1922	1,784,774
1923	1,904,606
1924	1,789,402
1925	1,873,013
1926	1,849,463

*Above comparative statement has been made to conform with the Interstate Commerce Commission's classification of accounts. Non-operating income not included.

Depreciation has been accrued and charged monthly to operating expense at the same rate as the previous years, with the exception of the property comprising the Duluth, Minn., Division for the months of October, November and December. During these months depreciation on the Duluth Division has been accrued and charged into operating expense at the rate of $100,000 a year as provided in the order of the Railroad and Warehouse Commission of Minnesota dated Oct. 4, 1926.

TRACK MILEAGE AND PASSENGER EARNINGS PER MILE OF THE DULUTH-SUPERIOR TRACTION COMPANY

(Street railway only)

Total miles, single track	16.94
Total miles, double track	44.64
Total miles, special track	6.15
Total miles, all track reduced to single	112.36
Average total miles, all track reduced to single, operated during 1926	110.39
Total miles of street and right-of-way occupied by tracks, 1926	61.58
Average total miles of street and right-of-way occupied by tracks, operated during 1926	60.37
Revenue from transportation, per mile single track	$16,604.37
Revenue from transportation, per mile street occupied by tracks	$30,362.05
Revenue from transportation	$1,832,956.77

A. M. Robertson, president, stated that the management hoped to have the charge for annual depreciation of the property in both Duluth, Minn., and Superior, Wis., fixed and accrued upon a percentage basis which would be uniform in both states instead of a percentage basis in one state and a flat annual amount in the other.

The amount accrued to depreciation reserve during the year 1926 was $194,760. There was expended for renewals and charged against depreciation reserve the sum of $48,402. There was expended for additions to property during the year the sum of $116,801.

Bus service operated as feeders to railway lines has been fully justified, according to Mr. Robertson, and affords a means of supplying transporta-

CONSOLIDATED INCOME STATEMENT OF THE DULUTH-SUPERIOR TRACTION COMPANY*

	1926	1925
Operating revenues:		
Revenue from transportation	$1,934,636	$1,928,624
Revenue from other operations	16,506	14,868
Total operating revenues	$1,951,142	$1,943,493
Operating expenses:		
Way and structures	$213,616	$209,908
Equipment	235,637	225,193
Power	176,183	178,704
Conducting transportation	746,487	729,398
Traffic	1,526	2.521
General and miscellaneous	260,065	243,109
Transportation for investment-credit	—11,384	—10,832
Total operating expenses	$1,622.131	$1,578,012
Net revenue from operations	$329,011	$365,480
Taxes assignable to operations	$133,974	$139,294
Operating income	$195,036	$226,186
Non-operating income:		
Income from funded securities	$22,284	$15,169
Income from unfunded securities and accounts	2,425	2,456
Income from sinking fund and other reserves	14,091	13,980
Miscellaneous income	67	465
Total non-operating income	$38,869	$32,070
Gross income	$233,906	$258,256
Deductions from gross income:		
Interest on funded debt	$169,664	$171,054
Interest on unfunded debt	2,740	2,736
Miscellaneous debits	704	604
Total deductions from gross income	$173,109	$174,395
Net income transferred to profit and loss	$60,796	$83,861

*The above income statement includes the results from the operation of the street railway system and motor coaches.

tion service to sparsely settled districts which could not support a railway. The earnings from bus operation during the past year have not been satisfactory, but a steady improvement has been shown and the year 1927 should show still further improvement.

During the year one railway extension of 2.63 miles of track was built in Duluth. This extension is known as the Crosley Avenue line and was put in service on Oct. 1, 1926.

No general mortgage bonds were authenticated or sold during the year, while $28,000, par value, of general mortgage bonds were retired under the sinking fund provision of the mortgage.

The report goes into some detail on the status of the appeal of the city of Duluth to the United States Supreme Court from the order and decision of the United States District Court and the appeal of the city of Duluth from the decision of the District Court of St. Louis County.

Revenue at Youngstown Holds Up Well.—The revenue of the Youngstown Municipal Railway, Youngstown, Ohio, during January was $184,679, compared with $185,393 for a similar month of 1926. During the first month of the year the revenue failed by $10,762 of paying all expenses, including a return on the investment.

Will Remove Tracks. — The Pacific Electric Railway has been granted permission by the California Railroad Commission to abandon and remove the tracks on its San Antonio Heights Line in the county of San Bernardino.

Files Abandonment Petition. — The New York & Stamford Railway filed a petition on April 4 with the Public Service Commission asking for the approval of a declaration of abandonment of its railway lines in the village of Port Chester, Westchester County, on North Main Street from Mill Street to the state line between New York and Connecticut. A public hearing will be held on this petition. This is part of the plan for readjustment to which reference has been made before in the JOURNAL.

May Reimburse Treasury.—The Key System Transit Company, Oakland, Cal., has been authorized by the Railroad Commission, in a supplemental order, to use $175,740 of the proceeds received from the sale of bonds heretofore authorized by the commission to reimburse its treasury.

Revenue in San Diego $1,667,519.—The San Diego Electric Railway, San Diego, Cal., reports to the Railroad Commission its 1926 operating revenue at $1,667,519, compared with $1,608,501 for 1925. The operating expenses, excluding taxes for 1926, are reported at $1,350,373, and at $1,405,130 for 1925, leaving net operating revenue of $317,146 for 1926 and $203,371 for 1925. During 1926 taxes charged to operation amounted to $113,828 and for 1925 to $106,583. Deducting the taxes leaves operating income of $203,318 for 1926 and $96,788 for 1925. Adding to the operating income the non-operating income of the company and deducting non-collectible revenue and rents results in a gross corporate income, which represents the amount available for interest, amortization of debt discount, other fixed charges, non-operating expenses, dividends and surplus, of $303,888 for 1926 and $175,822 for 1925.

Net Income Lower.—For the eight months period ended Feb. 28, 1927, the passenger revenue of the Brooklyn City Railroad, Brooklyn, N. Y., was $7,518,803, against $7,486,575 for a similar period last year. Operating expenses and taxes increased from $6,394,466 for the eight months period ended Feb. 28, 1926, to $6,542,038 for the 1927 period. After the consideration of income deductions a net corporate income remained this year of $766,626, against $930,680 in the eight months period ended Feb. 28, 1926.

Service Discontinued.—The Sacramento Northern Railway has been granted permission by the California Railroad Commission to discontinue passenger service over its Suisun-Vacaville branch in the county of Solano. The commission found that the service was not required by public convenience and necessity.

Abandonment Petition Dismissed.—Application of the Utah-Idaho Central Railroad for permission to abandon its passenger service between Ogden and Plain City, Utah, has been dismissed without prejudice by the Utah Public Utilities Commission.

Rail Lines at Tampico to Discontinue.—All of the railway lines of the Tampico Electric Company, Tampico, Mexico, except the one which runs from Tampico to the beach resort suburb of Miramar, were shut down on March 14. Whether or not the suspension will be permanent will depend on future conditions. Should there be no indications of improvement in patronage, the tracks will be taken up and the rails along with other equipment sold, it was stated. The Tampico Electric Company is owned by British interests.

New Directors Elected.—Harold J. Gallagher, New York, and W. Graham Boyce, vice-president of the Union Trust Company, were elected directors of the Washington, Baltimore & Annapolis Electric Railroad, Baltimore, Md., at the recent annual meeting. They succeeded J. H. Beatson and R. W. Graham, Baltimore.

Cable Road Reports.—The California Street Cable Railroad, operating in San Francisco, reports to the Railroad Commission its 1926 operating revenue at $532,537, compared with $557,858 for 1925. The operating expenses, excluding taxes for 1926, are reported at $462,344, and at $412,082 for 1925, leaving net operating revenue of $70,193 for 1926 and $145,776 for 1925. During 1926 taxes charged to operation amounted to $49,858, and for 1925 to $49,405. Deducting the taxes leaves operating income of $20,334 for 1926 and $96,370 for 1925. Adding to the operating income the non-operating income of the company and deducting non-collectible revenue and rents results in a gross corporate income, which represents the amount available for interest, amortization of debt discount, other fixed charges, non-operating expenses, dividends and surplus, of $41,869 for 1926 and $117,624 for 1925.

Net Income Up in St. Paul.—Total operating revenue of the St. Paul City Railway, St. Paul, Minn., for February was $391,008 compared with the January income of $428,574 and a total revenue of $402,566 for February, 1926. The operating expenses were $280,881, compared with $299,216 for the similar period a year ago. Operating expenses for February, 1927, were cut nearly $19,000 below similar expenses in February, 1926. Because of the sharp reduction in operating costs, the net income of the company for February, however, showed an increase of approximately $7,500 over the income of the corresponding month a year ago, despite a drop of $11,500 in total operating revenue. Net income for February was $24,575, after all deductions for taxes, operating expenses and miscellaneous debits had been made.

Would Dispose of Property.—The Pacific Electric Railway has applied to the California Railroad Commission for permission to sell its resort property in the city of Redondo Beach, Los Angeles County, valued at $1,800,000, to T. R. Gardner for a corporation to be chartered for the purpose of taking over and operating the property and designated as the Amusement Company. The Pacific Electric Railway has also requested permission of the Railroad Commission to dispose of certain real estate located along its Newport Beach Line in the city of Long Beach and in the city of Seal Beach, valued at $126,000.

Slight Earnings Decrease on Indiana Road.—The net income of the Terre Haute, Indianapolis & Eastern Traction Company for 1926 shows a decrease of $14,988 under the net income for 1925, according to a financial statement of the company filed with the Indiana Public Service Commission. The net income for 1926 was $137,929. Operating revenue was $3,155,296. Operating expenses were $3,129,919. The gross income was $1,185.513. The report shows, among deductions, $676,897 interest on the funded debt and $55,847 interest on unfunded debt. The total valuation of the property is $18,200,000.

Offers New Prior Lien Issue.—The first public offering of 6 per cent cumulative prior lien stock of the Midland Utilities Company, Chicago, Ill., was made March 24. The Midland Utilities controls the Chicago, South Shore & South Bend, the Gary Railways and Indiana Service Corporation. A new issue of 25,000 shares of this stock has been authorized and 15,000 shares is being offered to investors by the Utility Securities Company, Chicago, and the Central States Securities Corporation, New York. The additional 10,000 shares, which will be offered in the near future, take the place of 10,000 shares of 7 per cent prior lien stock which was repurchased and converted into 6 per cent stock. The stock is being sold at $92.50, to yield about 6.50 per cent. Dividends on other prior lien and preferred stocks are payable at the rate of 7 per cent annually. The new 6 per cent prior lien stock is on a parity in all respects with the 7 per cent prior lien stock except as to the annual dividend rate and the callable price, which is $110 per share.

Book Reviews

Profit Sharing and Stock Ownership for Employees

By Gorton James, Henry S. Dennison, Edwin F. Gay, Henry P. Kendall and Arthur W. Burritt. New York: Harper & Brothers. 394 pages. Price $4.

Profit motive is a strong force. As the authors point out, it may well be utilized in some one of its manifold forms as an agent of efficient management and of social betterment. The point of the present volume, however, is not only that it can and should be so used, but that its application demands an understanding of its principles and an analysis of the situation it is meant to fill.

Within these pages is a study of principles. There are no recommendations of ready-made plans, since, as the authors say, no plan is uniformly applicable to all situations. The hope of the authors is merely that the book will help managements to find the points of usefulness of profit sharing as well as to recognize the places in which it is not effective.

The present volume really is the successor to "Profit Sharing, Its Principles and Practice," published in 1918. That book has, in the present volume, been entirely rewritten, for since its publication there has been a steady and continued interest in the subject, while at the same time the business world has gone through changing conditions which have tested the various plans and revealed in many ways their points of weakness and strength. Moreover, there has recently been a wide use of employee stock participation to serve equivalent purposes if not identical ones.

The authors say that the principal conclusions of the former volume as to the great strength of the profit motive, when effectively applied, have been sustained and strengthened by the facts of experience, but that there has been some modification of previous conclusions regarding specific applications of the principles. Especially has it been proved that profit sharing and management sharing are very closely interdependent, and this fact has led to the addition of several chapters to the present edition. Furthermore, the use of stock participation has been studied, in so far as it has been used in place of profit sharing, or for the same purposes, and this subject has formed the basis for three additional chapters. The volume is wide in its appeal to railway executives.

What a Business Executive Should Know About Patents

By Roger Sherman Hoar, head of the patent department of the Bucyrus Company. New York, N. Y.: Ronald Press Company, 1926. 22 pages, bound in paper. 6x9 in. Price $4.50.

All things considered, the author has achieved well his object to prepare a treatise on tactics plus a translation into plain English of so much of the patent law as will enable a business executive to understand his attorney and to co-operate fully with him. This is said even with the fact in mind that the "business executive" is the one in charge of a manufacturing business and not the head of a transportation business.

With this end in mind the emphasis of the author is placed on patent applications, interferences and searches and on the contractual arrangement desirable in case of licenses. Considerable attention is paid to the problems of the inventor, the employer and employees, the right to repair patented machines and to the shop rights that may be developed when an employee has invented something that may be built outside. The chapters on infringements and on the choice of an attorney discuss many practical matters not usually put down on paper, but still of importance to any one interested in the patent question. In conclusion, the author summarizes a number of misconceptions about the whole matter far too prevalent even among those who are not without experience in dealing with patent problems.

Street Railway Transportation in Cincinnati

By Rebecca Van Hamm. Vocational Pamphlet of the Cincinnati Public Schools, No. 6. 64 pages.

Did you ever want to be a motorman when you were a boy? "Street Railway Transportation in Cincinnati" opens up new vistas of thought for the high school boy of today in choosing a life work, and it goes into the fields of mechanical, electrical and civil engineering. In fact, the story of railway transportation in Cincinnati is the sixth of a series of vocational studies for junior high school boys and girls, presented in pamphlet form and published by the Board of Education of Cincinnati, and the first of the public utilities in this series to be discussed. It develops all of the allied vocations in every line connected with the electric railway industry. Its author, Miss Rebecca Van Hamm, has brought together two great civic bodies, the Cincinnati Street Railway and the Board of Education.

She has shown the student his relation to the community through the very car on which he rides to and from school. How many more advantages he has today than his father yesterday are told in the introductory chapter. Health and safety of the workers whom he meets every day, the various organizations with which they are connected, how they are at work in constructing lines, their duties in the carhouses, shops and power stations; how they are instructed before they are allowed to go out on their new jobs; how they spend their moments of recreation in the shelter rooms; how their wages are determined; how many passengers ride on the cars every day, and statistics of the transportation department's functioning are all woven into this brief text and portrayed by pictures and charts.

In the glimpse into the future, the author asks the question, "How shall we come to town, or ride to school 25 years from today?" The student will be better prepared to think along these lines after reading some of the books and magazines appendixed to the text in the bibliography.

Switching Equipment for Power Control

By Stephen Q. Hayes, A.B., E.E., general engineer Westinghouse Electric & Manufacturing Company. Second edition. New York, N. Y.: McGraw-Hill Book Company, Inc. 556 pages. Price $5.

Progress in the design of generators, transformers and other electric machinery since the first edition of this book has made it desirable to bring the contents abreast of present practice. A number of European ideas have also been incorporated in the revision.

In America there has been a great development of the steel-clad switchgear, represented by truck panels, truck type oil circuit breakers, steel switchhouses for outdoor service and steel switchboards. In the second edition of this book a separate chapter has been devoted to these advances. A separate chapter has also been allotted to automatic substations so as to take care of the advances made in automatic railway substations, also automatic stations for d.c. light and power, substations for mining service, automatic hydro stations and similar automatic equipment. There is a discussion of supervisory control and a certain amount of information for load dispatching. The tying together of neighboring power systems has introduced many interesting problems connected with voltage adjustment and regulation by means of induction regulators, step induction regulators and ratio adjusters or tap changers to permit change of transformer ratio under load. A chapter is devoted to this subject.

The author describes the switching apparatus approximately in the order in which the various devices were developed and then proceeds to the consideration of the main connections desired in a power plant and the means of carrying them out so as to obtain the maximum amount of security and flexibility with minimum outlay. Switchboard panels, control desks, etc., are considered next with the location of breakers, bus structures, etc. Description of apparatus has been confined almost exclusively to present-day standards.

Employment Statistics for the United States

By Ralph C. Hurlin of Russell Sage Foundation and William A. Berridge of Brown University. 215 pages. Price, $2.50.

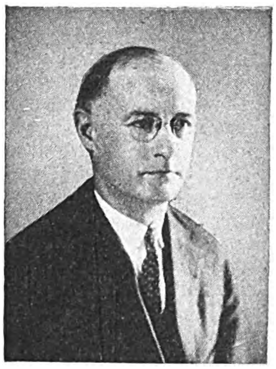
This is a plan for a national collection of statistics and a handbook of methods recommended by the committee on governmental labor statistics of the American Statistical Association. It presents the consensus of opinion of the members of that committee concerning problems involved in the collection and publication of adequate employment statistics for the United States.

Personal Items

Stone & Webster Confer Honor

In Promotion of Messrs. Clifford, Burke, Townsend, Wentworth, Management Recognizes Long Service Records—Careers of New Incumbents Reviewed

SINCE April 1 the Boston office of Stone & Webster, Inc., has been enriched by the services of George H. Clifford, who was recently appointed division manager in charge of the companies located in the Southwestern district, the Virginia Electric & Power Company and subsidiaries and the northern district properties of the Eastern Texas Electric Company. This change, along with several others, was referred to in the ELECTRIC RAILWAY JOURNAL, issue of March 5, 1927, page 438.



W. H. Burke

G. H. Clifford

A. S. Townsend

Mr. Clifford brings to his new position a record of valuable experiences, gained mostly on the Stone & Webster properties. About 26 years ago he entered the service of the Northern Texas Traction Company as secretary to F. M. Haines, general manager of the company, owned by the Bishop & Sherwin syndicate of Cleveland. Two years later Mr. Clifford was made secretary and treasurer. He held this position until 1905, when the property was purchased by Stone & Webster. After the change in ownership he was made general superintendent and in 1910 was elected vice-president and general manager of the Northern Texas Traction Company and in addition general manager of the Fort Worth Southern Traction Company, operating 32 miles of interurban line between Fort Worth and Cleburne. A little less than two years ago Mr. Clifford was made Southwestern district manager over all Stone & Webster properties in Texas, Louisiana and New Mexico. The properties involved embraced companies with many diversified interests, but his talents proved equal to the responsibilities imposed upon him. Mr. Clifford was born at Fort Worth in 1881. He was graduated from the public schools and attended Weatherford College.

Walter H. Burke, the new district manager in the Southwestern district, was appointed less than two years ago manager of the Northern Texas Traction Company of Fort Worth and the Tarrant County Traction Company. He went to Fort Worth at that time from the Houghton County Traction Company as successor to Mr. Clifford. Mr. Burke, too, has been identified with the Stone & Webster organization for many years. He entered the statistical department at the Boston office in 1910, remaining there for a year.

In 1911 he was sent to Dallas as clerk to E. T. Moore, then manager of the Dallas group of utilities under Stone & Webster management. Later he left Stone & Webster to go to Milwaukee and assumed the position of manager of the light and power operations of the Milwaukee Electric Railway & Light Company. However, in 1915 he was back again in the Boston office of Stone & Webster as assistant to M. M. Phinney, who was vice-president of the Stone & Webster Management Association. His next move was to Keokuk, Iowa, where he served as manager of the Keokuk Electric Company. From there he went to the Houghton County Traction and the Houghton County Electric Light Company. Mr. Burke was born in Maine. He was educated at the University of Maine, where he took an electrical engineering course. He was graduated in 1906. Following his graduation he spent about two years with various companies in New York and Pennsylvania on power house and substation operation and maintenance.

Alfred S. Townsend, formerly manager of the Florida Motor Lines, Inc., and its affiliated companies and vice-president of the Florida Motor Lines, Inc., is now manager of the Northern Texas Traction Company and the Tarrant County Traction Company. He has been associated with Stone & Webster for the past 26 years and during that time has been identified with the utilities at Lowell, Mass.; Ponce, Porto Rico, and Sydney, Nova Scotia. In 1916 he was appointed manager of the properties at Beaumont and Port Arthur, included in the Eastern Texas Electric Company.

Mr. Townsend began his career in the electrical industry with the Lewiston & Auburn Electric Light Company, filling various positions with the company until he was made general superintendent in 1898, serving in that capacity for about two years. In 1925 Mr. Townsend was appointed vice-president and general manager of the operating subsidiary company of the Western United Corporation with headquarters at Aurora, Ill. These subsidiary companies had previously signed contracts with Stone & Webster for executive management service. To Mr. Townsend will fall the task of preserving the reputation of the progressive company at Fort Worth. The company a few years ago won the Coffin medal and has aspiration for that distinction again this year. Recently the management instituted a cash fare of 10 cents and a ticket fare of 40 cents a week plus 5 cents per ride. The officials believe that the new rate schedule will help not only to build volume but will really solve the fare problem for the infrequent rider, the casual rider and the wholesale rider.

Philip M. Wentworth, who will replace Alfred F. Townsend as manager of the Florida Motor Lines, Inc., and its affiliated companies, was formerly manager of the Truckee River Power Company, Reno, Nev. Later he served as manager of the Fort Madison Company in Fort Madison, Iowa, and also manager of the Dallas City, Ill., Light Company. He succeeded Walter M. Bird in 1924 as manager of the Keokuk company.

C. A. Semrad Succeeds S. B. Irelan at St. Joseph

Charles A. Semrad, vice-president and commercial manager of the Public Service Company of Colorado, Denver, has been made vice-president and general manager of the St. Joseph Railway, Light, Heat & Power Company, St. Joseph, Mo. He succeeds S. B. Irelan, recently appointed Western manager of the securities department of Henry L. Doherty & Company.

Mr. Semrad became associated with the Boulder office of the Northern Colorado Power Company in 1912. A year previous to that he had assumed management of the Cheyenne Light, Fuel & Power Company, Cheyenne, Wyo., a subsidiary of the Northern Colorado Power Company, and later became manager of the Western Light & Power Company's properties, with headquarters at Boulder. Six years later Mr. Semrad was transferred to Denver to assume the duties of vice-president and commercial manager, which position he has held until his recent promotion. He is a graduate of the University of Wisconsin, class of 1907.

Promotions in Charlotte

A. B. Skelding, manager of the branch of the Southern Public Utilities Company at Charlotte, N. C., resigned, effective on April 1. His successor is Harry A. Orr, who has been manager of the Anderson branch since that city has been included in the Southern Public Utilities System. Coincident with the announcement of Mr. Orr's succession to the managership of the Charlotte branch, E. C. Marshall, president of the company, announced the appointment of T. F. Hill to succeed Mr. Orr at Anderson.

The former manager at Charlotte has interested himself in the formation of the Piedmont Wood Preserving Company, a new $100,000 corporation, being organized to establish a wood preserving plant near Charlotte. He will be president and treasurer of the new enterprise. At one time he organized and operated a wood preservation plant as a department of the Tidewater Power Company at Wilmington. Mr. Skelding has been manager of the Charlotte branch of the company for the past six years.

Harry A. Orr, his successor, has been engaged in utilities work since his college days. He was graduated from the Alabama Polytechnic Institute at Albany, Ala., where he specialized in electrical engineering. Following his graduation he spent two years in the engineering department of the General Electric Company at Pittsfield. When the Anderson Water, Light & Power Company was purchased by the Southern Utilities Company and became a branch of that system Mr. Orr was made manager of the Anderson branch of this company. This position he has filled since the transfer was made in 1912.

Thomas F. Hill, who succeeds Mr. Orr at Anderson, has also spent practically all of his time since his graduation from Wofford College with the utilities in Anderson. He joined the old Anderson Traction Company in 1909 and became its superintendent in 1914.

Engineering Firm Established

William H. Baker and C. G. Spencer announces the organization of the firm of Baker & Spencer, Inc., for the general practice of engineering and construction at 117 Liberty Street, New York City, N. Y.

Mr. Baker has had broad experience in investigating, financing, organizing and managing industrial businesses following an extensive engineering training. He was graduated from Cornell in 1901 and spent six years in diversified design and construction. He acted for ten years in managerial capacities for the Atlas Portland Cement Company, two years as vice-president and general manager of the Hardinge Company, three years as president of the Quigley Fuel Systems, Inc., two years as president of the Acme Cement Corporation and one year, until his resignation to organize this firm, as vice-president of the North American Cement Corporation.

Mr. Spencer, since his graduation from Cornell in 1904, has been engaged in the design, construction and operation of projects, including power plants for industrials and public utilities, railway electrification, passenger stations and repair shops, war construction, industrial plants for foundry and machine shops, leather tanning, copper wire and cable, paper making and cement manufacture during nine years with Westinghouse, Church, Kerr & Company, three years with the Toronto Power Company, two years with the Chile Exploration Company in South America, two years in the United States Army, two years with the American Sugar Refining Company and five years with McClellan & Junkersfeld, Inc., New York.

McGraw-Hill Editor Will Report Geneva Conference

In order to give American industrialists and engineers first-hand information on the deliberations and conclusions of the international Economic Conference at Geneva, the McGraw-Hill Publishing Company, Inc., publisher of the ELECTRIC RAILWAY JOURNAL, is sending Edward J. Mehren, one of its vice-presidents, to the meeting. He will sail on the same ship with the American delegates and experts on April 20.

Mr. Mehren has a broad knowledge of American industry and engineering. Joining the staff of *Engineering Record* more than twenty years ago, he became in turn editor of *Engineering Record*, editor of *Engineering News-Record* and vice-president and chairman of the editorial board of the McGraw-Hill Publishing Company, Inc. In his editorial travels he has covered engineering and industrial developments in every part of the United States, in eastern Canada and in the leading countries of western Europe.

In addition to his experience gained through his editorial and publishing work, Mr. Mehren was at one time manager of the Emerson Company, thus securing an intimate insight into management technique. He was one of the organizers of the National Association of Corporation Schools and of the wartime Highway Industries Association. He has been a director of the New York Building Congress and is a director of the American Arbitration Association and chairman of the arbitration committee of the American Society of Civil Engineers.

Mr. Mehren's ability as a public speaker makes him much in demand for meetings of industrial and engineering associations and societies.

Grandville Officers Elected

At a recent directors' meeting of the newly organized United Suburban Railway, Grandville, Mich., F. F. McCarrick, Grandville, was elected president of the railroad. Other officers elected by the board were Paul E. Gezon, Wyoming Park, vice-president, and Harold T. Slaght, Grandville, secretary and treasurer.

This company is the successor to the defunct Grand Rapids, Holland & Chicago Interurban line between Grand Rapids and Jenison. Mention of this project has been made previously.

Changes in Detroit Municipal Personnel

John A. Mulqueen has resigned as supervisor of employment of the Department of Street Railways of the City of Detroit, Mich. William S. Ready, who has been in charge of the instruction of new men in the department, has been named by General Manager Del A. Smith as temporary successor to Mr. Mulqueen.

Frank J. Denny has resigned as assistant general manager and director of publicity for the Department of Street Railways. Mr. Denny, a former newspaper man, entered the railway organization about twenty months ago as assistant to Col. H. U. Wallace, former general manager.

The appointment of Fred A. Nolan, former assistant auditor, has been announced by the street railway department to fill the position of assistant general manager made vacant by Mr. Denny's resignation.

Obituary

Jilson J. Coleman

Scarcely five months since his friends honored him with the presidency of the Pennsylvania Street Railway Association, they escorted the body of Jilson J. Coleman, vice-president and general manager of the Scranton Railway, Scranton, Pa., to his final resting place in Louisville, Ky. There, beside the scenes of his early boyhood, were interred the remains of one of the oldest executives in point of service among electric railway operators in the United States.

Something of the appreciation felt for Mr. Coleman was noted in the spring of last year when he was promoted to the position of operating vice-president by A. E. Fitkin, who, under the General Engineering & Management Corporation, purchased the Scranton Railway. Mr. Coleman at that time was retained to continue his duties as general manager. During the past six months, however, since Mr. Coleman's gradual decline in health, he devoted much of his time to legislative matters of the company, leaving a great deal of the daily operation of the concern in the hands of Operating Manager Harry Dartt. When Day & Zimmermann of Philadelphia secured the controlling interest in the railway from A. E. Fitkin, Mr. Coleman received a telegram in which it was stated that no changes would be made in the operating personnel of the company.

Mr. Coleman started on his railway career in Louisville, Ky., in 1882 as a clerk for the Central Passenger Railway. He worked his way up to the position of chief clerk, and then managed the lines in New Albany, Ind. Later he moved to Cleveland and assisted Tom L. Johnson in electrifying the horse car lines there. After the work was completed Mr. Coleman helped to build the line from Allentown to South Bethlehem, and from Allentown to Catasauqua. The company at Allentown purchased the line from Allentown to Bethlehem and consolidated the two companies. Mr. Coleman was engaged in the work of rehabilitating the Yonkers systems and later started the Nassau Electric Railroad, Brooklyn, N. Y., now included in the Brooklyn-Manhattan Transit System. He managed the consolidation of the St. Louis and Washington systems for Brown Brothers, New York bankers, and built the line of the New Jersey & Pennsylvania Traction Company between Trenton and Princeton.

The late Scrantonian, who was 69 years old, was well known for his work in connection with the Shipping Board, Emergency Fleet Corporation, under A. Merritt Taylor, former transit commissioner of Philadelphia. In this capacity he saw that ample transportation was provided for the shipbuilders between Boston, Mass., and Houston, Tex.

In 1920 Mr. Coleman became general manager of the Scranton Railway. During the seven years of his régime on that property many improvements and changes have been brought about. The rolling stock has been greatly increased and more than $250,000 has been spent for the purchase of the latest type cars during the past eighteen months. Improved schedules have resulted on practically all of the carlines, and many miles of new track and roadbed have been laid.

Major S. L. Nelson

Major Samuel L. Nelson, pioneer utility magnate in the Middle West and distinguished in the World War, died on March 30 in the Pastime U. S. Veterans' hospital at Tucson, Ariz. He began his career as a waterboy with the Baltimore & Ohio Railroad and became train dispatcher, going to Illinois as a manager for the Western Union Telegraph Company. In 1886, when the late W. B. McKinley was laying the foundation of the great utility enterprises he formed, Major Nelson became associated with him, having a large part in the development of the railway and water works in Champaign, Ill. Later he was active in other McKinley utilities. He served in various executive capacities, including the presidency of several of the McKinley enterprises, and later helped to rebuild the railway at Wichita, Kan. Major Nelson went to Peoria eighteen years ago to take charge of the electric railway system and engaged in other financial and industrial activities there. At the age of 58 he enlisted at the same time as his son and served 39 months in the World War. He was 68 years old.

Rudolph Henry Peppmuller, for 21 years with the New York Rapid Transit Commission, now the Board of Transportation, died on April 4. In 1906 Mr. Peppmuller joined the staff of the Board of Rapid Transit Railroad Commissioners of New York City as an assistant architect and was assigned to design the stations for the first subway. Since then he had specialized in that branch of rapid transit construction and he drew the specifications for the contracts for the construction of the subway stations. Mr. Peppmuller was born in Staten Island 53 years ago. He studied at the Stapleton, S. I., Academy; Columbia University; Beaux Arts, Paris, and Rome.

International Economic Conference to Meet

To determine the economic difficulties which prevent the revival of general prosperity, principally in Europe, and to acertain the best methods of overcoming these difficulties are the purposes of the International Economic Conference which will be convened at Geneva on May 4, under the general auspices of the League of Nations. Five delegates have been appointed by President Coolidge they will be accompanied by experts selected from government departments. Non-member nations as well as member nations have been asked by the league to send delegates. The acts of the delegates are not binding on their respective governments.

For more than a year a committee of 35 persons, drawn from 21 countries, has been working on the agenda and upon the data to be laid before the delegates. The topics fall under four heads. The first revolves about two main inquiries: An analysis of economic causes of the present disturbed equilibrium in commerce and industry, and a study of the economic tendencies capable of affecting the peace of the world.

Commerce questions, such as tariffs, import and export prohibitions and restrictions, monopolization and limitation of trade, dumping legislation and subsidies form the second group of studies. A particular inquiry into this group relates to the repercussion upon international commerce of reduced purchasing power.

Industrial problems come next and include study and discussion of:

1. The situation of principal industries, relating to productive capacity, output, consumption and employment.
2. Industrial, commercial and monetary causes of present difficulties of industry.
3. International industrial agreements as they affect producers, consumer and labor.
4. Production statistics.

Documents have been prepared, under the industrial classification, on coal, iron and steel, shipbuilding, the chemical industry, the electrical industry, legislation on cartels and combines, industrial management and standardization, technical and scientific progress and research, and on technical education and recruitment of technical staff.

Agriculture and its difficulties close the agenda.

In the preparation of the data for the delegates, the preparatory committee was assisted by the International Labor Office, the International Institute of Agriculture and the International Chamber of Commerce.

It is expected that topics that cannot be adequately traversed during the conference session will be referred to subcommittees for further study and report.

A characteristic of the conference is to be the breadth of its composition, the participating governments having been specifically asked to name delegates whose experience qualifies them as experts in the subjects to be discussed. In the preparatory committee, considered indicative of the composition of the conference itself, were economists, producers, merchants, financiers and representatives of labor and of consumers. The preparatory committee considers this broad representation an assurance that the conclusions will be free from the bias incident to conferences of special groups. Included in the committee were such men as Georges Theunis, Belgium; Sir Arthur Balfour, England; Ernesto Belloni, manufacturer, Milan, Italy; W. T. Layton, editor of the *Economist*, London, and Prof. Allyn Young of Harvard University.

Begin to Plan for Cleveland Now!

Diagrams of space layout for the convention of the American Electric Railway Association at Cleveland, Ohio, next October and applications for space will go out on May 16 this year instead of June 1, as has been the practice in the past.

It will be recalled that the exhibit committee voted at Cleveland on March 18 to accord all prospective exhibitors 30 days in which to file space requests. All applications received up to the close of business June 15 will receive the consideration of the exhibit committee when it meets on June 22 to make the official space assignment. Applications received after June 15 will be awarded space by the director of exhibits in the order in which they are received.

The suggestion is made that intending exhibitors plan their exhibit for the Cleveland convention now and be ready to file space requests promptly upon receipt of application blanks.

Twin City Officers in Motors Corporation

T. J. McGill of the Twin City Rapid Transit Company and H. L. Bollum of the Twin City Motor Bus Company, a subsidiary of the Twin City Rapid Transit Company, Minneapolis, Minn., are members of the board of directors of the newly formed C. H. Will Motors Corporation, which will manufacture trucks and buses. To start the company has orders from two companies for 40 buses.

The Will corporation has bought the business and assets of Wilcox Trux, Inc., a long established manufacturer of motor cars, trucks and buses, lately manufacturing only trucks and buses. The Wilcox factory will be operated until May 1, when a building at 1030 Ramsey Street, Northeast, containing 50,000 sq.ft. of space, will be occupied, with option for purchase. The first year 200 men will be employed on a production plan of more than $2,000,000.

Other directors are Paul Tibbetts, G. W. Traer, Edwin White, St. Paul, and R. F. Pack of the Northern States Power Company. Officers will be: C. H. Will, president; O. S. Caesar, vice-president; J. H. Colman, secretary.

Two New Westinghouse Electric Locomotives for South Shore Line

Orders for two standard 53-ton electric locomotives were placed on April 4 with the Westinghouse Electric & Manufacturing Company by the Chicago, South Shore & South Bend Railroad. The new locomotives will be of the type known as B-1. They will cost approximately $70,000.

In order to speed up the delivery of the locomotives, the South Shore Line has sent to the Pittsburgh manufacturer a consignment of electrical apparatus suitable for 1,500-volt direct-current operation. It is understood that the Westinghouse plant has on hand two new 750-volt electric locomotives which can readily be equipped for operation on the higher voltage of the South Shore Line.

The new locomotives will be used in switching service and for miscellaneous hauling and will increase the company's freight motive power units to six. At present four 80-ton engines are being operated in regular freight service. Increased freight business, and prospects of even greater growth during the summer, is the reason for the purchase of the additional locomotives, according to Charles H. Jones, general manager.

Metal Markets Dull; Prices Lower

Domestic markets for the major non-ferrous metals were dull during the week ended April 6. Even zinc and lead, which had been moderately active in recent weeks, were very quiet. Although some sellers are asking 13.125 cents in the East for copper, this price has been shaded on small sales the last two days. On Monday the New York price for lead was cut from 7.35 cents to 7.25 cents, and the prevailing figure in St. Louis is now 7 cents. Zinc fluctuated within narrow limits during the week, but was a shade easier on April 6 than the Wednesday previous. Tin has been firm in spite of a small volume of business on the part of consumers. Buying on account of both India and China has had the effect of strengthening silver quotations, a net advance of one cent to 57¼ cents being recorded for the week. Platinum and palladium are quiet and weak, with lower prices prevailing in the outside market, although the "official" price of platinum has not been changed. In spite of the Chinese situation, antimony has weakened, owing to the lack of interest on the part of buyers.

Another week, making five weeks in all, has gone by with an exceedingly slim volume of sales in the copper market. The entire tonnage sold during the last five weeks is little more than half that which changed hands in the single record-breaking week of February. Sellers are convinced that a large volume of buying must be piling up and that when the ice is broken business will be brisk. On March 30 most sellers were asking 13¼ cents delivered, but on Friday one large producer cut its price to 13.125 cents and on April 4 most of the others joined the procession. April 5 one interest that was anxious to sell a limited tonnage cut to 13 cents in order to do business. Of two transactions on April 6 one was at 13 cents and the other at 13.05 cents.

Although buying has been exceedingly limited, prices for zinc have eased only slightly. Galvanizers are reluctant buyers and in some instances have asked that April shipments be deferred. However, it is generally agreed that smelter production will show a material decline. High grade continues dull at 8½ cents delivery in the New York district.

On April 4 the American Smelting & Refining Company again reduced its contract price for New York lead, dropping from 7.35 to 7.25 cents. The reduction followed several very quiet days in a market which has been disappointing for several weeks. In the Middle West, as in the East, the market has been dull. The leading producers booked most of their business at 7.05 to 7.075 cents, St. Louis, until the A. S. & R. reduction on April 4, since which time an even 7 cents has ruled. Resale lots have sold at 6.975 cents, but offerings of this character seem now to be pretty well cleaned up. Corroding grades of lead are quoted at $2 to $3 per ton above common.

Spot supplies of tin continue scarce, and spot Straits has lately held close to 70 cents—in fact, reaching that level on Monday. July is about 3 cents less, and April about ¾ cent under spot.

METAL, COAL AND MATERIAL PRICES
F. O. B. REFINING

Metals—New York	April 5, 1927
Copper, electrolytic, cents per lb.	12.83
Copper wire, cents per lb.	15.25
Lead, cents per lb.	7.25
Zinc, cents per lb.	6.88
Tin, Straits, cents per lb.	69.625
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.975
Somerset mine run, Boston, net tons	1.975
Pittsburgh mine run, Pittsburgh, net tons	2.05
Franklin, Ill., screenings, Chicago, net tons	2.25
Central, Ill., screenings, Chicago, net tons	1.875
Kansas screenings, Kansas City, net tons	2.50
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	$5.50
Weatherproof wire base, N. Y., cents per lb.	16.75
Cement, Chicago net prices, without bags	2.05
Linseed oil (5-bbl. lots), N. Y., cents per lb.	10.90

Turpentine (bbl. lots), N. Y., per gal.	$0.74

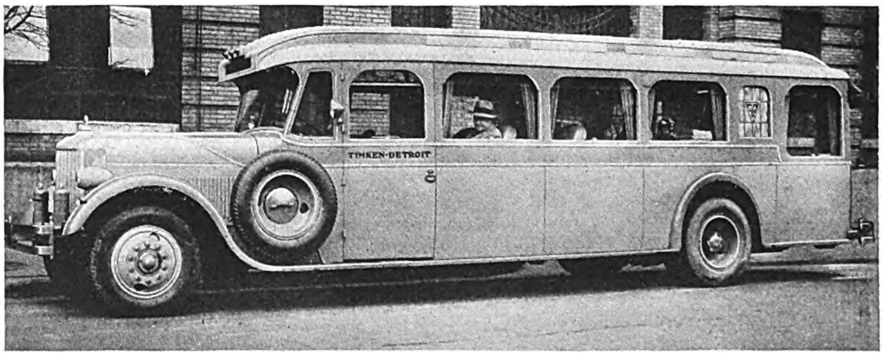
Virtues of Timken-Detroit Vehicle Brought to Possible Users' Doors

The new, specially built "Timken-Detroit" de luxe motor coach of the Timken-Detroit Axle Company is starting an itinerary that will include most of the states of the Union. It is the intention to bring to the users' doors the virtues of Timken axles and the most efficient way of caring for those in service.

The educational motor coach is complete in itself. It contains luxurious, leather-upholstered, individual chairs for twenty passengers, and in an emergency temporary seats are available for an additional twenty persons. An ice chest is provided to care for food, and large tanks are provided for drinking water. A special silver screen, which disappears into the ceiling, is provided to receive a motion picture projected from the desk in the rear of the coach. This enables an audience of forty persons, all seated comfortably in the coach, to witness the story of how Timken axles are built and serviced. In a corner of the desk at the rear of the coach a small worm-drive unit is concealed.

The interior of the coach is of natural finished mahogany. Seats are of blue leather. Protected electric fans and Pullman type ventilators are installed in the ceiling. A glass transom gives light in the daytime, and makes adequate fresh air available at all times—no matter how crowded the coach may be. The exterior is blue, trimmed in cream. Tastefully colored shades and awnings protect the passengers from the sunlight. Frosted shaded lamps make it possible to read at night without eyestrain. In fact, the coach is considered the final word in luxury possible in modern construction.

The axles are Timken, of course, and equipped with four-wheel, air-operated, metal shoe brakes providing the maximum in safety, ease of operation and brake-lining life. The powerful six-cylinder motor makes possible a speed of 60 m.p.h., although the maximum speed permitted by those in charge of the coach is 35 m.p.h., in rural districts.



New Timken-Detroit vehicle on country-wide tour

100 New Cars Likely for Detroit

Despite the defeat of the paving amendment, mentioned elsewhere in this issue, the Detroit Street Railway Commission, Detroit, Mich., will request the City Council for permission to purchase 100 new street cars to be constructed within the next year. It is estimated by Del A. Smith, general manager, that the new cars, of the Peter Witt type, can be constructed at a cost of $10,000 each or a total expenditure of $1,000,000. The original intention was to finance the new cars out of the savings of $700,000 a year which it was estimated would accrue to the system by relieving it of the paving charges.

Specifications Announced for 201 Philadelphia Buses

Announcement has been made of the details of the 201 new gas-electric buses for the Philadelphia Rural Transit Company, Philadelphia, Pa., bus operating subsidiary of the Philadelphia Rapid Transit Company, delivery of which is expected to begin about May 1. The principal specifications of the equipment follow:

Builder of chassis	Yellow Truck & Coach Manufacturing Company
Model	P.R.T. model "Z"
Builder of body	Yellow Truck & Coach Manufacturing Company
Seating capacity	Single-deck 33, double-deck 67, de luxe 27
Weight (total)	14,250 lb.
Length over all	29 ft.
Wheelbase	230 in.
Roofing material and headlining	Deck canvas and $\frac{3}{16}$-in. Haskelite
Brakes	Mechanical hand and foot
Buzzers	Electric Service Supplies Company
Destination signs	Hunter
Register	International R-10
Heaters	Exhaust pipes
Builder of engine	Yellow Truck & Coach Manufacturing Company
Bore and stroke	4¼ in. x 5½ in.
Axle bearings	Timken
Interior lighting	Electric Service Supplies Company
Ventilators	Garland
Wheels	Budd
Tires	Goodrich pneumatic, 38x7
Lubrication	Alemite
Ignition system	Northeast
Engine starter	Northeast

Rolling Stock

Evanston Railway, Evanston, Ill., has placed orders for six modern cars to cost $12,000 each. It is expected the new equipment will be put in service within the next two months, bringing the total number of cars owned to nineteen.

Macon Railway & Light Company, Macon, Ga., is planning to spend $314,000 in new equipment for its railway system following the granting by the City Council of its 10-cent fare petition. Specifications for the proposed equipment are now being drafted.

Illinois Traction System, Chicago, Ill., has announced plans for an expenditure of nearly $50,000 for new rolling stock and equipment for its "through service" between Illinois Valley points and Chicago, according to a recent announcement of F. E. Fisher, general manager. Four of the one-man cars put in use a year ago are being made over at the Ottawa shops. The new route, service over which begins on May 1, will eliminate the transfer at Joliet.

Power Houses, Shops and Buildings

Public Service Railway, Newark, N. J., will build an extension to its carhouse shop building at South Orange Avenue, Newark, for a bus garage. This garage will have a capacity of about 45 buses and will house the buses of the South Orange Avenue line.

Piedmont & Northern Railway, Charlotte, N. C., subsidiary of the Southern Power Company, has purchased from the city of Charlotte fourteen acres of land on which to build a modern passenger depot. This depot is in connection with the extension of the present electric line northward from Charlotte to Lexington, N. C., and southward from Gastonia, N. C., to Spartanburg, S. C. The price paid for the passenger station site was $46,500. The southern "missing link" between Spartanburg and Gastonia is considered one of the most important railway constructions announced in some time in this section.

International Railway, Buffalo, N. Y., has announced a comprehensive plan to attract more business to Niagara Falls and to improve facilities at the Falls View Bridge, formerly known as the Upper Steel Arch Bridge. The work intended to be carried out will cost $75,000. The present bridge structure is adequate for many years to come, although there has been congestion at the American and Canadian ends. The principal difficulty has been experienced on rush days in the American exit, where a maximum of three automobiles per lane per minute has been passed by customs and immigration inspectors. The bridge structure itself will permit the flow of twelve automobiles per lane per minute, so that by enlarging the bridge ends the company will double the capacity of the structure. Detailed plans for improvement were submitted to the group. They provide for eight exit lanes instead of two as at present. A new and more comfortable office building will be erected for customs and immigration officials with canopies over the inspection platforms. Facilities will be provided for the parking of automobiles held for detailed inspection. Tracks now used by the cars of the Niagara Great Gorge trip will be relocated, thereby facilitating the movement of automobiles.

Trade Notes

General Insulate Company, Inc., has been acquired by Insulation Manufacturing Company, Inc., Brooklyn, N. Y., and will be continued as a department of the new owners under the same corporate name. With the merger of these two plants each company will continue to specialize in Bakelite and the various kinds of molded products and insulators.

Chicago Fuse Manufacturing Company, Chicago, announces that it has purchased the Powerlet line of rigid conduit fittings formerly manufactured by the Multi Electrical Manufacturing Company. The purchasing company will continue the manufacture of its present product, Gem and Union switch boxes, outlet boxes, fuses, electrical protective materials and other wiring devices.

National Pneumatic Company on April 15 will move its New York offices to the Graybar Building, 420 Lexington Avenue, New York. The Graybar Building, located in the heart of the Grand Central business section, is adjacent to the New York Central Railroad Terminal, and by subway connection to the Pennsylvania Railroad Terminal.

Haskelite Manufacturing Corporation, Chicago, Ill., furnished its product, Plymetl, for the roofing of the new twin coach designed and built by Frank R. Fageol of Oakland, Cal. This new bus was fully described in the JOURNAL for Feb. 26.

Textile Leather Company, Newark, N. J., and the **Maumee Finishing Company, Toledo, Ohio,** have practically completed a merger which will result in the formation of the Textileather Corporation. Officers of the new corporation will be announced at an early date. Rumors announcing the closing of the Newark plant, according to a statement by the company, are entirely unfounded and the plant will continue to operate in the future as it has in the past. A new plant is nearing completion at Toledo which will supply the Western and Middle Western business and most of the automobile trade. The new corporation will be incorporated for $2,000,000 and there is no stock for sale. L. H. Green is at present acting as president of the Textileather Corporation and will continue to do so until new officers are elected.

New Advertising Literature

Ganz Electric Company, Ltd., Budapest, Hungary, is celebrating its 40 years as a manufacturer of transformers by the issuance of a handsome historical booklet that not only features the various inventors that had a part in the establishing of the company but gives an exhaustive résumé of the Ganz transformers and where they have been installed. The booklet is illustrated with sepia engravings.

Okonite-Callender Cable Company, Inc., Paterson and Passaic, N. J., is issuing a folder giving additional information for the users of Okonite tree wire.

Lincoln Electric Company, Cleveland, Ohio, has just issued its 1927 edition of the "Instruction Manual." This publication, which is revised annually to cover the latest practices used in manual electric arc welding, is of interest to practically overy one who uses arc welding. Among the subjects treated are high-speed steel welding, high-pressure pipe welding, automobile frames, boiler repairs, welding cast iron, manganese steel welding, carbon arc welding, manufacture of machinery and equipment using welded steel in place of castings.

Condit Electrical Manufacturing Corporation, Boston, Mass., is featuring its Type N-4 safety switch by a humorous folder signed by "Safety Sam."

Patching When the Material Is Too Old to Hold the Stitches

EVERY woman who does sewing knows well enough that it is a waste of time to put on a patch unless the material is strong enough to hold the stitches. Similarly, every electric railway manager should know that it is futile to build up a piece of special trackwork by welding when there is not enough rail left to hold the new metal. Unfortunately, however, that is just what some companies are doing.

To take a specific case, a railway in an Eastern city has spent much good money patching up a right-angle double-track crossing that was worn out long ago. Welding has been done on this special trackwork on an average of once in two months for years past. The crossing is so old, however, that the repairs never last long.

Every time repairs are undertaken it is necessary to transport the welding apparatus to the job, open up the pavement, weld, grind, close the pavement and take the apparatus away again. A crew of seven men has usually been employed on this job—a foreman, two traffic flagmen, a welder and his helper, and two laborers to take up and restore the pavement and operate the rail grinder. Always the work has been much hampered by traffic and has taken many hours for completion. In its effort to maintain the old crossing, this company is spending considerably more every year for labor alone than the interest and depreciation charges on a piece of new special trackwork.

Truly in this case it may be said that the railway is paying for new material without getting it.

Repair Defective Cars Before They Break Down

MECHANICAL men agree that higher standards of maintenance will improve performance. Many examples where records are kept carefully have shown that when once the equipment has reached a state of excellent repair, costs of the work are reduced considerably. The expense of putting the equipment in the condition desired, however, has proved a serious obstacle on many railways. At the present time most electric railway men are more alert to the need of high-class overhauling than ever before. Increased study is being given to maintenance problems and many railways are adopting higher standards with closer fits for wearing parts.

In the class of inspection work to prevent failure much can be accomplished, not only in reducing ultimate maintenance costs but also in improving public relations through preventing failures in service where the public will see them. Defective parts should be renewed before they cause difficulties and equipment should be kept as nearly as practicable in its original condition. This requires a carefully arranged organization with work so laid out that it will not be done hurriedly and the workmen will have ample time to make sure that all parts are inspected and repaired where necessary.

The great tendency where men are hurried and overworked is for them to slight parts which will continue to operate without producing an immediate failure. Frequently complete breakdown will result before the car is due for its next regular inspection and then costs mount rapidly, for the damaged parts often cannot be repaired but must be replaced.

Those responsible for maintenance of electric cars will do well to collect all the data possible regarding costs which result from repairing equipment after it fails, and present these to general managers in as convincing fashion as possible. Such arguments as this are needed in order to put across any campaign for higher standards of repair work and improvements in car equipment so as to give the best service from the car rider's standpoint.

Home-Made Tools Are Often Crude and Expensive

ONLY one field remains that is not flooded with tools for every inconveniently located bolt or screw. That is the railway industry. In fact, the tool manufacturers have scarcely entered it. In the past each master mechanic made most of his own tools when he had a special application where a standard tool would not accomplish the desired results. This habit of making his own tools is expensive, for it requires a great deal of his time for supervision which should be spent in studying ways and means of improving maintenance conditions. When the home-made tool is completed it will have cost more in man-hours to make it, which will be charged to the maintenance account, than would a corresponding factory-made tool. Home-made tools are generally very crude. When questioned as to why the tool was made the usual answer is, "We needed it and did not know where to buy it."

Since electric railway equipment is standard, if one master mechanic needs a special tool for a special application it is almost certain that some other master mechanic would be glad to get the same tool if he knew such a tool was in existence. The tool manufacturers have a group of engineers who are trained in the design and application of special tools. These staffs of engineers are available to assist in solving the tool problem in the railway field if they are consulted. Often it

This is the issue in April that is devoted essentially to maintenance and construction subjects

may only be necessary to make a slight change in some existing tool to fit the special purpose. Even though it may be necessary to design and make the tool from the ground up, the manufacturer can do it cheaper than it can be made in a railway shop. If the manufacturer can be convinced that a special tool developed for one railway can be sold at a profit to a number of others the cost of development may be absorbed by him.

By consulting tool manufacturers for all special tools two important things will be accomplished: First, the "Jack of all trades" is kept from wasting a lot of valuable time and material making some unnecessary tool just because he would rather do that than work at some productive job, and, secondly, if a tool manufacturer develops all special tools every railway operator can avail himself of these tools.

In the Annual Maintenance Number and in this issue of ELECTRIC RAILWAY JOURNAL a section is devoted to "Improved Equipment for Electric Railway Maintenance." Literature from these manufacturers should be obtained by maintenance foremen and kept on file for ready reference.

The Public Likes Soft Seats

WHERE, oh, where, is the man named Legion who argued that seats of slats or formed wood were so durable, so sanitary and so cheap to buy and maintain? Why provide shock absorbers in the seats, when kindly Nature had provided them in the passengers' anatomy?

Oddly enough, these arguments were so unconvincing to the pushful automotive fellows that not one of them put out an automobile with springless seats. To them "seat" was synonymous with "cushion." The purveyor of the cheapest cars incased his springs with near-leather; while the maker of cars "of the better kind" went to limp leather and over-stuffed cushions for the open cars and plush or velours for the closed ones. The very air itself was made to serve as down.

These improvements followed naturally, since the seat user was primarily the buyer of the vehicle, whereas in railway transportation the seat-user's choice was controlled by others. Now that almost everybody has enjoyed the experience of riding on air, the public utility carrier on rails is following in the wake of the personal carrier on rubber.

Desirable and even vital to ride selling as this use of softer seats may be, two factors must not be overlooked that make a direct, complete imitation of personal car standards unnecessary: First, a good car running over a good rail does not have as much jounce and bounce as the automobile. The simplest proof of this is the greater ease of reading. Second, a public transportation vehicle, especially in city service, cannot afford as much area per passenger as a personal car.

So it appears that eminently satisfactory seats can be provided for trolley cars without too wide a departure from the shapes and over-all dimensions of standard cross-seats. It is to be expected that over-stuffed or air cushions and extra-padded backs may increase seat centers to the point where 44 seats of the old type allow room for only 40 seats of the new. This is perhaps as large a concession as can sensibly be made.

It hardly seems necessary to go to the extent of installing individual bucket seats or otherwise striving to secure the effect of a Pullman chair car. Such arrangements are excellent for long-ride, interurban service, or for de luxe service, but are likely to prove rather confusing for the most expeditious handling of short-ride, city passengers during the "standing" hours. Recent visits to cities with soft-seat cars leads to the conclusion that the public is well pleased with standard cross-seats in the modern cushionings and is not likely to insist that its bread should be buttered on both sides.

Perfection of Detail Differentiates the Artist from the Dabster

FOREMOST among the qualities which have distinguished the great artists of all periods has been meticulous attention to detail. The painter does not execute his central figure with great care and then fill in the background in a hit-or-miss fashion. Perhaps it is a far cry from the painter with his palette to the painter of electric railway rolling stock, but the latter might profit by following some of the principles by which the former is guided.

Frequently the effect of a really creditable car design is marred by the intrusion of a few inharmonious elements. Take, for example, a car interior where the seats have been upholstered in leather, the floor has been covered with linoleum and the woodwork finished like fine furniture. After taking these steps to make the car comfortable and attractive, it is a pity to cover nearly all the available flat surfaces with the railway's prohibitions and warnings. Yet this often is done. A single de luxe car has been placarded with these several notices:

No smoking.
Spitting is unlawful.
Watch your step.
Do not talk to the operator.
Passengers are allowed to ride on front platform.

Variations of these themes, as well as many other ones, can be found in countless cars. At best the effectiveness of such stereotyped notices is extremely doubtful. Every one knows that smoking and spitting are forbidden, yet a certain number of passengers persist in doing these things despite the signs. Riding on the platform and talking to the operator are matters that can be controlled without plastering notices on the bulkheads. If the railway management really wants to attract the motorist by furnishing transportation approximating the private automobile in comfort, he should avoid covering the inside of his vehicle with notices and warnings that detract from its appearance and irritate the passenger.

Temporary Repairs Are a Source of Danger

SOMETIMES, due to a shortage in the working force or to an abnormal number of crippled cars, temporary repairs are made in order to allow the car to re-enter service immediately. The intention in some cases is to bring the car into the shop the following day and make permanent repairs. However, in many cases the following day's work schedule is filled completely and the car is allowed to continue in service.

The necessity for making permanent repairs promptly cannot be over-emphasized. Experience has proved that delayed repairs are uneconomical. They make the ultimate repairs more expensive, both in actual cost and in the length of time that the equipment must be withheld from service in order to make them. Frequently breakdowns that result on the road cause delays and inconvenience to passengers. In order to foster a good feeling with the public, delays in service must be kept to a minimum. This can be done by immediate care of repairs and frequent inspection which should cover all details thoroughly, even to small and seemingly unimportant parts.

Principles and Methods of Rate Regulation

JUST about the time that the decision was announced in the St. Louis & O'Fallon Railroad case there appeared the April issue of the *Yale Review*, with an article "Principles and Methods of Rate Regulation," by Arthur T. Hadley. This article, like the decision, has been widely quoted. Dr. Hadley's presentation is a brief but learned discussion of the matter. He goes back to the earliest times and says that for more than 2,000 years there has been a conflict between traders and philosophers as to the basis of value. His idea is that a reasonable rate is one that can be justified on grounds of public policy. It must not be so high as to place an unfair burden on the people who require the service, nor so low as to inflict an unfair disability on the people that render it.

To the leading electrical men in the United States Mr. Hadley pays a tribute by saying they have known how to avoid some of the difficulties into which the railroads have fallen. They have grasped the principle that the interests of the public service corporation are closely identified with those of the public which it serves, and they have done a great deal to make the people grasp it. They have taken the authorities into their confidence. They have consulted them in advance as to matters of financial policy. They have not been content with avoiding legal action; they have tried to avoid grounds of suspicion. The consequence is that public service commissions have generally been friendly to the electrical industry, and as a secondary consequence there has been more rapid and more varied development of electric service in this country than anywhere else, and the public has obtained its current at comparatively cheap rates. This is a nice compliment. On the whole, it is well deserved.

Where freedom is abused the abuse can be prohibitive, but a few abuses should not be made a reason for abolishing freedom. Seven principles are cited by Mr. Hadley as having been proved by experience but ignored by governments at their peril. He holds to the opinion that the use of cost of plant, and especially original or historical costs, as a rate base is wrong in principle and often dangerous in practice. He says that the true basis for judging whether rates are reasonable is comparison with those of other companies working under similar conditions. If the rate is low in comparison with what prevails elsewhere, and has developed traffic to an unusual degree, profits from that traffic have been well earned.

An important need, as he sees it, is to give public service commissions an opportunity to study the history of past attempts at regulation and the economic principles which have determined their success and failure, and to encourage them in such study. It is his idea that they should not be so overwhelmed with specific cases and complaints as to have no time for dealing with general questions of economic policy. They should be regarded and should regard themselves as expert advisers of the courts, the legislatures and the public on matters of vital importance to the country's future. His doctrine certainly is sound that the question of rate regulation must be considered from both ends—producers' and consumers'. And the conclusion is inescapable that it is quite as important for all parties to secure a supply equal to the demand at any given price or rate as it is to have that rate fixed as low as possible. There will be general agreement, particularly among utility men, with the observation of Mr. Hadley that politicians find it easier to concur in a widespread popular error than to decide for themselves what will prove best in the long run. It certainly takes a good deal of firmness and a good deal of economic and historical knowledge on the part of a commission or a court to protect the interests of the future against the loud-voiced demands of the present.

Massachusetts Companies Work in Concert

LESS attention in railway circles than it deserves appears to have been received by the operating agreement entered into recently by the New England Transportation Company, bus operating subsidiary of the New York, New Haven & Hartford Railroad, and the Eastern Massachusetts Street Railway. Under the terms of the arrangement between the companies the electric railway will receive from the bus company 18 cents for each passenger transported between East Walpole and Boston and Boston and East Walpole on the run from Attleboro to Boston.

The route covered by the buses encroaches upon territory served by the electric railway. The sole issue before the Massachusetts Department of Public Utilities in the case was whether public convenience and necessity required the operation of motor vehicles over the proposed route. The commission thought that it did. It ruled on this point, and this point alone. It volunteered the opinion that "however unjustifiable and unwarranted the payment to a street railway of a portion of the fare received by the transportation company may be, it does not affect the question which presents itself on this petition." And that question, as previously indicated, was one of public convenience and necessity.

The participation issue appeared to be clear cut. The transportation companies apparently found it not only expedient but mutually advantageous to enter into the agreement they did. All the points are not plain to the outside commentator, but it is not difficult to see that the disposition the companies made of the matter was advantageous to the public. Competition in the territory, if it received state sanction, which is unlikely, is unthinkable and not in the best interests of the public or the company. On the other hand, one of the companies involved was in a position better than the other to give the service, and it seems only sensible that the utilities of their own volition should conclude between them an arrangement satisfactory to each other. Certainly the end achieved seems on its face to be much more salutary than other so-called solutions resorted to in the past. If some such arrangement as this could have been amicably worked out in another Eastern state, to mention just one instance, recourse would not have been necessary there to the courts with all that such action implies of a struggle to the bitter end. It would not do to say that any compromise is better than such a contest, but it does appear in the Massachusetts case that compromise was much better than contest.

Careful Organization of Force Stimulates Effort

By Dwight L. Smith

Electrical Engineer Chicago Rapid Transit Company, Chicago, Ill.

To complete work speedily and make sure that finished jobs will be done in a manner to minimize service interruptions the electrical department must be organized thoroughly and be provided with many labor-saving tools

WORK in the electrical department of the Chicago Rapid Transit Company includes the operation, construction and maintenance of all electrical equipment except for rolling stock, signals and interlocking. It includes third rail, cables both underground and overhead, telephones, lights, bells, overhead trolley, pole lines, track bonding, storage batteries and such substations as are owned by the company. Maintenance of the system requires about 50 men, and work which can be classed properly as construction requires about 50 more.

This organization includes a centralized control, a definite and logical routing for all work, and specialists for each step in this routing. No step is begun before each preceding one is completed and checked, so that the personnel responsible for each step can proceed with full assurance that everything previous is in readiness, and entire attention can be devoted to doing each part with the utmost efficiency and dispatch.

PHYSICAL RECORDS by Engineer

Fig. 1—Plan followed in routing a construction job by the electrical department of the Chicago Rapid Transit Company

The general plan of routing construction work is shown on Fig. 1, Construction Job Routing. As a large engineering staff is employed, the construction organization does not even hear of a job until the engineering is completed, the work laid out for it in the smallest detail, all materials on hand and ready for delivery to the job, necessary permits obtained, and accompanying work by other departments arranged for; in fact, until there is nothing for the construction forces to look after but to do the physical work as planned. Frequently the actual construction work is the smallest part of the job. As an illustration of the methods employed, a job recently completed of making the cable connection to a new substation will be referred to in detail.

Most items of work initiate within the department, although certain items become necessary because of work of other departments. The greater part of a year's work is decided by inclusion in the budget at the beginning of a calendar year. As soon as the budget is approved all such known items are listed on a job list, Fig. 2. Such a list is made for each class of work, cable work being Class 3, and each individual job is given a number the first digit of which indicates its class. This job number is the office reference, and in a file identified by this number all information on the job is kept together.

The job list provides: (1) A ready record of the jobs which must be completed during the year; (2) a quick reference of the estimated time required for each job, and (3) a running record as to the status of each job, i.e., whether it is still untouched, under construction or completed.

At the commencement of each year the job list is first used to make a survey of labor and material requirements. The man-hour figures are based on unit man-hour costs for past work of a similar nature. The estimates as included on the job list are of course rough, for no details of the coming jobs are yet known, but are sufficiently close to make estimates of the total amount of labor for each class. These totals indicate the number of men required to complete all work in the year's program. This property has found that for the average cable job a gang of six men and a foreman is the most efficient and the total man-hours thus indicates the number of gangs necessary.

The job list is a continuous one. It is not closed until the end of the year and then any unfinished work is transferred to the next year's list. When work unforeseen at the beginning of the year develops it is entered, given a number and placed at the bottom of the list. There is always a certain amount of this additional work and so any estimate for man strength must make the necessary allowance.

Material requirements are also estimated at the beginning of each year, considering the items of major material on similar jobs in the past. It is not possible to estimate exactly all minor material, but this is a small part of the total. Estimating the major items gives the purchasing department an opportunity to buy on favorable markets and to order in ample time to have the material on hand when needed. Deliveries are specified throughout the year in accordance with the work program, sufficient leeway being allowed to make sure of receipt but allowing delivery at the same rate as that of use, thus keeping the storekeeper's amount of stock as low as possible.

The number of construction gangs having been determined, a job schedule is next made for each of them, showing the order in which each job will be started, and, from the man-hour estimate and the number of men at work, the actual date for starting. The order in which the jobs are scheduled is, in general, determined by the degree of necessity. In making the schedule the correlated work of other departments must be considered, and they are consulted and necessary compromises made to suit best all those concerned. The job schedule also gives information as to the progress of the work and references to allied work, status of authority. layout and material.

Jobs are assigned to the engineering staff for layout in the same order that they appear on the job schedule and from one to six months in advance of the time set for commencing the construction. Up to the time of assignment only the most general information on them is known, as a few preliminary sketches, correspondence and the general plan dictated by the department head. This information has been kept together carefully in the job file and is turned over and explained to the engineer.

In almost all jobs there are several ways of accomplishing the same result, but it is part of the engineer's work to determine the best and most efficient way. However, to assist the engineer as well as the construction forces, types of construction and kinds of material adopted as standards are used whenever possible. These are got up in standard circulars and standard prints. Each foreman is provided with a loose-leaf binder containing a complete set, so that when the engineer decides to make use of a certain standard he has only to indicate on his layout its number and the foreman will know exactly what is wanted.

The duties of the engineer are: (1) To make detailed drawings of the installation; (2) to make a detailed list of the kind and quantity of every item of material necessary for the job; (3) to make a detailed estimate of cost, and (4) when the job is completed to make or revise the permanent records.

For the substation connection job referred to, the engineer's first work was to determine the number and size of cables required. An annual survey made under heavy winter load conditions gives ampere loads and voltage conditions on each feeder section of the Chicago Rapid Transit system. This becomes a permanent record in the power supervisor's office and reference to it indicates the cable capacity necessary.

A field survey showed an underground duct line as the best method of carrying the cables from the substation to the right-of-way. With this determined, locations for manholes, grouping of cables in ducts and in laterals, location of laterals and disconnect switches were decided. On this job, second-hand lead-covered cable was to be used and the engineer had to check his required cable lengths carefully and tabulate them against lengths on hand to insure the minimum wastage.

While a part of each construction job can be covered by standards, many items cannot, and it is the duty of the engineer to lay these out in detail and provide the proper material. For instance, in the job illustrated, while the switch boxes are standard, the method of mounting is not, and necessary iron brackets had to be designed to fit the location.

A small shop is operated by the department, to build small special items of this sort; standard items and large quantities of special items can be bought from commercial sources more cheaply than they can be made outside of the organization.

The layout completed, showing in detail what was proposed and where and how it was to be done, and every method and material used plainly indicated, the next step for the engineer is the preparation of the material sheet illustrated in Fig. 3, showing the quantity of each item, both special and standard, needed to do the work. This must cover everything necessary, even to bolts, nuts and washers, so as to prevent any delay to the construction forces from lack of proper and sufficient material.

Special authority must be obtained for each construction job and the cost estimate for this authority is a part of the engineer's work. These are shown in Figs. 4 and 5. The material sheet needs only to be priced from material costs on record in a card system in the office, or obtained through the purchasing department for special material. Labor cost estimates are made by reference to previous unit costs, carefully checked by comparing the work into component parts and by making independent estimates of each part. Adding the proper per cents for stores expense, engineering and contingencies a total cost is obtained. The care used in making these is such that most job costs come within a few per cent of the estimates. All planning and estimates made are then checked carefully and approved by the department head and authority for the work is requested.

The proper authority obtained, material sheets are gone over and compared with blanket orders, material not already on order is requisitioned, and items to be made in the department shop are requested by a shop order as shown in Fig. 6. Appropriate notes are made on the material sheet. Work to be done by contractors or other departments is arranged for. The material sheets are sent to the electrical materials man. Follow-up checks are made from week to week to insure

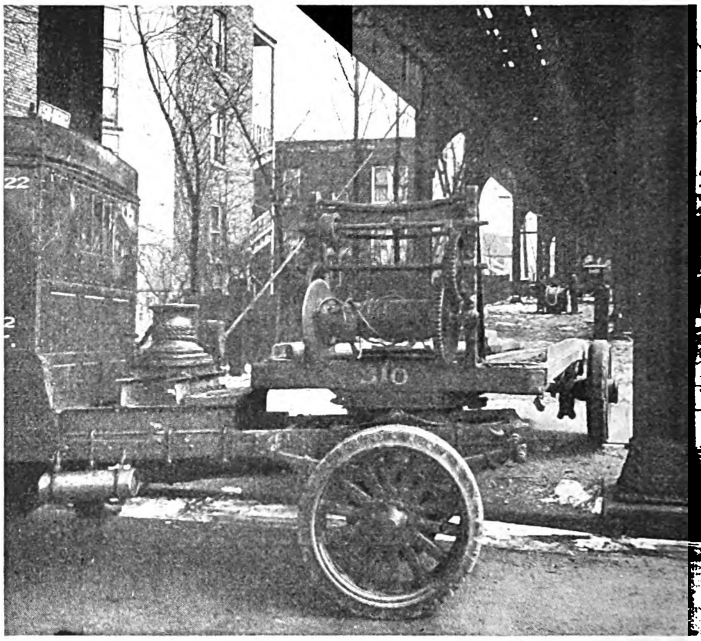
The splicer's cart is a handy piece of equipment brought to the job



In pulling overhead cables with a winch truck, it is necessary to anchor the cable reel

that all material will be in readiness when the schedule starting date arrives.

An interesting and necessary link in this department's organization is the electrical materials man, a stores department employee who devotes his entire time to handling material used by the electrical department and whose function is to furnish the necessary material delivered at the job, when and where needed. His duties include both the physical handling of this material and the clerical work necessary to account for it, as well as supervising the transportation necessary for its delivery.

The material sheet is received weeks, even months, before a job is scheduled to start. A reasonable length of time in advance he commences to gather together the material for a job. The smaller items are assembled in a material container, a box equipped with a standard lock to which each foreman has a key, and larger items are assembled in a bin, each of them as well as the containers being tagged with the job description and number. This assembly is simple, as all electrical material is kept in one storehouse, and its storing in steel cases with unit piling, each item identified by a lot number, makes it easy to find and count quantities. The items made in the department's own shop are also picked up and assembled with the balance of the material.

If repeated checks, as the commencement of the job approaches, show that certain items may not be received in time, it may be necessary to send after and pick up this material from local stocks on emergency orders, or to substitute obtainable items.

The material sheet shows the approximate date the material for each job is to be delivered, and the materials man plans to have it ready a few days in advance. In every case, however, the foreman advises by telephone the exact date when it is wanted and it is delivered only on receipt of this advice.

A truck has been found the cheapest and most efficient means of delivering practically all materials, and this company finds that one 1½-ton truck, intelligently handled, can ordinarily keep the entire force supplied with material. This requires consolidation of deliveries to different gangs working in the same area, and elimination of waste time. The truck is loaded in the late afternoon and is started out the next morning in time to arrive at the job when the construction force commences work. Even the smallest items of material are delivered by truck, the workmen being forbidden to come into the storehouse for any reason.

In delivering material, the truck driver takes with him two copies of the material sheet, one of which is signed by the receiving foreman, who retains the second copy of his list.

After each large order for material has been filled, or at intervals of one month or less, the stock of all items of standard material is checked against an indicated minimum quantity and orders are placed for all those which have fallen below the minimum. All the steps detailed herein have been taken before the construction force has even heard of the job. This force consists of a varying number of gangs, each in charge of a foreman, who reports directly to the electrical superintendent.

About a week before each job is scheduled to start the necessary information for the foreman is assembled. A numbered work order, illustrated in Fig. 7, is the actual authority for the construction. It refers to the job number, gives a brief description of the work, refers to the blueprint numbers of the details, indicates the auditor's charge number for the work, shows the measuring unit to be used by the foreman in making his report, and also shows the estimated man-hours for doing the job.

Six copies are made of the work order, one for each of the job foremen, electrical superintendent, electrical materials man, cost clerk, power supervisor and superintendent of maintenance of way, the latter to keep in touch with the department most interested in co-ordinating work with the electrical department.

Accompanying the foreman's copy of the work order are blueprints of all drawings pertaining to the job and copies of all material sheets. Since construction gangs have no headquarters other than on the job, correspondence with them is by U. S. mail to the foreman's homes, and they use the same means to send their time slips and reports to the office.

Within the next few days the foreman takes several hours away from his current job and goes to the location of the next one to study it there and plan his procedure. On that visit the superintendent accompanies him and explains and settles any details not clear.

Arriving on the site of the new job with men, tools and material, the foreman is at once ready to commence work. The material must be checked and compared with the lists. No matter how carefully work has been laid out and material computed, as the work progresses different or additional material becomes necessary. This is obtained by a telephone order from the foreman to the materials man and is likewise delivered by truck within 24 hours. Changes in plans may become necessary, in which case the engineer goes out to the job and approves them before they proceed.

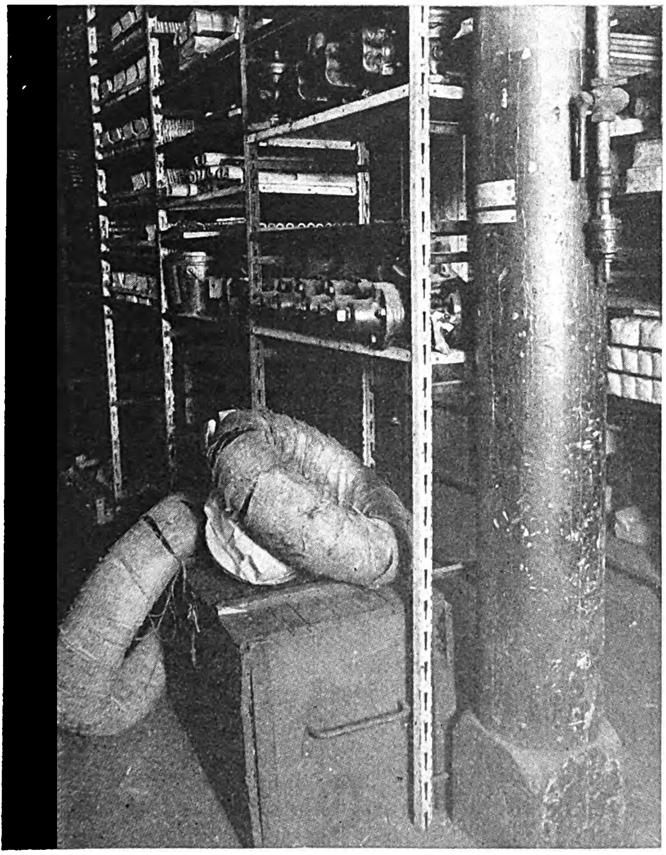
In the substation connection job used as an illustration more than 10,000 ft. of underground and overhead cable were to be installed, in sizes of 1,500,000 and 2,000,000 circ.-mil. Cable is pulled in with a power winch truck, which is ordered by the materials man when wanted. The special tools required for this work, such as cable grips, manhole guards, I-beam cable sheaves and steel pull line are sent out by the materials man from the tool storage room.

The splicing of the underground lead-covered cable is done by the cable splicer and helper, who are summoned by the construction gang foreman when he is ready. Splicing tools and equipment are contained in the cable splicer's cart which is brought to the job. When the splicing, training and racking are completed all cables are protected by wrapping with ¼-in. hemp rope over which a sand and cement mixture is plastered, a protection sufficient to confine the damage of a burn-out to the one cable in which it originates. All cables are identified by tagging in each manhole, at the disconnect switches and in the substation with aluminum tags on which is stamped the individual cable number, such as "71 C," the "71" being the feeder section number and the letter the reference to the particular cable on that section.

The foreman is responsible for the performance of his gang. In the job illustrated the duct line ran under an alley. While cable pulling was in progress the foreman learned that paving of the alley would start within two days. Since this would have blocked his pulling completely, it was necessary to work fourteen hours a day for two days to get out of the way, and although this increased the cost by overtime work, the result was better than being completely blocked from work for a time.

In cutting over cables and making them alive, the power supervisor is consulted on each move, as he is the man directly responsible for the operation of the power system. The construction work completed, it is inspected by the superintendent, who then approves the work order. The foreman makes notes of the date of completion and the quantity of the measuring unit of material used, and returns the work order to the office. All surplus material and scrap are returned to the storehouse for credit and the gang moves on to its next job.

The duty of the cost clerk is to keep detailed costs of each job and so summarize them when work is completed that he can tell instantly how much the job costs in man-hours or money, total or per unit. This work also furnishes an accurate record of dates, material,



Small items are placed in a box and locked—all are tagged carefully

All electrical material is kept in a storehouse with steel shelves arranged for unit piling special charges and credits. In fact, it becomes the highly condensed record of that job. The unit costs are further tabulated by groups for reference in estimating future jobs of like nature.

The cost system is a simple method of bookkeeping. An account sheet is opened for each work order. On this are entered the labor items as listed in the "Labor Distribution" sheet kept by the timekeeper, material charges, cartage charges, special charges and credits.

The job completed and the foreman's copy of the work order returned is the cue to the cost clerk to close up that account, price out his items, total and summarize them. These summaries are shown in Figs. 8, 9 and 10. The measuring unit shown on the work order is the appropriate one of a number of standard units each of which has a page in the condensed record of unit costs, and on this page, shown in Fig. 11, are entered the unit costs of this job for comparison against all jobs of a similar nature.

There remain to complete the job the making or revision of records by the engineer who handled it and the administrative details of completion such as notification to the auditor, general storekeeper and valuation engineer.

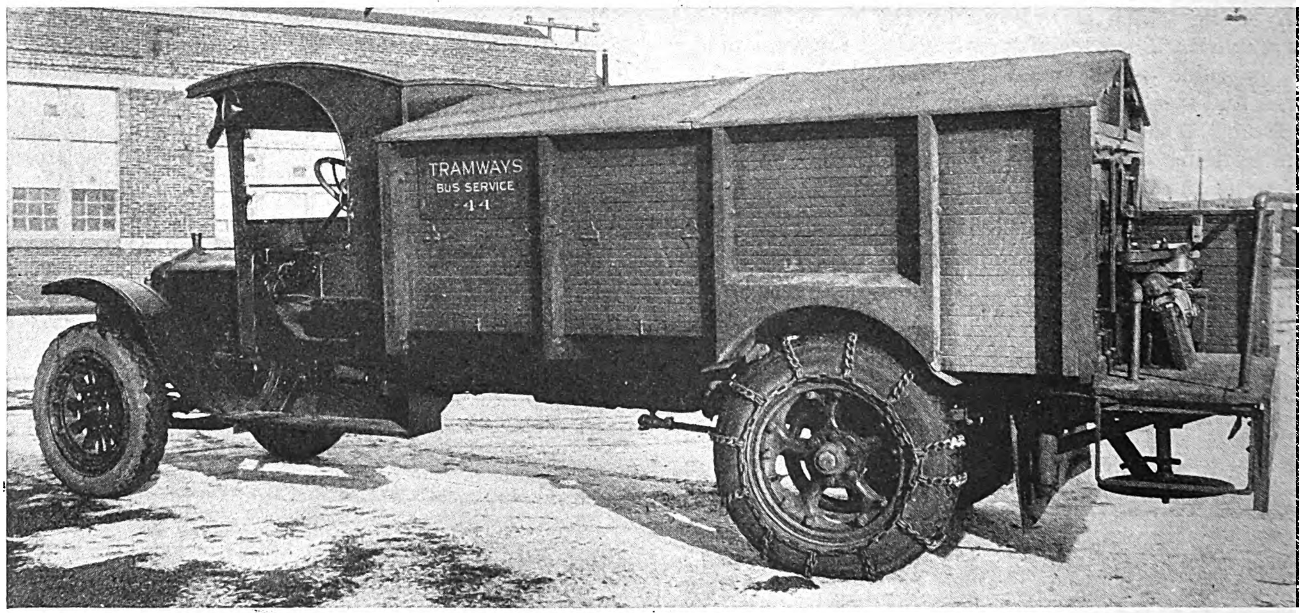
The entire scheme is nothing but an application of specialization, one man or a group of men to do each step in the work, and the whole so co-ordinated that each confines his work to his specialized portion. The advantages which result from this method of organization are several: Each job is given individual attention and occupies a very definite place in the year's program; all details of each job are settled before work is commenced; all work of similar character is done in a similar manner according to standards which have been found best; the gang foreman is provided with full instructions so there is no chance for guesswork by him; working efficiency is very high because the foreman and his men can devote their entire time to the actual construction, unhampered by the necessity to provide material, run errands or tend to other details. As a result all jobs move along faster, more jobs are handled during the year and the efficiency of the department is raised to a point that is hard to excel.

Truck Sands Bus Routes

By A. M. Lindsay
Superintendent of Rolling Stock Montreal Tramways, Montreal, Canada

Many heavy grades which must be negotiated in Montreal make it necessary during the winter months, with an abundance of ice and snow, to take every precaution available for safety. The slippery conditions make it necessary to sand bus routes not only on the grades themselves but frequently, under very icy conditions, over the greater part of their length. To carry out this work quickly and economically, the Montreal Tramways built the sand truck illustrated.

The equipment for this sand truck came from discarded parts of bus equipment. An overhauled chassis was taken, and an engine and sand hopper were added. The sand hopper will hold 2½ tons of sand when filled. Under the forward part of this hopper there is room for two compartments, which are used for tools, shovels, etc. The interior sides of the hopper have a slope of 1 in 3 toward the rear end of the truck, which has the distributing valve. The inside is sheet metal.



Sand-spreading truck as used on bus routes by the Montreal Tramways

Sand is spread by a saw-steel disk which rotates in a horizontal plane at the end of an extension shaft. This shaft is inclosed completely and runs on ball bearings which are mounted in a steel pipe. An Evinrude Super-Elto outboard marine motor operates the sand-spreading mechanism. Sand or ashes is delivered from the controlling slide valve through a flexible hose to the spreading disk. The top of the disk is provided with eight small hardened steel radial ribs ¼ in. high. These have been found sufficient to give the distribution required.

The width of the road surface which is to be covered can be altered by adjusting the speed of the engine, the height of the radial ribs and the point of delivery on the disk of the sand supply. Cooling water for the Elto engine is drawn from the truck engine radiator and has been found to assist the circulation in the latter. To dampen the exhaust of the spreading engine a large muffler is provided, and to steady the engine under the unusually light load it is made to drive a rotary oil pump against a fixed pressure in the closed return pipe.

Remodeling, Repainting and Overhauling Methods in Kansas City

By R. S. Neal

Floor plan showing arrangement of composition flooring

EXTENSIVE remodeling and overhauling of equipment is now being carried out in the shops of the Kansas City Public Service Company. The program includes work on 45 cars. Folding doors are being installed at the front and treadle-operated doors at the rear. Safety air equipment is combined with the electrically operated rear doors. Seats which were previously covered with rattan are being overhauled and maroon Kemi-suede is placed over the rattan. Window latches, lifts and other car fittings are being nickel plated. A floor covering of rubber tiling is being laid and a metal wear-proof flexible matting added in the body of the car. In the vestibule a metal-rubber floor will be installed. Special skirts, Celotex lined, are being attached to the base of the car body to improve the appearance and decrease noises from motors and trucks. Lamp shades of a special type are being used in connection with car lighting changes. A swinging gate and a special metal visor are to be installed on the front vestibule. Cars will be painted inside and out, using a new paint scheme.

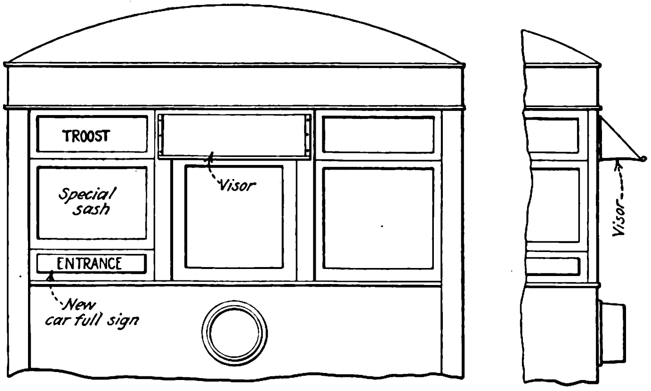
The work is being done on a twelve-car-a-week schedule, so that two cars are completed each day. The program for the work includes the placing of the cars in position in the erecting shop for overhauling. Trucks are removed and sent to the truck floor for general overhauling. Special attention is given to gears, bearings, gear cases and other parts so as to eliminate noise. Springs and side and center bearings are being checked up so as to maintain a standard step height.

In connection with the body overhauling the lower right-hand front vestibule sash are removed and used for replacement and a special sash is installed in this position in conjunction with a Hunter "Enter-Front" sign. Other sash are removed from the car, stenciled and then sent to the glazing bench in the mill. After repairs have been made they are sent to the paint room for cleaning and repainting. The sash are reinstalled in the car during the final trimming by the erecting department. Body curtains are removed and sent to the curtain bench for thorough cleaning and repairing. From there they go to the paint shop to be installed when cars are trimmed. Old type khaki motorman's curtains are removed and replaced by new pantasote curtains.

To reduce noise and also to provide greater warmth in the cars weather stripping is placed between the sash, as indicated in an accompanying illustration. All cars are being equipped with Faraday push buttons, and for this installation the pilasters are sent to the mill for reboring. Car roofs are inspected carefully, as it is found that about 25 per cent require recovering.

The practice of the railway is to use monel metal for heater resistors. Where this wire has already been installed in the heaters they are left on the seat frames, but if they are not so equipped they are removed and sent to the electric shop for this change. Seat frames are removed and the backs and cushions stripped from them. Frames are marked with position and car number and sent to the paint shop for painting, after which they are ready to be installed in the car when it is trimmed. Seat backs are sent to the erecting department and cushions are thoroughly dusted and cleaned. Spring plates on the longitudinal seats require considerable care, as many of them are broken. An accompanying sketch shows the method of reworking these plates. Cattle-hair felt ½ in. thick is installed over the rattan and over this a covering of maroon Kemi-suede is placed.

All car trim items such as sash locks, lifts, seat back corner castings, light sockets, etc., are removed, tagged with the car number and sent to the electric shop, where they are nickel plated, buffed and lacquered. Seat back corner castings are returned to the upholstering bench, where they are installed in the backs as they are upholstered. Other parts are sent to the paint shop. Body stanchions are removed and sent to the pipe bench to be cut to size for front-entrance use. Controllers are removed and pipes, valves, etc., installed for the use of new safety air equipment. The safety air adapters are installed on the heads of the controllers when these are overhauled.



At the front end of the car a special window is installed for use with signs and a visor is placed over the front center window

Motorman's and conductor's railings are removed and sent to the pipe department for necessary repairs. Fare box brackets are added to the large post on the front railing. Also, when stripping the vestibule floor, the individual seat at the right-hand corner of the car is removed. Floor strips in the walkway, in the center of the car body floor, are removed and level floor laid in their place. This requires resurfacing of the trapdoors. If the floor under the seats is very rough, uneven or weak it is replaced. All floor is placed in shape to make a good surface on which the composition flooring can be laid. An accompanying floor plan shows the arrangement.

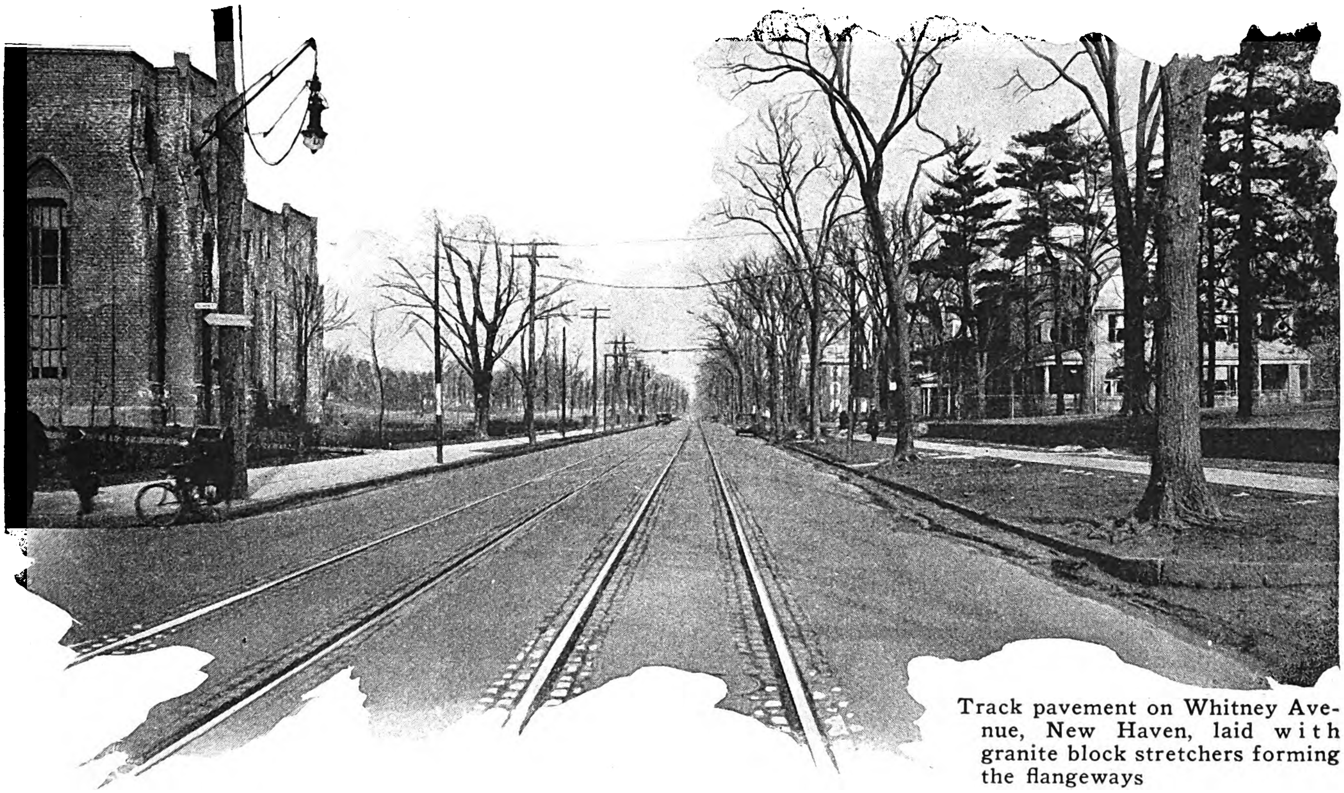
Present felt
Present spring plate
Present canvas
Slat
Coil spring
Turn kemi-suede under as shown and tack in front
Method of cutting down broken spring plates and curling ends for use

Method used for upholstering seats and cutting down broken spring plates

The front door, door posts and operating mechanism are removed and all except the doors scrapped. The front door header is removed and sent to the mill for clearance cuts for the upper door shaft arms. This header is reinstalled in its original position. Four new doors equipped with safety rubber buffers are fitted. Front doors are operated by one door engine located on a steel base plate mounted in cabinets over the front door. Rear doors and shafts are removed from the cars and shafts are stripped from the doors and sent to the welding and machine shops for lengthening. Doors are sent to the mill for repairs and reworking. A door engine cabinet, practically the same as that used over the front doors, is installed over the rear doors, in which two door engines are mounted on base plates. The rear exit step is equipped to operate in connection with a treadle device which is installed in the vestibule floor just inside of the exit doors. The rear doors are electrically controlled and air operated.

After the overhauling work is completed the car is placed over a pit in the rear of the paint shop and the composition flooring is laid. At the same time body skirts are installed. They are made of No. 16 gage steel lined with Celotex and hinged to the car bodies. These skirts improve the appearance and decrease truck and motor noises. The metal visor which is installed over the center vestibule window is made of No. 20 black iron and is installed when the cars are trimmed.

Cars remain six days in the paint shop. The first day they are washed inside and out, scraped and sanded. The second day they are primed and puttied on the outside and the ceiling and hoods painted on the inside. The third day they are sanded and touched up on the outside and the first coat of enamel for the inside and outside is put on. The fourth day the second coat of enamel is applied both inside and outside. The fifth day the outside is blocked up for numbers and striped. The inside is touched up and switches and numbers are put on. The next day the car is trimmed for service. An accompanying diagram shows the painting scheme used.



Track pavement on Whitney Avenue, New Haven, laid with granite block stretchers forming the flangeways

Extensive Annual Track Reconstruction Done by Connecticut Company

Way maintenance is co-ordinated with municipal paving program. T-rail is standard. Flangeways are formed by granite blocks set in rich concrete. Pavement between rails has extremely low crown

By M. M. Johnston

Division Engineer Connecticut Company, New Haven

BELIEVING that careful maintenance of the permanent way is an essential of good electric railway service, the Connecticut Company has adopted a policy of extensive annual track reconstruction. During the past six years 133 miles of track has been rebuilt, a yearly average of slightly more than 22 miles. Last year 21.33 miles of city track and 9.73 miles of interurban track were reconstructed, or slightly more than 31 miles in all. This was the largest amount done in any one year of the company's history. The total mileage reconstructed by the Connecticut Company in 1926 was second only to that of the Chicago Surface Lines, the largest urban electric railway in the world.

MILEAGE OF TRACK REBUILT BY THE CONNECTICUT COMPANY, BY YEARS

Year	City	Interurban	Total
1921	12.81	5.02	17.83
1922	27.73	2.91	30.64
1923	17.89	2.19	20.08
1924	14.59	5.04	19.63
1925	11.17	2.83	14.00
1926	21.33	9.73	31.06
Total	105.52	27.72	133.24
Average	17.59	4.62	22.21

The track rebuilt by the Connecticut Company has varied somewhat from year to year, as shown in the accompanying table.

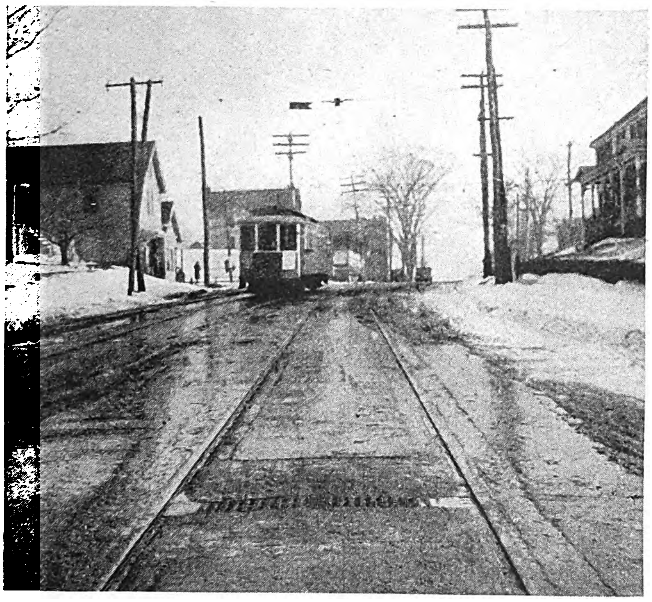
Under the laws of Connecticut an electric railway is required to pave only 8 in. on each side of the rail. However, if trackwork is done separately from general paving, the entire cost of removing and relaying the pavement in the track area must be borne by the railway. Where there is double track, this sometimes means paying for a strip of pavement 19 ft. in width. For this reason the Connecticut Company makes every effort to co-ordinate its track reconstruction with the paving programs of the various municipalities through which its lines run.

When a paving project is proposed the railway investigates the age and condition of its track in the street and decides whether or not it will last the life of the

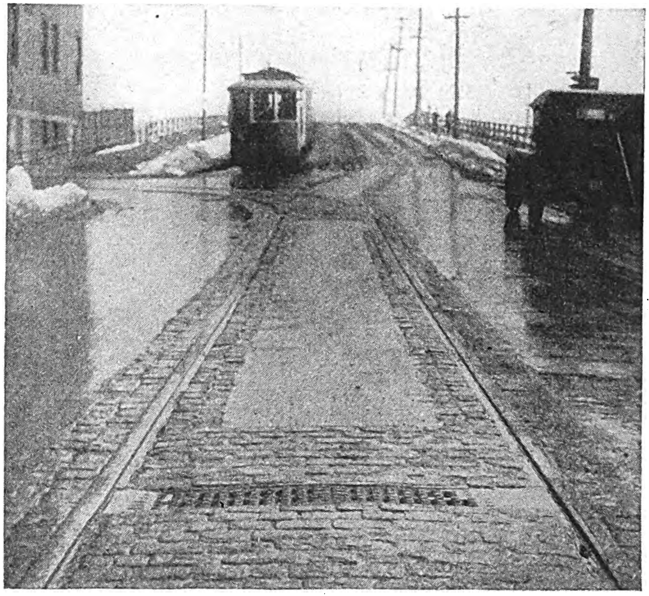
the area of wheel contact on the rail are used with new rail. A feature of these plates is the staggered notching of the spike holes. An article on this subject was published in ELECTRIC RAILWAY JOURNAL April 5, 1924, page 537.

Rail used on the city divisions is standard 6-in., 100-lb. A.R.A. section except in the Hartford division, where grooved girder rail is used on account of franchise provisions. Both thermit and seam welded joints are used. The cost is approximately the same, about $6.50 per joint. Base plates are used with seam welded joints, as told in the article already referred to. Thermit welded joints are unsupported. In paved track no expansion joints are provided except at special work.

Pavement used with the standard city construction is of five types: (a) Asphalt with granite stretchers on each side of the rail, (b) asphalt with a concrete strip on each side of the rail, (c) solid asphalt laid up to the rail, (d) solid concrete laid up to the rail, (e) solid granite block laid up to the rail. Because of the narrowness of the strip the cost does not vary greatly except in the cost of the granite block construction that averages about $2.35 per foot of single track, this cost representing four strips 8 in. in width. An article dealing with certain features of this construction was published in the ELECTRIC RAILWAY JOURNAL Jan. 31, 1925, on page 194.



Asphalt paving with 8-in. concrete strip on each side of rail. Flangeway is made by means of template shown on preceding page



Granite blocks are used for pavement 3 ft. each side of track drains regardless of how remainder of street is paved

When granite blocks are used to form a flangeway, as in structures (a) and (e) of the preceding paragraph, they are set in a dry mixture consisting of one part cement and two parts sand. The blocks are thoroughly rammed home. Between the block and the gage side of the rail a 1-2-3 mixture of concrete using very fine stone is placed. This mixture is thoroughly rammed between the block and the web of the rail and is plastered with a wet mixture consisting of one part sand and two parts of cement. Finally the whole strip is sprayed with water from a hose, which sets up the sand and cement cushion under the blocks and prepares them for grouting.

Sometimes the granite blocks are grouted all the way to the top, and at other times only half way up, depending on the amount of vehicular traffic using the street. Unless this is extremely severe, the grouting is carried only half way and the remaining space is filled in with pitch and gravel. From the railway viewpoint this method is considered preferable as it tends to seal up the track structure better and maintains the bond between rail and pavement.

When asphalt or concrete is used without granite block stretchers the flangeway is made by shaping this material. It is tamped under a special curved template shown in an accompanying sketch. This work is done in 12-ft. sections. A considerable amount of pavement has been laid in this manner and has given satisfactory service.

Only a ½-in. crown is given to the pavement between rails. Drainage depends largely on the longitudinal grade. At low points, and elsewhere as needed, track drains are installed. These are of cast iron shaped to fit the flat crown. Approaches to these drains are paved with granite block for 3 ft. on each side regardless of the general street paving.

During three years experience no trouble has been encountered with dirt or ice in these flangeways. Automobiles trying to turn out of tracks do not slew or skid. There is less wear on the pavement on account of less impact caused by vehicles crossing the tracks at right angles. There is also less wear because the flangeway is too narrow to permit wheels to drop down between rails. The low crown design has proved popular with the public in general because it has made the pavement smoother in the track area.

Data on Painting Car Roofs

THE time between paintings of car roofs was found to vary between six to eighteen months on several Southern railways. New Orleans paints once in eighteen months, Atlanta, Knoxville, Memphis and Birmingham paint once a year and Mobile paints twice a year. Dallas is using Gilsonite paint and has tried Valdura and Asphalt paints. The life of canvas roofs was found to vary up to a maximum of ten years.

Turning and Slotting of Commutators*

Modern railway motors are slotted. Mica should be removed carefully from the sides of the slot or the beneficial results from slotting will be lost. Depth of slots should be from 3/64 in. to 5/64 in.

By Jesse M. Zimmerman
Renewal Parts Engineer Westinghouse Electric & Manufacturing Company,

Undercutting machine made in the Homewood shop of the Pittsburgh Railways

DIFFERENCES of opinion will always exist regarding the resurfacing of the commutator face by grinding or by turning. Each method has its advantages as well as its disadvantages. The greatest advantage of turning the commutator face is that the time required is very short. The kind of tool to use is not important and each machinist has his favorite tool for each different line of work. However, a diamond pointed tool slightly cupped at the top and set so that it will have sufficient clearance between its side and the commutator face will give very satisfactory results. The cutting edge of the tool should be located slightly above the center line of the armature. One can always feel that the commutator will have a smooth finish if the chips of copper curl up while machining. During the machining the commutator should run at its maximum operating speed. If the speed is too slow the tool will cut the copper deeper than the mica. In order to remove as little copper as necessary the cut should be made very light.

The final finish given the commutator is usually removal of the tool marks by No. 00 sandpaper. This should be done after the undercutting operation. Some repairmen have found that by running the commutator

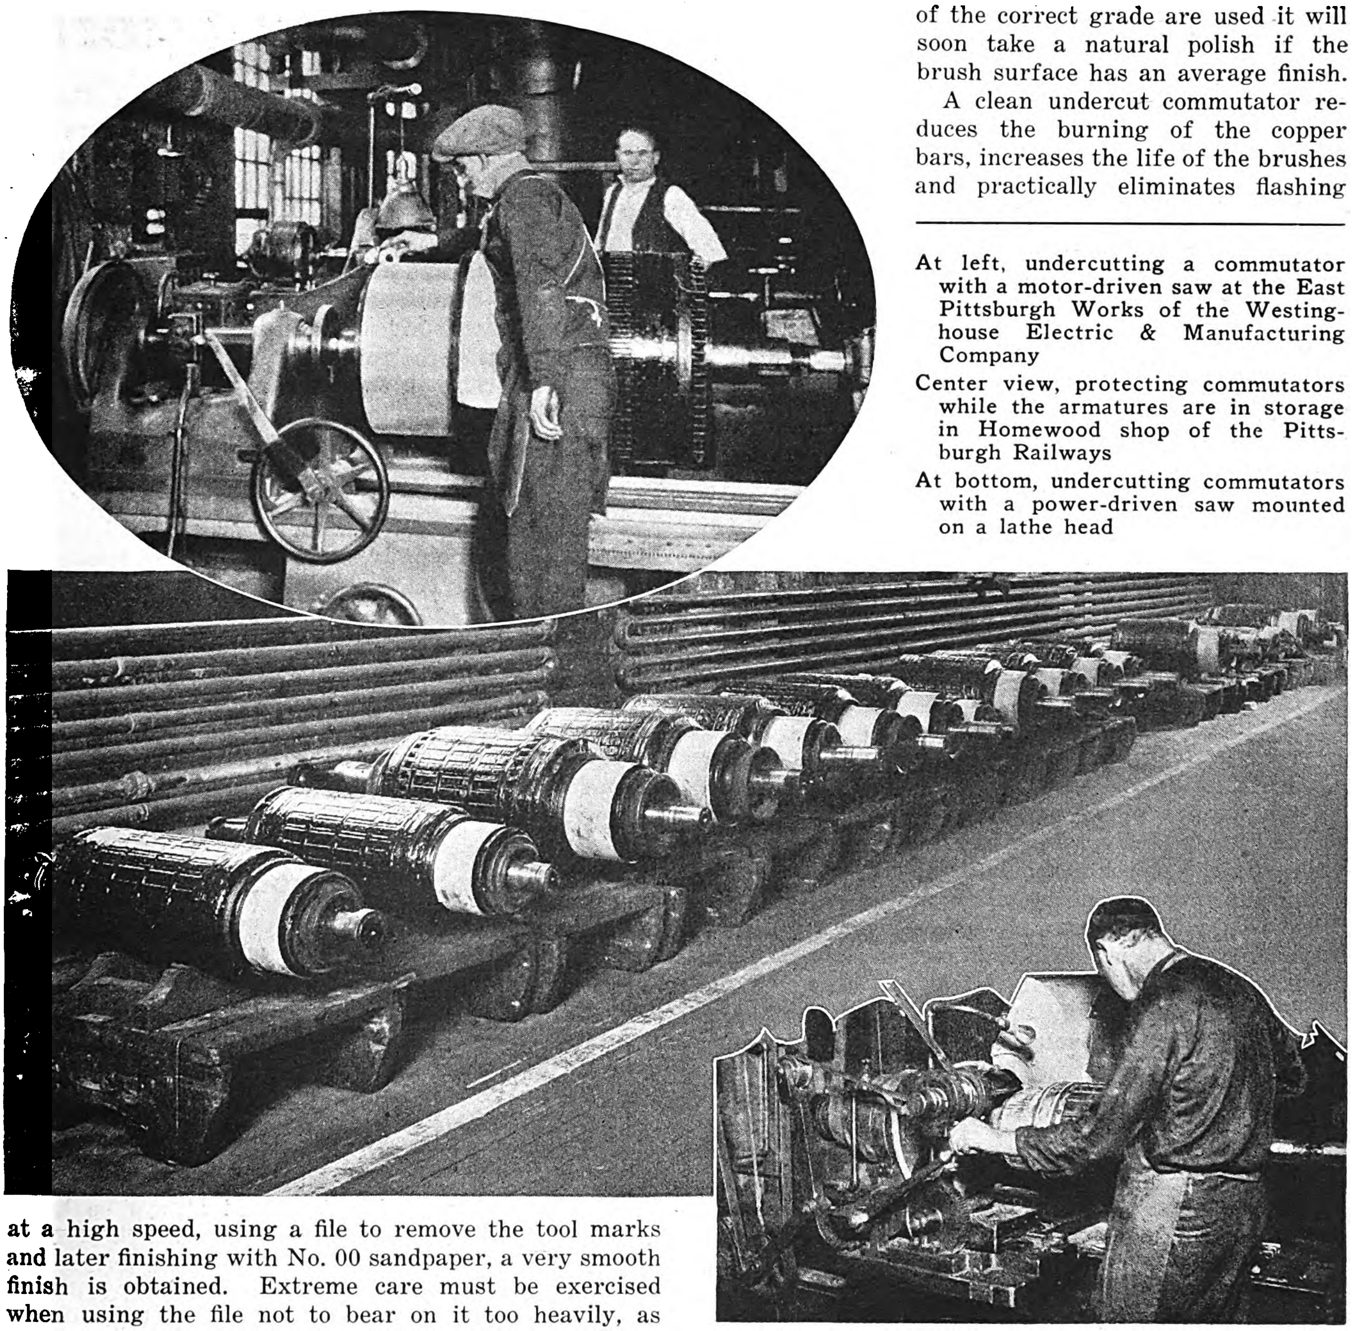
*This is the eighth of a series of articles on commutators for railway motors. The others were: Choosing Materials for Railway Motor Commutators, published Aug. 21, 1926; Important Considerations in Replacing Commutator Bars, published Oct. 23, 1926; Accurate Machining of the V's of Assembled Commutators Is Essential, published Nov. 20, 1926; Mica V-rings and Bushings Have Important Functions in Commutators, published Dec. 18, 1926; Methods and Equipment for Efficient Assembling of Commutators, published Jan. 15, 1927; Soldering of Railway Motor Commutators, published Feb. 19, 1927, and Preventing Flashovers Is an Important Part of Commutator Maintenance, published March 19, 1927.



At left, undercutting a commutator with a motor-driven saw at the East Pittsburgh Works of the Westinghouse Electric & Manufacturing Company

Center view, protecting commutators while the armatures are in storage in Homewood shop of the Pittsburgh Railways

At bottom, undercutting commutators with a power-driven saw mounted on a lathe head

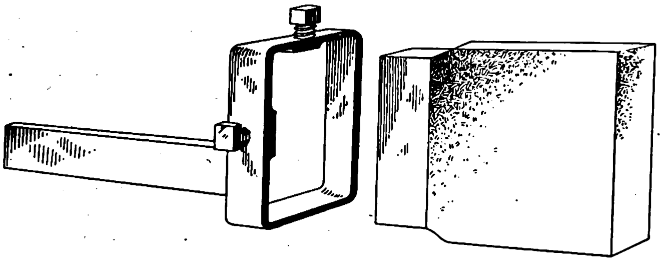
at a high speed, using a file to remove the tool marks and later finishing with No. 00 sandpaper, a very smooth finish is obtained. Extreme care must be exercised when using the file not to bear on it too heavily, as it has a tendency to cut very rapidly. This method has the disadvantage of removing too much copper from certain spots, making the commutator surface uneven. Both the sandpaper and the file have a tendency to cut the copper deeper than the mica.

The commutator face may be ground with a special carborundum stone which fits in the tool post of the lathe. It will remove a minimum amount of copper in resurfacing because the cuts made by the stone are very shallow. The last cut will produce a polish without need for file or sandpaper and give a true, smooth surface. The disadvantage of the grinding method is the length of time required. Some operators take a rough machine cut across the commutator surface when it is badly cupped and then use a carborundum stone for finishing. Other railway operators object to the use of the carborundum because the grit from the stone imbeds itself in the copper, causing the brushes to wear rapidly. Careful inspection of the commutator face will show whether this is so.

If the commutator is properly undercut and brushes of the correct grade are used it will soon take a natural polish if the brush surface has an average finish.

A clean undercut commutator reduces the burning of the copper bars, increases the life of the brushes and practically eliminates flashing because it prevents high mica, which is caused by the copper wearing the more rapidly so that the brushes will ride on the mica strips. This causes a burning action between the copper and the brush, which wears away the contact surface. If the burning action continues grooves will be burned completely around the commutator. When the mica is high at one part of the commutator only this burning action will eventually cause a flat spot, which will grow until it will be necessary to resurface and undercut the commutator.

Undercutting is done after the armature has been soldered and banded and the commutator face and neck resurfaced. It should never be done before the commutator has been soldered, as the undercut slot is liable to fill up with solder. Four essentials should be followed when undercutting a commutator. First, it is important that none of the mica remains in the slot. This can be prevented by using a saw which is at least 0.005 in. larger than the mica strip. After the undercutting a heavy hack saw blade should be drawn through



Lathe tool holder and carborundum stone for grinding commutators

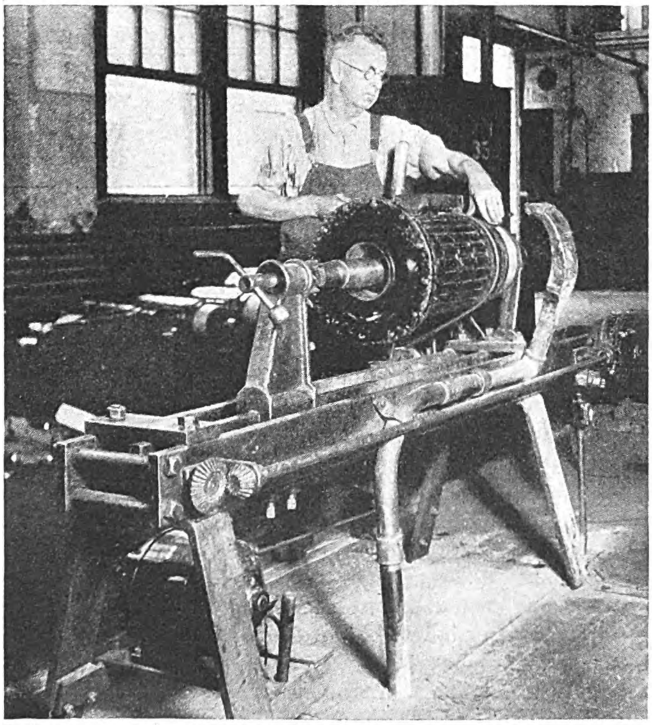
each slot to remove any mica which may remain in it. In order to undercut the entire face of the commutator without cutting into the neck the saw must be as small as possible, yet it must be large enough to undercut the commutator to the proper depth.

Commutators should be undercut with a high-speed carbon saw operating at approximately 2,000 r.p.m. This saw should be drawn toward the operator so that he can guide it when starting to cut. It should revolve so that the teeth will strike the bottom of the slot first. This will leave a clean slot on the brush surface.

An undercut commutator should operate from one heavy inspection period to the next. The maximum and minimum depth should be 5/64 in. and 3/64 in. respectively. However, the depth can be increased or decreased according to conditions. Should the armature be removed for minor motor repairs the commutator should be inspected carefully and if the mica is getting flush with the copper it should be undercut.

Undercutting is done by either a motor-driven or a belt-driven saw. Where only a few armatures are to be undercut a special knife or a hack saw is sometimes used, but this method is inefficient and slow. On the other hand, where many armatures are to be slotted the undercutting is usually done on a special machine.

An efficient undercutting outfit made in the shops of the Pittsburgh Railways is shown in the accompanying illlustration. This machine was made from an old lathe, the saw being belt driven from a ¼-hp. motor. After the commutator has been undercut, in order to polish the brush surface with sandpaper the armature is rotated by placing a belt around the armature connecting it directly to the motor.



Armatures are rotated by belt for polishing the commutator face after undercutting in the shops of the Pittsburgh Railways

Some operators have had good success with an undercutting outfit clamped to the tailstock of the lathe. The portable electric-driven outfits are popular in some of the smaller shops and give good results. The main objection to this type is the difficulty in guiding the saw. When making or purchasing an undercutting machine it is essential that the rotating spindle be supported by a bearing as close to the saw as possible. Any type of stationary undercutting outfit should have a hood and a suction hose to carry off the mica dust.

After the commutator has been undercut the bars have very sharp edges. If left, these will cause arcing and pitting. Once started, arcs between the bars will tend to concentrate on these edges, and may result in a flash. Eventually the bars will be pitted badly. It is important that these sharp edges be rounded off, which can be done by drawing a small three-cornered file through the slot.

After the commutator has been given its final finish, it should be protected from dirt, oil and moisture while the armature is in storage. The Pittsburgh Railways has adopted the scheme of covering the commutator face with several turns of wrapping paper.

Unnecessary Signal Lights Retard Traffic

HAPHAZARD installation of automatic signal lights not only delays traffic but may actually increase the congestion and danger at street and highway intersections, according to a report compiled by the Albert Russel Erskine Bureau for Street Traffic Research. It is stated by Miller McClintock, director of the bureau, that "automatic stop and go signals are unquestionably an effective means of controlling traffic, and their effectiveness has been proved by many installations that have speeded traffic and reduced accidents in Los Angeles and Chicago, but it should always be borne in mind that traffic signals stop traffic as well as move it, and that wherever a device of this kind is installed it immediately places an automatic limit on the time the intersecting streets may be used. In general, the time along one street is reduced 50 per cent—the signal giving alternate right of way to the streets controlled. Unless the alternate movement is necessitated by a real congestion at the intersection which reduces the opportunity for movement to a point below that permitted by the signal, it is apparent that the control device can have no other effect than to retard traffic flow.

"Stop and go signals should rarely, if ever, be installed for purely safety purposes. The primary purpose of the signal is to start and stop traffic to facilitate movement. Dangerous intersections where traffic conditions do not justify the maintenance of a stop and go signal can best be controlled by the installation of warning signs, and in some cases by the application of a through-stop street rule."

The danger of installing stop and go lights where they are not necessitated lies in the disregard for this type of regulation that grows when motorists are unnecessarily delayed. The willingness of the motoring public to give obedience to an unpoliced signal varies in ratio to the reasonableness of the control exercised.

Modernizing Work Car Equipment at Salt Lake City

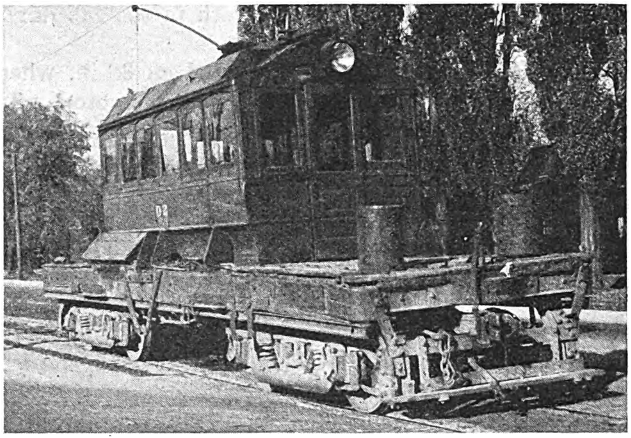
At a Cost of $1,700 an Electric Locomotive of the Utah Power & Light Company Has Been Completely Revamped and Adapted to Present-Day Conditions

By F. D. Heiges
Office Engineer Utah Light & Transit Company, Salt Lake City

STRIKING is the contrast between the dilapidated appearance of an old work car battered by years of service and the neat and trim look of the same car fresh from the hands of capable workmen. A transformation of this kind was recently accomplished in the case of an electric locomotive of the Utah Light & Transit Company. Air compressors, trucks, drawbar and electric equipment on the rebuilt vehicle are those that were on the old one. The frame and the body are new. Accompanying illustrations show this car before and after modernization. Reconstruction resulted in a substantial saving to the company, and also had considerable advertising value in that the operation of an up-to-date efficient looking locomotive over the streets of Salt Lake City gives the people the impression that the company is endeavoring to furnish high-class service with the best possible equipment of every kind.

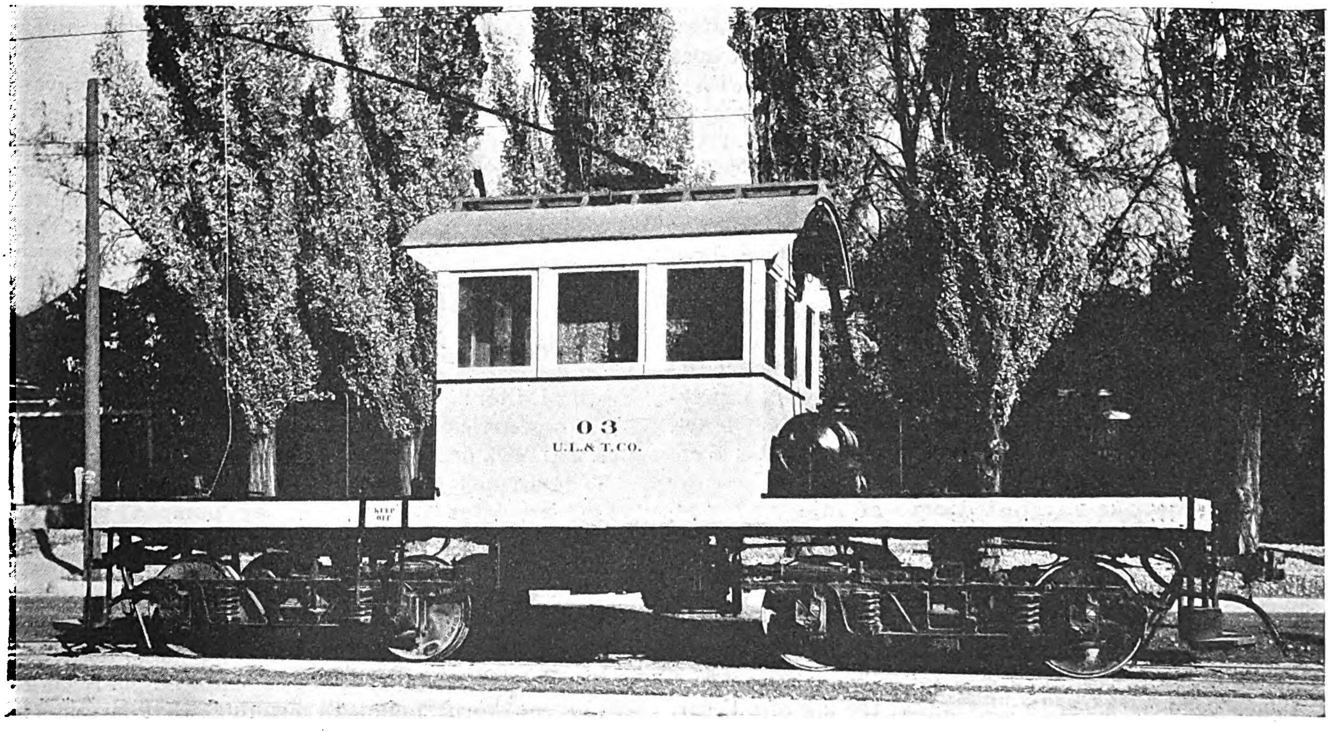
The old locomotive originated about 1909 by the installation of an obsolete street car body on a flat car and motorization of the trucks. Its color was black instead of the standard yellow of the company's other rolling stock.

After the old car had been completely dismantled the trucks were thoroughly overhauled, steam-cleaned and repainted. Upon these, in place of the old wooden frame, was constructed a steel frame 30x6 ft. in size consisting of two 8-in. channels running lengthwise on the outside, four 8-in. steel I-beams running through the center, and two 10-in. arched channel bumper plates forming the ends. The extra height of the 10-in. bumper plates above the 8-in. I-beams permits a 2-in. floor of tongued and grooved wood to be fitted under the ends. Steel strips have been placed along both edges of the floor as a protection to the surface.



This locomotive was built in 1909 by placing an old body on a flat car and motorizing the trucks

A cab was built 8 ft. 6 in. square. This is 13 ft. shorter than the old cab, while the frame itself is 3 ft. shorter. The greater length and narrow width of the old cab hampered the view of the motorman. Having a smaller cab on a shorter frame and flush with it permits the operator to have a clear range of vision on all sides and there is less likelihood of accidents. The center height of the cab is 7½ ft., while the side height is 6½ ft. It is built of steel and wood lined. In all there are ten windows, three on each side and two on each end. All the windows are movable in the new cab, while in the old cab only the center windows were movable. Doors are located at the ends, diagonally opposite each other, with the controller located at the center window on one side. Five electric heaters main-



The same locomotive after being thoroughly overhauled. A new frame and a new cab were installed on the old running gear tain a comfortable degree of warmth in the cab during cold weather.

This rebuilt locomotive is mounted on 33-in. wheels and is equipped with four Westinghouse 93 motors. The total weight is approximately 40,000 lb. All the wiring has been placed in conduits, another advantage over the old vehicle. The cab of the old locomotive was congested by the presence of air tank and compressor, while on the new locomotive the compressor is underneath the frame and the air tank is outside of the cab along the end wall.

The new body and the reconstruction work cost $1,700. Including the value of the old equipment used, the total valuation is about $8,500 for the vehicle. In utility it is believed to be the equivalent of an $11,000 car. Two locomotives were rebuilt in this way, effecting a saving estimated at $5,000.

The Readers' Forum

Difficulties in Wheel Removal Discussed

INDIANA, COLUMBUS & EASTERN TRACTION COMPANY
SPRINGFIELD, OHIO, April 4, 1927.

To the Editor:

I have read with considerable interest the article "Wheels Removed and Pressed on Economically," on page 331 of the Feb. 19 issue of ELECTRIC RAILWAY JOURNAL. Just to make it more interesting, I wish to criticise the practice of the Wilkes-Barre & Hazleton Railway, as I think it can be improved upon.

In the first place I do not approve of burning the wheels in order to remove them from axles. I note they have a 400-ton wheel press, and that 36-in. wheels are bored 7 in. and put on at 75 tons, which is standard practice. It is true that it will require probably twice this pressure to remove these wheels after they are worn out, due to the metals of wheel and axle settling into each other under continued pressure and vibration. We have found that a method of removal much cheaper and better than burning is to heat the wheels with a large coal-oil torch. This does not injure the wheels in the least, which is worthy of consideration for the reason that frequently wheels removed from axles are used again for some purpose.

The practice at the I., C. & E. shops is as follows: 100 tons is considered a maximum safe pressure for a 5-in x 9-in. axle. A pressure of 100 tons is first applied; if the wheel does not start, the flame from a torch is applied for about five minutes, and pressure is then again applied, letting the flame still play on the hub of the wheel. If the wheel does not start, a pressure of about 100 tons is kept on until it does start, which is rarely more than seven or eight minutes from the time of first applying the torch.

There is not the slightest danger of injury to case-hardened or heat-treated gears in this process, as the temperature of gear or hub rarely exceeds that of boiling water, or 212 deg. F., while with the cutting process there is some danger of injury to a gear and also to the surface of the axle and journal bearings unless protected thoroughly.

The second criticism I make is that the use of a thrust cylinder and mandrel in putting on wheels is cumbersome, slows up the work and is not at all necessary. If ends of axles are faced off square with the center line and the pressure faces on the wheel press are kept in good order there is no danger of springing an axle if allowable pressures are not exceeded.

F. J. FOOTE,
Superintendent Motor Power and Equipment.

Judging Maintenance by Car Failures

DES MOINES CITY RAILWAY
DES MOINES, IOWA, April 6, 1927.

To the Editor:

The discussion of car failures in ELECTRIC RAILWAY JOURNAL has been very interesting. This is important, first from the point of judging the degree of maintenance and second from the transportation standpoint. The mechanical and transportation departments must be in perfect accord or the car failures per 1,000 miles cannot be kept at a low point. Car failures cause the car riders much discomfort, as no one likes to change to another car during the short ride downtown even in good weather, not to mention in bad weather, when troubles generally happen.

It is only by frequent and thorough overhauling of the equipment and a strict method of inspection that the mechanical department can deliver the service it should. In addition, all car failures must be gone into carefully and steps taken to prevent future ones of the same nature.

Cars on this property are overhauled on a 100,000-mile basis, including painting. They are inspected on a 1,200-mile basis, except the brakes, which are given attention every 600 miles. Oiling of armature and axle bearings is taken care of at every 1,200-mile inspection, while journal bearings and gears are lubricated every 4,800 miles.

There seem to be many different ways on the various properties of classifying a car failure. If we find it necessary to pull a car off before its run has been completed, it is considered a car failure, of which a certain number are chargeable to equipment and a certain number are not chargeable to equipment. Every item is chargeable to equipment except broken glass and collisions.

Although the pull-in of many cars can be prevented by having a man repair cars on the road, we do not believe this to be a satisfactory practice on account of delays and discomfort to passengers while the man is making the repairs. About the only road work we do is to replace burned out lamps. C. R. MCMAHON,
Superintendent of Equipment.

Cast Bars Not Drop Forged

WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY
WILKINSBURG, PA., April 1, 1927.

To the Editor:

In my article in ELECTRIC RAILWAY JOURNAL for Oct. 23, 1926, one sentence read:

"The Brinell hardness number for cast copper bars which are later 'drop forged' or 'bumped' is from 50 to 55."

The use of the word "drop forged" was somewhat ambiguous. It was not my intention to convey the impression that "drop forged" bars are cast, but it was my intention to state that the Brinell hardness number for cast copper bars which are later "bumped" is from 50 to 55, by the word "bumped" meaning what is sometimes termed "cold pressed bars."

Fifteen Cash Prizes Offered tc

WITH a desire to stimulate the improvement of railway maintenance methods and to assist in spreading information regarding practices and equipment that are proving of value, ELECTRIC RAILWAY JOURNAL will award three capital prizes of $200, $100 and $50 for the three best maintenance ideas submitted before Aug. 1, 1927. In addition twelve monthly prizes of $25—one each month beginning with the May 21, 1927, issue—will be given. The articles submitted for the capital prizes will be published in the maintenance data sheet section of the issue of ELECTRIC RAILWAY JOURNAL devoted to maintenance and construction. A minimum of $5 will be paid for each article submitted in this competition which is accepted for publication.

The purpose of the competition is to arouse interest among maintenance men in the development and adoption of improved methods for performing routine work, or new methods or fixtures that save labor, time and money for the electric railways.

The prizes will be awarded primarily on the value of the idea presented and its adaptability to the maintenance work of electric railways generally. The form of presentation will be judged only as to the clearness with which the method or device is described and illustrated, and the extent to which information is given which will be needed by other properties interested in using the idea. Fine writing is not necessary. It is the intention to make the prizes available to men engaged in practical maintenance work. Therefore all that is necessary is a concise and clear statement that will be in a form to help other maintenance men. At least one photograph, drawing or sketch is required.

Rules for the Competition

THE competition will be judged and the prizes awarded by a committee consisting of men in the industry intimately associated with the line, rolling stock, and way departments, whose affiliations particularly fit them to pass on the subjects covered in the maintenance data section, and the editor of ELECTRIC RAILWAY JOURNAL. The names of the judges will be published later. All decisions of the judges in making awards or in interpreting the conditions of the contest will be accepted as final. The articles submitted will be judged in accordance with the following conditions:

1 Any employee or official of an operating electric railway or electric railway bus subsidiary may compete for the prizes.

2 Each contestant may submit any number of items he desires, each of which will be judged separately. An individual may win several of the prizes. One item may win both a capital prize and a monthly prize.

3 The author does not necessarily have to be the originator of the idea, but it must be adopted and be in use on the property with which he is connected. The idea submitted may have originated on another property or may have been furnished by a manufacturer. No device or method a description of which, to the knowledge of the contestant or the judges, has been previously published will be eligible for this competition.

4 The competition is not limited to those who originated or developed the idea or apparatus described. Any employee, with the approval of the department head concerned, may submit a maintenance practice or device used on his property. More than one article covering the same device or method will not be accepted, however.

5 Where the management of a railway has a practice of requiring approval of articles sent out for publication such approval must accompany the manuscript. If written approval does not accompany the manuscript it will be assumed that such approval is unnecessary.

aintenance Men

6 An article may be submitted by several persons or by a department, and need not be written by the person in whose name it is submitted. The prize will be awarded to the individuals or department whose name appears on the manuscript, and can be distributed among the winners on any basis they may desire. Should there be a tie for any prize the full amount will be awarded for each of the articles involved in the tie.

7 Articles may describe any maintenance practice or device used by any department of a railway such as the maintenance of rolling stock, buses, shop equipment or methods and equipment for overhead line repairs, power distribution and power generation devices, signal work, track and way maintenance, etc.

8 Due to the limited space available in the maintenance data pages, articles submitted for these prizes should be preferably 100 to 200 words in length and should be accompanied by one illustration. Brevity consistent with a proper presentation of necessary information will be given weight in judging articles. In no event should they be longer than 400 words with not more than two illustrations. Articles will be published as promptly as space permits.

9 In rating the various articles the committee will consider the primary value of the method or device as of highest importance. The committee will also consider its practicability, the advantages and economies that are set forth. In rating manuscripts for the capital prizes the committee will also consider the clearness and completeness with which the idea is presented in the original manuscript.

10 All articles must be in the English language and be mailed to the editor of ELECTRIC RAILWAY JOURNAL, Tenth Avenue and 36th Street, New York City. To be eligible for the capital prizes to be awarded the envelope must bear a postmark dated before Aug. 1, 1927. Envelope and manuscript should be marked "Maintenance Competition." Any number of items may be sent in the same envelope. Photographs or sketches should accompany manuscript and be attached thereto. Drawings or sketches may be in pencil, or blue prints will be accepted. Photographs should be protected against damage in mailing. Each item submitted should bear the name or names of the individual or individuals for whom it is submitted and to whom awards are to be made. Articles will be published under the names of individuals or department appearing on the manuscripts. Photographs, sketches and manuscripts should be so marked that should they become separated they can be identified readily.

11 The original manuscripts and illustrations will be turned over to the committee of judges to determine which will receive the capital prizes. These may, however, be published before or after capital prizes are awarded. Monthly prizes will be judged by the committee after the articles are published in the maintenance data section, the best items being selected each month from those appearing in the issue in the month devoted to maintenance and construction.

12 The announcement of the winner each month will be made in the issue devoted to maintenance and construction (the third issue each month) following the one containing the item.

13 Any material submitted may be published at any time after its receipt that the editors of ELECTRIC RAILWAY JOURNAL decide.

14 The winners of the capital prizes—for the best idea $200, for the next best $100, and for the third best $50, will be announced in the annual convention number of ELECTRIC RAILWAY JOURNAL to be published in September, 1927.

15 All articles submitted will become the property of ELECTRIC RAILWAY JOURNAL and no manuscripts will be returned.

More Comments on Annual Maintenance Issue of March 19

A. E. HAAK, general superintendent the Gray Line Motor Tours, Colorado Springs, Col., writes:

The Maintenance Number of ELECTRIC RAILWAY JOURNAL for March 19 is certainly very interesting. One of the outstanding items in the issue is the review of improved equipment for maintenance operation. It certainly will help the shop forces. We are passing the number to all of our departments and we are sure that they will be benefited greatly by reading all the items covering maintenance suggestions.

H. R. MEYER, renewal parts section Westinghouse Electric & Manufacturing Company, says:

I wish to compliment you on the new maintenance data section which appeared in your Annual Maintenance Number. It will be of unquestionable help in getting before all railway men the things which have been accomplished in an engineering way or from a maintenance standpoint. In a previous issue there was an article by Mr. Williams of the Department of Street Railways, City of Detroit, calling attention to the need for a real good method of correlating engineering information and putting it in such form that it would be of use to electric railway men. It seems to me that the new department which you have started in ELECTRIC RAILWAY JOURNAL will do more toward taking care of this situation than anything that has been done so far.

G. H. STIER, superintendent of rolling stock and buildings, Philadelphia Rapid Transit Company, says in part:

We feel that the step which you have taken in establishing a special maintenance notebook section is an interesting one. The material which you propose to publish in this section will be of particular interest and benefit to all parties interested in the maintenance of electric railway equipment. Having the information presented in a form which will make it possible to bind the sheets together in compact form, while at the same time the copies of the JOURNAL will not be rendered unfit for binding purposes, seems a good plan.

KEITH CONNER of the Jamestown Street Railway, Jamestown, N. Y., says:

Fine! Expect to receive much valuable information through your new department.

C. R. MCMAHON, superintendent of equipment Des Moines City Railway, says:

There are so many good things in the March 19 issue that I hardly know which to mention first, but really I believe that your new section of maintenance data sheets will prove very popular with the readers. It surely will with me. I was interested greatly in the articles by various maintenance superintendents, especially the 100 per cent operation of Chicago surface lines, the article by J. S. McWhirter on car cleaning and the article by A. T. Clark of Baltimore on car painting. The section on improved equipment calls to our attention new devices which might otherwise escape our notice.

C. J. JONAS of the Cincinnati Street Railway writes:

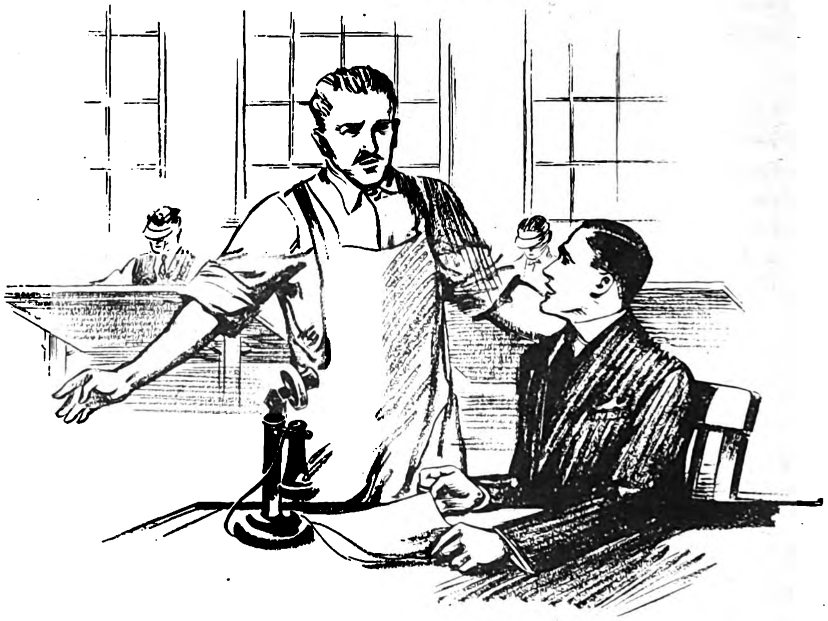
I know of no better way to serve the maintenance men than the JOURNAL as it is now being conducted.

S. L. VAUGHAN, vice-president and general manager Grand Rapids, Grand Haven & Muskegon Railway, said:

I have looked over the March 19 issue very carefully and find some very interesting articles. I think your scheme of publishing monthly maintenance numbers is good.

Dick's Enemies Keep Active

And Provoke a Crisis



WHILE Dick Prescott, assistant shop superintendent of the Consolidated Railway & Light Company, was engrossed in the work of raising the company's maintenance standards and improving shop practices, those to whom progress is anathema and to whom energy and ability in others always loom as a threat to their own personal prestige became more and more uneasy.

Pete Welsher, shop inspector, saw in Dick's ability not only a definite obstacle to his own ambition but a positive menace to the privileges which he had built up for himself in the shop. He was amazed at the rapidity with which the young superintendent gained knowledge and experience. Being lazy himself, he realized that Dick was ready to pay a price in hard work and devotion to the job with which he was powerless to compete. There loomed before him constantly the fear of being shown up in his true light as a shirker and a loafer.

But what Pete lacked in energy he made up in cunning. He never lost an opportunity among the men of casting aspersions on Dick, but he was careful to do so by inference rather than direct statements. His position as inspector fell in well with these private ends. He nagged the men, found fault with the work, issued orders that were unfair, but always left the impression that he was merely carrying out Dick's instructions. Among his own small clique of cronies he talked continually of an imaginary flood of orders and regulations that were supposed to originate with the assistant superintendent. They, in turn, were quick to pour their own versions of disagreeable things to come into the ears of the worried and dissatisfied men.

That definite trouble would ultimately result was inevitable. Pete was wise enough to know that the carpenter shop would not be healthy for his scheming. Steve White, the foreman, was too alert and too close to his friend Dick. Besides, Dick had worked there as a carpenter's helper when he first came to the Consolidated, and most of the men liked him and were pleased at his rapid promotion. But in the truck shop slow old Bill Johnson was not aware of what was going on until it was too late.

One morning just after Dick had arrived at his office Bill Johnson came in with a worried look on his face.

"Hello, Bill," said Dick pleasantly, "what's on your mind?"

"I got some trouble down at the shop, Prescott; men won't go t'work."

Electric Railway Journal Maintenance Data Sheet

ROLLING STOCK—CARPENTER SHOP—1

Lumber Roller Supporting Stand

HANDLING of long pieces of lumber during the sawing, planing and milling process in the carpenter shop of the Virginia Electric & Power Company, Richmond, Va., has been simplified greatly by design and adoption of a portable roller supporting stand. It was designed and constructed in the shop under the supervision of the master mechanic, W. J. Hicks.

A piece of 2-in. pipe 26¼ in. long is screwed into the drilled and tapped hub of a 14-in. pony wheel. It projects approximately 24 in. above the face of the wheel. A round steel bar 24 in. long is threaded and installed inside of this pipe through a 2-in. hexagon nut. This nut supports the weight of the roller bracket, roller and rod and rests upon the end of the pipe. On top of this threaded rod is riveted a ¾x2-in. flat bracket designed to support a 1½-in. round roller 15 in. long over all.

This stand is very rugged and it can be transported easily to any part of the shop. It is free to revolve, is 25 in. high and can be adjusted to suit almost any condition by turning the 2-in. hexagon nut. Several of these stands have been built in the company's shop and have proved of great value, particularly in the carpenter department.

ROLLING STOCK—ELECTRICAL DIAGRAMS—1

Field Winding Diagrams for Westinghouse 101B Motor

TO MAKE certain that the pole faces of a motor have proper sequence of polarity, it is essential that the coils be installed correctly. The accompanying diagrams are for the Westinghouse type 101B motor. The one on the left is for motors with leads on the axle side and the diagram on the right is for motors with the leads on the suspension side.

It is the practice of manufacturers to stamp the style number of main field coils on a tag attached to one side of the coil. The proper position of each coil in the frame is also indicated by a tag.

POLARITY TEST

In the accompanying diagrams

N = north pole.

S = south pole.

With a compass, check the polarity of coils laid out on a bench, also after assembling in the frame. Use a resistor between the trolley connection and coils to give about 5-amp. current, flowing as shown by arrows in the diagram.

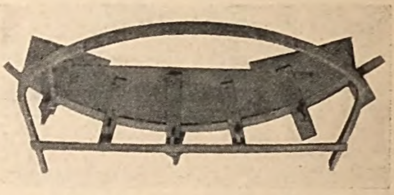
ROLLING STOCK—CARPENTER SHOP—2

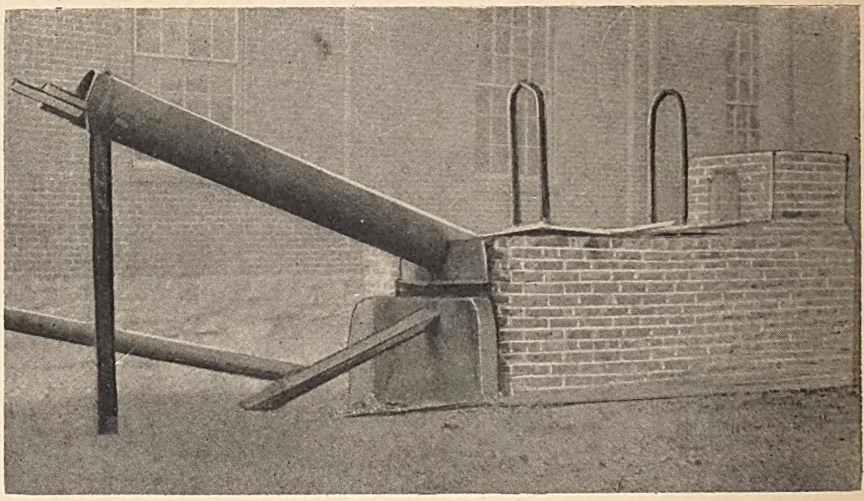
Refuse Used to Generate Steam for Wood Bending

REFUSE which can be burned easily, such as sawdust, shavings and small pieces of wood and other material which has to be disposed of from the shop of the Reading Transit Company, Reading, Pa., is deposited in a specially constructed fire box, burned, and the heat utilized for the steaming of wood to permit of easy bending.

This fire box, which is made of brick, is about 8 ft. x 6 ft. and 4 ft. high. Extending from one end is a 12-in. galvanized iron pipe of sufficient height to create a suitable draft and imbedded in the chimney base is a 12-in. iron pipe projecting through the fire box at an angle of about 45 deg. This pipe is partially filled with water and the flames surrounding that portion in the fire box soon cause the water to boil. The wood to be steamed is placed inside of the steam pipe. The box has suitable hinged covers and stops.



Wood bent after steaming



Refuse fire box, chimney and steam pipe for steaming wood to bend

Armature Winding Diagram for Westinghouse 101B Motor

IT IS very important that the connections of armatures be made correctly when they are rewound. Many railways obtain their winding information from the armature itself as it comes in for repair. Mistakes are sometimes made where information is obtained in this manner. The following information is given out by the Westinghouse Electric & Manufacturing Company and can be relied upon as being correct for the type 101B motor.

1. The center line of the starting coil is on the center line of the tooth between armature slots 5 and 6 and on the center line of the mica between commutator bars Nos. 29 and 30.
2. Starting at bar No. 29 count back clockwise to bar No. 1 and in this bar place lead No. 1 from the bottom leads of the starting coil.
3. Count from bar No. 1 forward counter clockwise to bar No. 56 and in this bar put lead No. 1 from the top leads of the starting coil.

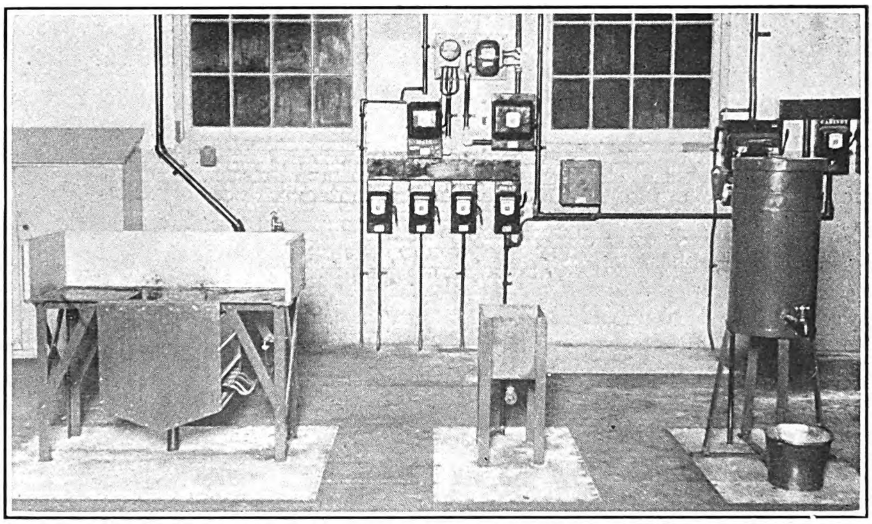
Electrically Heated Equipment for Shop Purposes

HEATING of pinions and lubricating oils used for car journals and motor bearings as well as heating a cleaning solution used for greasy metal car parts is being done effectively with some new equipment at Division 2 carhouse of the Los Angeles Railway, Los Angeles, Cal.

The tank at the left in the illustration, of 24 gal. capacity, is for heating the cleaning compound. It is made of sheet metal thoroughly insulated to retain heat. This class of cleaning was done formerly with gasoline or distillate. The new apparatus eliminates the fire risk and also does the work much more easily.



Equipment for electrically heating cleaning solutions, pinions and oils

The small tank shown in the center of the illustration is for heating pinions. This has a capacity sufficient to cover three pinions at once. After a pinion is immersed the boiling point temperature is maintained for one hour before it is removed. This tank is equipped with heating elements of the immersion type having a load capacity of 6 kw.

The round tank shown at the extreme right is used to heat oil for lubricating purposes. It is made of metal and has a heat-insulating compound between the inside and outside walls. The electric heating units are of the clamp-on type and are imbedded in the heat insulation. Heat is distributed uniformly to the inside tank, which has a capacity of about 10 gal. Thermostatic control makes it possible to keep the oil at the proper temperature regardless of weather conditions.

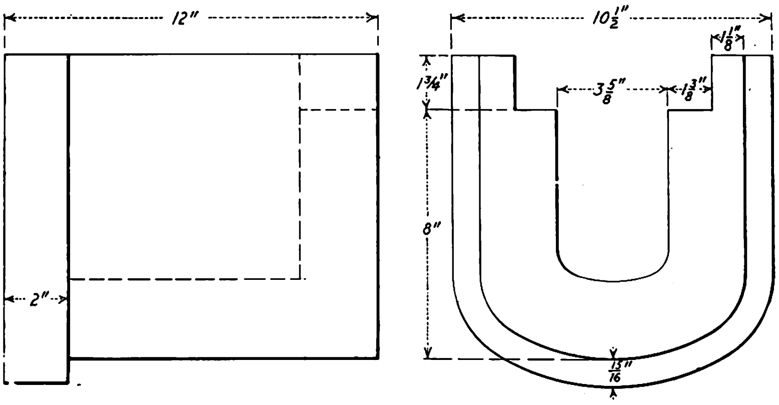
Pinions Pressed On and Off by Wheel Press

PINIONS are being pressed on and off armature shafts cold in the shop of the Lynchburg Traction & Light Company, Lynchburg, Va., in a wheel press with the aid of a special horseshoe-shaped metal block, designed by Master Mechanic Cochran and built in the shop. This block has a strong collar projection to fit snugly a recess in the tailstock of the press, while an inside shoulder takes the pinion thrust when pressure is applied to the armature shaft during the removal.



Appearance of the horseshoe block used for pressing off pinions in a wheel press in Lynchburg, Va.

To press on a pinion the armature is suspended between the tailstock and the ram, with the commutator end of the shaft placed against the tailstock. The pinion is started on the shaft by hand. One end of a sleeve is placed against the face of the pinion and the other end against the ram. Gradual pressure forces the pinion onto the shaft, the sleeve equalizing the pressure on the pinion surface and eliminating the possibility of injury to the pinion nut threads.

To remove a pinion the armature is swung outside of the tailstock and the pinion inserted into the horseshoe-shaped block with its inside face resting against the shoulder. A copper-tipped steel bar is inserted between the ram and the armature shaft with the copper tip against the shaft. A gradual pressure presses the shaft from the pinion.

It is understood that with this method not a single pinion has become loose for the past five years.

More About Improved Equipment

for Electric Railway Maintenance

SIXTEEN pages devoted to short articles about improved equipment for maintenance work appeared in the annual maintenance issue of ELECTRIC RAILWAY JOURNAL dated March 19, 1927. Even this amount of space was insufficient to describe all the devices about which information was received. The following pages contain another installment and more will follow in subsequent issues.

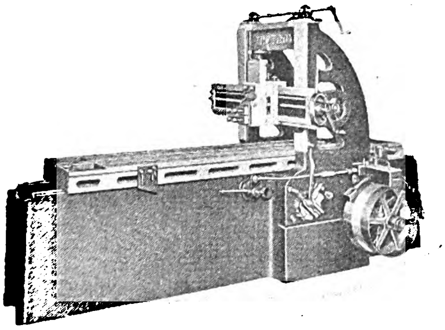
Many favorable comments have been received from the readers of this paper as to the value of this section. By illustrating some of the latest tools that can be adapted to electric railway work, those responsible are able to visualize the shortcomings of the particular equipment that they are using and so provide for changes that will put maintenance work on a higher plane and enable it to be done with less cost to the company. The most efficient system is one that uses its cars the greatest proportion of the time. Modern machine tools speed up repairs and so make cars available for service sooner than could otherwise be expected.

◆

Improved Whitcomb Second-Belt Drive Planer

REED-PRENTICE CORPORATION
Worcester, Mass.

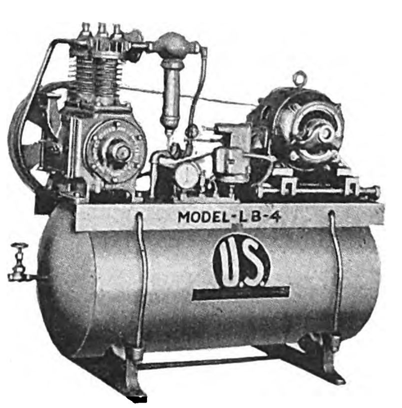
SECOND-BELT drive as used in the planer shown is the result of more than 70 years of study in the design and manufacture of such machines. The bed, which is cast solid on top except where the driving pinion engages with the rack, is of heavy box section having a bearing full length on the floor. The table is also of box construction of unusual width and thickness and is braced at short intervals with ribs to guard against any possibility of springing. Provision is made for lubricating the tracks of the bed by a simple oil leveling system, each track being fitted with a series of automatic oil rollers. The housings are of box form, bolted to the bed. By means of the second-belt drive a number of gears in the bed are eliminated. A belt-shifting mechanism shifts the moving belt quickly and noiselessly entirely off the tight pulley before starting to move the other on. The drive pulleys as well as the second-belt pulleys are made of a light-weight aluminum alloy which reduces their inertia and consequently the horse-power required. The cross-rail binder is constructed so that it can be locked to the housing by a simple movement of a lever without the use of wrenches or moving from the operating side of the planer. No wrenches are required for moving the shifter dogs. They are self-locking and are released by finger pressure upon a small lever. A two-speed countershaft, designed to meet the demand for more than one cutting speed, is furnished with the standard equipment. Two different types of motor drive can be used if desired, the plain overhead motor drive and the other belted. With the plain overhead drive a motor and countershaft are mounted on the top of the housing, with a belt from the countershaft pulleys to the main driving pulleys of the machine. The belted motor drive has a self-contained countershaft on the housings. This may be located either on the floor or at the rear of the planer or on a building wall.



Air Compressor Equipment

U. S. AIR COMPRESSOR COMPANY
Cleveland, Ohio

SPECIAL air compressor equipments for use in automobile repair shops and gas and oil stations have been developed by the U. S. Air Compressor Company. This equipment can be used for the inflation of tires, spraying springs with penetrating oil, cleaning motors, operating air lift, grease racks, gasoline pumps, spray painting under the fenders and in various other manners.

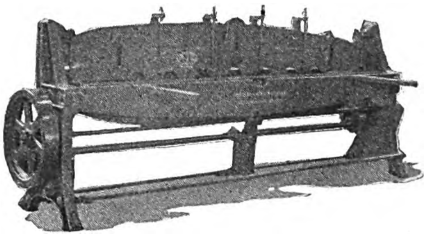


These machines are made in two sizes, the LB-4 and the LB-6. The LB-6 machine is a single-stage, air-cooled unit furnishing a tank pressure of 90 to 125 lb. and has a displacement of 16 cu.ft. of air per minute. The LB-4 machine is a two-stage, air-cooled unit furnishing a tank pressure of 165 to 200 lb. and has a displacement of 12 cu.ft. of air per minute. This constant tank pressure is maintained under all conditions by an automatic controller.

Power Squaring Shears

PECK, STOW & WILCOX COMPANY
Southington, Conn.

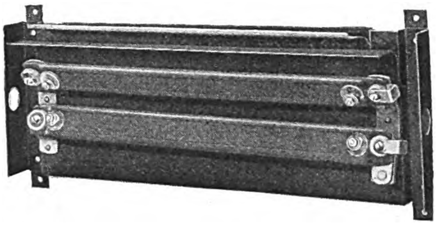
PEXTO power squaring shears are constructed with heavily braced housings designed to maintain the original alignment. The downward thrust is absorbed by a heavy ledge on the housing. These machines will resquare sheets which have been cut roughly in mill shears and cut sheets into strips, trim edges of sheets, cut squares, rectangular or other straight-sided blanks. The knives are of high-carbon crucible steel welded to a soft backing. A feature is the manner in which the vertical adjustment of the upper knife bar can be made, so as to retain the nominal cutting length of the shears regardless of the amount the knives are ground. A spring pull-down actuates automatically the movement of the knife bar and serves to clamp the sheets while the cut is being made. The gears are cut from solid castings. A Johnson clutch is furnished with the machine shown and is lubricated internally by grease. All of the bearing surfaces are lubricated thoroughly by means of oil cups. Large dustproof bearings are provided with convenient adjustment for wear. The bed of the machine is designed so as to obtain a quick change of the bed knife in a standing position. Front, back and side gages are furnished. The machine illustrated weighs approximately 2,000 lb. and has a normal cutting length of 52 in.



Electric Heater

RAILWAY UTILITY COMPANY
Chicago, Ill.

HEATING elements of a nickel-chromium ribbon embedded in a refractory material under hydraulic pressure of 100 tons per lineal foot are

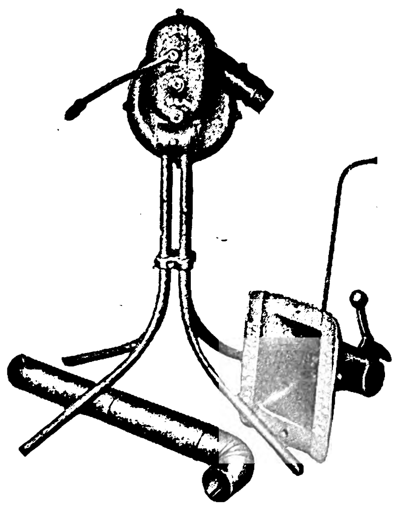


used in the heater shown. It is a two-unit horizontal type heater suitable for paint storage, oil rooms, drying and baking ovens. The embedded heating element is entirely closed in rust-resisting iron or when extreme conditions are to be met, in high temperature sheathing material, with no open ends or mica to break off and collect moisture. All units are fired in a furnace at a temperature of 1,500 deg. F. to vitrify the refractory material and to make it moisture-proof. Every unit is tested for insulation breakdown at 1,500 volts alternating current. Automatic control can be supplied with these heaters, if desired, but ordinarily the three heat switch is sufficient. The Chromalox strips are mounted in a black enameled perforated pressed steel case and are similar in appearance to those in electric heaters used for street car service. Separate Chromalox strips can be obtained for the heating of babbitting furnaces, glue pots, drying ovens, sand driers, etc. The mounting of these units is very simple. Holes are provided in the ends for fastening to a support made from steel angles or straps.

Silent Blower

BUFFALO FORGE COMPANY,
Buffalo, N. Y.

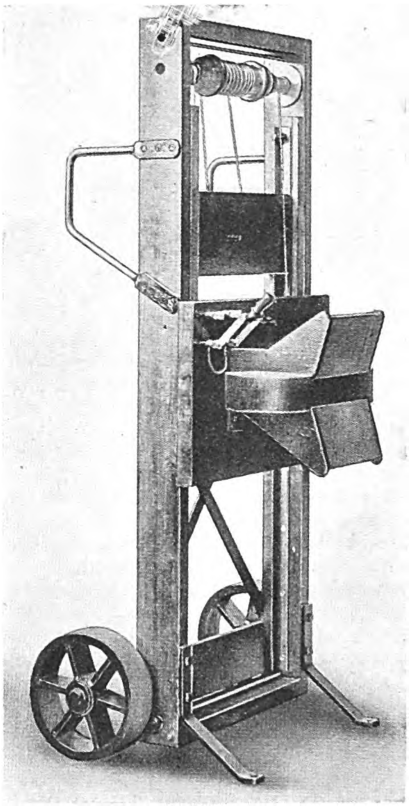
PERMANENT alignment of the gears of the Buffalo blower is assured by use of a one-piece cast iron gear case with removable cover. Frequent oiling also is unnecessary. The helical pinion on the fan shaft is a part of the steel shaft itself, making the part strong. The helical type of gear assumes almost noiseless operation. A simple adjustment on the end of the shaft provides the means for taking up wear on the main bearing. Adjustable bearings are used for the shaft end thrust. New Departure ball bearings are furnished throughout. The fan is of the volute type, made of cast iron in two pieces.



Armature Testing Equipment

WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY
East Pittsburgh, Pa.

PROVIDING a convenient method of testing railway armatures and one which will detect short circuits and grounds readily, the Westinghouse Electric & Manufacturing Company has placed on the market the armature testing outfit illustrated. This consists of a laminated iron core in which an alternating magnetic flux is set up by connecting the terminals of its exciting coil to a source of alternating current. The core is mounted on a wheeled stand which can be readily moved up to an armature being repaired and on which tests are to be made. The upright framework has a windlass for raising or lowering the crosshead which supports the laminated core so that the latter can be shoved against the armature as it rests on the usual type of rewinding stand.



When either a direct-current or an alternating-current wave-wound (two-circuit) armature is placed against the face of the laminated core, which is shaped to fit an armature, an alternating flux passes through the armature iron. If the armature winding is correct the electromotive forces generated counterbalance each other and no current passes through the winding. A short-circuited or reversed coil will allow a local current to flow, generating a flux around the slot in which the coil lies.

This testing equipment is suitable only for use with wave-wound (two-circuit) armatures, as the equalizing connections on lap or multiple-wound armatures make the entire winding appear to be short circuited.

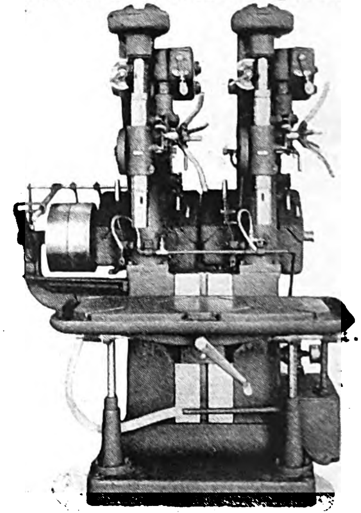
With the exciting coil energized, a piece of metal or a knife blade is passed around the commutator. This short circuits in succession each of the coils that have one side under the testing pole. If there are no faults in the winding a decided spark occurs as the knife blade leaves each of the bars. Absence of a spark between two bars indicates either a short circuit, an open circuit or a reversed coil in the winding.

A short-circuited or reversed coil will also have a local current induced in it which will generate a flux around the slot in which the coil lies. A local flux can be detected by moving a piece of sheet iron, held lightly, over the surface of the armature, so as to bridge from one tooth to the next successively. The local flux caused by a short circuit or reverse connection will attract the piece of iron when it bridges across the slot containing the defective coil. The sheet iron is thus made to vibrate. If no local flux is detected, the fault disclosed by the sparking test is due to an open circuit.

Two Spindle Box Column Gang Drill Press

BARNES DRILL COMPANY
814-830 Chestnut Street, Rockford, Ill.

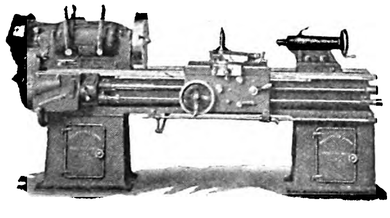
DRILLING and tapping can be done readily on the machine illustrated. All gears and their bearings are fully inclosed and are supplied automatically with a continuous flow of oil. There are eight geared speeds and eight geared feeds on each spindle, all of which can be operated independently of one another, and are under the instant control of the operator from the front of the machine. If desired, the gear thread leading feeds may be supplied with slip gears for different pitches for accurate tapping and threading. The transmission gears are cut from special chrome nickel steel, heat treated and tempered, giving high tensile strength. The machine will drive drills up to 1¾ in. through their working limits. If desired, a geared motor drive can be supplied. For the machine shown a 7½-hp. motor, 1,200 r.p.m., is recommended. For tapping, any and all spindles can be furnished with reversing friction clutch gears and automatic reversing mechanism. Spindles can be furnished with back gears, geared feed and automatic stop. This machine will drill a 1½-in. hole in steel at the rate of 3 in. per minute and in cast iron at the rate of 5 in. per minute.



Standard Geared Head Lathe

REED-PRENTICE CORPORATION
Worcester, Mass.

USE of an all-friction clutch headstock is said to make the geared head lathe shown very rapid in speed changing. The drive is direct from the main crankshaft or motor shaft, to a single pulley running on ball bearings. Start, stop and reverse of the spindle is obtained by a lever on the apron which operates a mechanism consisting of three bevel gears and a double friction clutch. The eight spindle speeds are selected by means of three levers on the front of the headstock. A quick-change gear box provides 44 rates of feed and 44 different threads of the most useful pitch. The spindle is made of high-grade steel with journals hardened and ground. Spindle bearings are made of high-grade bronze and are provided with an effective oiling system.

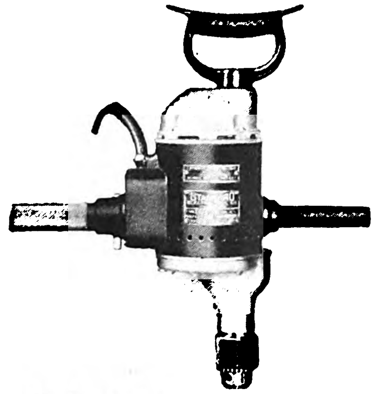


A carriage with rigid and wide bridge and of heavy design is furnished. An apron with a double support is rigidly bolted to the carriage. Lateral adjustment for taper turning is a feature. The standard equipment of the machine consists of a steady rest, large and small face plates, compound rest, regular tool post, quick change gear mechanism, thread-chasing dial and all necessary wrenches.

Universal Electric Drilling Machine

STANDARD ELECTRIC TOOL COMPANY
1938-46 W. Eighth Street, Cincinnati, Ohio

BALL BEARING design and a special plunger type switch are features of this ½-in. electric drill. This machine is equipped with a Universal motor interchangeable for both a.c. and d.c. of the same voltage. It is fitted with a cord and plug, combination spade handle and breastplate as shown. A three-jaw geared chuck for straight shank drill bits up to ½ in. is also furnished. It is particularly convenient for car body work in electric railway shops where parts cannot be taken to a stationary drill press.



American Association News

Trolley Wire

MEMBERS of the joint committee on standardization of trolley wire met at association headquarters in New York on March 29 to continue the work on specifications for hard-drawn copper and bronze trolley wire.

There were present at this meeting H. J. Horn, W. R. Webster and C. D. Gray, representing the American Society for Testing Materials; W. H. Bassett, representing the A.S.T.M. and the A.E.R.E.A.; C. L. Hancock, J. W. Allen, H. S. Murphy, chairman, and G. C. Hecker, representing the A.E.R.E.A.

Practically the entire meeting was given over to a discussion of the bronze trolley wire specification, considering in detail the requirements for tensile strength and elongation and for the twist test. A number of suggestions were made for compromises on the requirements under discussion and several of these were favorably received. It is proposed to submit these suggestions to proper sub-committees of the two interested associations to obtain further discussion and a decision.

COMING MEETINGS OF *Electric Railway and Allied Associations*

Oct. 3-7—**American Electric Railway Association, annual convention and exhibit, Public Auditorium, Cleveland, Ohio.**

Traffic and Safety

CLASSIFICATION of accidents was discussed at a meeting of the joint committee on traffic and safety held at Pittsburgh, Pa., April 7. It was the opinion that the classification adopted by the association in 1926 after several years discussion and consideration was so drawn up as to be applicable to any company and could be modified to meet its individual requirements. The only improvement deemed desirable in that classification was some slight simplification. To accomplish this result it was recommended that items 7, 9 and 10 be combined into one item, boarding and alighting accidents. The question of further classification of accidents into the two divisions chargeable and non-chargeable was brought up. It was the general opinion that this would be a very difficult division to make. It was felt that the committee could not, this year, bring about any change in the classification of accidents, but that it should be brought before the convention with the idea that it might be changed next year or the one following.

In order that the general opinion of the industry might be determined as to this it was decided to appoint a sub-committee to draft a questionnaire including two questions relating to changes of classification of accidents and chargeable and non-chargeable accidents, the questionnaire to be sent out by association headquarters. S. W. Baldwin, E. J. Paige and R. W. Emerson were asked to draw up this draft and forward it to the executive secretary.

At the meeting held in New York in January a letter was read from W. H. Boyce asking that ideas for safety posters be submitted to Labert St. Clair. Six sketches were brought in by Mr. Emerson. With slight modifications they were approved. Mr. Emerson suggested that furnishing of such posters is more a function of the National Safety Council and that if the association undertakes such work it would probably be a duplication, even though a small proportion of the street railway companies in the United States are members of the council. However, he stated that at the meeting of the council executive committee to be held in the near future he would bring up the question of the purchase of posters by non-members of the council.

Further, in the matter of a study of traffic surveys of a number of cities C. H. Evenson reported that he had received reports from Atlanta, Washington, Baltimore, St. Louis, Chicago and Detroit and had had a summary made of them. He further suggested that a sub-committee make a further study of this summary, submitting a report to all the members of the committee for study before the next general committee meeting. All members present concurring, Mr. Emerson, Mr. Paige and Mr. Evenson will act as this sub-committee. Mr. Evenson suggested that a point which should be stressed in the report of the committee was that of urging street railway managers to initiate action looking toward traffic regulation, using the question of safety to the general public as the means of bringing this question before the authorities and the public at large.

Since it is desired to have all reports submitted to the executive committee of the association not later than July 1, it was suggested that a general meeting of the committee be held about June 1, the exact date to be fixed by the co-chairman, the meeting to be held in New York. Members present were C. H. Evenson, chairman; H. K. Bennett, co-chairman; A. J. Fink, R. W. Emerson, E. C. Spring, J. P. Ingle, J. A. Stoll, S. W. Baldwin, E. J. Paige, Samuel Riddle, sponsor, and W. H. Boyce, sponsor.

W. & S. Special Committee No. 4

CHAIRMAN BAKER of special way and structures committee No. 4 on track ballast and drainage of the Engineering Association called a meeting of his committee in Chicago on March 9 at which there were present C. L. Hawkins, J. H. Haylow, E. J. Archambault and S. Clay Baker.

The progress made by the committee was reviewed and discussed. It was finally agreed that a questionnaire should be sent out to obtain an up-to-date view on standard practice. This questionnaire will probably not go out to the entire membership but only to members of the way and structures committee.

Special Bulletins Available

Following is a list of special reports being prepared by the Bureau of Information and Service of the American Electric Railway Association:

Bulletin No. 133: Working Conditions of Electric Railway Trainmen. A tabulation showing the hours of labor, length and types of run, proportion of straight and swing runs, overtime rates, what constitutes overtime, extra compensation allowed for special types of work, labor turnover, etc., for over 250 operating companies.

Bulletin No. 134: Working Conditions of Bus Operators. This bulletin gives for bus operators substantially the same information as is given in Bulletin No. 133 for trainmen—namely, hours of labor, length and types of run, proportion of straight and swing runs, overtime rates, etc. This is the first bulletin which the association has ever prepared on the working conditions of bus men and includes information for 112 bus operations.

Bulletin No. 135: One-Man Car Operation. A new compilation of one-man car data containing a complete list of electric railways now operating one-man cars, showing the number of cars operated by each company, record and summary of all cases in which the legality or propriety of operating one-man cars has been attacked, statements of opinion by public regulatory bodies as to the merits of the one-man car. It also gives a comparison of the results of operation of one-man and two-man cars, including the comparative accident record of each. This bulletin brings up to date and supersedes the data contained in Bulletin No. 95: "Recent Developments in One-Man Car Operation."

Bulletin No. 136: Electric Railways Operating Motor Bus Lines. A new, revised list of more than 350 electric railways now operating motor buses, showing for each company the number of miles of bus route, number, type and seating capacity of buses, fare charged and transfer privileges to railway lines.

In addition to the above the following supplements have been prepared:

Supplement No. 19 to City and Interurban Fare Bulletins Nos. 41 and 42.

Supplement No. 1 to Bulletin No. 129: Wages of Trainmen.

Supplement No. 1 to Bulletin No. 130: Wages of Bus Men.

Cost of Living Studies (Bulletin No. 137).

Sub-Committee on Depreciation

ACTION to be taken by the American Electric Railway Association in connection with the forthcoming hearing on depreciation before the Interstate Commerce Commission on May 23 was discussed at a meeting of the sub-committee on depreciation held in Chicago on April 6 and 7. Those present at the meeting included the following: R. R. Bradley, Chicago; Thomas Conway, Jr., Philadelphia; J. H. Hanna, Washington, D. C.; Frank Karr, Los Angeles; L. R. Nash, Boston; J. A. Knowlton, Springfield, Ill.; B. E. Bramble, Chicago; F. W. Doolittle, New York; Richard Sachse, Los Angeles; S. M. Haskins, Los Angeles; W. H. Sawyer, East St. Louis, Ill.; R. S. Torgerson, Chicago; C. H. Allen, Chicago; A. W. Brady, Anderson, Ind.; Leo Loeb, New York; H. M. Sowle, New York; Charles Gordon, New York; F. A. Newton, New York; F. E. Stout, Chicago; C. D. Jackson, New York; P. J. Lucey, Chicago; B. W. Warren, Boston; C. L. S. Tingley, Philadelphia; C. E. Thompson, Chicago; A. S. Richey, Worcester, Mass.; B. F. Weadock, New York; Harry Reid, New York; L. S. Storrs, New York; C. D. Cass, Waterloo, Iowa.

One outstanding problem before the committee is the collection of the information necessary to show what would actually be the result of a depreciation order for electric railways by the Interstate Commerce Commission similar to that issued for steam railroads. Since the compilation of this data may prove difficult to some properties, a selected list of companies which are typical of various classes are to be specially urged to co-operate in supplying the needed information.

In general, the committee agreed that the retroactive feature of the steam road depreciation order and the arbitrary requirement of setting up a fixed reserve for depreciation each month regardless of business conditions would be particularly harmful to the electric railway industry. In representing the industry before the commission it is the intention of the committee to speak for the association, without waiving the right of individual properties to present their own cases. It was the expressed hope of the committee, however, that properties which expect to present their own cases during the hearing will notify the committee of their intention. Because of the short time available before the date set for the hearing a subcommittee consisting of Chairman J. H. Hanna, R. R. Bradley, Thomas Conway, Jr., and L. S. Storrs was appointed to seek a postponment of the hearing date from the commission.

News of Other Associations

Mr. Johnson Discusses Transportation

SPEAKING before the Birney Club of St. Louis on April 4 H. A. Johnson, general manager Chicago Rapid Transit Company, said that transportation needs of the country although greater than ever before are being met more adequately than they have ever been since our early ancestors discovered the wheel as a method of transport, and expressed as the greatest need of the hour a more complete co-ordination of transportation agencies so that wasteful duplication of service may be eliminated; so that the steam railroad, the electric railway and the motor bus are each put to the use for which it is best adapted, both from standpoint of service to the public and economical operation.

We are only on the threshold of a properly co-ordinated system of transportation but we are making progress. There is a general tendency to absorption of small and unreliable transportation companies incapable of rendering good service by large and responsible companies. The task of co-ordinating our transportation agencies is one of such magnitude that it will require time and infinite work to bring it about, but it will be done and it rests with those whose life work is transportation to do it.

We are making progress in use of the motor coach. In 1921 there were only 21 electric railway companies operating 73 motor coaches with 35 miles of route; whereas in September, 1926, they operated 6,469 coaches over 14,907 miles of route. This increase is at a rate much faster than that at which independent lines have grown.

Mr. Johnson also said that it is significant that traffic in American cities in general is increasing more rapidly in the suburbs than in the city itself and that in every large city the commuting zone was extended with every improvement in transportation service. The only limit which the city worker recognizes in the distance between his home and his place of work is the time consumed in his daily travel.

Mr. Johnson, who has given considerable study to transportation problems both here and abroad, said that one of the greatest problems to be met in the development of comprehensive transportation plans for cities was the difficulty of getting enabling legislation, because the attitude of the average man toward some new proposal which he does not completely understand is usually to vote "no."

The News of the Industry

New St. Louis Petition Provides for Flat Eight-Cent Fare

Receiver Rolla Wells of the United Railways, St. Louis, Mo., filed a petition on April 9 with the Missouri Public Service Commission at Jefferson City asking again for an increase in rates. The latest request is for a flat fare of 8 cents. The increase is on the basis of an estimated $75,000,000 valuation for the properties. A former application, pending before the commission for many months, sought a fare of 8 cents or two tokens for 15 cents. The company was able to charge that fare base between Feb. 7 and Feb. 28 under the protection of a temporary restraining order issued by the federal court.

In the new petition it is set forth that during the brief period in which the higher rate of fare was in effect the company collected $48,420 more than for a similar period in 1926. The petition further recites that the original request for higher fares filed with the commission on June 4, 1926, was based on a physical valuation of the road's properties of $51,781,348. The petition said:

> The fare prayed for in the application filed June 4, 1926, would not, in the light of experience with that rate of fare and in view of the fact that the number of revenue passengers has been steadily falling off during the three months of 1927, produce sufficient revenue to pay operating costs, taxes and depreciation and yield a fair return on the present value of the property devoted to public use.
>
> An increase in the rate of adult fare to 8 cents cash and two for 15 cents would yield only about $870,000 additional revenue annually, which would represent a net income available for returns of only $75,000,000, and only 5.77 per cent on the Public Service Commission's 1919 valuation plus additions and betterments.
>
> To provide sufficient revenue to yield at least a part of a fair return on the present value of the property it will be necessary to increase the adult fares to 8 cents, which will, in the opinion of the petitioners, predicated upon the experience of 7½-cent fares, produce no more than $2,000,000 additional revenue during the year of 1927, compared with 1926, and represent an annual return of only 6 per cent on the present value of the properties and less than 8 per cent on the commission's 1919 valuation.

An audit completed recently by the Missouri Public Service Commission disclosed that the railway suffered a net loss of $225,000 during 1925 and the first ten months of 1926. The commission will hear the company's petition on April 22.

Injunction Action by Duluth Street Railway Upheld

In a decision by Justice Holmes the United States Supreme Court April 11 affirmed the ruling of the lower court which had granted an injunction to the Duluth Street Railway, Duluth, Minn., in a fare controversy with the Railroad and Warehouse Commission of Minnesota.

The railway applied for higher fares and the state commission fixed its value for rate-making purposes, but entered an order that instead of granting permission to charge a straight 6-cent fare, as the company had sought, it might charge a 6-cent cash fare but should sell five tokens for 25 cents. The company immediately secured an injunction in the federal court.

The state commission appealed to the United States Supreme Court, on the ground, among others, that the procedure followed by the railway was erroneous in that the Minnesota State law provides a method of appeal from decisions of the Railroad and Warehouse Commission and that this remedy had not been exhausted, therefore the company could not rightfully apply to the federal courts for relief. The commission also pleaded that the action of the company was premature in that it sought an injunction before testing out the rates ordered by the commission.

The Supreme Court holds that the company had a right to choose the court to which it would appeal for relief and therefore that its action in asking an injunction of the federal district court was proper. The high court did not discuss the question of whether the suit was premature, and it permits the decision of the district court in enjoining the rates fixed by the state commission to stand.

Few Indiana Utility Measures Become Law

Following adjournment of the Indiana Legislature and the signing by the Governor of bills he favors, only three bills pertaining directly to public utilities and how they shall be regulated succeeded in becoming laws.

Senate bill No. 178 gives any one the right to appeal to circuit or superior court from any ruling of the Indiana Public Service Commission. The appeal shall be taken thirty days after the ruling is made.

Senate bill No. 171 amends the public service commission act of 1913 by adding a provision that, if the commission finds, on inquiry, that salaries paid by utilities are excessive or that more persons are employed than necessary, or that any unjustified expense is being incurred, the commission shall designate such items and not take them into account in fixing rates.

Senate bill No. 124 amends the utilities act of 1915 by omitting from it the proviso which required a report to be made to the Public Service Commission and its approval obtained before the earnings of a municipal plant that had accumulated a sinking fund sufficient to pay its debt could be turned into the general fund.

A joint resolution was passed requesting the Congress to enact legislation denying jurisdiction to federal courts to hear utility rate cases until the legal remedies offered by the state courts are exhausted.

Columbia Carries On Without Car Service

Operation of street cars in Columbia, S. C., suspended on March 11, has not yet been resumed. The matter of suspension of service may find its way into the courts of the state. On petition of a citizen, the South Carolina Railroad Commission ordered the Columbia Railway, Gas & Electric Company to show cause why it had suspended operation without permission. The railway failed to show cause, whereupon the commission ordered it to resume operations within a stipulated time or else pay a fine. Then the company filed an appeal for further hearing before the commission, this appeal serving to stay the execution of the "pay a fine or resume service" order, and at the same time asked that it be permitted to discontinue the service permanently.

The Railroad Commission, giving as its opinion that "the unregulated unrestricted system of 'jitney' transportation has utterly destroyed the railway system in Columbia," handed down an order permitting permanent discontinuance of service and at the same time revoked the order to pay a fine or resume service. Now the question has arisen of the right of the commission to grant permission to suspend service and the matter may get into the courts on that angle. As is shown by the order, the 10-cent "jitneys" continue to be a most disturbing factor in the transportation problems of the city. They offer keen competition to buses operated on a regular schedule and over a definite route. The jitneys, operated without route or schedule, carry passengers at the same rate as the buses and take them direct to their door or office.

Another Move by City in Rochester Railway Valuation

The long-pending suit of the city of Rochester for a new valuation of the lines of the New York State Railways in Rochester came to the fore again with announcement by Corporation Counsel Platt that, on behalf of the city, he would ask court permission to inspect the books of the railway under which the valuation under the service-at-cost contract was fixed.

The move is considered preliminary to establishing whether the appraisers fixed the valuation according to regular procedure. The railway has denied the city the right to inspect its books and a court order is now sought. When the case will actually come to trial is still uncertain. The litigation, in which the city is striving to obtain a lower valuation for the service-at-cost contract in the hope of gaining a fare reduction, has been hanging fire three years.

One-Man Car Bill Killed in Pennsylvania

Legislation against the one-man car in Pennsylvania is dead for this session. The House has killed the one-man car bill. There was very little public support for the bill and the wonder was that the measure got as far as it did. Newspaper comment, particularly in Philadelphia and Pittsburgh, was decidedly against the measure. The extent of the appreciation by the newspapers of the value of the one-man car was, perhaps, nowhere better expressed than by the Pittsburgh *Gazette-Times*. That paper said:

> Substantial improvement of electric railway service in populous places and reduction of the rates of fare apparently depend entirely on lowering the costs of transportation. The one-man car is less expensive to operate than the two-man car. A greater number of cars on a route without increase of the wage account is possible where the newer system is in use. This opens up a prospect not unpleasing to car riders.

Franchise Acceptance Formalities Being Concluded in Kansas City

The Kansas City Public Service Company, Kansas City, Mo., during the week ended April 2, completed its formal acceptance of the terms of the new railway franchise awarded to it by the city officials on March 21. The form of the acceptance document was approved by the City Council, and it was mailed to Chicago on March 21 to the First Trust & Savings Bank, corporate trustees under the new mortgage on the local properties.

Under the provisions of the franchise ordinance as passed, the public service company had twenty days in which to accept or reject the franchise. The acceptance now awaits only the signature of William G. Woolfolk, president of the Kansas City Public Service Company, before being filed with the City Council. The ordinance, according to Powell C. Groner, chief counsel for the company, would become effective on April 10. The new fare schedule will then be filed with the State Public Service Commission as required by law. It is pointed out, however, that the commission has ruled that the new fare schedules will not become effective until 30 days after approval by commission, unless good reason is shown for putting them into effect earlier.

Six Cents and Other Requests Asked in London

A 6-cent fare with five tickets for a quarter for a period of two years is requested by the London Street Railway, London, Ont. This petition is part of a proposal to the city which states that at the end of the two-year period the railway would arrange to revise the fares as necessity might dictate with leave to appeal to the Ontario Railway & Municipal Board by either party.

The proposals include an exclusive perpetual franchise with all controversial clauses, including the use of one-man cars, to be referable to the board. The company agrees to pay the cost of track foundations but believes the city should assume obligations for surface paving. A clause provides for the purchase of the railway and bus lines by the city on six months notice, the value of the system to be decided by arbitration. The company also seeks exemption from all taxation except the school tax. If an agreement is reached the company will spend $300,000 within five years on general improvements.

The temporary agreement which authorized the London Street Railway to charge a 5-cent fare expired on April 1. The railway is now really operating under the old agreement whereby it is compelled to sell seven unlimited and nine limited tickets for a quarter.

Investigation of International Accounts

William R. Pooley of the New York Public Service Commission has reserved decision on the application of the municipal authorities of Buffalo, N. Y., for permission to examine the books of the International Railway, for certain figures to be used in opposition to the company's request for a 10-cent fare in Buffalo. Henry W. Killeen, of counsel for the International, says the application is a mere device for delaying the proceedings or for seeking information to be used in the United States District Court litigation.

Testifying before the commission, John J. Schmunk, vice-president of Mitten Management, Inc., in charge of accounts, said that the amount of half-fares collected is far below the amount estimated by the commission's experts when fixing the 8-cent fare which now is in effect in Buffalo.

Dr. Milo R. Maltbie, acting for the city, will oppose the 10-cent fare request of the International.

Electrification and Allied Projects Cost $55,500,000

Beautification of Chicago's downtown lake front through electrification of its suburban divisions, lowering of track levels in Grant Park, erection of a new suburban terminal at Randolph Street, and completion of the vast Markham freight yards on the south side of the city and similar undertakings in the last six years, represents a total investment by the Illinois Central Railroad to date of more than $55,500,000, according to a recent statement by L. A. Downs, president. During the current year, he said, an additional $4,600,000 will be spent in continuance of this work. Electric operation of all Illinois Central suburban trains in Chicago was begun last August in compliance with the terms of an ordinance for the development of the city's lake front.

Plans for the construction of another monumental new Union station by the Illinois Central on the site of the present Central station at Roosevelt Road and Michigan Avenue, have been retarded by the lack of definite decision as to terminal building by other railroads entering the city from the south. The Illinois Central hopes to induce the lines now using the Dearborn, La Salle and Grand Central terminals to join with it in the centralized terminal project to cost about $20,000,000.

Fearful of Future Fares in San Francisco

A controversy has arisen over the effect on fares of a proposed bond issue election early next year for extensions of the Municipal Railway, San Francisco. One faction declares that an 8-cent fare, superseding the present 5-cent rate, will be the ultimate outcome. City officials deny this indignantly.

Adolph Uhl, manager of the City Efficiency League, declared that the extensions under the proposed $3,500,000 bond issue will produce only $444,000 revenue a year, and that there will be a total deficit of $393,000 on the lines before the bond redemption is added, and that when this redemption is finally added the deficit will total $520,000 a year.

"This means an 8-cent fare," was Mr. Uhl's deduction.

Nelson Eckart, assistant city engineer, retorted in this fashion:

> Including bond redemption the first year is ridiculous. As every one knows, bond redemption doesn't begin until the fifth year. To say that the line into the Sunset district will produce only $130,000 yearly is also ridiculous. The B line into Richmond district, which is comparable to the Sunset line, took in $308,000 in 1915, its first year, and $520,000 last year.
>
> The Sunset line will not only take in considerably more than $130,000 the first year, but its receipts will increase even faster than those of the B line did.
>
> If San Francisco is to grow it must have transportation. The railroad bond issue will give transportation to districts which are partially built and which need only transportation to become densely settled.
>
> But even if the lines proposed all lost money the first year they would be worth building.

In addition to extensions on five lines it is proposed to erect a car repair shop and a garage. Purchase of twenty buses for use in the Sunset and Potrero sections also is recommended.

The recommendations involve the building of 11.54 miles of track at a cost of $1,382,000, acquisition of 47 new cars at a cost of $799,000, purchase of $150,000 worth of buses and expenditure of $1,660,000 for land and auxiliary establishments.

The city engineer recommends that no further extensions be approved until 1929, when franchises for 126 miles of track of the Market Street and California Street Railway systems expire.

St. Louis Expert Will Report on New York Subways

Charles Edward Smith, St. Louis, Mo., has been engaged by the city of New York to study the subway lines and the possible consolidation of them with the existing rapid transit systems. He is now in New York City to remain four or five months. Mr. Smith, who is well known in the West as engineering counsel to public utilities, is head of a firm of consulting engineers, with offices in St. Louis, and for some time has been conducting a survey on the development of the rapid transit system for that city. He has had wide experience in railroad construction, in municipal developments and in government service. His appointment was authorized by the Board of Estimate and Apportionment a month ago. An appropriation of $25,000 was made in connection with the appointment.

Fare Issues

Dr. Delox F. Wilcox, traction expert, has been assisting the city of Los Angeles, Cal., in opposing higher fares for the Los Angeles Railway. The City Council authorized his services on March 28. The increase sought by the Los Angeles Railway is from 5 to 7 cents. The city is scheduled to start presentation of its case on May 17 before the State Railroad Commission.

Meanwhile the Pacific Electric Railway fare case is again before the Railroad Commission following a hearing on April 5. A compromise was effected recently between attorneys representing the Pacific Electric Railway and Los Angeles and the neighboring cities whereby Glendale and Burbank will accept a temporary schedule of reduced single and round-trip fares and a 20 per cent increase in the price of commutation books. The Pacific Electric Railway is seeking a 7-cent local fare and a 20 per cent increase in the interurban rate. Supplemental to its application for a fare increase the railway filed an amended petition which sought as an experimental measure a general reduction in all interurban rates. This petition was referred to in the ELECTRIC RAILWAY JOURNAL, issue of March 19, page 548.

Chattanooga Commission Receives Transit Plan

A transit plan prepared for the city of Chattanooga, Tenn., which would mean a considerable expenditure for the Tennessee Electric Power Company was passed recently to the City Commission. The plan was prepared by Harland Bartholomew, expert city planner.

B. C. Edgar, vice-president and general manager of the Tennessee Electric Power Company, said that his company would not approve the plan at the present time. One section, he explained, dealt with the proposed changes in present railway routes and the other with additional lines for the future development of the system. The report recommended the removal of all tracks from Broad to Chestnut Streets. This, Mr. Edgar declared, would not be satisfactory with the present width of Chestnut, but might later if the street were widened. He further called attention to a recommendation favoring removal of all tracks from the Walnut Street bridge. This change would not be favored by the company, he said, because it would entail a lot of expense and would not accomplish any improvement. In his opinion the recommendations in Mr. Bartholomew's plan would call for the expenditure of $1,662,000.

Confer on New Jersey Canal Bed

The desire of the Public Service Railway, Newark, N. J., to take over and operate the abandoned bed of the Morris Canal for rapid transit lines was expressed again by Thomas N. McCarter, president of the road, at the first of a series of conferences between representatives of the city and the Public Service Railway on the proposed use of this canal bed. Other conferees were John L. O'Toole, vice-president in charge of public relations; Corporation Counsel Congleton, acting director of the department of public affairs, and Chief Engineer Costello. If equitable terms can be worked out, Public Service will consider financing the subway construction. The company would prefer to operate the bed as an open-cut subway from Plane Street northwest to the city line, as originally proposed, the section from Plane Street to the new Pennsylvania Railroad to be covered. Mr. McCarter said, however, the corporation will be ready to go along on plans for covering the canal bed at other points if found advisable.

Worm-Drive Car Successful at Springfield, Mass., Test

New Unit There Operates Successfully in Trial Run Attended by Railway Men, Manufacturers and Others—Car Noiseless and Remarkably Smooth

IN THE presence of visiting railway executives, manufacturer's representatives, city and state officials and newspaper men, the experimental worm-drive car built for the Springfield Street Railway, Springfield, Mass., by the Wason Manufacturing Company was thoroughly tested on April 14 under various track conditions.

The car, described in detail in the ELECTRIC RAILWAY JOURNAL for March 26, exceeded in several respects the expectations of its designers. Construction was completed only a few hours before the demonstration run, but the unit operated perfectly in all of its details. Members of the American Electric Railway Engineering Association committee on noise reduction, headed by Chairman H. S. Williams, were present to ride the car during its demonstration run. Mr. Williams planned to make a series of noise tests of the new car in comparison with standard cars on the property.

CAR PERFORMS WELL IN SERVICE

The Timken worm-drive axles gave smooth and rapid acceleration. The Westinghouse motors, mounted longitudinally in the truck frame and driving the axles through Spicer universal joints and a short drive shaft, operated smoothly and handled grades and curves successfully. A remarkable smoothness and quietness around curves was attributable to the differential drive in the axles. Reduction of unsprung weight by mounting the motors in the truck frame instead of on the axles eliminated pounding over special work and reduced the usual shock and vibration of ordinary operation over special work to a mere metallic click. The electrically controlled automotive type brakes with diaphragms mounted on the axles and with internal expanding shoes inside brake drums bolted to the wheels made possible such high rates of deceleration that it is anticipated the brake diaphragms will need to be made smaller to reduce the braking power. The automotive type hand brake was found ample to slide the wheels on dry rail.

Good riding qualities of the radical truck design proved to be one of the outstanding features of the demonstration. Noise of operation was limited to the hum produced by the wheel flanges in grooved rail, the trolley wheel and motor armatures. Gear noise was absent and brakes were entirely silent. It is expected that even greater quietness will be obtained by the use of rubber pads on the wheel webs.

All those who witnessed the demonstration declared that only a service test long enough to determine the strength and wearing features of the design is necessary before the car can be considered successful. After the finishing touches of trimming and painting are completed, work that is expected to take about ten days, the car will be placed in regular operation in Springfield.

Rapid Transit Operating Agreement Talk in Philadelphia

Thomas E. Mitten, chairman of the board of directors of the Philadelphia Rapid Transit Company, Philadelphia, Pa., is willing to enter into negotiations with the city for leasing the Frankford Elevated Railway and the Broad Street subway jointly.

This fact was made known by Mr. Mitten in a letter sent by him to Mayor Kendrick in reply to the Mayor's inquiry as to the best terms the P.R.T. could offer to the city for operation of the Frankford Elevated Railway after the expiration of the present lease.

Under the original Frankford L agreement, which was dated May 5, 1922, the term of the lease was fixed for five years, beginning Nov. 5, 1922, and expiring Nov. 4, 1927, with an option reserved to the city, but not to the company, to extend the term to July 1, 1957, by notifying the company to that effect not later than six months prior to the expiration of the five years term. That is, the city must notify the company of its intention by May 5, 1927, which is just about a month off. In order to decide what the city shall do in the matter Mayor Kendrick about a week ago wrote to Mr. Mitten, reminding him that May 5 is rapidly approaching, and requesting him to state the best terms under which the company would continue to operate the Frankford L in view of the fact that the proposed amended L lease had not received the approval of the commission.

There has been a decided opinion that the city should negotiate with the P.R.T. for an agreement that would embrace both the Frankford L and the Broad Street tube, which will soon be ready for operation. On the other hand, some persons are inclined to favor separate agreements for the two lines.

How One Manager of a Small City System Sees It

The Poughkeepsie & Wappingers Falls Electric Railway, Poughkeepsie, N. Y., carries 10,000 persons about the city daily, and suddenly to cast aside the railway and substitute buses would be disaster. This statement was made by George Wells, superintendent of the lines, who stressed the need of every up-to-date city keeping its railway lines and augmenting them wherever necessary with buses. He was answering an inquiry from one of the local newspapers. His comments on the changing aspects of transportation were especially pertinent. He said in part:

> When movies came, some people thought that actors would no longer be wanted. When victrolas were invented, many expected that singers and orchestras would not be in demand. When radios were invented, people asked if concert halls and public auditoriums were to be torn down.
>
> As a matter of fact, actors are wanted everywhere—likewise public speakers and orchestras and bands. Telephones have not superseded the telegraph.
>
> Since the advent of automobiles and buses, everyone is riding more. In the past year, more people traveled on steam roads, on trolley roads, in automobiles and buses than did the year before.
>
> Buses are a new and useful means of transportation and electric railways are adopting them. They do not take the place of electric railways in the majority of cases, but supplement them.
>
> Some electric railways have failed. Many bus lines have failed, and when railways have not paid it almost invariably follows that buses over the same routes do not pay unless the railway failed on account of poor management or tax burdens or both.
>
> A well-established and well-regulated railway is essential to any city of any consequence, and just because a few towns of lesser importance have allowed their railway systems to slip away from them, it should not follow that a modern, prosperous and promising city like Poughkeepsie should think of giving up its up-to-date, well-established and well-organized railway system and replace it with buses that are still in the experimental stage. Is any modern and self-respecting city allowing such a thing to happen? Not any, that I know of. Many are adding buses but not giving up their trolley system. Many cities are even paying the railways where they have failed, in order to keep them going. Many have canceled paying debts, taxes, etc., in order to help their trolley companies get on their feet again. They will not allow the railways to go. Those who have are regretting it.
>
> Electric railways are here to stay. They are beyond the experimental stage.
>
> Buses are here to stay, but they are still in the experimental stage.
>
> There are many failures of bus ventures all over the country, and it would be very unwise indiscriminately to abandon tracks for buses at this period of uncertainty.
>
> This company carries 10,000 passengers daily. It is a great responsibility, but the service seldom fails. The system has been built up through many years of practice and large expenditures of money. Suddenly to abandon this system for a form of transportation where many more vehicles would be required to do the same work might bring disaster upon the community.

Railway Issue in Oakland's Mayoralty Fight

Oakland, Cal., is in the midst of a lively spring election campaign. Frank Colbourn, one of the arbiters who two years ago awarded employees of the Key System Transit Corporation a higher wage scale, is running for Mayor. His opponent is J. L. Davie. One of the issues of the campaign is the 7-cent fare, which Mr. Colbourn is accused of having made imperative for the company in consequence of the expense saddled on it by the wage advance. It is a minor issue, though, and is not attracting much attention.

I DON'T WANT CUFFS ON 'EM
HEY, THESE TROUSERS BAG IN THE SEAT!

Clothes don't make the man, but they help

A Fitting Process

"Hey, those trousers bag in the seat!"

"Make those sleeves a little longer!"

"No, I don't want cuffs on those pants!"

These and similar expressions came from the office of J. Frank Johnson, vice-president and general manager of the Community Traction Company recently, arousing the curosity of car company visitors.

A peep inside the room disclosed a dozen men in various stages of dishabille, some of them with less of clothing than the greased challenger of the Catalina Island swim, but lacking the beautiful symmetry of this challenger.

Some were on chairs trying on trousers. Others were pulling and hauling at stubborn trouser legs from less advantageous places on the floor of the office. Others tried on vests and coats.

Paunches that demanded the utmost skill of expert tailors for proper fitting, shoulders round and shoulders square, victims of obesity and malnutrition—a gathering of sufficient variety in shape and size to drive the ordinary tailor woozy—all were there being fitted.

Outside several scores of other men waited, listening to the buzz of chatter that came from Vice-President Johnson's room.

The occasion was the fitting of Community Traction motormen, conductors and bus drivers with the new olive drab whipcord uniforms which have been ordered for them. Superintendent Emery had charge of the job.

"We want to have 'em all fitted out so they can appear as a unit in the new uniforms in a few days," said Mr. Emery, puffing vigorously and perspiring. "But at the present rate of speed we will have 'em all ready to make their bow to the public soon. I cannot give a definite date. It all depends on the outcome of this fitting process. But it will be either the 10th or the 15th of this month," he said.

The new uniforms have the new army roll collar. Hats to match also have been provided and heads of the several hundred motormen, conductors and bus drivers are furnishing another interesting phase of the outfitting process.—*Toledo Blade.*

Hartford Loses Tax Suit to Connecticut Company

The city of Hartford, Conn., has lost its suit against the Connecticut Company to collect a yearly tax of 2 per cent of the gross fares. The railway paid this 2 per cent tax from 1894 to 1923, and the total for the period amounted to $677,000. Judge Newell Jennings in his finding said that the tax was illegal. The ancient ruling of the City Council of Hartford reads in the records as follows:

> The directors shall pay into the city treasury each year 2 per cent of the annual gross receipts of fares as evidenced by such reports, until such time as the state law shall be so changed as to provide that taxes of street railways shall be paid locally instead of to the state, and in case of such change in the law, the company shall pay annually to the city any deficiency in the amount of the said taxes from the amount of the said 2 per cent on the receipts of the aforesaid.

The counsel for the railway contended that the levy was a tax and therefore illegal. The city contended the payments annually were for the privilege of electrifying lines in 1894 under the Tucker grant. To support the railway Judge Jennings stated: "I find as a fact, upon all evidence, that this levy was and is a tax."

Important New Subway Station Opened in New York

The New York Transit Commission, the Queensboro Chamber of Commerce and several civic organizations arranged an elaborate program to celebrate the opening of the Seventh Avenue (Times Square) station of the Queensboro subway on March 14. The new station, in conjunction with the Interborough Seventh Avenue line and the Times Square-Grand Central station shuttle line of the Interborough, consists of four levels. It is one of the most commodious subway stations in the world and will relieve the present congestion at Grand Central, where the former terminus of the Queensboro line is located. There is a Queensboro station at Fifth Avenue and 42d Street, but because of traffic conditions most of the passengers who use the Queensboro line board and leave trains at Grand Central. A considerable portion of this traffic transfers from the Seventh Avenue line of the Interborough and reaches Grand Central by shuttle. All of this traffic will be handled in the new four-level station at Seventh Avenue and 41st Street.

The entire extension of the Queensboro subway from Grand Central Station westward under 42d Street, to the rear of the Public Library, thence under 41st Street and west to Eighth Avenue, with the Seventh Avenue connection with the west side subway of the I.R.T., was constructed by the Powers-Kennedy Contracting Corporation. The contract price for the entire extension was $3,867,138. Of this, approximately $1,500,000 has been expended for the section from Fifth Avenue to Eighth Avenue, including the cost of the station and its equipment. Immediately after the exercises the Interborough put in effect a regular schedule, approved by the Transit Commission.

$300,000 Improvement Program for Beaver Valley

Probably in no other section does the paving question have so many ramifications as in the Beaver Valley, where the management of the Beaver Valley Traction Company, New Brighton, Pa., must deal with the official body of some 26 incorporated boroughs or towns, varying in size from 700 to 18,000 population and each one urging its particular program of street improvement, which invariably involves a portion of the lines. Here, as elsewhere, the company seeks relief from the paving burden which belongs to the horse car days when Dobbin did the damage. This is realized by many of the officials in the various towns and the many other favorable factors in the company's public relationship are rapidly breaking down all prejudice and the management sees, in the very near future, the elimination of the paving burden. In fact, a suitable contract, superseding a most unfavorable one, has already been made with one of the largest towns in the district.

In view of the possibility of being totally relieved of this burden a program for the rehabilitation of equipment and track has been devised. The purchase of six new cars leads the list. This will be followed with the rebuilding of several miles of track, replacing portions which were not kept up in the years past when dollars were scarce and revenues unequal to the equipment, labor and paving charges.

The change of public sentiment is perhaps best indicated by the fact that the company now has 15 miles of track on paved streets on which it has been relieved of all paving requirements.

In Ambridge, a town of 17,000 population, the street over which the lines are operated was improved. At the same time the company laid new track. This was under a franchise requiring that the town pay the cost of the paving and maintain it. The company is then to pay, if earned, a rental of $1,200 a year, after operating expenses, taxes and interest on bonded indebtedness have been deducted from revenues.

Approximately $300,000 is to be spent on the improvements to be made.

News Notes

Brooklyn "L" Removal Bill Signed.—Governor Smith of New York has signed the Hearn bill as chapter 374 of the laws of 1927 authorizing the city of New York to acquire by condemnation the right to remove the elevated railroad structure from Fulton Street and other streets and avenues in the Borough of Brooklyn and to assess the cost and expense thereof upon property benefited thereby.

Will Make Survey of Other Lines.—An inspection tour of electric railways in the principal cities of the country is being made by eight men experienced in railway operation under the direction of J. M. Loftis, superintendent of transportation, and A. J. Fink, superintendent of traffic and schedules of the Pittsburgh Railways, Pittsburgh, Pa. By this study of other systems the Pittsburgh Railways expects to discover improvements and advances in transportation that can be adjusted to its own lines.

Transportation Plan Under Consideration.—Mayor Frank X. Schwab of Buffalo has asked members of the City Council to consider plans for a transportation policy in anticipation of the opening of the new Peace bridge, which spans the Niagara River between Buffalo and Fort Erie, Canada. The Mayor recommended a municipal bus line from the retail shopping zone of the city to the American approach of the new bridge, to be opened early this summer.

Rate-Fixing Bill Killed.—The Minnesota Legislature in St. Paul has killed in committee of general legislation a bill to fix 6 per cent as legal rate of earnings for electric railways. The rate fixed by the Railroad and Warehouse Commission is 7½ per cent. The bill was sponsored by Representative Frank Starkey, St. Paul, and was designed to amend the Brooks-Coleman act, which placed the rate fixing power with the commission.

New Route Book in Los Angeles.—A new booklet entitled "Seeing Los Angeles by Yellow Car and Bus" has been published by the Los Angeles Railway, Los Angeles, Cal. This booklet contains information on places of interest in Los Angeles and how to reach them by street car or bus. It also contains schedules of owl car service on the various lines. Copies of these booklets are being distributed among the divisions for the use of conductors.

Would Increase Token Rate. — The Illinois Power & Light Corporation has applied to the Illinois Commerce Commission for authority to change its fares in Peoria, Ill., from seven tokens for 50 cents to three tokens for 25 cents, with a continuation of the present 10-cent cash fare. The nickel permit fare will be dropped under the new schedule. The company says that since the present schedule, put in force in 1922, it has failed by $200,000 annually to meet a fair return on its investment.

Intercompany Transfers Issued. — Issue of 1-cent transfers between cars of the Capital Traction and the Washington Railway & Electric Companies at New Jersey and New York Avenue in Washington, D. C., was authorized on April 7 by the Public Utilities Commission. The intercompany transfers will be issued, however, only by northbound cars on New Jersey Avenue to eastbound cars on New York Avenue and by westbound cars on New York Avenue to southbound cars on New Jersey Avenue.

One Mayor Expresses Views on Paving Ruling.—At a meeting of city officials of the state of New York to be held at Niagara Falls on May 31 legislation to relieve electric railways of any of their tax burdens will be discussed. The railways seek to amend the paving law to require them to pave only 8 in. on each side of a rail instead of paying for the pavement between the rails and 2 ft. outside. Mayor Clarence J. Cook of Binghamton, N. Y., is quoted as saying he believed that taxes paid by the electric railways were low enough and that the paving imposition might be considered as part of rental.

Ten Cents in Port Chester.—The fare on the new bus line of the County Transportation Company, Inc., within the village of Port Chester, N. Y., is 10 cents. Books containing twenty tickets each will be sold for $1 to pupils under eighteen years of age attending public or private schools having similar grades. Free transfers are given between the bus lines as well as to cars of the New York & Stamford Railway. The order became effective on April 3.

Rebus Contest in Grand Rapids.—Still further to stimulate riding and to familiarize the people with the names of its new electric rail coaches and other cars, the Grand Rapids Railway, Grand Rapids, Mich., has put on a rebus contest, with $100 in cash prizes, 25 special prizes—74 prizes in all. *Trolley Topics*, published monthly by the Grand Rapids Railway, explains the terms of the contest, which began on April 1 and ends on April 30. Of the 76 electric rail coaches and street cars with names in Grand Rapids, 27 are represented in the rebus sketches which the railway presents in the form of a contest open to everybody except employees. All are urged to familiarize themselves with the street car names, study the sketches and solve the puzzles. Answers will be judged by a committee and correct answers and names will be announced as soon as possible after April 30.

Commission Without Right to Order Extension.—The Fresno Traction Company, Fresno, Cal., has never dedicated its property to the service of the "Fink-Smith" district of that city. This was the ruling of the California Railroad Commission on April 5. The commission also held that it was without jurisdiction to direct the company to make the desired extension under the previous ruling of the California Supreme Court in the suit of the Hollywood Chamber of Commerce. This ruling compelled the commission to order a railway to construct an extension of its line. The city of Fresno filed a complaint with the Railroad Commission against the Fresno Traction Company and asked the commission to require that company to extend its tracks into the so-called "Fink-Smith" district.

Traction Line Hauls Large Quantities of Coal.—In spite of the strike of the union coal miners in the southern Indiana field, the Evansville & Ohio Valley Traction Company and the Evansville, Suburban & Newburgh Traction Company, the last named company operating from Evansville to Boonville and Evansville, are hauling a large amount of coal. The non-union coal mines in the southern Indiana fields are being operated steadily and as a result the electric railways are taxed to capacity to haul the coal into Evansville, from which city it is shipped to other markets. The wagon mines also are being operated and coal from many of these mines is hauled several miles in wagon to the nearest switch on the Evansville, Suburban & Newburgh line. It seems likely that most of the coal mines in the "pocket" will be operated to capacity all summer.

Recent Bus Developments

Bus Law in Lansing Upheld

The city ordinance of Lansing, Mich., prescribing routes for interurban and suburban buses was upheld by the State Supreme Court on April 1 in deciding the case carried up by the Highway Motor Bus Company and other bus lines operating in the city of Lansing. The bus companies sought to restrain the city from enforcing the ordinance. They brought action against the city in the Ingham County Circuit Court, claiming the city had no right to force the buses to operate on certain streets in Lansing.

Judge Leland W. Carr of the Circuit Court upheld the ordinance and after an appeal of the plaintiffs the Supreme Court affirmed the decree of the Circuit Court.

Taxicab Operation in Cincinnati Under Control

The City Council of Cincinnati, Ohio, passed an emergency ordinance on March 16 requiring taxicab owners to carry insurance against personal and property damage. The policies for personal injuries to passengers must provide a $5,000 liability for a single personal injury and $10,000 for two or more persons for any one licensed vehicle. Damage to property must be covered by $1,000 insurance for one cab.

In the case of property damage the insurer has the option of limiting his total liability as follows:

For not more than two public vehicles	$2,000
For each vehicle in excess of two, not in excess of five	1,000
For each vehicle in excess of five, not in excess of ten	750
For each vehicle in excess of ten, not in excess of 25	500
For each vehicle in excess of 25, not in excess of 50	300
For each vehicle in excess of 50	200

Tax Subject Under Discussion in St. Louis

The St. Louis Bus Company, the bus auxiliary of the United Railways, St. Louis, Mo., paid taxes the past year of $155,306, or almost double that of the preceding year. The competing bus company, the People's Motorbus Company, for the last year paid the city $63,803 in a special tax on the basis of 3 per cent of gross receipts. In the previous year this tax totaled $66,909.

The legislative committee of the St. Louis Board of Aldermen on April 6 voted to shelve the bill to raise the special tax on bus companies from 3 per cent to 5 per cent of their gross receipts. Mayor Miller and Director of Streets and Sewers Brooks and Street Commissioner Joseph Slater had advocated the passage of the bill.

Mayor Miller, comparing the taxes paid by the People's Motorbus Company with those of the United Railways, contended that the 5 per cent tax bill would tend to equalize the taxation of these public utilities. Richard W. Meade, president and general manager of the People's Motorbus Company, answering Mayor Miller's contentions, presented to the aldermanic committee a memorandum on the comparative tax assessments of the United Railways and the People's Motorbus Company.

New York Board Still Marks Time on Bus Proposals

No solution of New York City's bus problem was reached on April 8 at a hearing before the Board of Estimate. Mayor Walker did announce his intention of moving for a vote on the award of bus franchises at the next meeting of the board on April 21. There was no indication, however, that he would be able to get the twelve votes in the board necessary to award the franchise for Manhattan, Brooklyn and Queens to the Equitable Coach Company, which he favors, or that the board would vote to award the franchises for the Bronx and Richmond.

Substitution an Issue in Tarrytown

No action was taken at the meeting at Tarrytown, N. Y., on April 11 on the matter of local transportation there. It was a joint conference between the boards of Tarrytown and Elmsford and the town of Greenbush, comprising the whole township, and among those who attended were Judges Duell, McDowell and Seely. President S. W. Huff of the Third Avenue Railway and counsel for that company explained the position of the railway in the matter. Railway officials favor the continuation of that service, but the cost to the company of improving the roadbed under the repaving program proposed by public officials would be more than $300,000. This is an expenditure the railway considers prohibitive. The present fare by trolley is 5 cents in the zone from White Plains to Elmsford and 5 cents from Elmsford to Tarrytown. The fare suggested by bus is 10 cents from White Plains to Elmsford and 15 cents from Elmsford to Tarrytown. The next meeting to consider the matter is subject to call by Supervisor Williard.

Indiana Service Seeks to Abandon Unprofitable Bus Lines

Authority to discontinue approximately 135 miles of intercity bus lines in northeastern Indiana is asked in a petition filed with the Indiana Public Service Commission by the Indiana Service Corporation, Fort Wayne. The lines over which the company proposes to abandon service are between Fort Wayne and Marion, 57 miles; Fort Wayne and Angola, 46 miles; Angola and Crooked Lake, 10 miles, and Angola and Coldwater, Mich., 22 miles. Interurban electric railway lines are operated by the same company between Fort Wayne and Marion and between Fort Wayne and Waterloo, near Angola.

In a statement accompanying the petition, Robert M. Feustel, president, said that the thirteen months ended Jan. 31, 1927, had shown a net operating loss of $19,411 on the Fort Wayne-Marion line. Income, he said, was $8,083, as against operating expenses totaling $27,494.

Blue Goose Fare Increased.—Fare on the Blue Goose Bus Line, operated between St. Louis, Mo., and Alton, Ill., by the Alton Railway, affiliated with the East St. Louis & Suburban Railway, has been increased from 65 cents to 90 cents for one way. The new rate became effective on April 10. The interurban fare on the cars of the St. Louis & Alton Railway will continue at 85 cents for one way or $1.50 for the round trip.

Bus Patronage Disappointing.—The Connecticut Company, which recently opened a new bus line between Newington Junction and Hartford, Conn., via West Hartford, has not carried the expected patronage. The Board of Selectmen of Newington is to take steps to advertise the advantages of the service offered by the railway. Schedules are to be printed and personal letters sent to the people, especially those who petitioned for the route.

Bus Service Starts.—The Washington, Baltimore & Annapolis Electric Railroad installed on April 1 a new, comfortable and de luxe coach service between Washington and Annapolis over the new National Defense Highway. Coaches leave Washington daily, including Sundays, at 9:30 a.m., 1:30 p.m. and 5:30 p.m. and leave Annapolis, including Sundays, at 8:30 a.m., 1 p.m. and 5 p.m. The one-way fare is $1.22 and the round-trip fare $2.32. Children under twelve years of age are carried at approximately half fare. Buses also serve intermediate points en route at proportionate fares. In Washington buses stop at all of the principal downtown hotels. This is in addition to the electric railway service that has been operated for years by the Naval Academy Junction Line.

Bus Service Replaces Railway.—The Northampton Street Railway discontinued its railway service between Northampton and Hatfield, Mass., at the close of business on April 13 and started bus operation in its place. This was the last link in the route from Northampton to Greenfield, formerly operated by the Connecticut Valley Street Railway. Tracks above North Hatfield are already removed and those from North Hatfield south to Northampton will be removed soon.

New Bus Project Made Known.—Plans have been announced by Mayor Frank X. Schwab of Buffalo, N. Y., for the establishment of another municipal bus line, although all previous attempts to operate municipal buses in Buffalo have resulted in failures. The latest idea of the chief official is to operate municipal buses in Kensington Avenue from Bailey Avenue to the easterly city line at a 5-cent fare with a 3-cent half-fare charge. The International Bus

Corporation, a subsidiary of the International Railway, and the Buffalo Motor Coach Company, Inc., have applications pending for the operation of buses in this section of the city where there are now no transportation facilities.

Eight Cents on Bus Line.—An 8-cent fare has been established between any two points in the city of Hudson, N. Y., on the bus line of the Eastern New York Transportation Corporation. Tokens, each good for a continuous trip between any two points, will be sold 17 for $1, but will not entitle the passenger to transfer to interurban cars of the Eastern New York Utilities Corporation, the parent company. Transfers to the interurban cars of the latter company will upon request be issued by operators of buses which connect with the cars and which buses are so marked. Valid single trip and commutation tickets, good on Eastern New York Utilities cars, will be accepted as part of a continuous trip. Tokens will not entitle passengers to transfers.

Double-deckers on Pleasant Sundays.—All single-deck coaches heretofore operated on the Morningside and Highland-Virginia Avenue lines of the Georgia Power Company, Atlanta, Ga., are to be replaced by double-deck coaches on all pleasant Sundays during the summer months. The schedules on Sundays are to be the same as the daily schedules. Both lines are operated through some of the most beautiful residential sections of the city.

Working Out Bus Schedule. — The Northland Transportation Company, Minneapolis, Minn., has bought the Mesaba Railway Coach Company, which serves communities between Aurora and Hibbing and has local runs in Virginia and Eveleth. The transaction is subject to the approval of the State Railroad and Warehouse Commission. The acquisition of this property gives the Northland company virtual monopoly of the transportation business on the range. The company already has a bus line running from Duluth north through Virginia and it is understood that buses on the line running east and west through Virginia will be scheduled to connect with buses on the north and south line out of Duluth. Abandonment of the electric line has been ordered by the federal court.

Railway Supplies Service; Bus Petition Denied.—The Public Service Commission has denied the petition of William A. Stone, doing business as the Silver Lake Park and White Plains Bus Line, for permission to operate a bus line in White Plains, N. Y. When this petition was filed the Silver Lake railway line was not in operation, as the receiver of the Westchester Street Railroad had discontinued service. The proposed bus line was intended to serve substantially the same section of White Plains as this branch of the railway. Subsequently, the Westchester Street Transportation Company, Inc., which succeeded the electric railway and is owned by it, resumed service and also obtained the consent of the city and the Public Service Commission to substitute buses for street cars. It was the opinion of the commission that the operation of a bus route in addition to the railway was not necessary.

Financial and Corporate

$58,157,236 Value at St. Louis

State Commission Allows $6,395,888 for Additions Made to United Railways Property Since Year 1919

The United Railways, St. Louis, Mo., earned a return of only 4.2 per cent on its properties during 1926, a report of auditors for the Missouri Public Service Commission filed at Jefferson City on April 2 shows.

The audit sustains the contention of Receiver Rolla Wells that the company operated at a loss during 1925 and 1926 after paying interest on bonded indebtedness. The net loss for 1925 was $172,247 and for the first ten months of 1926 the deficit was $52,730, the report shows.

As a result of the audit the new valuation of the railway's properties for rate-making purposes is $58,157,236, including $6,395,888 in additions since 1919, when the valuation was found to be $51,761,348.

The auditors found the amount available for return in the first ten months of 1926 was only $2,039,886 and on that basis estimated the total for the entire year at $2,447,864. This is only 4.2 per cent of the $58,157,236 valuation.

The audit was made to determine the net amount of expenditure for additions and betterments between Jan. 1, 1919, and Oct. 31, 1926, and to determine results of operations in 1926 up to Oct. 31.

The auditors were J. J. Murphy, chief accountant for the commission; H. W. Ross, accountant in charge, and George B. Coleman, A. L. Houlehan and H. B. Lysaght. The investigation revealed:

Average requirements for working capital, $2,109,105.

Gross operating revenues for 1925, $18,913,332; operating expenses, taxes, depreciation, $16,445,402; net, $2,467,929.

After adding non-operating income and deducting interest, discounts and miscellaneous the deficit for 1925 was $172,247.

For first ten months 1926 operating revenues were $15,671,311 and operating expenses, taxes and depreciation $13,631,424, leaving a net revenue of $2,039,886. After adding non-operating income and deducting interest, discounts and miscellaneous items the deficit for the ten months was $52,730.

The estimated amount available for return in 1926, based upon first ten months, was $2,477,864, compared with $2,467,929 in 1925.

The audit revealed the payments for personal injuries and property damage claims in the period April 12, 1919, to Oct. 31, 1926, were $8,000,000.

The credit balance in the depreciation reserve as of Oct. 31, 1926, was increased by almost $900,000 by the auditors in their adjustments, which showed credits of $1,004,356 and debits of $114,931.

The total estimated liability of the company for personal injuries and damage claims as of Oct. 31, 1926, was $1,549,840, while the balance in the reserve on that date was $645,629, a deficit of $904,210. The company has based its credits to this reserve at 6 per cent of gross receipts.

In their report the auditors expressed the opinion that a fixed percentage of gross revenues does not appear to be the best method for measuring the cost of injuries and damage claims since fares and gross revenues may go up or down without affecting traffic accidents. The report stated that "in our opinion 'cost per car-mile' is a more scientific method for measuring injuries and damages."

Receiver Wells filed his first petition for a higher fare some months ago. The city then demanded an audit of the company's books to determine whether an increase was warranted. From Feb. 5 to March 1 under a federal court injunction the company charged a fare of 8 cents, with two tokens for 15 cents, but this rate was later set aside by a special federal court of three judges.

The company now has an application for increased fares pending before the commission. A fare of 8 cents, with two tokens for 15 cents, has been asked. In view of the findings of the auditors for the commission it is very probable the company will be granted the increase.

The bringing of the company's valuation up to date is expected to speed up the negotiations between Mayor Miller and the reorganization committee on a new franchise for the railway under the service-at-cost plan.

$1,885,000 Boston "L" Issue Offered

A syndicate composed of Paine, Webber & Company, White, Weld & Company, Stone & Webster & Blodget, Inc., of New York, and the First National Corporation, Boston, offered for subscription on April 14 $1,885,000 of ten-year 5 per cent gold bonds of the Boston Elevated Railway, Boston, Mass. They were priced at 100¾ and interest to yield 4.90 per cent. The bankers stressed the point that the net earnings are about 2¼ times the rentals and interest charges.

$7,000,000 Cincinnati Street Railway Issue

A syndicate headed by the Guaranty Company, New York, and W. E. Hutton & Company offered publicly on April 11 $7,000,000 of first mortgage series A 5½ per cent gold bonds of the Cincinnati Street Railway, Cincinnati, Ohio, to mature April 15, 1952, at 100 and accured interest, to yield 5½ per cent. The issue has been authorized by the Director of Public Utilities of the city of Cincinnati and the Public Utilities Commission of Ohio, and the proceeds will be used to retire outstanding $4,500,000 of 6 per cent notes, to reimburse the company for capital additions heretofore made and to provide funds for further additions and other corporate purposes.

The bonds will be a direct first lien on all fixed property and all equipment now owned by the company, except a part of the company's railway cars on which there is a prior lien represented by $711,400 outstanding equipment trust certificates.

Changes in Foshay Company Corporate Structure

Although the W. B. Foshay Company, Minneapolis, Minn., has sold its controlling interest in the Peoples Light & Power Corporation, its utility business will continue as in the past. The Foshay company now operates electric, gas and artificial ice properties in Nogales, Ariz., and Nogales, Mexico. valued at $1,600,000. It has under contract electric and gas properties which are in operation in Vermont, Kansas and Idaho.

The name of the W. B. Foshay Company's new public utility holding company will be Public Utilities Consolidated Corporation. This corporation will operate the Arizona company, which will be called Public Utilities Arizona Corporation. When public utility properties which are under contract in other states are taken into the holding company, they will be known as Public Utilities Vermont Corporation, Public Utilities Kansas Corporation and Public Utilities Idaho Corporation.

Readjustment in Grand Rapids

Voluntary Recasting of Financial Structure of Grand Rapids Railway Proposed—Financing Can Be Done Now Only Through First Mortgage Bonds—The Details

A PLAN of readjustment has been suggested for the Grand Rapids Railway, Grand Rapids, Mich., which contemplates the organization of a new company to take over the assets of the present company and the cancellation of all of its common stock, and extinguishment of $600,000 of its indebtedness through the issue of common stock of the new company, and the exchange of preferred stock on the basis of two shares of new company common stock for one share of present preferred stock, the depositors of which are also offered subscription rights. The plan also provides for the authorization of additional preferred stock by the new company to provide funds further to reduce existing indebtedness and for other corporate purposes.

CAPITAL EXPENDITURE SITUATION OF GRAND RAPIDS RAILWAY

Payments:		
Bonds maturing June 1, 1919..		$3,700,000
Construction from June 1, 1919, to Dec. 31, 1926		1,411,892
Reacquirement of $229,000 first mortgage bonds of present issue through sinking fund, etc.		206,000
Total payments for capital purposes		$5,317,892
Receipts:		
$3,200,000 first mortgage bonds sold....	$2,944,000	
Insurance moneys received on account of Hall Street carhouse property and cars destroyed by fire	368,395	
Provided out of earnings and reserves..	559,298	3,871,693
Leaving net increase in debt junior to first mortgage bonds amounting to		$1,446,199
Now represented by:		
Gold debenture 7 per cent	$700,000	
Car trust notes	198,045	
Increased amount of paving assessments not due	69,977	
Increased amount of accounts payable ..	58,218	
Advances payable ..	245,458	
Bank loans	174,500	

It is explained that the changes suggested are deemed advisable at this time because of the large floating indebtedness of the old company and its lack of a medium for doing any financing other than through first mortgage bonds which cannot be issued and sold in sufficient amount or at advantageous prices in view of the company's present condition. The present floating debt position dates back to June 1, 1919, when three-year bonds amounting to $3,700,000 became due, which bonds were in turn issued to refund the long term 5 per cent bonds originally issued in 1900. The capital expenditure situation since June 1, 1919, is shown in the accompanying table.

The present outstanding first mortgage bonds require sinking fund payments of $80,000 annually and the car car trust notes become due about $8,000 a month or approximately $98,000 a year until their final maturity May 26, 1929. Thus these two items alone constitute a cash requirement of about $178,000 a year. It is believed the consummation of the plan will enable the company again to sell its first mortgage bonds at prices more nearly approaching par, and an agreement has been reached for the sale of $200,000 of first mortgage bonds upon the plan being declared operative, the proceeds to be applied to the retirement of all the car trust notes, thus ending the monthly drain on the cash resources on their account, which with saving of interest on the $600,000 debt canceled will reduce the annual cash outlay by about $140,000. The proceeds from the new preferred stock will be applied first to the liquidation of bank loans and thereafter to the liquidation of other indebtedness and thereby improve the current asset position and thus to that extent free the cash derived from earnings and make it available for payment of dividends, first on the new preferred stock and then on the new common stock.

The 100,000 shares of new common stock are to be issued in consideration of the extinguishment of $600,000 of present outstanding debt of the Grand Rapids Railway (i.e. cancellation of $245,000 advances payable and $355,000 gold debenture 7 per cent bonds), the cancellation of $2,000,000 par value of old common stock and the making to the holders of the old preferred stock of the exchange and subscription offers outlined in the plan. Assuming that all the holders of old preferred stock exchange and subscribe to the full amount of new preferred stock offered under the plan, there would result:

100,000	shares new common stock issued
40,000	shares new common stock to holders of 20,000 shares old preferred stock
60,000	shares new common stock representing consideration for extinguishment of $600,000 of debt
15,000	shares new common stock of which will be delivered if entire $300,000 new preferred stock offered under the plan is subscribed
45,000	shares remaining in hands of holders who cancelled the $600,000 of debt
15,000	shares of which will be reserved for delivery upon payment to them of $10 per share upon exercise of options expiring May 1, 1929. delivered to subscribers under the plan.

The earnings position of the new company, based upon all matters outlined in the plan as applied to the actual earnings for twelve months ended Feb. 28, 1927, will be:

Gross earnings	$1,774,748
Operating expenses and taxes:	
Operating expenses	1,091,267
Taxes	153,671
Total	$1,244,939
Gross income available for fixed charges, retirements and dividends	$ 529,809
Annual interest at 7 per cent on $3,171,000 mortgage bonds...	221,970
Interest on $219,500 debentures	15,365
Interest on unpaid paving assessments	5,052
Total interest and other fixed charges	$ 242,387
Balance	$ 287,421
7 per cent on $300,000 preferred stock	21,000
Balance available for retirements and other purposes.....	$ 266,421

In September, 1922, an ordinance ratified by the voters granted the Grand Rapids Railway a 30-year franchise and provided a sliding scale of fares based on net return upon valuations agreed upon in the franchise. This franchise will be assumed by the new company. The original value placed upon the property was $5,500,000 as of Jan. 1, 1922, which with subsequent additions to Feb. 28, 1927, amounts to $6,043,234. The rates of fare now in effect, viz., 10 cents cash and six tickets for 50 cents, were instituted at the beginning of 1925, at which rates the property is entitled, according to the franchise terms, to earn a return of 7¾ per cent on its value after deduction of operating expenses and taxes, and an amount equal to 3 per cent of the value of the property for retirement reserve. As of Feb. 28, 1927, the deficit in the automatic fare equalization account was $423,173; in other words, that is the amount that the property failed to earn the return allowed under the franchise from its date to Feb. 28, 1927. It is estimated that if the full return allowed by the franchise is realized the earnings would be increased $98,912.

Deducting from $266,421 the balance of earnings previously indicated, 3 per cent of the present value of the property for retirement reserve, or $181,297 there would remain available $85,124, or 85 cents a share on the 100,000 shares of the new company common stock to be issued and outstanding. If the charge for retirement reserve were modified to 2 per cent or $120,864, an amount the management believes adequate in view of the present excellent condition of the property, the sum of $145,557 would be available for the 100,000 shares of common stock of the new company, to be issued and outstanding. This would mean a return on the stock at the rate of $1.45 per share.

Deal on for Newport Electric Corporation

Offer of $150 a share on option has been made for control of the Newport Gas Light Company by the Utilities Power & Light Corporation of Chicago. The Colonial Gas & Electric Light Company, which controls Newport Electric Corporation, is a subsidiary of Utilities Power & Light. No action either toward recommending or advising against sale has yet been taken by the directors. The Newport Electric Corporation operates 22 miles of electric railway and city and interurban bus service in which nineteen buses are used.

$159,000,000 in Boston "L" Against $25,000,000 in 1897

A chart prepared by the Boston Elevated Railway, Boston, Mass., shows some of the important facts regarding the Boston Elevated Railway in terms of increase from 1897.

At present the investment of about $159,000,000 in the property is roughly 530 per cent greater than that of 1897, which was somewhat more than $25,000,000. The investment has on the whole increased steadily, with a rapid increase in 1917-1918, and very slight increases in some years, such as 1912-1913, 1919-1921 and 1924-25. The average annual investment has been about $4,500,000.

Revenue passengers carried have about doubled, but since 1914 the annual total has remained fairly constant. Riding, however, has increased faster than the population.

The population is now a little more than 50 per cent greater than in 1897, and is still rising, although somewhat slowly at the present time.

The relation of riding and population is reflected in the revenue rides per capita, which in 1917 were 50 per cent greater than in 1897. The increase in fare which the trustees found necessary as soon as they took hold of the property resulted in some falling off. This loss has since been recovered in part. While the total of revenue passengers is about as great now as ever, the population increase lowers the ratio.

Eastern Massachusetts Does Well

Intensive Merchandising of Service Helps Road Operating in Suburban Boston Territory

The Eastern Massachusetts Street Railway, Boston, Mass., reports for 1926 an increase of $149,855 over 1925 in revenue from all sources, but the cost of operation before taxes, interest and rental charges was $182,484 greater than the previous year. In 1926 the company failed to earn operating expenses and depreciation (not including taxes and interest) by $62,207, compared with a loss of $82,823 in 1925.

Revenue from all sources in 1926 was $9,788,035, an increase over 1925 of $149,855. Expenses including depreciation, taxes, etc., in 1926, were $7,807,332, an increase over 1925 of $199,295. Gross income in 1926 was $1,980,703, a decrease from 1925 of $49,440. Interest and rentals, etc., in 1926 were $1,245,865, a decrease from 1925 of $45,955. Net income available for dividends in 1926 was $734,838, a decrease from 1925 of $3,485.

Dividend payments of $866,522 were made in 1926 as follows:

First preferred	$249,165
Sinking fund	1,929
Preferred B	179,868
Adjustment	435,560
Common	none

On the first preferred and sinking fund stocks payments of 3 per cent were made on Feb. 15 and Aug. 15. On preferred B, payments of 3 per cent were made on Feb. 1 and Aug. 1. On adjustment stock, payments of 2½ per cent were made on April 1 and Oct. 1.

Bonded obligations were retired and paid at maturity as follows: $131,000 Bay State equipment 6's due Aug. 1, 1926; $300,000 Eastern Mass. series A 6's, due Jan. 1, 1927; $115,000 Eastern Mass. series C 6's, due Feb. 1, 1926; $2,500 par sinking fund stock, series 7, due Feb. 1, 1926, paid and canceled.

The largest factor in the increased expenses was the additional burden imposed by a board of arbitration which not only granted the blue uniform, line, power and rolling stock and miscellaneous employees on increase of 1½ cents an hour but also established an eight-hour day and time and one-half for all overtime.

As compared with 1924 and 1925, when there were decreases of $993,343 and $449,395 respectively, an increase in 1926 of $136,501 in revenues is encouraging. This increase is attributed in a considerable measure to an advance in ticket fares which took effect on Oct. 1, and to weather conditions in November and December, the early snows and low temperature causing private automobile owners to store their machines and ride in street cars.

The percentage increase in riding for these two months was substantially the same throughout the system. Total passenger car miles operated in 1926 were 17,731,483.

Realizing that the principles of merchandising must be applied to the railway as in every other business, the company has pursued the policy of improving its cars by large expenditures for painting, various up-to-date devices and the installation of de luxe seating and lighting facilities and linoleum flooring. This program will be consistently followed. In this connection the company now operates between Brockton and Mattapan, Lowell and Everett terminal and Lawrence and Everett terminal high-speed cars of the very latest type at popular reduced rates of fare. Increased earnings are reported on all three of these de luxe lines.

In addition the company has recently purchased 50 new light-weight, high-speed cars embodying the new ideas of comfort and convenience. These are to take the place of cars worn out in the service. Delivery is expected during May and June. The new cars will be paid for from the depreciation reserve accumulated for that purpose.

As might be expected, in view of the arbitration award, the cost of car operation was $162,380 more than in 1925, overshadowing all other items of increased expense. Wage comparisons for 1926 and 1925 follow:

	1926	1925
Wages two-man car operators	$158,683	$154,241
Wages one-man car operators	1,527,011	1,468,430
Wages carhouse employees	177,466	165,183

The cost of snow fighting in 1926 was $141,845, compared with $54,693 in 1925. Approximately 70 per cent of this was paid in wages.

Other increases in expenses were:

Way and structures	$8,273
Law expenses	13,429
Rent of track	7,355
General wages and expenses	12,591
Pensions	2,215
Stationery and printing	1,717
Miscellaneous expenses	23,857

The claim department made a very creditable showing, the total expenditures for the year being $262,165, the smallest yearly amount since public control began and less by $32,495 than the previous year. Other decreased expenditures were for: equipment, $24,-

INCOME STATEMENT OF EASTERN MASSACHUSETTS STREET RAILWAY

	1926	1925
Street car revenue	$8,699,914	$8,563,413
Auto bus revenue	321,317	278,758
Express and other revenue	41,879	42,757
Rentals, advertising, etc.	198,051	205,713
From sale of power	272,527	†313,248
Interest and other income	254,347	234,291
Total revenue	$9,788,035	$9,638,180
Expenses:		
Way and structures	$1,229,616	$1,221,343
Equipment	1,230,046	1,254,192
Power	1,281,790	†1,277,787
Car operation	2,378,475	2,216,095
Injuries and damages	262,166	294,661
Insurance	73,810	84,895
Law expenses	40,255	26,826
Rent of tracks	80,167	72,812
General wages and expenses	235,724	223,133
Pensions	23,045	20,830
Group insurance	64,866	64,402
Stationery and printing	37,201	35,484
Stores and garage expenses	53,299	61,316
Miscellaneous expenses	68,210	44,353
Auto bus expenses	383,524	361,581
Total operating expenses	$7,442,194	$7,259,710
Total operating expenses and taxes	$7,807,332	$7,608,037
Gross income	1,980.703	2,030,143
Interest and rentals	1,245,865	1,291,820
Net income	$734,838	$738,323

Operating expenses include charges for depreciation amounting to $917,940 in 1926 and $898,254 in 1925. During 1926 $745,578 of the depreciation reserve was applied to reconstruction and amortization.

† Of the amount $313,248 in 1925—$304,930 was included in report for 1925 as a reduction to power expense; the difference, or $8,318 included with "rentals, advertising, etc."

146; insurance, $11,085; stores and garage expenses, $8,017.

The attitude of the trustees on the matter of bus operation is that where the company has rails and overhead construction in good condition and there is sufficient volume of business to warrant the continuance of electric cars, it would be unjust, not only to the owners of the property but to the riding public, to supplant street cars with buses. In densely populated areas the addition of a multiplicity of buses would throw an unwarranted burden upon communities whose principal highways are already overloaded with motor traffic. On the other hand, there are some small communities in which there are no peak loads and where the bus can be used to advantage and principally in the handling of this type of business the company operated in 1926 1,287,167 bus-miles, this being 207,451 more miles than in 1925. Wherever, in the territory served by the railway, the trustees know that there is only enough "pole to pole" transportation business for one responsible carrier, and there is a threat of bus competition they do not intend to be coerced or driven to establishing a duplicate and wasteful service. On this point the trustees say:

> Our duty to the car riders and the owners of this road is clear and we propose to perform it. Among those who would be first to condemn us if the fallacious reasoning of the advocates of paralleling street car lines with bus line were adopted and the inevitable higher fares and deteriorating service followed, would be these same, perhaps well-intentioned but misinformed, partisans of such an experiment.
>
> Wherever public convenience and necessity require service, this company, with permission from the proper authorities, will perform it, either with street cars or buses.

All of the bus lines operated in 1925 were continued in 1926. In addition bus operation was substituted for railway service between Rockland and Braintree and between Weymouth and Hingham, where the rails were worn out and rebuilding was out of the question because of its great cost and the comparatively small receipts of the route. Bus revenues for the entire system increased $42,559; expenses were $21,943 more than last year. The company now owns 65 buses and motor coaches, representing an investment of $458,608 and operates them in eighteen cities and towns.

It also runs an interstate route between Taunton and Providence, and during the summer months runs lines between Mattapan and Nantasket and Neponset and Nantasket. To aid in snow fighting on bus lines, seven caterpillar tractor snow plows were purchased during the year at a cost of $33,810. There are now 37 bus snow-fighting units on the system. During the summer months part of this equipment is available in connection with track and other types of construction.

Reference was made in the last annual report of the public trustees to the bill in equity brought by L. Sherman Adams, a stockholder, seeking to compel the public trustees to pay dividends claimed to have accrued on the common and adjustment shares of the company to Feb. 1, 1924. As stated in the last annual report, the master appointed by the Supreme Court to hear the evidence and find the facts filed his report on Jan. 29, 1926, after long hearings. The case was reserved upon the pleadings, the master's report and the exceptions of both parties for the consideration of the full bench of the Supreme Judicial Court. The case was argued March 18, 1926, and the opinion of the full bench of the Supreme Court was rendered on Oct. 2, 1926. In its opinion, the Supreme Court over-ruled the exceptions of the plaintiff and sustained thirteen out of fourteen exceptions of the defendants, and ordered a final decree to be entered dismissing the plaintiff's bill with costs.

The trustees point out that at no other period in the history of this company has the rolling stock throughout the system been in such good condition. They ascribe this as due to the systematic and intensive program of overhauling which was started several years ago. Every car in regular service has been through the repair shop, either at Chelsea or Brockton, painted inside and outside and thorough attention given to mechanical details. The results are apparent even to the casual observer. Twofold benefits are set down as having accrued from the establishment of this policy: the net cost of maintenance has been greatly reduced and the company also enjoys the advantage of doing business with well pleased customers.

In 1920, 14,336 crippled cars were taken out of service and pulled in the carhouses, this being at the rate of one defect for every 1,550 miles of operation. In 1926 only 685 crippled cars were pulled in, this being at the rate of one defect for very 27,110 miles of operation. In the Brockton-Mattapan, Lowell - Everett terminal, Lawrence-Everett terminal de luxe service, the rolling stock department outfitted nineteen cars at the cost of $1,500 a car.

Conferences Look Toward Sale of Hocker Line

Negotiations are under way for the sale of the Kansas City, Lawrence & Topeka Electric Railroad, a 12-mile interurban, known as the Hocker line, to the Kansas City Public Service Company, Kansas City, Mo. The line has been in receivership for the past eight years. It operates between Kansas City and Zarah, Kans., passing through Merriam and Shawnee where the chief patronage lay.

As a basis for the negotiation, W. K. Paul, superintendent of the line for the receiver, is preparing a complete report of the physical assets to be presented to officials of the Kansas City Public Service Company. It is known that Fred G. Buffe, vice-president of the Kansas City Public Service Company, made a survey of the Hocker line a year ago, prior to the termination of the receivership of his company.

The Kansas City, Lawrence & Topeka Electric Railroad was organized in 1907 by the late R. W. Hocker. All the stock of the company is held by the Hocker estate and by F. P. Dickson, president of the company. The original plan was to extend the line through to Topeka and a start toward this end was made in 1916 when the line, which ended at Shawnee, was extended to Sarah, a distance of 6 miles. The coming of the World War halted development.

Increase in Revenue in Boston.—For the month of January, 1927, the revenue of the Boston Elevated Railway, Boston, Mass., exceeded cost of service by $186,947 compared with an excessive revenue of $223,301 in January, 1926. The revenue passengers numbered 34,160,787, against 33,144,528 for January, 1926. In January of the current year 5,004,125 miles were operated, against 4,871,361 in January of the year preceding.

Jersey Issue Oversubscribed. — The offer of 30,000 shares of 6 per cent cumulative preferred stock of the Public Service Corporation of New Jersey, Newark, N. J., to customers of its subsidiary companies on April 1 has been oversubscribed. Subscriptions for 33,561 shares had been received from 6,818 persons at close of business on April 6. The average number of shares per subscription was less than five. This issue, sold in five working days, is a new record for the company.

Stock Issue for Improvements.—The Cleveland Railway, Cleveland, Ohio, has been authorized by the Ohio Utilities Commission to issue $2,904,600 in capital stock at $100 a share plus accrued interest. The additional money is to be used for extensions and improvements including the buying of buses and cars.

Investment Expert Discusses Chicago Issues.—Wm. Hughes Clarke, Chicago, dealer in investments bonds and stocks, has issued a circular in which he has reviewed earnings and other data covering the combined Chicago Surface Lines and the separate companies. He is also the author of articles contributed to the Feb. 26 and March 5 issues of the *Financial World* containing summaries covering the Chicago traction situation interesting to all who are concerned with electric railway operations and investments.

Oppose Abandonment.—Protests are being filed with the Public Service Commission to enjoin the Portland Electric Power Company from discontinuing 12 miles of interurban line between Montavilla Depot, Portland, Ore., and the town of Troutdale, Multnomah County. The company is applying for authority to discontinue the branch of service on the grounds that the operation of motor trucks and private automobiles has become so great that the railway can no longer operate with profit.

Authorized to Sell Land.—The Pacific Electric Railway has been authorized by the California Railroad Commission to sell to the Pacific Electric Land Company for the sum of $126,000 a number of parcels of land along its Newport Beach line, partly in the city of Long Beach, and partly in the city of Seal Beach, Orange County.

Union Street Railway Shows Deficit.—For the calendar year 1926 the Union Street Railway, New Bedford, Mass., reported a deficit of $1,748, after deducting dividends, which were equivalent to 6 per cent on the company's capitalization of $2,437,500. For 30 years previous the annual dividend had been 8 per cent. The profit and loss surplus as of Dec. 31, 1926, was $619,927. This company is the last with a 5-cent fare unit in Massachusetts; the railway now proposes a 10-cent fare.

Personal Items

Personnel Changes in Richmond

The election of William E. Wood to the presidency of the Virginia Electric & Power Company, Richmond, Va., to succeed Luke C. Bradley resulted in numerous advancements.

J. Franklin McLaughlin will be in charge of operations of the company with offices at Richmond.

Thomas P. Walker, who has previously been in charge of properties under Stone & Webster management in El Paso, Tex., will succeed Mr. McLaughlin as vice-president in charge of the Norfolk Division. T. Norman Jones, Jr., will become general manager of the Norfolk division. J. B. Hayes, formerly assistant to the president, will become general superintendent of transportation of the Norfolk division, reporting to the general manager of the Norfolk division. R. C. Hopkins succeeds Mr. Hayes as assistant to the president and to the vice-president in charge of operations.

Other changes include the following: Louis F. Riegel, heretofore sales manager for Richmond, will become general sales manager for the system, reporting to the vice-president in charge of operations. W. E. McCreery, sales manager of the Norfolk division, will hereafter report to the general sales manager. C. S. Stackpole, formerly of the sales department of the Norfolk division, will succeed Mr. Riegel as sales manager of the Richmond division and will report to the general sales manager. O. W. Morton, formerly assistant to the vice-president of the Norfolk division, will become sales manager for Norfolk, reporting to the sales manager of the Norfolk division. E. H. Hill, formerly assistant superintendent of the electric department of the Norfolk division, will succeed Mr. Morton as assistant to the vice-president of the Norfolk division. E. F. Turner will become superintendent at Fredericksburg, succeeding Mr. Venable.

W. L. Snodgrass Heads New Department in Fort Wayne

The Indiana Service Corporation, through Henry Bucher, manager of railways, recently announced that a separate department had been formed to handle all traffic matters. This new department was made necessary because the combined work of transportation and traffic matters, which has been handled by J. A. Greenland, had grown to a point where it was necessary to organize a new department.

The new department will be known as the traffic department. It will be under the direction of W. L. Snodgrass, with the title of superintendent of traffic. Mr. Snodgrass has had considerable experience in traffic matters and for some time past has been in charge of traffic solicitation for this company. Under the new arrangement he will move from LaFayette to Fort Wayne.

Mr. Greenland, superintendent of transportation, will continue to supervise all transportation matters.

N. T. Brown a Vice-President in Buffalo

Nelson T. Brown has been elected vice-president in charge of transportation of the International Railway, Buffalo, it was announced by Bernard J. Yungbluth, president of the corporation. Mr. Brown comes to Buffalo from Philadelphia, where he has been in charge of the bus division of the Philadelphia Rapid Transit Company for the last five years. He has been associated with railway interests in Philadelphia for 25 years. Mr. Brown has already assumed his new position in Buffalo.

F. M. Mills of Sioux Falls Honored

Frank M. Mills, president of the Sioux Falls Traction Company, Sioux Falls, S. D., celebrated his 96th birthday anniversary on April 4. He is said to be the oldest active electric railway executive in the United States. When a group of representatives of the Chamber of Commerce called to pay their respects and extend felicitations, he announced that he was confidently looking forward to his centennial year. Mr. Mills launched the Sioux Falls railway system more than twenty years ago. Much of the business is now handled by his son, Roger Mills, but the elder executive is daily at his desk.

Changes in Jersey

At a meeting on April 13 of the directors of the Public Service Corporation, operating the Public Service Railway, Newark, N. J., a few changes were announced. They are as follows:

Edward A. Armstrong, assistant general counsel, was appointed general counsel.

William B. Hartshorne was made assistant to the president.

Harry P. Chandler, recently appointed executive assistant, was made chairman of the welfare committee.

Arthur Bland Made Manager

Arthur Bland, who has been director of public relations for the Southern Ohio Public Service Company, with offices in Columbus, has been made manager of the company. He succeeds R. Z. Zimmermann, who is now associated with Day & Zimmermann, Philadelphia.

George J. Carney Joins McGraw-Hill Staff

George J. Carney, who has been assistant to the director of the Wisconsin Public Utilities Bureau since 1920, became an assistant editor of the *Electrical World* on April 1. His headquarters will be in Chicago for the present, and his editorial duties will involve general editorial assistance to F. R. Innes, the Western editor of the *Electrical World*. For the past six years Mr. Carney has been engaged in utility information bureau work in Wisconsin and has served as correspondent for the ELECTRIC RAILWAY JOURNAL, *Electrical World* and other McGraw-Hill publications. He has a wide acquaintance with utility men and utility conditions in the Chicago territory.

Mr. Carney was born in Milwaukee in 1898 and after completing his education served in the World War and participated in all the major engagements of the American forces. Business experience with the Pathé Exchange, Inc., and general newspaper work preceded his connection with the Wisconsin Public Utility Bureau.

Obituary

Albert M. Lynn

Albert M. Lynn, president of the West Penn Electric Company and a director of the American Water Works & Electric Company, died in New York City at the Roosevelt Hospital on April 8. For more than 30 years Mr. Lynn had been identified in important executive capacities with the public utility properties of the American Water Works & Electric Company. Subsidiary companies include the Monongahela West Penn Public Service Company and West Penn Railways.

The late president of the West Penn property entered the employ of the American Water Works & Guarantee Company, the predecessor of the American Water Works & Electric Company, on Feb. 1, 1893, and served for some years in the general offices at Pittsburgh. He then became manager of the company's water works plant at Chattanooga, Tenn., and later of that at Birmingham, Ala. For many years thereafter he was in charge of a large proportion of the company's water works properties. In 1917 Mr. Lynn was elected president of the West Penn Company and upon the organization of the West Penn Electric Company he became its president, in which capacity he was serving at the time of his death.

Mr. Lynn was born in Indianapolis on Oct. 12, 1875, moving with his family to Pittsburgh in 1889, where he attended public schools.

William T. Nary, a superintendent of the Berkshire Street Railway, North Adams, Mass., since 1892 and one of the oldest electric railway operating officials, in point of service, in that section of the country, died in his home in Adams on April 10. He entered the employ of the Hoosac Valley Street Railway in the late '80s as a conductor on a horse car running between Adams and North Adams. The Hoosac Valley company was one of the first to electrify its lines and Mr. Nary was instrumental in making the change. As superintendent of construction Mr. Nary supervised the construction of the Williamstown-North Adams line of the Berkshire Street Railway. He was 63 years old.

Manufactures and the Markets

News of and for Manufacturers—Market and Trade Conditions
A Department Open to Railways and Manufacturers
for Discussion of Manufacturing and Sales Matters

Committee Formed to Consider Cars for New York

A committee of engineers, to be headed by Col. William C. Lancaster, chief engineer of the New York Transit Commission, whose function it will be to ascertain whether a steel car of sufficiently light weight can be designed for operation on the elevated structure in New York City, was formed on April 3 at a conference held at the Transit Commission offices, attended by representatives of the Board of Transportation, the rapid transit railroads, various car construction companies, the Bethlehem Steel Company, the Westinghouse company and other organizations concerned with the subject. W. S. Menden and Frank Hedley, heads of the B.-M.T. and I.R.T. respectively, pledged their assistance in the Transit Commission's effort to ascertain whether such a car can be designed.

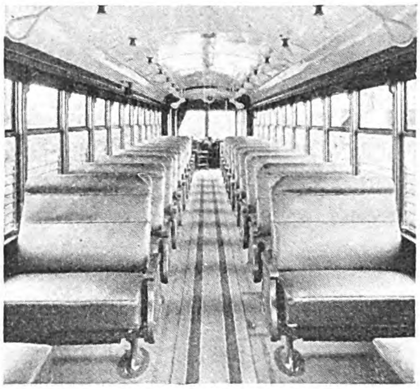
A.C.F. Sells Wire Wheel Business

The Wire Wheel Corporation of America has purchased the wire wheel business of the American Car & Foundry Motors Company, a subsidiary of the American Car & Foundry Company. The acquired business is in Detroit, and under the plan of acquisition a considerable portion of the plant equipment is to be moved to Buffalo, where the Wire Wheel Corporation is located.

The current output of Wire Wheel, will be increased from 20 to 25 per cent by the acquisition of the new concern. No present expansion of the business of the Wire Wheel Corporation is expected, he said, but that action may be necessitated later on account of increased business.

New Cars for Berkshire Railway Elicit Public's Praise

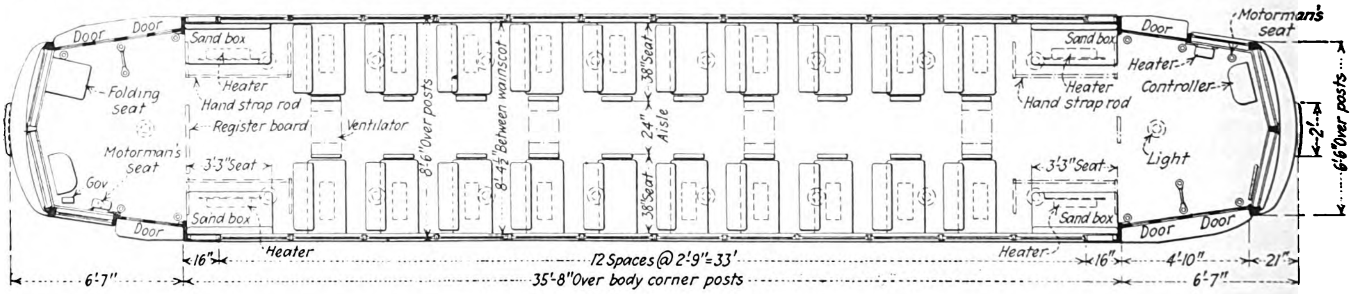
Citizens and the press of Pittsfield, Mass., have joined in praising the twelve new A.E.R.A. standard interurban double-truck safety cars recently delivered to the Berkshire Street Railway by the Osgood-Bradley Car Company, according to a recent statement from General Manager C. Q. Richmond. "We find," writes Mr. Richmond, "that the comments of the people riding and of the press have been entirely favorable and we are very sure that the placing of these cars on our lines has brought us increased business."

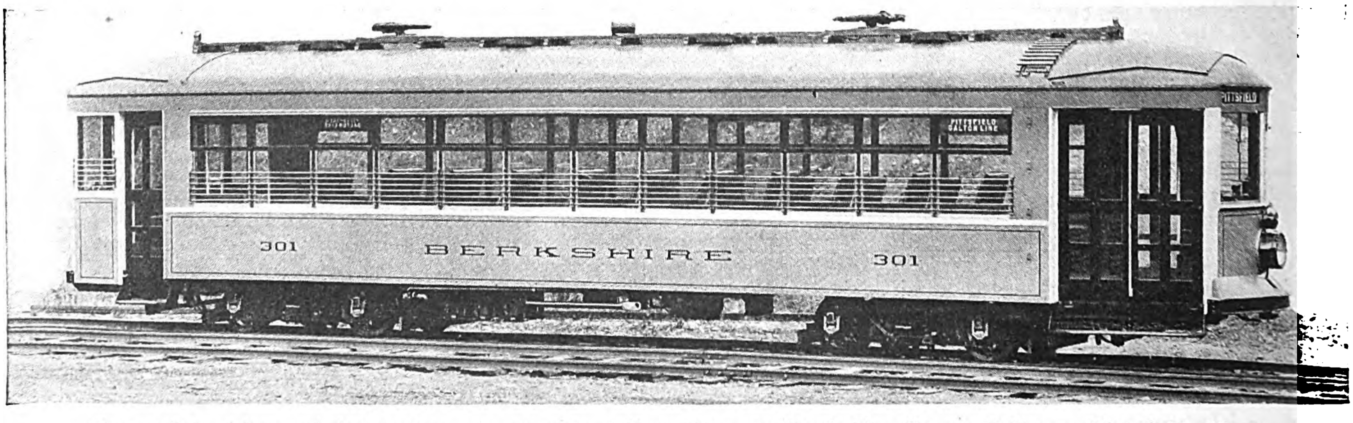


A glimpse of the riding comforts afforded by the twelve new Pittsfield cars, which were built by the Osgood-Bradley Car Company

Specifications for the cars, which were delivered late in November last year, are as follows:

Weights:	
Car body equipped	22,800 lb.
Trucks with motors	14,400 lb.
Total	37,200 lb.
Bolster centers, length	24 ft. 11 in.
Length over all	48 ft. 10 in.
Truck wheelbase	5 ft. 6 in.
Width over all	8 ft. 7⅝ in.
Height, rail to trolley base	11 ft. 3 in.
Body	Semi-steel
Interior trim	Mahogany
Headlining	Agasote
Roof	Arch
Air brakes	General Electric
Armature bearings	Plain
Axles	A.E.R.A. standard E-2
Bumpers	Anti-climber
Car signal system	Consolidated
Car trimmings	J. L. Howard & Co.
Center and side bearings	Osgood-Bradley
Compressors	General Electric CP-27B
Control	General Electric K-35-KK
Couplers	Osgood-Bradley
Curtain fixtures	Curtain Supply
Curtain material	Double-faced Pantasote
Destination signs	Hunter
Door-operating mechanism,	National Pneumatic
Energy-saving device	Arthur
Fenders	Massachusetts standard
Finish	Enamel and varnish
Gears and pinions	General Electric
Hand brakes	Peacock
Heater equipment	Consolidated Car Heating
Headlights	General Electric
Journal bearings	A.E.R.A. standard
Journal boxes	Symington
Lightning arresters	General Electric
Motors	Four GE-265, inside hung
Registers	Ohmer
Safety devices	Safety Car Devices
Sanders	Osgood-Bradley
Sash fixtures	Curtain Supply
Seats	Heywood-Wakefield
Seating material	Leather
Slack adjuster	Osgood-Bradley
Springs	Fort Pitt and Railway Steel Spring
Step treads	Mason
Trolley retrievers	Earll
Trolley base	U. S. No. 20
Trolley wheels	General Electric
Trucks	Osgood-Bradley OBC-48-66-G
Ventilators	Garland C-3
Wheels	Steel Car Forge 26-in. diameter





Type of double-truck interurban car recently delivered to the Berkshire Street Railway, Pittsfield, Mass.

Bids for 100 Cars and Ten Buses for Detroit

The Department of Street Railways at Detroit, Mich., has been authorized and directed by the City Council to take bids upon 100 modern Peter Witt cars and ten single-deck, 30-passenger motor coaches for the purpose of making comparisons with the department's cost estimates for building cars of similar type. The new cars are required both to serve the longer lines that expansion into new territory brings and to replace equipment that is becoming obsolete.

Basing an estimate on a cost per car unit of $14,500 and a financing plan spread over a period of seven years with a down payment of 25 per cent and the balance bearing interest at 8 per cent, Del A Smith, general manager, cited that the cost per car would be approximately 7½ cents per mile. Taking into account the economic elements involved in these factors—seating capacity, weight per seat and cost of maintenance per year—the saving to the department would be 6.85 cents per mile, according to Mr. Smith, leaving a net cost to the department for this equipment of $182,000, or $1,820 a car.

In view of these facts and anticipating the availability of funds the commission requested permission for the taking of the bids for both the cars and buses. The bids for the cars, when received, will be compared with the department's own cost estimates for building a like type. It will be determined whether to acquire the rolling stock by purchase or to have it built by the department.

The purchase of new cars will mark a departure from the policy of Col. H. U. Wallace, former general manager, who planned to confine future purchases of rolling stock to buses. The present opinion of the management is that neither cars nor buses alone are sufficient for a complete, modern transportation system. The belief has been expressed by Mr. Smith that on certain lines buses are useful and necessary, but on other lines they can never take the place of rail transportation.

$500,000 for Improvements in Parkersburg

Improvements and addition to the railway and bus lines in and about Parkersburg, W. Va., totaling approximately $500,000 are planned by the Monongahela West Penn Public Service Company if relief from paving costs is granted by the Legislature, C. H. Hardesty, local manager of the company, and Capt. G. M. Alexander, president of the system, have stated. The company's plans call for improvement to be started as soon as the relief is secured, with the program carried to completion about 1930 or 1931.

New cars and buses to be purchased will cost more than $315,000. Some of the new cars will be used to replace present equipment; others to provide additional service on existing lines. Present plans call for the purchase of about eighteen cars immediately upon word of granting the relief. Nearly $140,000 will be spent on reconstructing trackage and more than $20,000 will be required to rebuild overhead trolleys and to renew block signals and telephones. Tracks will be rebuilt on the principal streets of the city. New overhead will be provided where needed and additional block signals and telephones will be installed.

Buses will be purchased for use in territory not served by the railway or territory where it develops that bus service is needed in accordance with a thorough study of the transportation situation in Parkersburg and its suburbs, made by the management and the company's engineers.

Copper Moving; Lead Weak

THE long-deferred buying movement in copper showed signs of materializing April 13, when a good tonnage was sold at 13 cents for Eastern deliveries. Zinc continues quiet at slightly lower prices, though the volume of sales was better than a week ago, according to *Engineering and Mining Journal.* Lead perhaps looks the weakest of any of the non-ferrous metals at the moment, business having been very poor lately. Tin has been a little lower for spot offerings, and consumers have bought somewhat more liberally for forward as well as prompt. Silver is back to 56¼ cents today after having been as high as 57⅜ cents. Antimony is distinctly stronger, being held at close to 15 cents.

Copper statistics which appeared April 13 showed a decline in refined stocks at the end of March from 105,020 to 102,637 tons and of blister from 272,219 to 260,225 tons, rather surprising in the case of blister. The rate of both domestic and export shipments improved by about 4 per cent over February. Refinery production rate decreased by close to 7 per cent and smelter production by almost 9 per cent. Mine production data are not yet available, but the indications are that the rate of mine production was cut at least 10 per cent in March. The favorable statistics stimulated demand on April 13, when more than 6,000 tons were sold, more than in some entire weeks recently. A large buying movement is overdue and may be getting under way. The foreign price was reduced on April 12 from 13.65 cents, c.i.f., to 13.50 cents. Export demand has been quiet.

Zinc has gradually weakened during the last seven days, dropping from 6½ cents, St. Louis, to 6.40 cents. In fact, some offers were made April 13 as low as 6⅜ cents. Business has been a little larger than last week, but is still below normal. The statistics are not particularly reassuring, showing practically the same rate of production in March as in February; shipments were also at about the same rate as in February. April production should be markedly less, owing to smelter curtailments in late March. At present prices it is felt zinc is scraping bottom, as ore is only $42 a ton. Below this, production is likely to be curtailed.

American Zinc Institute's statistics, in tons of 2,000 lb., follow:

Stock, March 1	32,938
Produced	56,546
Shipped	53,205
Stock, March 31	36,279
Shipped from plant for export	5,098
Retorts operating, March 31	83,208

ELECTRIC RAILWAY MATERIAL PRICES—April 15, 1927

Metals—New York

Copper, electrolytic, cents per lb.	12.775
Lead, cents per lb.	7.25
Nickel, cents per lb.	35.00
Zinc, cents per lb.	6.75
Tin, Straits, cents per lb.	67.87
Aluminum, 98 or 99 per cent, cents per lb.	26.005
Babbitt metal, warehouse, cents per lb.:	
Commercial grade	61.00
General service	31.50

Bituminous Coal

Smokeless mine run, f.o.b. vessel, Hampton Roads	$4.375
Somerset mine run, Boston	2.00
Pittsburgh mine run, Pittsburgh	2.175
Franklin, Ill., screenings, Chicago	2.50
Central, Ill., screenings, Chicago	2.00
Kansas screenings, Kansas City	2.50

Track Materials—Pittsburgh

Standard steel rails, gross ton	$43.00
Railroad spikes, drive, 9/16 in. and larger, cents per lb.	2.90
Tie plates (flat type), cents per lb.	2.35
Angle bars, cents per lb	2.75
Rail bolts and nuts, cents per lb.	3.95
Steel bars, cents per lb.	1.90
Ties, white oak, Chicago, 6 in.x8 in.x8 ft.	$1.45

Hardware—Pittsburgh

Wire nails, base per keg	2.55
Sheet iron (24 gage), cents per lb.	2.75
Sheet iron, galvanized (24 gage), cents per lb.	3.65
Galvanized barbed wire, cents per lb.	3.25
Galvanized wire, ordinary, cents per lb.	2.40

Waste—New York

Waste, wool, cents per lb.	12–18
Waste, cotton (100 lb. bale), cents per lb.:	
White	12–17.50
Colored	7–14

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), cents per lb.	10.90
White lead in oil (100 lb. keg), cents per lb.	14.50
Turpentine (bbl. lots), per gal.	$0 71
Putty, 100 lb. tins, cents per lb.	5.25–5.50

Wire—New York

Copper wire, cents per lb.	14.875
Rubber-covered wire, No. 14, per 1,000 ft.	$5.50
Weatherproof wire base, cents per lb.	16.75

Paving Materials

Paving stone, granite, 5 in. New York—Grade 1, per thousand	$130
Wood block paving 3½, 16 lb. treatment, N. Y., per sq.yd.	$2.70
Paving brick 3½x8½x4, N. Y., per 1,000 in carload lots	51.00
Paving brick 3x8½x4 N.Y., per 1,000 in carload lots	45.00
Crushed stone, ¾-in., carload lots, N. Y., per cu.yd.	1.94
Cement, Chicago consumers' net prices, without bags	2.05
Gravel, ¾-in., cu.yd., f.o.b. N. Y.	1.75
Sand, cu.yd., f.o.b. N. Y.	1 00

Old Metals—New York and Chicago

Heavy copper, cents per lb.	10.75
Light copper, cents per lb.	9.25
Heavy yellow brass, cents per lb	6.75
Zinc, old scrap, cents per lb.	4.00
Lead, cents per lb. (heavy)	5.875
Steel car axles, Chicago, net ton	$17.75
Cast iron car wheels, Chicago, gross ton	15.50
Rails (short), Chicago, gross ton	17.25
Rails, (relaying), Chicago, gross ton (65 lb. and heavier)	28.50
Machine turnings, Chicago, gross ton	7.75

Gradual recession in prices in the St. Louis district has been the feature of the domestic lead market during the week. As early as April 8 sales were made at 6.95 cents and on April 13 the leading interest reduced its price to that level, the price on the latter date going as low as 6.90 cents. American Smelting & Refining Company has maintained its price all week at 7.25 cents, and scattering sales at 7.20 cents were offset by others that brought a small premium.

Tin buying on the part of consumers has been in moderate volume for May and June, with some for prompt delivery. The price tendency has been generally downward in the domestic market, though a 30 shilling rise in London on April 13 stiffened prices here, prompt Straits being sold at 68 cents.

New Trackwork Underway in Minneapolis

Work began this week on the 1927 program of the Minneapolis Street Railway, Minneapolis, Minn., covering improvements and extensions to cost $654,900. Improvements started with an extension of the Kenwood-25th Street line at the east end across the new bridge over the Mississippi river, making a new connection with St. Paul at the Ford Motor Company plant, where the Randolph Street line of the St. Paul City Railway ends. Double track will be laid on 50th street from Penn Avenue South, making connection at Bryant Avenue with the Bryant-Johnson line, including double tracking the line from Xerxes avenue to Penn; single track from 50th to 54th Streets on Penn Avenue, etc.

A. C. Godward city planning engineer, has been authorized to complete survey of the cost of extending the Franklin Avenue line east to connect with the Rondo-Maria line of the St. Paul City Railway to make a fourth through interurban.

Rolling Stock

Southwest Missouri Railroad, Webb City, Mo., has placed an order with the American Car Company, St. Louis, Mo., for one 50-ft. double-end passenger motor car.

Portland Electric Power Company, Portland, Ore., will place in service about May 15 eight new 33-passenger buses, costing approximately $90,000, according to W. H. Lines, vice-president. The equipment will be operated over the Ross Island Bridge to serve the Mount Scott district. The buses are being provided in accordance with the company's new franchise which stipulates better service for the outlying districts.

Fitchburg & Leominster Street Railway, Fitchburg, Mass., is repeating the order placed last fall with the Wason Manufacturing Company for four light-weight motor passenger cars. The four cars originally ordered in October, 1926, and placed in service on Jan. 1, 1927, proved so satisfactory that an order for four more cars of the same type was placed in February, 1927, for delivery in April. Specifications follow:

Seating capacity	40
Total weight	26,000 lb.
Bolster centers, length	17 ft. 8 in.
Length over all	36 ft. 10 in.
Truck wheelbase	4 ft. 10 in.
Width over all	8 ft. 1 in.
Height, rail to trolley base	10 ft. 11 in.
Body	Steel
Interior trim	Mahogany
Headlining	½-in. Agasote
Roof	Arch
Air brakes	General Electric
Fare boxes	Johnson
Headlights	Golden Glow, city type
Motors	General Electric 265, 35 hp., inside hung
Paint	Pratt & Lambert and Sherwin-Williams
Sanders	Air, Wason Company
Seats	J. G. Brill Company
Seating material	Leather
Trolley catches	Ohio Brass Company
Trolley base	Ohio Brass Company
Trolley wheels	Ohio Brass Company
Trucks	J. G. Brill Co. 177 Ex
Wheels	27-in. J. G. Brill Co. rolled steel

Trade Notes

O. M. Edwards Company, Syracuse, N. Y., announces the appointment of H. A. Cronmiller as Eastern representative of the company with offices at 412 Broadway, New York City. Mr. Cronmiller succeeds A. J. Hogan.

Canton Culvert & Silo Company, Canton, Ohio, has received an order from the government of Colombia, South America, for immediate shipment of 750 tons of "Acme" (Nestable) toncan iron corrugated culverts, to be used in highway construction in that country. This is believed to be the largest single order for corrugated culverts ever awarded to any corrugated culvert manufacturing company in the United States. It represents a shipment of 42 carloads.

General Electric Company announces the sale of the entire Sprague hoist business to the Shepard Electric Crane & Hoist Company, Montour Falls, N. Y. This includes the right to manufacture and sell Sprague electric hoists and winches as built and sold from 1903 to 1923 by the Sprague Electric Works of the General Electric Company and from 1923 to date by the General Electric Company.

L. B. Foster Company, distributor of steel rails and complete track equipment, has opened offices in the Illinois Merchants Bank Building, Chicago. Adequate warehouse and storage yard facilities have also been provided and plants for the housing of fabricating and reclaiming machinery are in process of erection, so that a complete service can be had, and material shipped, from this point. The Chicago office will be under the management of Reuben A. Foster, vice-president of the firm. The L. B. Foster Company has offices, plants and warehouses in Pittsburgh, Jersey City, Baltimore, Hamilton, Ohio, Roanoke, Virginia and Chicago.

Pittsburgh Testing Laboratory, New York, N. Y., announces the removal of its offices from 50 Church Street and its laboratory from 35 Sixth Avenue, to its new laboratory and offices at 72 Washington Street. The most improved types of accurate physical testing machines and chemical apparatus have been installed. The facilities have been greatly improved and the scope of service enlarged to serve better its clients. This company, with its main office in Pittsburgh, has branch offices in the principal cities of the United States and facilities for inspection and testing abroad.

John R. Hayward of Roanoke, Va., will on April 1 succeed Frank N. Grigg of Washington, D. C., as Southeastern railway sales manager of the Heywood-Wakefield Company. Mr. Grigg has represented the Heywood-Wakefield Company for many years and is now retiring because of his health.

R. H. Beaumont Company, Philadelphia, Pa., announces it has taken over the business of the American Manufacturing & Engineering Company, Kalamazoo, Mich. Products formerly manufactured by this company, including the American slack line cableway excavator, will now be manufactured by the R. H. Beaumont Company. The addition of the American slack line cableway excavator to the Beaumont line, which already includes the Beaumont LeClair cable drag scraper, completes a full line of equipment for the elevating and storing of sand, gravel, stone and kindred materials. The R. H. Beaumont Company will sell the complete system for this service, including the hoist.

New Advertising Literature

Sullivan Machinery Company, Chicago, Ill., has published new editions, enlarged and improved, of two of its bulletins on concrete breakers and on electric portable hoists. Second edition, 81-I, describes two types of tools, a 75-lb. or heavy-duty Buster and a 48-lb. light Buster. The bulletin is liberally illustrated to show different applications of concrete breakers. Second edition, 76-G, is a sixteen-page pamphlet describing Sullivan single and double drum, electric portable hoists. This also is liberally illustrated. Copies may be secured on application to the company at 122 South Michigan Avenue, Chicago.

J. G. Brill Company, Philadelphia, Pa., is mailing out an attractive folder giving operating statistics on cars furnished for the Warren & Jamestown Street Railway, Cumberland Traction Company, Lewistown & Reedsville Electric Railway and Milford & Oxford Street Railway. All the cars that are featured are of the light-weight modern type.

O. M. Edwards Company, Inc., Syracuse, N. Y., through its metal sash department is issuing a new folder describing the application of Edwards metal sash to modern bus bodies.

Carnegie Steel Company, Pittsburgh, Pa., has issued an attractive leather-bound book of 172 pages, giving dimensions and other information on Carnegie beam sections. The series of beams now placed on the market provide a series of shapes which combine sound engineering principles with practical improvements. The new beam sections are explained under the following captions: Contour Design, Web and Flange Ratio, Range of Sizes, Progressive Beam Designs and Improved Column Design.

History Was Made in Springfield, Mass. Last Week

SUCCESSFUL demonstration of the experimental worm-drive car built under the auspices of the Springfield Street Railway, Springfield, Mass., which was reported in last week's issue, has created a great deal of discussion among electric railway men. Many are enthusiastic regarding the possibilities of this new design. Others are frankly skeptical. Between these two groups lies the great majority of the industry, whose attitude may be properly described as one of watchful interest.

The performance of the experimental car exceeded every reasonable expectation. In judging the results of the demonstration account must be taken of the radical changes which were made from conventional design practice. These included not only the truck, axles and brakes but also many features of the control and miscellaneous devices on the car. Even the lines of the body were radically changed from customary practice. All of these factors must be considered in judging the significance of the Springfield demonstration.

The new car accelerated smoothly and rapidly. The automotive type brakes, with diaphragms mounted on the axles and with internal expanding shoes in brake drums bolted to the wheels, performed efficiently and entirely without noise. The spring suspension cradled the body nicely against rough track and low joints. Over special work the familiar clank and rattle was replaced by a not unpleasant metallic click.

From the standpoint of noise reduction, the car did not seem to live up entirely to what had been anticipated for this design. This was true particularly on the interior of the car. While there was a distinct reduction of street noise to a pedestrian on the adjacent sidewalk, there was a hum on the interior which increased in intensity as the car picked up speed.

Even in this respect, however, there seems little cause for disappointment on the part of those responsible for the new car. It must be remembered that the wheels were solid steel, with no deadening pads of rubber or other noise-absorbing material. A special deep-dished plate section was used to bring the tread under the axle bearings, and this had the effect of making the wheel into a bell rolling on its edge. The sound of the flange rubbing in the rail groove was consequently amplified. Furthermore, the motors used were an adaptation of vehicle motors. They were wound for 300 volts and permanently connected in series for operation on trolley voltage. Some of those present during the demonstration were inclined to attribute part of the hum to the motors. If that is so, further development may be expected to show considerable improvement.

Some of those who are inclined to be skeptical regarding the possibilities of the worm-drive car contend that there has been no actual reduction in unsprung weight in comparison with modern types of conventional truck and motor assemblies. Here again it is important that premature judgment be withheld. It is to be expected that the axle manufacturer played safe in these first experimental equipments. In addition, the axles used are a direct application of heavy automotive vehicle practice. As the requirements for street railway conditions are better understood further refinement of the design may reasonably be expected. There is also another type of shaft-drive construction for street cars which is still untried in this country under modern conditions. That is the use of bevel-gear drive instead of a worm. Whether bevel-gear construction would have any advantages in weight reduction over the worm is hard to determine at this early stage in development.

Will the new type of construction stand up under the severe conditions encountered in street car operation? Nobody knows. Will the maintenance of worm-drive axles, roller bearings and differentials prove excessive in comparison with conventional truck construction? Nobody knows. But the industry does know that a design which materially reduces noise, which may be developed to decrease the pounding on expensive special work and joints and which gives the passenger a smooth and comfortable ride is very much to be desired if it will stand up in service. It is safe to say that equipment maintenance could be permitted to increase considerably if it resulted in decreased track maintenance. It would be a good investment if the change helped to eliminate from the public mind the idea that the electric railway is obsolete and on the way out.

The Springfield Street Railway is entitled to a great deal of credit for taking the brunt of responsibility in pioneering an improved type car. It is perhaps a reflection on the industry as a whole that the men on this comparatively small property, while going through the throes of a change in ownership, had the courage to spend good money in developing a car which they felt was needed. The benefit to be derived by Springfield is small in comparison to the possibilities which are opened up to the rest of the industry—both manufacturers and operators. Regardless of the final verdict on this first shaft-drive car, electric railway history was made in Springfield last week. The men who backed their convictions with courage to go ahead are entitled to frank commendation by every one who has faith in the electric railway industry.

Get Out the Broom and Dust Cloth

EVERYWHERE over this broad land of ours windows are being raised; blankets are being hung on wash lines; every room in the house is topsy-turvy; the male members of the household are told that they are in the way; their favorite pipes must be excavated from the ash barrel. In short, en masse the housewives of the nation are engaged in spring cleaning.

As the women generally are the most practical of the human race, we should follow their example, bearing in mind that around May 1 the industry usually indulges in clean-up week. It is a fearsome job. The long winter months seem to take a malicious delight in making unsightly every nook and cranny of shops, office buildings, stations, street cars and carhouses. Winter's greatest ally in this respect is the heating plant, whose function seems to be airily to deposit soot and grime on windows, curtains, in bins and corners. The principal assistant of the heating plant is cold weather, which continually urges man to hibernate.

The clinging snow has stopped the scythe and grub hook that ordinarily we would employ on the right-of-way. Sleet and rain have washed off last summer's paint. Slush has left its mark on the underframes of our rolling stock. The winds of November and March have made leaf storehouses of our interurban stations. In the corners of our cars, especially near the sand containers, the reverend dirt lays down the gauntlet of battle. The cars may have been cleaned each day, but we must remember they were cleaned in a cold carhouse.

But what's the use of arguing when our duty is plainly laid out for us? Nature is cleaning up. Man is coming forth attired in new raiment. The home is feeling the merciless swish of brush and dust cloth. So it's plainly our duty to get out the brush and dust cloth, soap and water bucket, grub hooks and pruning knife. Roll up your sleeves and get to it.

Relief of Traffic Congestion Demands Action, Not Words

REALIZATION of the seriousness of the transportation problem in our large cities is brought home by the address of J. Rowland Bibbins before the Chicago traffic meeting, published in this issue. Unless there is co-ordination of all forms of local transport so as to obtain the greatest good for the greatest number, all of the residents are bound to suffer, and suffer greatly.

Mr. Bibbins points out that the use of streets indiscriminately for all classes of traffic can lead only to confusion. It is not generally known that freight traffic is being carried on city streets to so great an extent as seriously to hamper the movements of passenger vehicles, but those who have given the matter careful consideration are aware that this is so. Then, too, use of the streets for loading and unloading these same freight vehicles reduces the capacity of the streets for those moving to a great degree. Add to this the parking of passenger vehicles, and it is small wonder that free circulation of vehicles is next to impossible.

Heed should be given to the conclusion that it is not enough to plan for the future. It will take years and millions of dollars to carry through projects involving extensive street widening, double-decking, subway construction and the like. In the meanwhile every effort should be made to get maximum use of the existing streets, which Mr. Bibbins has found out are by actual count often carrying only from 25 to 50 per cent of their possible capacity. While there are several alternatives to the proposals for increasing street capacity presented in the article, it will be necessary to make some decisions in the immediate future and to carry them through, for every day of delay adds its quota to the congestion and makes the solution of the problem that much more difficult.

Corporate Readjustment Favorable to Future Financing

THINGS are happening in the electric railway financial world. This the record of events shows. Even considered singly they are significant, but a week's news that spreads on the pages of history the details of the voluntary readjustment of the financial structure of the Grand Rapids Railway, refunding operations in Denver and Cincinnati and the new Boston issue surely contains particulars worth pondering.

The railway at Grand Rapids helped materially to blaze the way in new things mechanical with new cars and in its efforts more intensively to sell transportation. Now it has come to the front again with a scheme for strengthening its financial structure. Financial papers refer to the plan as a reorganization. That is hardly the correct designation. It is a voluntary readjustment, the details have been given in the JOURNAL, whereas the term reorganization connotes something that is not voluntary.

It is the philosophy behind this move rather than the details that is of interest to the reader. The readjustment is dictated because of the large floating indebtedness of the company and the lack of a medium for doing any financing other than by the sale of first mortgage bonds. The feeling is that in view of the company's present condition, bonds cannot be issued in sufficient amount or be sold at advantageous prices.

The cause of the present floating indebtedness dates back to June 1, 1919, when $3,700,000 three-year bonds became due. These bonds were intended to refund long term 5 per cent bonds issued in 1900. The net increase in the debt of the company junior to the first mortgage bonds is $1,446,199, represented by $700,000 of 7 per cent gold debentures, $198,045 of car trust notes, $69,977 in increased amount of paving assessments not due, $58,218 of increased accounts payable, $245,458 of advances payable and $174,500 of bank loans.

The payments on the first mortgage bonds and on the car trust notes constitute cash requirements of about $178,000 a year. This is contrasted with payments of $140,000 under the plan of readjustment. Not only that, but it is anticipated the consummation of the plan will enable the company again to sell its first mortgage bonds at prices more nearly approaching par. In fact, an agreement for the sale of $200,000 of the first mortgage bonds has been made contingent upon the readjustment plan being declared operative. The sale of preferred stock locally may even be in prospect based in part on the results of the readjustment and the fact that for the twelve months ended Feb. 28, 1926, the gross income of the company increased $97,263, attributed largely to the reduction in operating expenses resulting from the use of the new Grand Rapids type of one-man rail coaches placed in service on June 30, 1926.

Conditions in Money Market Have Made Refunding Easy

IT IS not such a far cry from the readjustment in Grand Rapids to the sale by the Boston Elevated Railway of ten-year 5 per cent bonds at 103¾ and interest to yield 4.90 per cent and the sale by the Cincinnati Street Railway of 5½ per cent first mortgage gold bonds at 100 and accrued interest to yield 5½ per cent. It might be objected that both of these companies are operating under terms and conditions unduly favorable to them. This is, of course, in part the explanation for the ability of these railways to finance at the favorable prices at which these securities are being marketed, but the entire explanation is not to be found in these operating contracts. Neither is the explanation for the favorable financing to be found in the steady rise of bond prices. That tendency, however, is propitious for all borrowers with a balance sheet that will withstand the scrutiny of the bankers. Of particular interest, however, is the feeling that bond prices generally are likely to continue at high levels for some time to come. This is forecast not only by the U. S. Treasury operations but by comparatively easy money, large and steadily mounting gold reserves with a downward trend in commodity prices. It does not appear to be going too far to predict that as bond prices continue to advance investors will more and more turn to the better grade of electric railway securities for yields which they feel their funds should command. And in that event companies like the ones in Cincinnati, Boston and Grand Rapids, to mention just a few that have set their houses in order, will be in the best condition to borrow at favorable rates.

Cast Thy Bread Upon the Waters— It May Return Next Day

RECENTLY the local superintendent was taking a visitor over the routes to show how nicely his trolley and motor-bus services were being dovetailed. The outermost part of the area had been reached, possibly a half mile or more from a house, when a limousine was seen careened in the roadside ditch. Promptly he stopped his own car at the scene of the trouble and found that the chauffeur and woman rider were in a dilemma regarding what to do next. The lady did not care to be left alone on the open road while the chauffeur trudged for help. On the other hand, neither car carried towing equipment strong enough to drag the limousine out of the ditch.

The superintendent was equal to the occasion. He told the lady that he would hustle back to town at once and send his company's wrecking car to her aid with the compliments of the management. So promised, so done. The visitor ventured to praise him for his courtesy, but he said it was all in the day's work. It was bread cast upon the waters, to return, perhaps, after many days.

"Came dawn and a new day," as they say in the movies. With the day came the postman and with the postman a letter in fashionable, feminine hand. It was from the lady whose car had been retrieved from the ditch. And who was she? None other than a relative of one of the most influential men of the town. She had made no secret of the fact that her friendly Samaritan was the chief of the local transportation concern and was satisfied that the corporation he represented must be a human and worthy one. Of such is the Kingdom of Good Public Relations.

Tax Burdens for Our Stepbrothers and Possibly Us

OUT in Ohio the tax leviers are at it again. As usual, their prey is the public utilities. The upper branch of the Ohio Legislature has passed a bill to increase the excise tax on intrastate gross receipts of several of the public utilities from 1.2 per cent to 1.5 per cent on the dollar. Action by the House is expected soon.

Here is what the measure means to certain public utilities in the Buckeye State, according to a recent speech made by Senator Atlee Pomerene before the committee on taxation of the Ohio body:

"It is estimated that their gross receipts (water, gas, heating, telephone and electric light utilities, etc.) for the coming year will be about 7.6 per cent in excess of what they were last year. For the year 1930, carrying out these estimates of increase in accordance with the general increase during the past several years, it will be found that under the 1.2 per cent levy the increase in state revenue from this source will be about 93.5 per cent. And for 1935, assuming that the utilities' rate of growth during the past ten years is continued during the next ten years, the sum of money which the utilities must pay into the state treasury under the 1.2 levy will be increased 423.5 per cent. If the proposed 25 per cent increase in the excise tax be imposed by raising the rate from 1.2 to 1.5 cents on the dollar, the present year's increase in money which the utilities would have to pay in excise tax would amount to 34.5 per cent over last year. In 1930 the increase would be 141.9 per cent, and in 1935 it would be 554.5.

All of which, summed up, resolves itself into the fact that if the 1.5 per cent rate becomes effective, the utilities, which in 1925 under the present rate paid $2,413,000 in round figures, will pay to the tune of $15,797,000 for 1935.

Bearing these figures in mind, there are found, in addition, the following interesting sidelights:

1. While the increase in the total state tax valuation (1910-1925) was 410 per cent and on all utilities amounted to 481 per cent, the increase on electric light and power, gas and telephone industries amounted to 807 per cent.

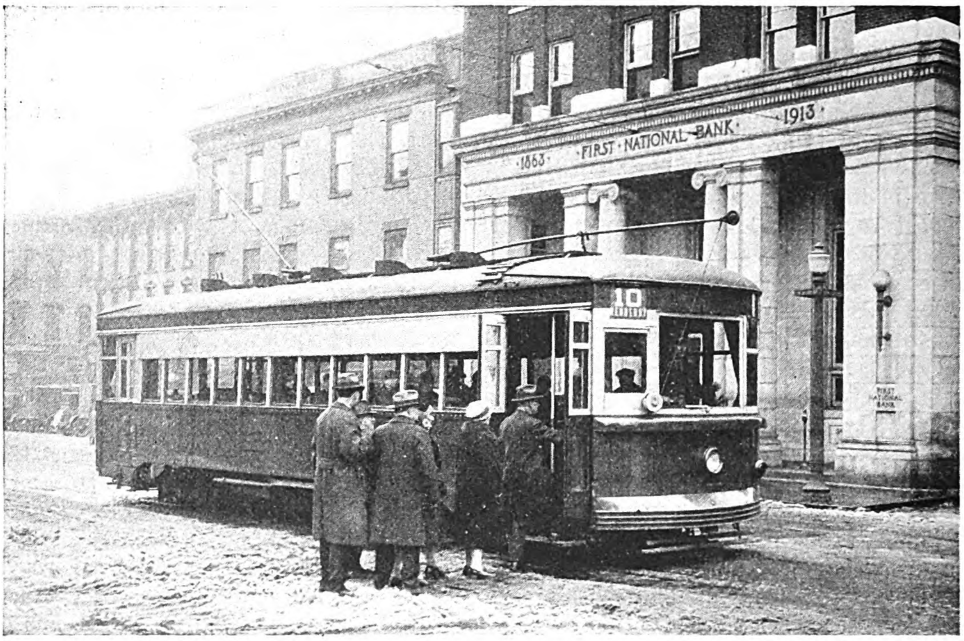
2. The total value of credit in round numbers included mortgages, accounts receivable, notes, bonds, etc., listed for taxation in the entire state for 1924 was only $366,000,000; money on deposit and listed for taxation totaled $269,000,000, whereas an examination of the bank statement reveals that the total amount of money on deposit throughout the state was about ten times that amount.

3. The total tax, state, local and federal, paid by electric light and power, gas and electric railway companies in Ohio has increased 31.06 per cent in six years.

4. The funded debt of the Ohio counties and other political subdivisions has increased 385 per cent since 1910.

Is it necessary to go any further? Are we not presented with the old pussyfooting practices of making the other fellow pay; with burdening the ultimate consumer with the hocus-pocus of robbing Peter to pay Paul? And lastly, another orgy of bad issues, which are not backed by solid financial practice.

What is apparently in store in the way of further burdens by our stepbrothers may be imposed on us at any minute. Because the electric railway field is not the sufferer it is no reason to relax our vigilance.



Passengers entering one of the five new cars recently delivered to the Williamsport Passenger Railway from the Philadelphia works of the J. G. Brill Company. The group shown in the picture is the Citizens' Traction Committee of Williamsport, inspecting the cars before they were placed in service.

Williamsport Rehabilitates Following Citizens' Recommendations

Attractive new cars are provided in Pennsylvania city, following constructive report by citizens' committee and co-operative attitude between city and railway. Extensive rehabilitation program undertaken. Company given increased fare and relief from paving

FOLLOWING several months of intensive study, the traction investigation committee, a group of representative citizens appointed by the Mayor of Williamsport, Pa., some time ago found that the transportation situation in the city needed not only an improvement of the physical properties but an improvement of the laws that govern the corporation. The committee was equally as frank in recommending one as the other.

So pertinent were the recommendations that immediate action was obtained. Shortly after the report was submitted, the city removed the obligation to pave within the track areas. The company has also started an extensive rehabilitation program requiring large immediate expenditures. This includes the erection of a new carhouse, the purchase of new cars, the rehabilitation of several other cars and extensive reconstruction of certain tracks.

The four underlying railway companies have been consolidated into the new Williamsport Railways Company in compliance with one of the recommendations. The fare increase recommended was held up voluntarily by the company until its share of the program was well under way. Application was filed with the Public Service Commission for the increase. This was granted and went into effect on March 1, 1927.

Upon completion of the new carhouse and shop an "open house" was held on Jan. 22, 1927. More than 2,000 citizens visited the new shops of the company and employees explained the many features of the building and officers told of the change that has taken place in the entire transportation situation of Williamsport. In the evening a dinner was given by General Manager L. W. Heath to presidents and other officers of the various local clubs and associations of the city. The work of the traction investigation committee was reviewed and a report of the progress made during the first year was presented.

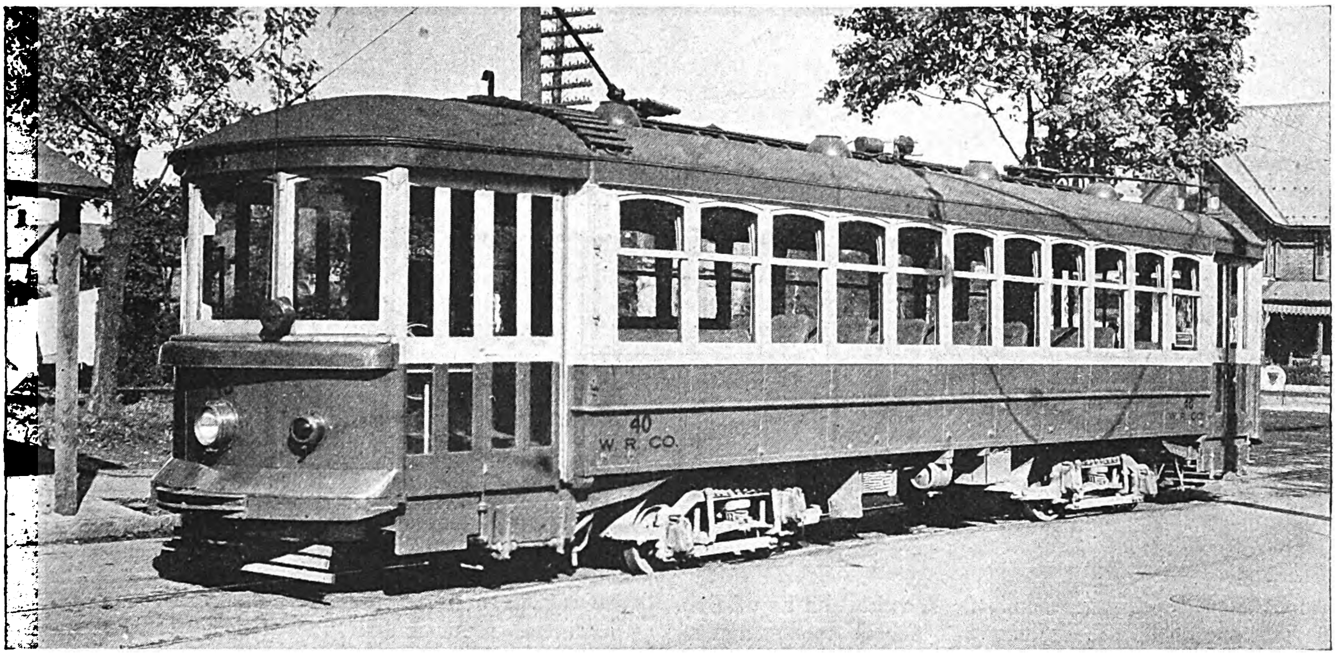
THE COMMITTEE'S FINDINGS

Six representative business men were appointed by the Mayor of Williamsport in July, 1925, to investigate the traction situation. The committee was formed at the request of the four operating companies that such a body be appointed to investigate, advise and if possible to offer some solution of the problem that would permit the continuance of the service so that they could earn a fair profit.

The findings of the committee herewith presented in abstract are of interest in that they show a comprehensive understanding of the situation.

Tracks in certain sections of the city were found in excellent condition, but in others they were in such poor condition that it was held they should be immediately replaced. The carhouse on West Fourth Street was found to be inadequate and in bad physical condition. Construction of a new carhouse was recommended.

Of the 37 cars owned, some were of a type that could



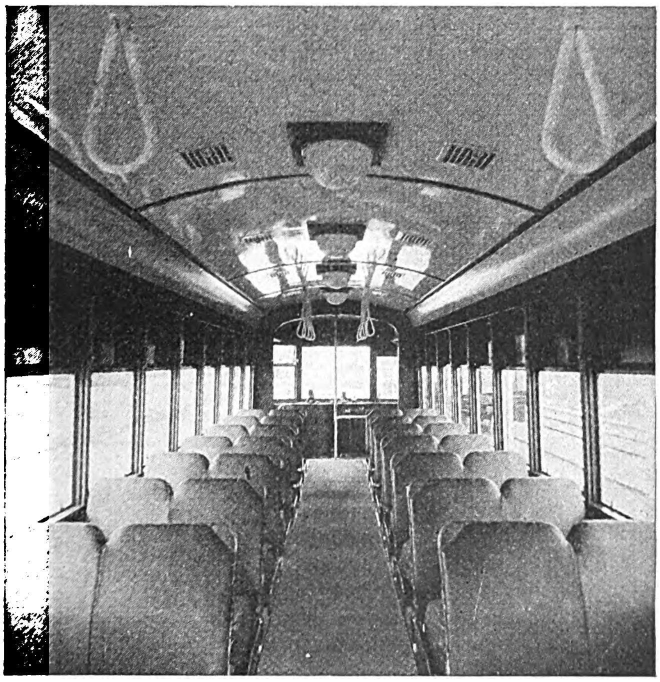
The exterior of one of the 32 cars rehabilitated in Williamsport. Dash floodlighting is in conformity with the new cars recently purchased

be rebuilt and modernized. Five of the old cars were in very poor condition and it was recommended that they be scrapped and written off. Others were good only for extra service and could not be economically operated on regular schedules. The committee also found that the major portion of the trolley wire and feeder system was in good condition.

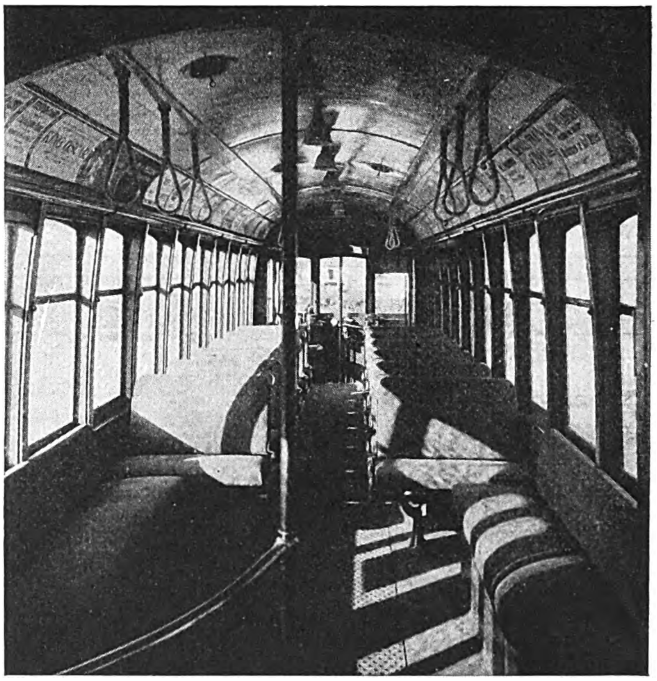
Largely due to automobile competition, the number of riders has decreased steadily during the last five years.

The statement of consolidated income shown elsewhere indicates a general falling off in net returns, so that the rate of return on the investment had decreased gradually from 4.7 per cent in 1920 to 1.3 per cent for the first few months of 1925, according to the committee's report. It is obvious that with this low rate of return the street railway system could not continue to grow and properly serve the city of Williamsport without a substantial increase in gross revenue. For this reason, the committee recommended an 8-cent cash fare, with two tokens for 15 cents and a $1.25 weekly pass. It is explained that the company originally took the position that a 10-cent cash fare was necessary with the same ticket and pass rates, but agreed to a trial on the basis of the committee's recommendations.

The committee compared several appraisals of the company's properties made during recent years and



From the interior of one of Williamsport's new cars both passengers and motorman are afforded an excellent view through the large vestibule window



Many of the old cars in Williamsport have been rehabilitated to conform in general design to the new cars purchased

All platform equipment is housed in mahogany cabinets on the new cars. The seats are of full spring construction and covered with genuine leather. Note the absence of bell cords and register rods.

found them in close agreement. A valuation as of Dec. 31, 1924, totaling $1,533,023 was finally determined as a basis on which a fair return should be earned. The committee further investigated the cost of power purchased from the Pennsylvania Light & Power Company and found this to be at approximately the same rate as paid by other railway properties under similar conditions throughout the state of Pennsylvania. A further finding was to the effect that the street railway system was being operated economically and that no substantial reduction in operating expenses could be made.

To provide adequate service, the committee recommended the immediate purchase of five new cars, the rehabilitation of 32 others, numerous routing and track changes, and the construction of a new carhouse, all totaling $245,770. It held that other items for track reconstruction and extensions, amounting to

Each of the seven tracks entering the carhouse is equipped with washing facilities, after which they pass over inspection pits and then into the storage end of the carhouse. This arrangement saves switching the cars.

Williamsport Citizens' Committee makes possible paving relief granted in ordinance of Dec. 30, 1926.

SECTION 3. The grantee shall repair any damage to street paving within its roadbed, as hereafter in this section defined, caused by the construction, maintenance or operation of its street railway, and in such cases shall restore and replace such street pavement so damaged in good order and repair. Whenever any street or streets, upon which the tracks of the grantee are laid or shall hereafter be laid, shall be paved, repaved or repaired, the additional cost of such paving, repaving or repairing occasioned by the existence of such tracks on such streets shall be paid by the grantee. Such additional cost shall be deemed to be the difference between the cost per square yard or other unit of paving, repaving or repairing within the roadbed of the grantee and the cost of a similar unit outside of said roadbed. The term roadbed, as herein used, shall mean that portion of the street between the rails of each track and for such distance outside of the rails as the ties under the rails shall extend beyond the rails. The grantee shall have the option of doing the work within the limits of its roadbed in the same manner and with the same material as is used in other portions of a street being paved, repaved or repaired, or in such manner and with such materials as shall be agreed upon with the City Council, and for doing such work the grantee shall accept from the city, as full payment for such work, such sum as will equal the cost of paving, repaving or repairing in the same manner an equivalent area outside of the grantee's roadbed. The snow and ice removed from grantee's tracks, and constituting an interference with public travel, shall be removed by the grantee.

$69,000, should immediately follow, and that within the course of the next five to ten years additional expenditures totaling $193,000 will probably have to be made.

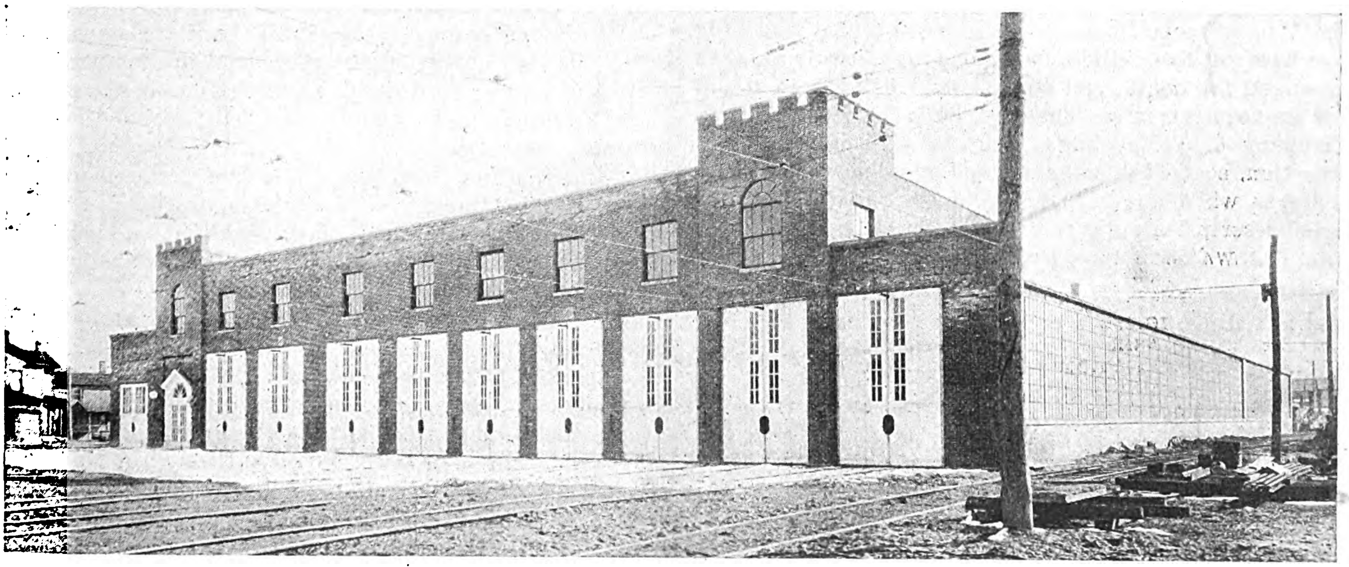
At the time the report was presented the local street railway companies paid a city tax of $50 annually for each car operated. Competing transportation mediums pay no such tax and therefore it was recommended that this burden should be reduced to $1 per car per year. The committee also recommended that the company be relieved of the paving burden which exists today as a heritage of horse car operation.

BUSES NOT CONSIDERED FEASIBLE AS SUBSTITUTE

Motor buses for transportation service in Williamsport were carefully considered as a substitute for trolley cars. The committee agreed that the fare under such conditions would have to be at least 10 cents. It felt that it would be impracticable to operate buses outside of the paved street areas, and that in the winter months, because of deep snows, such service would not be as reliable as car service. If buses were used, it held many large residential sections would be left without common-carrier transportation, which would restrain city development. The downtown streets in Willimsport are fairly congested with traffic at the present time and with the substitution of buses for street cars this condition would be greatly aggravated, according to the report, as several buses would be required for each street car replaced. Four buses are now operated by the railway company as a supplement to its rail service.

The committee concluded this portion of the study by strongly recommending the continuance of street railway service with the additions and improvements recommended. No public benefit was found in the operation of four separate street railway companies, and the necessary ordinances to provide a suitable working agreement for a new company, consolidating all of the four companies, were recommended.

The wages paid conductors and motormen on the local



Modern carhouse, shop and office recently completed in Williamsport, Pa. Considerable attention and expense were devoted to architectural design

A SIGN OF PROGRESS
WMSPORT RAILWAYS CO.

Part of the track reconstruction program under way following recommendations of the Williamsport Traction Committee that will extend over several years

railways were below what they should be, in the opinion of the committee, and an increase of 4 cents per hour was recommended.

Emphasis was laid on the fact that the operation of a street railway system is a mutual matter between the city served and the company. The city cannot grow without good transportation and the company cannot live without earning enough properly to maintain its facilities and to pay interest on its securities. Every recommendation was strongly urged by the investigating committee as necessary to provide good service.

The report as submitted was accepted by the Mayor, the City Council and also by the Public Service Commission of the Commonwealth of Pennsylvania. Shortly after its submission, the City Council passed an ordinance relieving the companies from the paving burden. Plans were immediately formulated by the companies to carry out their share of the recommendations. The new carhouse and shop has since been completed. Five cars were ordered last year and were delivered to the property during December and much of the recommended reconstruction work on the tracks and other property is under way.

Five Attractive Cars Purchased to Improve Service

After careful consideration of the factors involved, the Williamsport Passenger Railway decided upon the purchase of five light-weight, one-man, two-man cars arranged for double-end operation as being best suited for its requirements. The cars, built by the J. G. Brill Company of Philadelphia, Pa., are of semi-steel construction, seat 44 passengers, and combine several new features which make them stand out prominently. A brief description appeared in the Jan. 8 issue of Electric Railway Journal, page 103.

PRINCIPAL WEIGHTS AND DIMENSIONS OF FIVE NEW CARS PURCHASED BY WILLIAMSPORT PASSENGER RAILWAY FROM J. G. BRILL COMPANY

Weights:	
Car body	19,460 lb.
Trucks	9,600 lb.
Equipment	9,820 lb.
Length over all	42 ft. 2 in.
Width over all	8 ft. 8 in.
Height, rail to trolley base	10 ft. 10½ in.
Truck centers	19 ft. 8 in.
Truck wheelbase	5 ft. 4 in.
Wheels	26 in. diameter
Seating capacity	44

A bright and attractive color combination was used, consisting of a golden orange body with vestibule, letterboard, window sash and posts finished in cream. This combination of colors harmonizes well with the green roof and black trucks. Dull mahogany interior finish is used with an agasote headlining finished in ivory with trimming of Valdura red and tan enamel.

The Brill No. 201-B seats give the appearance of individual cushions and backs. They are of heavy upholstered construction, with deep spring cushions, padded backs, and are covered with genuine leather. With a width of 36 in. and a 30 in. spacing between seats comfortable riding space for two passengers is insured. The cars have seven transverse seats on each side and four longitudinal seats, one in each corner, all finished alike. The floors of wood are double on both sides of the 30-in. aisle. Within the aisle area, a single thickness of flooring is used with a flexible punched leather mat constructed in two pieces that extends the full length of the car body in the recess.

Instead of glass in the upper sash, Haskelite panels covered with metal on the outside and wood inside are used. The interior is finished to match the balance of the wood trim and the outsides of the panels are painted the color of the sash. With this arrangement, the use of curtains was considered unnecessary.

Thermostatic control of the fourteen cross seat heaters manufactured by the Railway Utility Company is used, the thermostat being set to hold the temperature between 55 and 60 deg. F. when the outside temperature is lower. Individually controlled vestibule heaters are also installed.

A combination electric tail and stop light, manufactured by the Electric Service Supplies Company, is used in conjunction with a dash floodlight on each end. This stop light shows red when the brakes are applied and the car is coming to a stop.

The four-part, two section, air-operated folding doors and folding steps provide an easy unobstructed exit and entrance. The doors at the right of the motorman are operated from the brake valve through Safety Car Equipment Company's ball check engine, and the rear door by means of a selective valve through a National Pneumatic Company engine. All rear doors are interlocked with the air brake and are balanced, during an emergency brake application, so that they may be opened by hand.

Interior illumination is provided by five Electric Service Supplies Company compensating dome lights, installed on the center line of the ceiling, and equipped with 94-watt lamps. The compensating panels are located to permit of easy access and ready inspection.

Four Westinghouse 510-A motors and control are used with Westinghouse brakes and General Electric air compressor. Trucks are Brill light-weight type 177-E-1.

The motorman's front vestibule sash is of unusual width to give clear vision. It is hinged at the top and carried on brackets so that it may be tilted out like an automobile windshield. The platform apparatus is all inclosed in a mahogany finished cabinet so that no parts are exposed except the controller handle, air valve and gauge. An upholstered seat with adjustable back is provided for the operator. A recess in the center of the cabinet gives the operator leg room so that his position is comfortable and all operating controls are within convenient reach.

By the installation of mirrors within the vestibules on the frieze board, and outside of the vestibules on the corner post, a clear view of the interior and the rear step is obtained at all times. The motorman's hand-operated window cleaner affords a means of providing him with good vision under the most severe weather conditions.

NEW CARHOUSE AND SHOP COMPLETED

The site selected for the new carhouse and shop is in a well built up part of the city, and attention was given to the architecture so that it would blend well with surrounding buildings. The building as constructed is of two stories, steel frame, red brick and art stone trim, with steel frame windows extending the entire length on each side so that ample light is insured. It is 260 ft. long by 200 ft. wide and has a storage capacity for 45 cars in addition to shop and servicing areas.

The first floor is divided by a fire wall extending the full length of the building. On one side are located the wash tracks, inspection pits, paint shop, and storage space. On the other side is the carpenter shop, truck and machine shops, store room, garage, master mechanic's office, boiler room, and store room.

Seven inspection pits are provided, and each track on the West Third Street side is provided with car washing facilities. It is planned to wash cars every three days. After each washing they are run over the pits and inspected. These pits are heated by direct radiation, which will help in the drying process as the cars stand over them during winter months. The interiors of the cars are cleaned by the washing and vacuum process. The pits are well illuminated to facilitate the inspection and light repair work.

Two cars can be placed in the paint shop at once and closed off from the outside, or by means of the center fire door either side of the shop can be isolated from the other.

Heating is by hot air from the unit heater system, each unit being equipped with motor and fan for passing the air through the steam coils of each heater. The temperature is regulated by a thermostat.

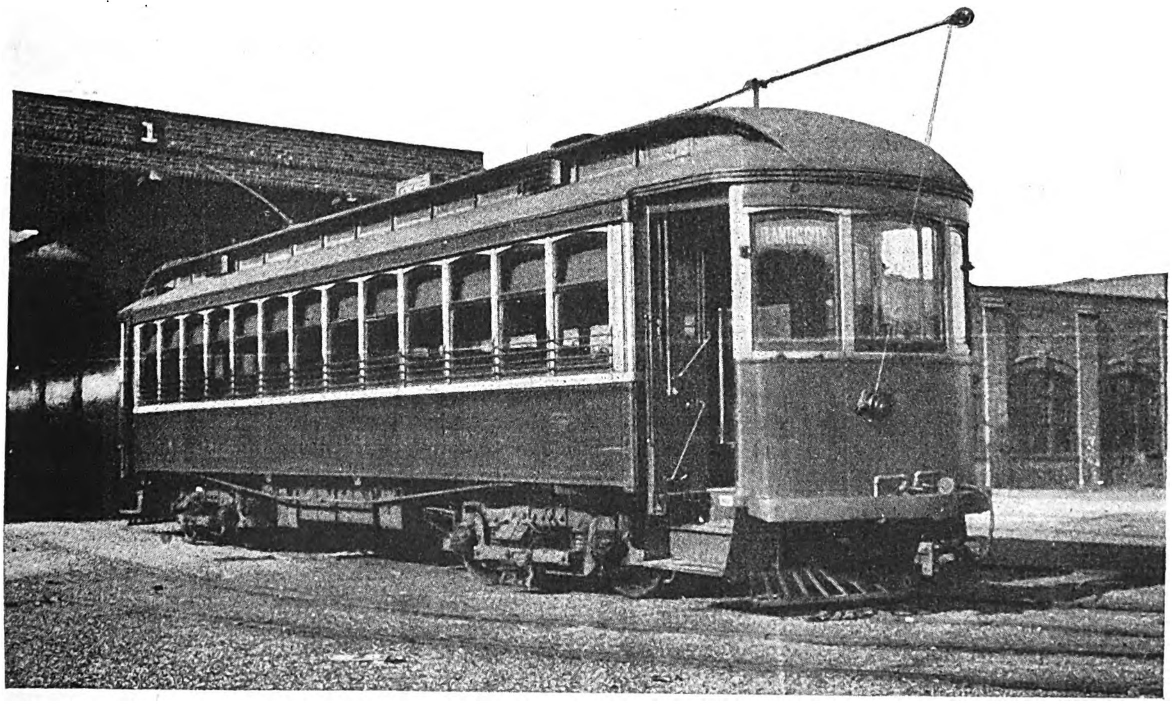
On the second floor of the carhouse are the offices of the company and a club room for the employees.

Cars Rebuilt for "Shore Fast Line"

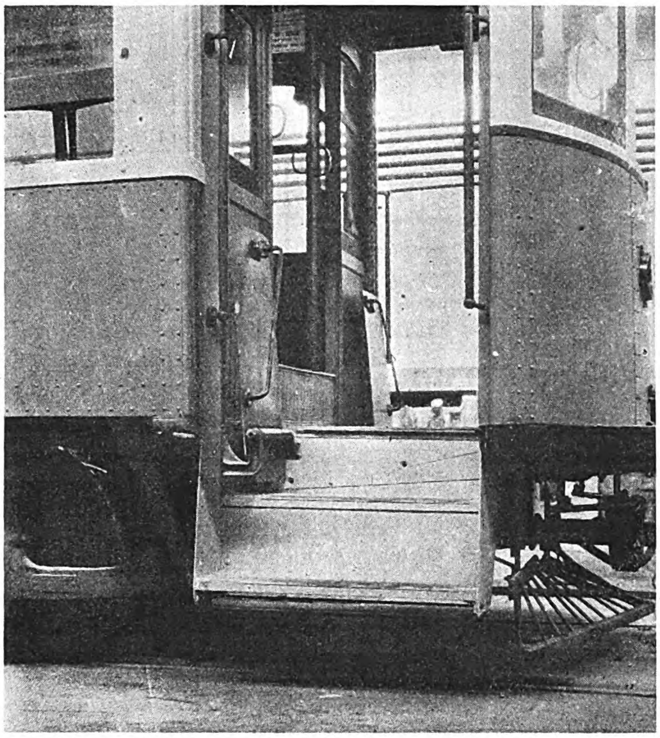
Improved Appearance and Greater Passenger Comfort Have Resulted from Reconstruction of Rolling Stock on the Atlantic City & Shore Railroad

DURING the past several months the cars of the Atlantic City & Shore Railroad, Atlantic City, N. J., have been undergoing thorough overhauling and refitting. Changes have been made to increase the comfort of the passenger, reduce noise and improve the appearance of the car, inside and out.

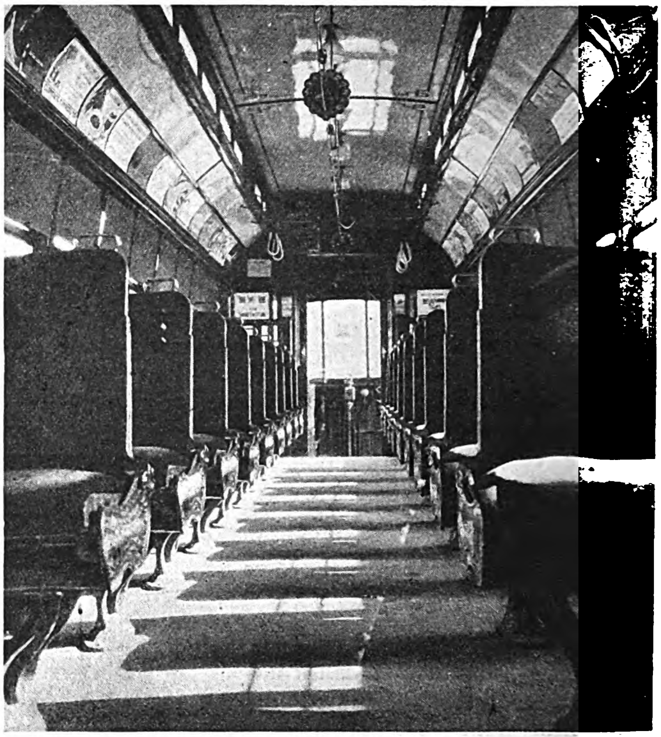
Plush seats have replaced the cane seats formerly used. This was done by installing new seat covering on top of the old rattan. The process consisted of placing,



High-speed, multiple-unit cars of the "Shore Fast Line" have been improved in appearance by the installation of sheet steel over the old wood side sheathing



Installation of drop steps in place of fixed wood steps has reduced accidents by eliminating projection and has made passenger ingress and egress easier



Plush-covered seats and magnesite flooring have improved the appearance of the car interior. The ceiling is white with gold ornamentation

in order, a ⅝-in. layer of felt, a 1-in. layer of woven hair, a layer of cotton and one of 16-oz. duck. On the outside standard Pennsylvania Railroad plush was used. New plain green pantasote curtains have been installed.

The ceilings are white with gold ornamentation. Cherry woodwork inside the car has been thoroughly cleaned and freshened up. Sash in the monitor deck has been sealed and Garland ventilators installed.

Over the old wood floor a new flooring of magnesite has been laid. This is ¾ in. thick, laid on a foundation of ¾-in.-mesh chicken wire. Two transverse and two longitudinal expansion joints have been provided. In this process the old trapdoors have been permanently closed, and work on the motors and trucks must now be done by raising the car body.

STEPS BROUGHT WITHIN BODY LINES

On the platforms O. M. Edwards drop steps have replaced the old fixed wood steps. This has made it possible to bring the steps within the lines of the car body and has reduced the number of accidents as well as made passenger entrance and exit easier. In the process of installing these drop steps it was necessary to remove the outside platform knees. The center knees were therefore reinforced with 4-in. x 4-in. x ½-in. steel tees extending from the bolster to the bumper and anchored to the end sill.

On the outside of the car No. 16 sheet steel has been placed directly over the old wood sheathing, with four panels on each side. Sheet steel also has been used to cover the old wood dashers.

Altogether about 1,000 lb. has been added to the weight of each car. This is believed by the management to be unobjectionable because the cars operate principally over steam railroad right-of-way where the track is obliged to carry heavy freight trains every day and is constructed accordingly.

An Indirect Argument

OWNERS of automobiles in the territory served by the Beaver Valley Traction Company, New Brighton, Pa., have a chance to compare the cost of operating their cars with cost of street car rides if they use the expense cards that have been distributed by General Manager C. D. Smith. "We are not finding fault with the automobile," he writes, "but are just bringing about an understanding."

BEAVER VALLEY TRACTION CO., NEW BRIGHTON, PA.

Problems of Mass Traffic

By J. Rowland Bibbins
Consulting Engineer, Washington, D. C.

Broad consideration of the entire transportation problem in cities shows that all elements, both freight and passenger, must be taken into consideration if real relief and provision for future growth are to be obtained. In this article, abstracted from a paper presented at a conference held in Chicago on April 13 under the auspices of the National Automobile Chamber of Commerce, Mr. Bibbins points out the magnitude of the problem and the multiplicity of elements involved.

"TRAFFIC" as generally discussed is simply another name for "mass transportation," though rarely so understood. It is worth while to broaden our conception for the moment to examine base principles, trends and future needs to see whether the real problem will be met by any other policy of approach than sound technical planning, based upon transportation experience.

For the traffic problem of today seems to be the result of bad planning of yesterday and lack of appreciation today of transportation essentials.

Look at the following perspective:

Per 1,000,000 persons, the average large city covers 107 square miles, while the metropolitan district covers 364 square miles; the average length of streets is 800 to 2,000 miles; the average street railway track is 300 to 500 miles; the average motor registration is 100,000 to 400,000 vehicles. Population of a large city doubles in five to 40 years, say 30 on the average. In this time city land values increase about three times; city passenger traffic, rail and motor about four times; railroad freight tonnage about seven times; railroad passenger traffic about eight times. Motor registration in the United States doubled in the last 4½ years, with a decreasing rate of increase.

Therefore study now the problem of doubled population without stopping to quarrel just when it will take place. The above perspective of the physical problem today and the clear trends of traffic growth tomorrow are sufficient, for the purpose of this discussion, to put to the acid test the propriety of any opportunist policy, i.e., whether superficial or fundamental measures are in the best interests of the community as a whole, and whether, in our mad scramble for relief, the right emphasis is being placed upon the various elements of the problem.

My perspective of any traffic and transportation problem involves all these elements: rail, transit, bus, truck, taxicab, automobile, horse, pedestrian, and even water transport—all to be co-ordinated in a city-wide, well-integrated, unified, transport system, both passenger and freight, with "track and service" capacity adjusted to local needs, particularly to recognize the differentials in speed and bulk of these various transport agencies.

At the outset, I submit the debatable proposition that the private automobile is not by any means the greatest part of our problem; but that freight transport, which has been almost entirely neglected, looms very large in the picture, especially in the central district.

Time is the first essential—home to work. The 30-minute time zone practically controls the main settlement of our denser city areas. Five minutes saved expands the zone 1 mile; fifteen minutes, 3 miles. Thus, double the populated area can be brought within the 30-minute time zone at the same cost. Here is the basic answer to traffic congestion, and motor competition.

It needs no demonstration that the widespread use of private motors in rush-hour transportation is due largely to the demand for speed, increasing with the spread of our cities. Troublesome as it is, the private motor is fulfilling an economic need, complementary to established public agencies which may not fill that need.

An ideal transport system is essentially based upon speed (and fare) differentials: (1) railroad suburban service, steam or electric, to central terminals or through-routed; (2) rapid transit on private rights-of-way, surface outside, and elevated, depressed or subway inside; (3) automobiles and taxicabs; (4) buses, express and local; (5) by "Shanks' mare." And the last is by no means unimportant, for our surveys show that more than 25 per cent of our major industrial employees walk to work. And industries are being relocated to make this possible.

Now, in practice we are trying to run express, local and freight services on surface streets already cluttered by business. A modern transit system handles 20 per cent of the total traffic in the maximum rush hour, and at least the entire population once every day. Rapid transit system peak loads run from four to ten times midday movement. In large cities, rush-hour tripper cars can make only one load-trip during each rush period. While central district traffic will always be heaviest, cities are developing more and more through-riding and crosstown riding, entirely outside the center.

Transit routing and terminals are thus of fundamental importance, though many systems still adhere, mainly by necessity, to the "town-pump" system of focusing all service and transfer facilities at the center, which involves the serious question of franchises.

After years of study of transit and traffic and the practical aspects of city planning, zoning and motor transport, I submit the proposition that the electric car, mainly surface transit, is still the essential backbone of passenger mass transportation. Each form of motor transport, however, has its particular part to play in a properly unified system of differential speeds, fares and services. In view of the existing paving situation, mounting taxation and financial condition of our cities, it seems idle to talk now of replacing the transit system by buses, except in very specific instances and localities. The automobile must play its part, largely complementary, rather than competitive.

By the same token, it is the clear responsibility of the electric railway industry and city officials to develop transit by every known means to maximum schedule speed and capacity, as the greatest single contribution to the reduction of central traffic congestion. No adequate city plan or traffic plan will survive the acid test of experience and public need, unless it recognizes these transport elements in true perspective. We shall not by fiat clear our streets of 14,000,000 city motors, nor shall we relegate to the scrap heap 30,000 miles or more of urban railways.

FREIGHT TRANSPORT ON CITY STREETS A SERIOUS PROBLEM

The volume of motor freight is exceedingly difficult to estimate, although we know that all of our package or l.c.l. freight requires one or more terminal handlings in our cities. Little progress has yet been made in night haulage of commodities and construction materials, also little progress as yet in consolidated motor tracking to increase the loading efficiency of the city truck, and little or no progress in the scheduling of retail merchandise during off-peak hours for consolidated motor delivery to reduce waste mileage, and avoid peak congestion. Clearly, the tendency of local freight transport is more and more toward the public streets.

I have found in some downtown cordon traffic counts that truck and delivery movement in a large city is perhaps 50 per cent of the automobile movement, in many districts exceeding that of autos. Thus, bearing in mind relative speed, bulk, and character of drivers, it is perhaps not an exaggeration to say that motor freight transport has grown to be perhaps as serious a part of the traffic congestion problem as the private auto. Yet it has received very little, if any, detailed study and consideration. I submit it to be deserving of equal consideration in the traffic-transit plan, not so much by virtue of its volume, but by its obstructive nature.

> **AFTER years of study of transit and traffic and the practical aspects of city planning, zoning and motor transport, I submit the proposition that the electric car, mainly surface transit, is still the essential background of passenger mass transportation. Each form of motor transport, however, has its particular part to play in a properly unified system of differential speeds, fares and service.**

"EXPRESS AND LOCAL" SERVICE

Coming now to specific matters, the only way to insure needed speed differentials is by traffic segregation in the thoroughfare plan with different streets so far as available for transit (which usually means business streets) for fast traffic (usually automobiles and bus) and for slow heavy-duty trucking. A detailed examination of most city street systems will reveal possibilities for securing this segregation. The policy of concentrating all traffic on dense transit streets simply defeats all fast transportation, both rail and rubber.

To secure these speed differentials with existing facilities, we must have limited-stop service for expresses, meaning skip-stops. The bus, although less mechanically suited to frequent stops, will probably have to do this service and stop at the curbs, thus raising the transit schedule speed, perhaps to 15 m.p.h. outside of the central zone. It appears from experience that large-capacity buses, especially double-deckers, can not make the high schedule speed demanded in mass transportation, largely due to design restrictions and unavoidably slow loading and unloading. The small-capacity unit really fulfills a good purpose on a transit trunk. The real reason seven-passenger jitneys have survived in Detroit is because they are needed. Making only two or three stops per mile, they are today able to double the street car speed and far exceed the local buses. Large-capacity buses of course have their field, especially in developing new routes, distinctly not on transit trunks.

Adequate continuous paving lies at the bottom of practical traffic segregation, needing no signs, signals or policemen. A relief route well laid out and reconditioned will immediately be discovered and used.

As there are approximately 1,000 miles of city pavements per 1,000,000 city people, here is perhaps the major economic problem of traffic which has been generally sidestepped, i.e., to provide "tracks" for our growing motor transport system.

Any thoroughfare plan must be financed, presumably on the basis of relative usage and wear. The fact is that thousands of miles of old light pavements have suddenly been thrown into heavy duty service for which they were never designed. It thus appears that financing traffic street pavement at $50,000 or more per mile is a far larger problem than financing railway track at $65,000 per mile, exclusive of pavement. It will not do to waive the matter aside as one of general taxation, and the cost of motor "tracks" will soon have to be recognized as part of the cost of transportation by rubber, as well as rail.

Terminals.—Railroads cannot operate without terminals. But we are expecting the same from traffic, an impossibility. I refer to day storage as distinct from short-time parking as one of our "essentials." This very practical problem has been utterly neglected. A few de luxe garages charging 75 cents to $1 per day will have no appreciable effect upon congestion. A day storage service at not more than 25 cents will have to be developed if real results are to be expected. Garaging has thus become a major national utility, and the community itself may have to undertake at cost some form of self-supporting garage service.

Wider Roadbed.—Railroads usually had the foresight to provide a 100-ft. right-of-way against their future needs, and expanded by adding one, two or three tracks. But street widening is daily becoming financially more prohibitive. The efficient method of "arcading" to widen roadways to double present capacity while still preserving the old air rights has made no progress, yet wholesale arcading would probably cost not more than 25 per cent as much as full street widening.

The alternative is double-decking, even more financially strenuous. The South Water Street double-deck improvement along the Chicago River, known as Wacker Way, cost $30,000,000 a mile, the same as the London widening, Kings Highway to the Strand. Although in Chicago the benefit assessment practically absorbed the damages awarded, it is clear that few cities can undertake such an ambitious program over large areas with an additional complication of ascending ramps and the problem of ventilation of the lower level. This has received little consideration, although we introduced it in the design of Wacker Way.

Railroads run on standard gage. Similarly, the old decimal system of street width must give way to a design adjusted to the number of lanes needed and paved accordingly. And the standard width should be adjusted further according as the streets are to handle street cars, buses or trucks, or motors only, for there is 3 ft. difference in the widths of these vehicles, or over 50 per cent of the standard auto width. The relative volume of movement should control; thus a transit street operating 30 seconds rush-hour headway should be more liberally designed than one operating ten minute headway; similarly with buses and trucks.

WE MUST have both safety and speed. But this never will be realized until mass transportation, both rail and rubber, is designed and operated collectively along modern transportation lines and so conceived in the city plan.

Street widening, in the absence of local benefit assessment and excess condemnation, is thus the most serious economic problem. We shall never catch up with the budget under present methods. New York City's budget is increasing as the cube of the population, property values as the 2.7 power. Main city land values, the basis of all tax revenue, increase much slower than the square, and in the central high value districts about proportional. Thus, the vicious economic circle is started—first, raising the assessments, which in turn force up the skyscraper, which in turn raise the assessment again—the circle has become a spiral. The day population is concentrated beyond all bounds of efficient mass transportation and sidewalk capacity. Witness one building proposed in New York, holding a young city of 14,000 people, which alone would absorb one-third of the capacity of an entire subway line. This raises the very serious question, whether rapid transit really relieves or simply concentrates central congestion, although through-routing as distinct from loop terminals undoubtedly spreads commercial business. It must spread. For I have recently discovered that high-building cubage is increasing as the square of the population, i.e., four times today's in 1950.

At the very center of this circle lies the real crux—land values and taxation.

OPERATING EFFICIENCY

For the present, our one hope is efficiency. A railroad superintendent operating on two tracks of a four or six-track system would promptly be fired. Yet we are doing just that thing in traffic. And my closing proposition is that until we devise some equitable source of further public revenue for vast public improvements higher efficiency in mass transportation, rail and rubber, is our main avenue of present escape. In one large city with 90-ft. streets and 60-ft. pavement, I found within the mile square only 25 per cent traffic efficiency assuming solid parking or perhaps 12 per cent clear. This city was actually encouraging one-line traffic each way, and could easily have doubled its capacity. I think we must come to parallel lanes marked with white paving blocks, or flat white metal plates. Now, the capacity of our streets is reduced at least 50 per cent by "meandering," or straddling lanes, and big buses are notoriously offenders in this respect.

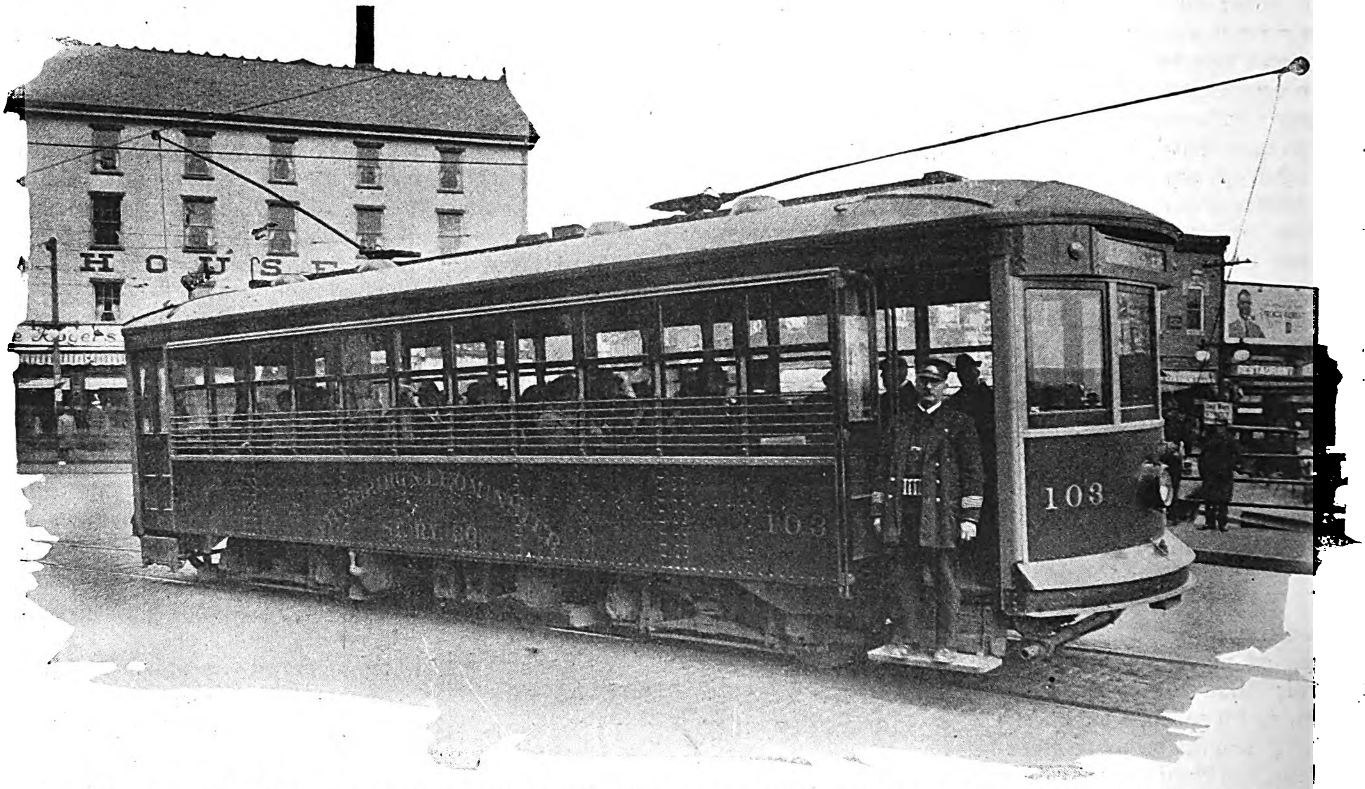
The reversible center line on heavy traffic streets has at least been tried in Cleveland with success. The New York elevated delivers express service with three tracks, reversing the center track morning and evening, making it equivalent to four tracks for express and local. By this simple means, present streets can be increased from 50 to 100 per cent rush-hour peak capacity when capacity is most needed.

In comparison, one-way streets are generally an economic blunder, and in any case, should be in pairs, rather than singly, though cutting the total street capacity to half. Reversible street operation, morning and evening, is clearly impracticable, but reversible center line is practicable.

We all grumble when the Capitol Limited or the 20th Century is held up at some block signal, yet I venture the assertion that probably 50 per cent of the total crossing time and capacity of our city traffic intersections is being wasted by badly adjusted "stop-and-run" signals or in hand control by waiting for "stragglers." Yet railroad signal practice pointed the way 30 years ago. The Chicago system of progressive interlocking movement and especially with independent control of each and every intersection, not only as to period, but as to time ratio or balance of traffic, is the one outstanding encouraging development, an adaptation of railroad and subway transportation experience.

SHORT SIGNAL INTERVALS NEEDED

The shortest possible signal interval is essential for maximum volumetric efficiency. This can only be determined by "calibrating" a traffic crossing under different load conditions, just as a voltmeter is calibrated for accurate reading. It is general observation that the usual run of signal installation has retarded transit and traffic movement throughout the country and diverted traffic from the logical artery to those less suited. Example, one of our largest cities installed a stop-and-run system, 100 seconds cycle, on its main business trunk carrying rush-hour car service at 22 seconds headway. Result, which any transportation man could foretell, from 2 to 3 minutes added trip time to every car entering the business district. This is not efficient transportation or planning. It is not enough to hide behind the slogan "order and safety." We must have both safety and speed. But this never will be realized until mass transportation, both rail and rubber, is designed and operated collectively along modern transportation lines and so conceived in the city plan.



New cars of this type placed in service Jan. 1, 1927, on the Fitchburg & Leominster Street Railway have reduced operating expenses about 15 per cent and increased the gross revenue

Rehabilitation Increases Riding on the Fitchburg Railway

By Emerson W. Baker
President Fitchburg & Leominster Street Railway, Fitchburg, Mass.

During past year track has been rebuilt, new rolling stock bought and rotary converters installed in old power house. Energy is now purchased. Operating expenses have been reduced about 15 per cent

NOT much more than a year ago the Fitchburg & Leominster Street Railway, with its 40 miles of track serving these two Massachusetts cities and also Lunenburg, Shirley and Ayer, was on the verge of bankruptcy. Buses were being given the preference by the traveling public and street railway patronage was fast disappearing. As a member of the law firm of Baker & Baker, counsel for the company, the writer had become thoroughly acquainted with its problems. To meet this emergency a plan of reorganization was carefully worked out. Today, scarcely more than twelve months since the reorganization was effected, the Fitchburg & Leominster Street Railway is coming back into its own.

Before the advent of the automobile this railway was one of the most prosperous properties in the entire state. Its bonds were gilt edged and its notes were sought by banks. Its tracks and equipment were well maintained. Its income was constant and adequate and its dividends were regular and satisfactory. For years the stock sold at many points above par. But with the coming of the auto this situation gradually changed. The income shrank from year to year until it seemed almost as though there would be no stopping point.

The company had a funded debt of $400,000 and more than $700,000 of unsecured notes, as well as $450,000 of stock. Before the bonds came due on Feb. 1, 1921, they were extended until Feb. 1, 1926, with interest at 7 per cent. The notes carried interest at 6 per cent. This made the annual fixed interest charges about $70,000.

In the spring of 1925 it was apparent that something

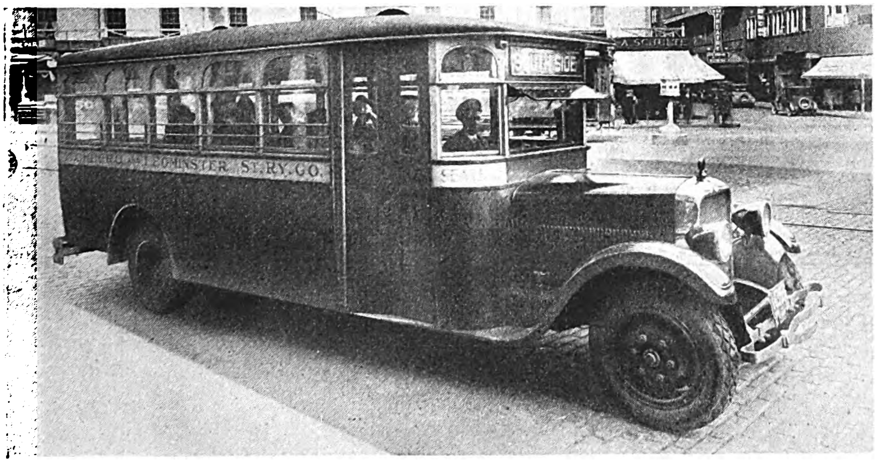
ANALYSIS OF OPERATING EXPENSES

	1927 January	1927 February	1927 Total
Maintenance of way and structures...	$2,704.48	$2,879.07	$5,583.55
Maintenance of equipment..........	2,970.07	2,446.82	5,416.89
Power..........................	6,532.98	5,968.00	12,500.98
Transportation expense.............	11,164.21	9,054.96	20,219.17
Traffic..........................	165.59	114.42	280.01
General expense..................	2,016.42	2,355.48	4,371.90
	$25,553.75	$22,818.75	$48,372.50

	1926 January	1926 February	1926 Total
Maintenance of way and structures...	$2,082.17	$5,941.90	$8,024.07
Maintenance of equipment..........	2,507.31	2,843.43	5,350.74
Power..........................	7,744.84	7,267.60	15,012.44
Transportation expense.............	11,080.92	10,263.16	21,344.08
Traffic..........................	69.57	67.49	137.06
General expense..................	3,513.52	2,949.09	6,462.61
	$26,998.33	$29,332.67	$56,331.00

drastic must be done if the railway was to be saved. So the writer, purely as a volunteer but with the knowledge and friendly co-operation of a noteholders' protective committee, went about the state and talked with as many of the bondholders as possible. He pointed out to them that unless they gave some assistance on Feb. 1, 1926, they would find the street railway company on their hands and would be faced with a serious impairment in the value of their bonds. Somewhat later a meeting was held at Fitchburg attended by a large majority of the bondholders. There were present also representatives of the noteholders and stockholders. They appointed committees to represent each group and delegated to G. A. Gaskill of Worcester and the writer the duty of formulating a definite and constructive plan of reorganization.

As finally worked out this plan contemplated a five-year test period to determine what could be done. The bondholders were asked to accept 5 per cent and 4 per cent instead of 7 per cent. The noteholders were asked to accept 1, 2, 3, 4 and 5 per cent interest for the first, second, third, fourth and fifth years. The stockholders were asked to place their stock for five years with trustees who should be designated by the protective committee and should vote the stock and elect officers during this period.



Five Studebaker buses of this type have been in service for several months and are proving more satisfactory than the heavier vehicles formerly operated

On Sept. 23, 1926, the plan became operative. The directors met and elected E. W. Baker as president, B. N. Hodges as treasurer, and L. H. Cushing as manager.

Track was in very bad condition and in some places almost unsafe for operation. A large repair gang was immediately put to work on the roadbed at a weekly cost of about $1,000. A number of lines were rebuilt, the work continuing until halted by cold weather. While this large increase of the payroll was a severe drain on the resources of the company, it was considered so essential to get the track in good condition that there was no alternative. This spring it is proposed to do further work on the track, replace light rails with heavier rails, put in new ties wherever needed and ultimately to have smooth, properly aligned track everywhere on the system.

The cars were almost all ancient, broken down and hardly usable, costing an excessive amount for repairs needed to keep them running. It seemed imperative that the public be given something better in which to ride. Immediately after the reorganization, the company ordered four new 26,000-lb. cars costing $13,000 each. These were built by the Wason Manufacturing Company. It was far from clear how the cars could be paid for even though the terms were only one-quarter down and the balance distributed over a period of five years. By exercising rigid economy, however, the company was able to accumulate sufficient funds to make the first payment, and by Jan. 16, 1927, all four cars were in active service. Four more of the same type ordered in February, 1927, have just been delivered.

Snow-fighting equipment was not dependable and was worn out. This was a serious difficulty because nowadays the best riding occurs on New England street railways during the winter months. A second-hand but satisfactory and effective sweeper was purchased for $1,500. This has proved adequate to take care of the snow problems during the worst storms of the past winter.

The carhouse and power house were dilapidated and their roofs leaked badly. They have been temporarily repaired. Later it will be necessary to put on new roofing, but the expense will not be heavy. One end of the carhouse where buses were sheltered was open to the weather and the heating was inadequate. This has been boarded up and doors installed so that it is now protected and properly heated.

Power house equipment was practically worn out. The steam boilers, originally high-pressure units, had been forced to reduce pressure from time to time by the state inspectors and were in danger of being con-

SUMMARY OF REVENUE AND EXPENSES

	1927 January	1927 February	1927 Total
Operating revenues................	$33,883.75	$30,678.60	$64.562.35
Operating expenses................	25,553.75	22,818.75	48,372.50
Income above expenses...........	$8,330.00	$7,859.85	$16,189.85
Interest........................	2,768.00	2,768.00	5,536.00
Taxes...........................	960.23	960.23	1,920.46
Net income......................	$4,601.77	$4,131.62	$8,733.39

	1926 January	1926 February	1926 Total
Operating revenues................	$33,945.13	$29,896.02	$63,841.15
Operating expenses................	26,998.33	29,332.67	56,331.00
Income above expenses...........	$6,947.80	$563.35	$7,511.15

Taxes...........................	1,047.60	1,107.59	2,155.19
Net income......................	$12.97	*$6,431.57	*$6,418.60

* Deficit.

demned at any moment. The books showed that energy was costing about 2 cents per kilowatt-hour, but the expense probably was even greater than that. A contract was made with the Fitchburg Gas & Electric Light Company to buy energy at a much lower figure. Three modern rotary converters were installed in the old power house. These operate effectively and satisfactorily in place of the machinery which has been removed. Another rotary converter is used as a booster in the Cleghorn district of Fitchburg. All the old machinery has been sold for junk. The converters cost about $10,000 completely installed, but the company has four years in which to pay for them. They are expected to be adequate for its needs for a long time to come. It has been estimated by the engineers that the net saving in energy cost will amount to some $10,000 to $25,000 a year.

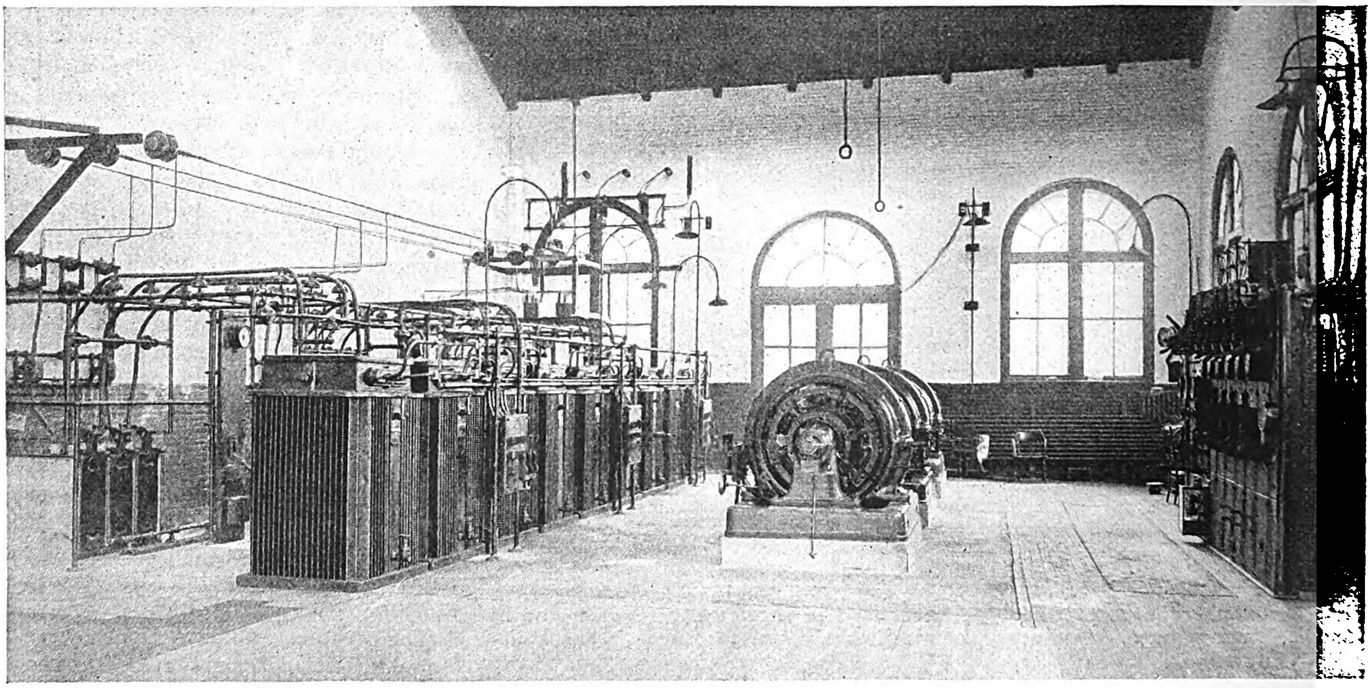
Overhead wire in places was found to be thin and weak. In the spring it is planned to secure some used copper trolley wire for replacement purposes and install it where it is most needed. At a relatively small expense this problem will be solved for the time being.

Whalom Park is owned by this company and is one of the best located natural parks in the state. Its woods were seriously damaged by cyclones a few years ago. Its popularity has been even more adversely affected, however, by the failure to keep up the general tone of the park. It is proposed as soon as the weather permits to repair and repaint the buildings, especially Whalom Inn, and to make them clean and attractive. Only the best amusement features will be tolerated and a conscientious effort will be made to regain for the park the splendid reputation which it formerly enjoyed.

Use of buses presented a complicated problem. In the fall of 1925, because of competition by independent operators and the unwillingness of the city government to protect the railway, the old management felt obliged to go into the bus business. Five 28-passenger buses were leased. These were permitted to parallel the car lines. Roughly speaking, with reference to the period from September, 1925, to the time when the present management took charge, these buses increased the expenses of the railway about $75,000 and added less than $2,000 to the income. It was obvious, therefore, that there would have to be some radical change of policy with respect to bus operation. It was felt that the buses were too heavy and too expensive to operate and that duplication of service was unwarranted and unwise. The lease, therefore, was discontinued and instead the company is operating four light-weight 21-passenger Studebaker buses. Routes have been revised so that the buses are acting as feeders to the principal rail lines.

Large rent was being paid for the offices uptown. This seemed an unnecessary expense and the office has now been moved to the power house, where ample room is available. The dispatcher's office is also located under the same roof.

A study of the records showed that about $5,000 was being paid annually for insurance premiums based on valuations which had long since ceased to be correct. Policies have now been adjusted to suit the present situation and an annual saving in premiums has been effected, amounting to about $3,800.



Rotary converters installed in Fitchburg & Leominster power house, replacing old steam-generating equipment

Taxes had been paid annually to the several cities and towns amounting to about $13,000. These were based on valuations which may have been proper when the company was making money but which were considered in excess of the worth of the property at the time of reorganization. Agreements have been negotiated so that the gross annual taxes henceforth will not exceed $6,000. This cannot be made to apply to the past, or to the taxes now in arrears, but it is expected that in the future there will be a saving of about $7,000 annually.

When the present management took charge it was discovered that the line from North Leominster to Ayer was operating at a large loss. This line was promptly abandoned. For a time buses were substituted, but finally the Boston & Maine Railroad took over the operation of this route, thereby permitting the street railway to concentrate its efforts in its local territory.

Other unprofitable outlying lines have been discontinued also. The mileage of track in operation Jan. 1, 1927, was 25.35 as compared with 41.63 a year before. Daily car-miles have been reduced from 1,845 to 1,685.

Notwithstanding the reduced trackage over which service is now rendered, the gross income for December, 1926, was greater than for any month in recent years. This increase is believed to be due in large part to the four new and attractive cars. The first two months of 1927 show a comfortable increase over the corresponding months of 1926. Moreover, operating expenses have been reduced about 15 per cent as indicated in the table on page 739.

NET INCOME SUBSTANTIALLY INCREASED

Thus the net income for January and February was about $15,000 higher in 1927 than in 1926. Within the next few months it is planned to rehabilitate the remainder of the company's rolling stock so that ultimately there will be available sixteen well painted, clean and attractive cars. The management believes that the street railway has a definite and vital place in the life of the community and that nothing thus far has been devised to take its place. The original enthusiasm for rubber-tired vehicles is abating somewhat and the public is beginning to realize that buses are inadequate to handle the transportation in Fitchburg, where the bulk of the traffic is carried during the rush hours.

The policy of the management has been one of entire frankness with the public. It is felt that the railway belongs to the people. Neither the president nor any of the directors receives a dollar for his services. The old idea that the street railway was a kind of financial octopus which fastened itself upon the public, an enemy always ready to attack and to be attacked, no longer prevails in Fitchburg. The public recognizes the attitude of the new management. Indications are that patronage will continue to increase and that a sound and prosperous transportation system will be established.

Energy Consumption Accurately Measured

Survey Made to Determine Constant for Every Type of Passenger or Freight Car Operated by Nine Electric Railways in the Dayton Central Power District

ENERGY used in the operation of all cars in the central district of Dayton, Ohio, is supplied by the Dayton Power & Light Company from its Fourth Street power plant. Nine separate electric railways operate cars through this district, and in order to allocate properly the energy charges it is necessary to determine the consumption for each type of equipment.

In May, 1921, a comprehensive survey of this nature was conducted by the Economy Electric Devices Company, establishing constants for each type of equipment operated. Since these constants were based upon the energy consumption at the car, the bill rendered by the power company was in excess of the figured energy consumption, due to line loss, etc. During the first year following the survey this excess was a comparatively small amount, but shortly thereafter it began to increase until the latter part of 1926, when the excess amounted to approximately 30 per cent of the total. Accordingly, another survey was undertaken to establish new constants.

Because of the thorough manner in which the 1921 survey was conducted it was unnecessary during the recent investigation to go into as much detail as the first time. Quite a number of the cars operating in Dayton are equipped with Economy meters, hence the procedure was much simplified. On cars so equipped the meters were used in checking the old constants, the cars being in regular service. Otherwise a portable meter was used and the car operated as a special through the district. A relation was established between service and special cars by comparing similar types of equipment, and it was possible thereby to check the present energy consumption against the old constants.

Constants for freight equipment were obtained in a like manner. Most of the freight motor cars operating in Dayton are equipped with Economy meters. By riding these trains the investigators were able to obtain the energy consumption of the various freight motor cars hauling different numbers of trailers. By analyzing the data thus obtained constants were derived for light freight motors and for freight trailers. While the energy consumption of a freight train does not vary directly with the number of trailers hauled, the differential is small, and in order to simplify the bookkeeping a single constant was established for all freight trailers.

Practically all of the rolling stock used in city service is now equipped with electric heaters. The exact amount of energy used for electric heat by each company was difficult to determine due to differing standards of heating on the various properties. The amount of heating energy used in proportion to the motor energy in the central district is high, because of the length of time required to move the cars through this area.

Temperature of the outside air is a factor which largely affects the energy consumption of heaters, and it is obvious that as much heat will not be required during a moderate day as on an extremely cold day. This presents an accounting difficulty. The old system required that all trips be reported as "heat trips" during the heating season. It was thought by the investigators that a well-defined relation exists between the average monthly temperature and the amount of energy used for heat and that a more accurate method of calculation should be used. In the following tabulation is shown the per cent of trips recommended to be reported as heat trips during each of the seven months of the year when heaters are used.

Month	Mean Monthly Temperature	Per Cent of Trips to Be Reported as "Heat Trips"
August	73.4	0
September	72.6	0
October	47.0	30
November	40.9	60
December	29.6	100
January	28.8	100
February	33.7	75
March	33.9	50
April	45.6	25
May	62.8	0

Figures were developed by this survey showing the energy consumption for motors and heaters on each type of car operated by each of the nine railways. By the use of these revised constants and the recommended proportion of heat trips it is believed that the total energy consumption can be accurately divided and the proper amount allocated to each railway.

The Readers' Forum

Standard Specifications Should Be Utilized

80 PARK PLACE
NEWARK, N. J., April 18, 1927.

To the Editor:

I recently read with considerable interest an article in the Feb. 12 issue of the *Electrical World* covering the high points of an address by C. F. Hirshfeld, chief of the Detroit Edison Company's research department, before the third annual meeting of the public utility group of the National Association of Purchasing Agents at Detroit in January, 1927. This article contains several thoughts that should be of sufficient value to call to the attention of the purchasing agents and engineers of the electric railway industry.

The first is the need for co-operation between them and the necessity for each thoroughly understanding the viewpoint of the other. The next thought that seems to me to be of particular value, especially to the engineer, is the desirability of utilizing existing standard specifications, such as those of the American Society for Testing Materials and the National American Standards as adopted by the American Engineering Standards Committee. It is quite probable that, except in certain very special cases, all practical requirements will be met by one of these standard specifications, which, as Mr. Hirshfeld states, have passed through the trial of fire and the test of actual use over a period of years. They are generally accepted as representing the best commercial manufacturing practice, and if individual engineers are going to continue to insist on using their own particular specifications much of the benefit of standardization will be lost. Mr. Hirshfeld has well stated the case when he expresses the belief that "Mr. Engineer cannot take offense when Mr. Purchasing Agent asks him to explain why the standard material or equipment which many manufacturers are prepared to furnish is not good enough, and he is no proper engineer if he cannot produce a proper answer. There are exceptional cases where something better than the nationally accepted standard is required, but fortunately they are few and far between."

Perhaps a large part of the difficulty can be attributed to a lack of proper knowledge on the part of the engineer as to just what materials are covered by national standard specifications or by those of our national associations, and of their specific requirements. It is quite probable in many cases that he has never taken the trouble to study them and compare them with his own and attempt to convince himself that they would meet his requirements equally as well as his own specifications. The solution of the problem would seem to be a thorough knowledge on the part of the purchasing agent of the various existing standard specifications, at least by title, so that he could then be in a position to call them to the attention of the engineer when the latter submits his own particular pet. There must also be a willingness on the part of both officials to confer on such matters so that each may have a chance to obtain the viewpoint of the other.

The last important matter discussed by Mr. Hirshfeld has to do with a practice in vogue in some purchasing departments of pitting one vendor against another after bids have been received, for the purpose of securing percentage reductions from the first quotations. He calls it "the questionable satisfaction of 'persuading' them into a reduction," and states as his experience that "the cleverer salesmen serve up to you exactly the sort of dish that your past performances lead them to think that you want." It is quite probable that a great many purchasing agents, if they made an honest analysis of the situation in their own cases, would have to admit the truth of this conclusion. It is only once that a vendor will submit a bona-fide quotation and find that in order to secure the order he has to cut an amount equal or approximately equal to his estimated profit. Once it becomes known that this is the practice employed in making purchases, and such news spreads around rapidly, original quotations are submitted on the basis that such cuts will be asked for and the saving to the company becomes imaginary rather than real. It may even mean an increase in cost. The practice certainly creates bad feeling among the vendors and it should be condemned as strongly as possible. It has a decided disadvantage when employed in the case of prices being obtained for use of a contractor in an estimate when competing with other contractors for a job. The result is that the vendor submits lower quotations to the purchasing department which awards contracts upon the basis of original quotations than to the firm which insists upon the bargaining process after receipt of quotations, and the effect on the bid of the latter is too evident to require discussion.

HOWARD H. GEORGE,
Chairman Committee on Way and Structures,
American Electric Railway Engineering Association.

Agrees on Need of Research Department

PITTSBURGH RAILWAYS
PITTSBURGH, PA., April 19, 1927.

To the Editor:

The letter by H. S. Williams, assistant superintendent of equipment Department of Street Railways, City of Detroit, published in the March 26, 1927, issue of ELECTRIC RAILWAY JOURNAL, page 575, was read with a great deal of interest.

It is believed that such a research department is very necessary to the proper functioning of the American Electric Railway Association. Such work as is being done in Joliet, Ill., and Springfield, Mass., on more modern design of street railway equipment is a sign of the need of such a department in the association.

The entire expense of work of this sort should not be borne by individual properties, but should be divided among the companies composing the industry. The only way this may be done is through the establishment of a research department in the association.

W. T. ROSSELL,
General Manager.

St. Joseph Belt Line Half Finished

THE belt line, a 22,000-volt power transmission line which is being constructed by the St. Joseph Railway, Light, Heat & Power Company, and when completed will entirely encircle St. Joseph, is half finished. More than $75,000 has been expended on it and almost that much more will be used in finishing the job, which will take two or three years more. The big substation on Cook Road, north of the city, was completed and put in operation in December, 1926, and its completion marked the last work on the belt line last year.

MAINTENANCE MEN, Here Is Your Opportunity—

Go After a Prize!

First Prize . .	**$200**
Second Prize . .	**$100**
Third Prize . .	**$50**

Twelve Monthly Prizes, $25 Each

IN ELECTRIC RAILWAY JOURNAL'S Maintenance Data Contest you may win the money; you are sure to acquire greater prestige. Help to increase interest in the work of the maintenance man!

For the benefit of new readers and those who may have missed the announcement in last week's issue of ELECTRIC RAILWAY JOURNAL, the conditions for competing for the various prizes offered in the Maintenance Competition are restated in condensed form. Full information will be found in the April 16, 1927, issue, pages 700-701.

Three capital prizes will be awarded for the three best maintenance ideas submitted before Aug. 1, 1927. These are: First prize, $200; second, $100, and third, $50. In addition twelve monthly prizes of $25 each will be awarded, one each month beginning with the May 21, 1927, issue. Articles submitted will be published in the Maintenance Data Sheet Section of ELECTRIC RAILWAY JOURNAL, and a minimum of $5 will be paid for each article published.

ANY employee or official of an operating electric railway or electric railway bus subsidiary may compete for the prizes.

Each contestant may submit any number of items he desires. Each will be judged separately.

The prizes will be awarded primarily on the value of the idea presented and its adaptability to maintenance work on electric railways. The form of presentation will be judged only as to the clearness with which the method or device is described and illustrated.

The author does not necessarily have to be the originator of the idea or device. An article may be submitted by several persons or by a department and need not be written by the person in whose name it is submitted.

Articles may describe any maintenance practice or device used by any department of an electric railway, such as the maintenance of rolling stock, buses, shop equipment, or methods and equipment for overhead line repairs, power distribution and power generation devices, signal work, track and way maintenance, etc.

Articles should be preferably 100 to 200 words in length and should be accompanied by one illustration. Brevity consistent with a proper presentation of information will be given weight in judging articles. In no event should they be longer than 400 words, with not more than two illustrations.

MANUSCRIPTS should be mailed to the editor of ELECTRIC RAILWAY JOURNAL, Tenth Avenue and 36th Street, New York, N. Y. To be eligible for the capital prizes the envelope must bear a postmark dated before Aug. 1, 1927. Photographs or sketches that accompany the manuscript may be in pencil, or blueprints will be accepted. Each item submitted should bear the name or names of the individual or individuals by whom it is submitted and to whom awards are to be made. Photographs, sketches and manuscripts should be marked so that should they become separated they can be identified readily.

Monthly prizes will be judged by the committee, to be announced later, after the articles are published in the Maintenance Data Sheet Section, the best item being selected each month from those appearing in the issue in the month devoted to Maintenance and Construction.

The announcement of the winner each month will be made in the issue devoted to Maintenance and Construction, the third issue each month, following the one containing the items.

The winners of the capital prizes will be announced in the Annual Convention Number of the ELECTRIC RAILWAY JOURNAL to be published in September, 1927.

ELECTRIC RAILWAY JOURNAL offers these prizes to help maintenance men win the recognition in the industry which they deserve. Enter the contest now. Send in as many of your maintenance practices as you like. The JOURNAL will pay $5 for each item published, whether or not it wins a prize. The more items you send in the more chances you have of winning a capital or a monthly prize. Get started early. Articles to be published in the Maintenance and Construction issue for May will have the first chance to win one of the $25 monthly prizes. Maintenance men, here is your opportunity!

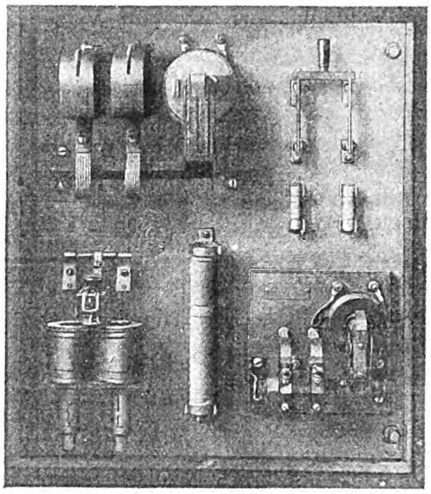
Maintenance Notes

Convenient Truck for Armatures

WITH a capacity of eight large-sized armatures, a truck has been constructed in the shop of the Grand Rapids Railway, Grand Rapids, Mich., for running into the oven and supporting the armatures while they are being baked. The truck, which runs on a stationary track between the dipping tank and the oven, can be readily pushed by the workman. The top of the truck is covered with galvanized iron and has holes arranged so that the armatures can be set on their end bells with the commutator ends up just as they are received from the dipping tank. By particular care in spacing the holes the truck is arranged to accommodate different types of armatures.

The baking oven used was constructed in the shop. It is of sheet steel with a height of 6 ft., length 6 ft. and width 5 ft. Each side is made as a complete unit so that it is portable and can be set up quickly. The sections are made with a ⅜-in. x 3-in. x 4-in. angle framework covered with No. 20 gage sheet steel and No. 16 gage galvanized sheet inside. An inside lining of 2-in. Johns-Manville panel cell asbestos insulation is used between the sheets.

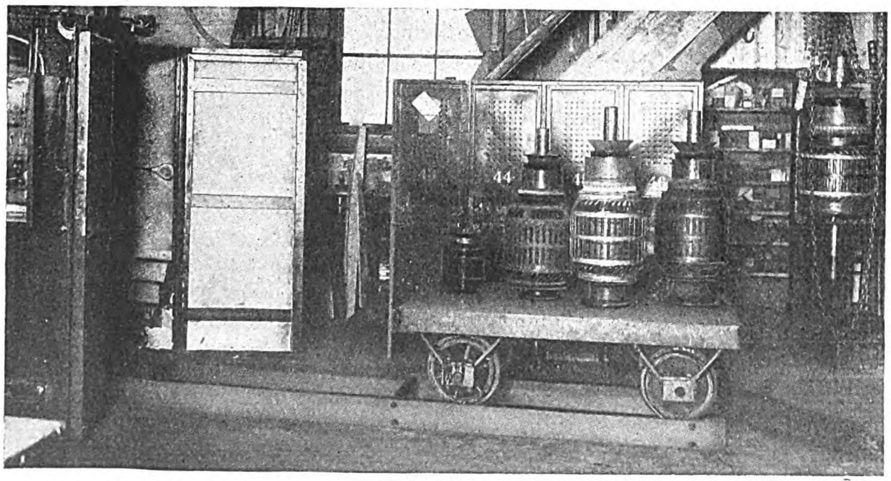
The oven is heated electrically with six 110-volt, 3½-kw. heaters in series across the 600-volt trolley circuit. Thermostatic heat control is used, the control panel being located on the side of the oven. This is fitted with a glass door so that all equipment can be seen readily. Thermostats inside the oven are set so as to indicate the temperature at the commutator neck, as it appears that the solder in the leads is the limiting temperature. Heaters have baffles so as to direct the heat through the trucks and thus prevent its escape at the sides.



The oven control apparatus is covered with a glass door

For ventilation the oven has four 2-in. x 4-in. adjustable louvers and a 5-in. stovepipe from the center of the oven leading outside the building. A damper inside controls the amount of ventilation.

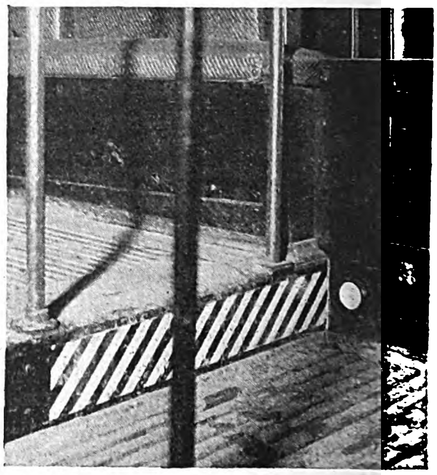
The dipping tank is located under the floor and is 18 in. diameter by 46 in. deep. It is piped to a large barrel outside the building so that it can be refilled easily as the varnish is used. The float has a sheet iron tube, closed at one end. The armature shaft fits into the tube as far as the wiper ring so that varnish cannot get on the shaft when dipping. A similar float used in Montreal for keeping shafts free from varnish was described in ELECTRIC RAILWAY JOURNAL for April 17, 1926, page 676.



Convenient type of armature truck used for handling armatures between dipping tanks and into oven

Barber Pole Stripes for Safety

ANTICIPATING accidents occurring to passengers entering the drop platform cars of the Memphis Street Railway, Memphis, Tenn., 1¼-in. diagonal black and white stripes have been painted on the end sills. Twenty-five cars were converted recently for one-man operation, and in order to provide for the easy entrance and exit of the passengers it was found necessary to rebuild the cars with drop platforms. The stripes are visible immediately on boarding the car. A lamp installed in a cabinet at the right makes the stripes visible at night.



Barber pole stripes on the end sills prevent accidents. A lamp makes the stripes visible at night

"Four out of every five have it." Prevent "pyorrhea of your gear teeth" by better maintenance of the gear center distance.

Around the World Without a "Pull-in"!

GOING farther than the distance around the world without a pull-in is the record set by the average street car of the Georgia Power Company during 1926, and it is a record of which many larger companies might be envious.

In 1921, when systematic improvement was begun on the street railway system in Atlanta, the average number of miles per pull-in was 3,002. Now, at the end of five years, the number of miles driven without a pull-in has increased to 26,041. Putting it one way, this is an increase of approximately 800 per cent. Putting it another way, it means that each street car in the city runs a distance equal to that around the world before it has to be pulled in for repairs.

At the present time Atlanta is leading the "Southern League" of street railway companies in mileage per pull-in, the average for Little Rock being 15,848 miles, for Birmingham 13,694, for Memphis 9,889, for Mobile 8,633, for Dallas 6,954 and for Covington, Ky., 5,686. Other cities show even less mileage per pull-in.

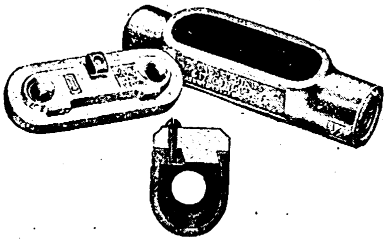
Incidentally, Atlanta is leading a good many other cities in the matter of pull-ins. The figures speak for themselves.

New Equipment Available

Wedge-Nut Fastening for Condulet Cover

FASTENINGS without screws which might project inside so as to injure wiring are a feature incorporated by the Crouse-Hinds Company, Syracuse, N. Y., in a new line of Obround condulets. The particular innovation of this line is the method by which the cover is fastened. The inside surface of the condulet at the opening has a slight bevel and the condulet cover is also provided with a corresponding bevel. After the cover is in position it is fastened by what is termed a wedge nut. This nut has beveled surfaces, one side of which fits against the bevel of the condulet while the other side is against the similar surface of the cover. By tightening a single screw on the outside the nut is drawn against the beveled surfaces and the wedging action holds the cover firmly in position.

Some of the advantages claimed are that the wedge nut holds the cover securely in position and it cannot become loosened by vibration. The cover openings are also unobstructed by any lugs necessary for fastening and therefore it is easy to pull conductors into conduits and there are no screws to project inwardly and so injure the conductors. The unobstructed cover opening provides a large wiring chamber which makes splicing and taping easy. The covers and wiring devices can be installed in inaccessible places, as they can be turned to bring the fastening screws outward and a few turns of the screwdriver clamp the covers securely. The cover and wiring devices are complete units so there is no danger of losing small parts. These condulets are furnished in the various sizes and designs which are standard by the Crouse-Hinds Company for other condulets.



New type of Obround condulet with wedge nut fastening

Flexible Mounting for Electric Hoist

MOUNTING in a fixed position, either overhead or on the ground, is possible with a new "Lo-Hed" electric hoist announced by the American Engineering Company, Philadelphia, Pa. It also can be placed on skids and used as a portable hoist. The hoist is suitable for such purposes as a car puller, hoist, derrick or elevator.

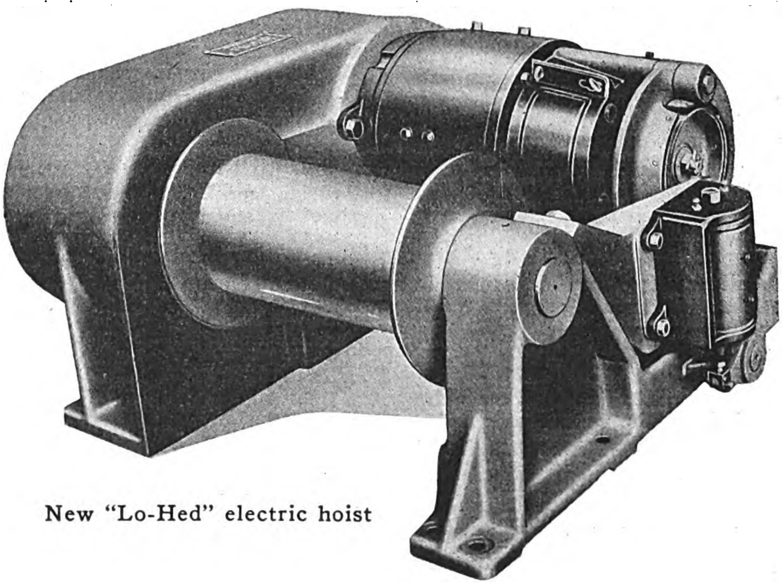
The standard machine has a smooth drum, driven by a motor through a chain of spur gears, all mounted on a common bedplate. It is furnished in sizes for handling loads from 500 lb. to 4,500 lb.

The motor and gears are inclosed completely. Gears are of drop-forged, heat-treated steel, run in an oil bath. Hyatt "high duty" roller bearings are mounted on the ends of all gear shafts. The cover of the gear case is removable.

The drum has large flanges, which prevent the rope from jumping the ends and give maximum stowage capacity. One bearing of the drum shaft is splash lubricated from the gears and the other has an Alemite fitting.

The motor has ball bearings and is especially designed for hoist service. Either d.c. or a.c. motors can be furnished. The controller is of the single-speed, reversing-drum type.

When desired, certain modifications in the hoist can be made by the manufacturer, such as the inclusion of grooved drums, push button and remote control, holding and lowering brakes, extension shafts with additional heads and either air or steam motors.



New "Lo-Hed" electric hoist

American Association News

Way and Structures

PROGRESS made in the formulation of recommendations to be presented to the standing committee on way and structures was outlined by the chairmen of the various special committees at a meeting held at association headquarters, New York, on April 7 and 8. The special committee on review of existing standards presented a progress report. Chairman George reported that he had written to the chairman of the A.R.E.A. rail committee requesting information as to the action taken by the A.R.E.A. on the request of the A.E.R.E.A. to make certain revision in its open-hearth girder rail specifications, but that the information had not been received. The chairman will follow this matter up with another inquiry if the information which is requested is not received within a reasonable time.

Mr. Alden requested that the Manual be modified to fix the tolerances for rail template fit as follows:

"No variation will be allowed in dimensions affecting the fit of the joint bars except that the fishing template approved by the purchaser may stand out not to exceed $\frac{1}{8}$ in. laterally."

After the matter had been thoroughly discussed by the entire committee and the proposed revision explained by sketches on the blackboard, it was moved to amend the motion by changing the permissible variation to $\frac{3}{32}$ in. instead of $\frac{1}{8}$ in. The motion as amended was carried without dissenting vote. The committee decided that this matter should be referred to the executive committee as soon as a letter ballot had been taken.

Mr. Merker submitted six designs of existing special expansion joint designs in actual use at various locations in Brooklyn, and called attention to the fact that the special requirements of each particular situation generally made necessary a special design each time an expansion joint was required. It was decided that the matter of expansion joint design be referred to special way and structures committee No. 2 for investigation and report as a part of next year's program.

Mr. Ryder reported that the committee on special trackwork had held a meeting at which the following subdivisions of the work were considered: (1) Switch tongue design; (2) hard center plate design; (3) design of iron binding for iron-bound special trackwork.

Mr. Ryder stated that it was the committee's intention to concentrate its efforts on subjects Nos. 1 and 2, as No. 3 could not be worked out until after No. 2 had been disposed of. His committee submitted a full-sized detail of switch heel design showing the hold-down device. Mr. Entwisle expressed the opinion that certain modifications of the proposed design would have to be made in order for it to be effective.

Mr. Merker submitted a progress report of the special committee on rails, but owing to the fact that the way and structures committee had not had an opportunity to study this Mr. Merker was requested to send a copy to each member of the standing committee, and the latter are then to submit individual written discussion to the chairman of the special committee.

COMING MEETINGS
OF
Electric Railway and Allied Associations

April 26-29—Southwestern Public Service Association, convention, New Orleans, La.

April 27-29 — American Welding Society, eighth annual meeting, Engineering Societies Building, New York City.

May 3-5—United States Chamber of Commerce, annual meeting, Washington, D. C.

May 6—American Electric Railway Association, Metropolitan Section, Engineering Societies Building, New York City, 8 p.m.

May 9—National Conference on City Planning, Washington, D. C.

May 11-12—Central Electric Railway Master Mechanics' Association, meeting, Webster Hall Hotel, Pittsburgh, Pa., 9 a.m.

May 18-19—Central Electric Traffic Association, meeting, Tuller Hotel, Detroit, Mich., 9 a.m.

May 31—June 1-2—Canadian Electric Railway Association, annual convention, Winnipeg, Man.

June 6-8—American Association of Engineers, annual convention, Tulsa, Okla.

June 19-23—International Street and Interurban Railway Association, annual conference, Copenhagen, Denmark.

June 24-25—New York Electric Railway Association, annual meeting, Hotel Champlain, Bluff Point, N. Y.

June 29-July 1 — Central Electric Railway Association, summer meeting, Book-Cadillac Hotel, Detroit, Mich.

June 30-July 1 — Tramways and Light Railways Association, annual meeting, Bath, England.

July 27-29—Association of Equipment Men, Southern Properties, 12th semi-annual meeting, Atlanta, Ga.

Oct. 3-7—American Electric Railway Association, annual convention and exhibit, Public Auditorium, Cleveland, Ohio. Exhibits open Oct. 1 at noon.

Mr. Baker reported for the special committee on track drainage that he had prepared a tentative questionnaire on the subject which was to be sent out at an early date to the maintenance of way members of all A.E.R.E.A. committees this year. He stated that his committee had reviewed preceding reports on the subject that had been referred to them, but that the information was now obsolete and would have to be revised and brought up to date, which the above questionnaire was designed to do.

The committee on bus garage design has decided that the study of "Effect of Garage Design on Insurance Rates" was the most important assignment and that it should be given first consideration. The members have decided to study also the three following subjects, leaving the others referred to them for future attention: (1) Door design; (2) bus washing facilities; (3) ideal layouts for various street frontage conditions.

Mr. Wysor reported that there had been no meetings held but that the rail corrugation committee is slowly collecting data. He reported that the Westinghouse company is making tests covering the determination of hardness tests on corrugated rail to determine the variation in hardness between the crest and trough of the corrugations. He also reported that the services of Professor Ewing had again been retained this year. It was stated that the committee will again submit only a progress report at the October convention.

TERMINAL WORK HELD UP

No report of the committee on joint bus and railway terminals was submitted but Chairman George reported that the special committee chairman had resigned and that an invitation had been extended to another member of the committee to serve as chairman and that it was hoped to get the work of this committee under way at an early date, although it was hardly probable that any definite progress could be made this year.

Mr. Spencer gave a record of the installations of chrome-nickel steel special trackwork, which will be covered by the report of his committee. He stated that he had arranged for a series of weldability test specimens to be made by the Canadian Steel Foundries, Ltd., and that Bethlehem Steel Company, Lorain Steel Company, and William Wharton, Jr. & Company, Inc., had also signified their willingness to make similar tests. It has not been definitely decided whether to have the various manufacturers make these weldability tests on specimens in their shops or to have the specimens sent out to several railway companies for welding tests.

The entire subject was carefully discussed and it was the general opinion that the welding should be done by three railway members on identical test specimens, with the same welding wire and under as nearly the same conditions as practical, the operator being the only uncontrolled variable. It was suggested that it would probably be desirable to introduce artificial cupping in the test specimens in order to reproduce more accurately the actual field conditions, and that the welding should also be made on a ground surface. The discussion was informal and no definite action was taken by this committee.

SEVEN-INCH RAILS USED EXTENSIVELY

Mr. Alden submitted a tabulation showing the rollings of the various 7-in. girder rails by the Lorain Steel Company for a period of five years and stated that he would prepare comparable data from the Bethlehem Steel Company. This showed that over 50 per cent was the A.E.R.E.A. standard, with an additional 15½ per cent covering the A.R.E.A. standard heavy 7-in. section for use in paved streets. A little less than 9 per cent was the 116-lb. rail sections L.S.-434 and 494. Of the remainder, the greatest percentage was sections L.S.-103-478 and B.S.-103-287-A, which comprised 11.16 per cent of the total. Mr. Alden stated that it was his belief that the Bethlehem figures would show at least as high a percentage from their total rollings and that his committee would probably recommend this 103-lb. section for adoption as a standard light section girder rail, without modification.

Mr. Gailor submitted a tentative draft of a set of specifications which had been prepared as the result of the study and investigation made by the special committee on arc welding and which was now in its hands for study and criticism. He said that the rules of procedure for welding operations are now being studied by the committee. Mr. Ryder gave a comparison between the chemical requirements of the various grades of welding rods in this tentative specification and those for similar grades in the specifications of the American Welding Society. It developed that there were no radical differences.

NEW CODE OF INSTRUCTIONS

Mr. Burke read a letter sent out by Mr. Harvey to the members of the committee on pavement giving the tabulation of the replies that he had received to a questionnaire he had sent out, and also his summary of these replies.

The chairman called the attention of all members of the way and structures committee and all chairmen of special committees to the new code of instructions or rules governing committees, activities and the preparation of reports.

The date and place of the next meeting were discussed. It was agreed to hold it at association headquarters in New York on June 9 and 10, 1927.

Members and chairman of special committees present were H. H. George, chairman; C. A. Alden, E. B. Entwisle, W. G. Hulbert, H. F. Merker, E. J. McIlraith, E. M. T. Ryder, A. T. Spencer, W. W. Wysor, S. Clay Baker, E. P. Roundey, W. R. Dunham, Jr., and C. F. Gailor.

Power Generation and Conversion

PROGRESS reports were presented at a two-day meeting of the committee on power generation and conversion of the Engineering Association held at association headquarters, New York City, April 4 and 5. Those present were W. E. Bryan, chairman; L. D. Bale, sponsor; C. A. Butcher, H. W. Codding, H. A. Kidder, Otto Naef, F. W. Peters, R. L. Weber, G. I. Wright, F. B. Davenport representing C. E. Bennett; C. L. Gerhardt representing G. W. Saathoff, and E. G. Sohlberg.

Extended discussion was given to the subject of ventilation. Table No. 6 of last year's committee's report was expanded to show the computed temperature rises at 100 per cent and 125 per cent rated load. The handbook figures for watts per square foot radiation per degree centigrade were found to differ from actual test results. This was thought to be because test figures took into account not only radiation, but absorption by the building structure as well. It was decided to use a figure of 0.450 and compute the temperature rise at 100 per cent rating on the basis of this figure.

This year's assignment on ventilation provided for a study of the conditions under which natural ventilation was desirable on the one hand and forced ventilation on the other. In view of the very great variation as to air temperatures, size and construction of buildings, loads to be carried, etc., it was felt that no definite line of demarcation could be drawn and that the report should state the various factors to be considered when designing the scheme of ventilation, and only in a general way the conditions requiring forced ventilation.

Graphs have been prepared for 600-volt rectifiers and converters for both 25 and 60 cycles. The difference in the two was found to be due to the difference in transformer design. Since transformer efficiency can be varied by design and since the efficiency of the rectifier itself is independent of the frequency, it was desided to use one curve for both 25 and 60-cycle rectifiers. It was decided that this year's report should include a table showing the protection necessary or advisable for automatic operation of converters and rectifiers. A questionnaire has been sent out to a number of companies operating rectifiers in this country and answers from these will be tabulated.

Fire Prevention

RULES for employees were considered by the sub-committee on fire prevention of the American Association insurance committee that met at association headquarters in New York on April 8, with the following present: F. J. Petura, A. D. Knox, J. H. Moran, N. H. Daniels, B. L. Tomes and H. B. Potter, chairman.

The committee discussed the "Rules for Instructions to Employees for Fire Prevention" which are given in Manual Section B100-23, and decided that mention of this section should be made in its report. A complete discussion on the subject of fire prevention was held and at its conclusion it was decided that each of the sub-committee members would submit a draft of a report for use in preparing the final report.

The committee also considered the replies that had been received to the insurance questionnaires sent out some time ago, and urged prompt compliance with the committee's request to fill out and return these questionnaires at the earliest possible moment.

Hotel Reservation Blank for Cleveland Ready

APPLICATIONS for hotel reservations for the convention of the American Electric Railway Association at Cleveland, Ohio, next October, together with a statement of rates at the various hotels during the period of the convention, will be mailed from association headquarters in New York early during the week commencing April 25.

Bus Operation

MEMBERS of the committee on bus operation of the Transportation & Traffic Association met in Chicago on April 8 to discuss progress reports of the four sub-committees. The one on fares and fare collection was presented in a letter from E. D. Dreyfus, its chairman. It was the opinion of the members in attendance that this report should contain the practices of operating companies in establishing, determining and collecting fares. It was the thought of R. N. Graham, chairman of the main committee, that if the expressions of opinion of the members were incorporated in a report it would materially benefit present and prospective operators of bus lines, both city and intercity.

Out of questionnaires sent out to 51 companies operating buses, 46 have been returned, according to Mr. Graham. Material in these answers would assist the sub-committee in preparing a more comprehensive report on the subject of fares. D. L. Fennell, Kansas City, suggested that the sub-committee study the question of fares and perhaps work out a formula by which it would be possible to establish equitable rates for various bus services. A. R. Myers, Erie, Pa., suggested that the sub-committee work out such a formula based upon the density of population, riding habit and amount of service.

All of this discussion resulted in a motion by P. E. Wilson, Cleveland, that the sub-committee be directed, first, to analyze the data on fares and fare collection as contained in the questionnaires; second, to summarize this information for city, interurban and charter service, and, third, to make recommendations as to a definite policy to be followed by member companies. It was the opinion of the committee that the rate of fare must be based on the cost of service and should not follow in the footsteps of the early electric railway fare which was based upon a coin, rather than upon the cost of service. Mr. Fennell stated that now is the time for the electric railway industry to break away from the old practice of a coin for a fare. As this subject was considered the most important of the four, Mr. Graham increased the membership on the sub-committee by adding to it H. M. Bollum, Minneapolis; A. R. Myers, Erie, Pa.; Adrian Hughes, Jr., Baltimore; H. G. Monger, Milwaukee, and B. W. Arnold, Highwood, Ill. These men were asked to write to Mr. Dreyfus and co-operate with him and D. A. Scanlan in preparing a comprehensive report.

Progress reports were read by the sub-committees on equipment; methods, practices and economics of bus operation, and bus operating rules and instructions to personnel. Discussing the latter subject, Mr. Wilson made a motion that the program committee be requested to make arrangements for D. A. Scanlan, Akron, Ohio, to give a demonstration at the Cleveland convention of the Northern Ohio Traction Company's school for bus drivers' instruction.

Members present at the meeting included R. M. Graham, chairman; B. W. Arnold, vice-chairman; D. L. Fennell, S. W. Greenland, M. L. Harry, Adrian Hughes, Jr., H. M. Bollum, Thomas Noonan, E. S. Pardoe, members, and Paul E. Wilson and A. R. Myers, sponsors.

News of Other Associations

Traffic Congestion a Paramount Issue

CITY governments have thus far failed to take adequate steps to cope with the traffic problem, according to speakers at a conference held under the auspices of the National Automobile Chamber of Commerce at Chicago on April 13. Mayors, safety commissioners and other city officials were gathered there to consider the problem of traffic regulation from the executive standpoint. Various speakers emphasized the fact that traffic congestion has ceased to be merely a petty annoyance and has now become a major economic problem. Traffic is increasing so rapidly that a situation is likely to arise in a few years requiring the expenditure of much larger sums to provide relief than will be needed if the problem is attacked now.

Every city of 25,000 or more population should have at least one official whose sole duty it is to devote his time to traffic problems, according to Miller McClintock, director of the Erskine Bureau of Street Traffic Research. Congestion has reached its present seriousness, he said, because municipal officials have not attacked it with the same success that they have had in tackling other problems.

A discussion of signals and signs was led by E. J. McIlraith, staff engineer Chicago Surface Lines. Automatic signals, he said, are preferable to traffic policemen wherever conditions justify the expense. To be of any value, however, these signals must be properly timed. Too many cities buy signals like so much hardware and stick them up where it is most convenient, with little regard for time intervals or their relation to other signals. He urged municipal officials to obtain competent engineering advice before signals are installed. Co-ordination of lights to permit continuous flow of traffic at a certain specified speed is the latest development in traffic signaling, he said. This is putting a much needed curb on the driver who endeavors to "beat the lights."

The traffic problem is likely to get worse before it gets better, in the opinion of J. Rowland Bibbins, consulting engineer, Washington, D. C. He pointed out that the private automobile is not the only phase of the problem, but that freight transportation, which has not been greatly developed yet, looms large in the picture of the future. Local freight transportation will tend more and more to use the public streets, he said. He suggested that the best way to speed up traffic is by segregating it by classes, making some streets available for rapidly moving vehicles and others for slow, heavy trucking. Mr. Bibbins' paper appears in abstract elsewhere in this issue.

Central Electric Traffic Association

IN ACCORDANCE with the action taken, the Central Electric Traffic Association will hold its next regular meeting at the Tuller Hotel, Detroit, Mich., May 18 and 19. The opening session will be called to order at 9 a.m. Eastern Standard time.

Members are requested to submit subjects for discussion to the secretary as soon as possible in order that the docket may be mailed from his office not later than May 2.

C.E.R.A. Program Discussed

SUBJECTS for the summer meeting of the Central Electric Railway Association to be held at Detroit, June 29-July 1, were discussed at a meeting of the program committee of the association held in Cleveland, Ohio, on April 15. All members were present.

The tentative program includes a session on track construction and maintenance, with a talk on the general subject of standardization and elimination of waste; a session on better business methods for electric railways, city, interurban passenger and freight; one on electrical overhead construction, and one on financing. An address is planned for Wednesday evening.

Entertainment proposed includes a trip through one of the automobile plants in Detroit on Wednesday afternoon; a boat trip to Bob-Lo Island, with a golf tournament, on Thursday afternoon, and a dinner-dance Wednesday evening. A trip around Detroit by motor coach for the ladies is also planned for Thursday morning.

Central Master Mechanics

MAY 11 and 12 the Central Electric Railway Master Mechanics' Association will hold its next regular meeting at Pittsburgh, Pa. The session of May 11 will be called to order at 9 a. m., Eastern Standard time, at the Webster Hall Hotel. The morning session will be taken up with reports from committees and many important matters are up for discussion by the membership.

At 2 p.m. the same day members will visit the shops of the Pittsburgh Railways, where an opportunity will be given to see the new Pittsburgh car washing system.

On the morning of May 12 there will be a visit to the plant of the Westinghouse Air Brake Company and in the afternoon the Westinghouse Electric & Manufacturing Company's plant will be visited.

Platitudes Will Not Solve Traffic Problem

TOO much guesswork about our traffic problems, too many attempts to apply quick cures based on opinion rather than detailed engineering study, were reasons assigned for the failure of most American cities to deal more effectively with the problems of traffic congestion by Miller McClintock, director of the Albert Russel Erskine Bureau for Street Traffic Research, speaking April 15 before the first annual Central States Safety Congress, held in Kansas City.

"Those who would solve the American city traffic problem by some vague formula are as certain to be disillusioned as the takers of patent nostrums which claim to cure all human ills," said Dr. McClintock. "Until American officials are willing to recognize the traffic problem for what it is—a detailed and complex engineering problem—little progress will be made.

"There is no single panacea for so complicated a situation. In fact, it may be said that there is no solution for the traffic problem. There is, however, a series of reliefs for it. An engineer taking charge of a complicated machine that has not been properly lubricated turns his attention to oiling the various bearings of the mechanism in order that the friction from a large number of sources may be reduced. So in dealing with the traffic problem of a great city it is impossible to attempt to bring a solution by the application of some general formula or single remedy. It is necessary to make a minute investigation of the sources of friction and to treat each individual contributor to the general problem in an individual and specific manner.

"Before the public can be educated in methods of street traffic operation which will relieve congestion and add to safety it is first necessary to develop the principles that should be taught. Once careful investigation in each particular city has been made there can be formulated a simple and uniform code of traffic regulation.

"Until this is done vague and general educational programs on public safety matters related to traffic can be of little value."

The News of the Industry

Passengers Petition Before Massachusetts Commission

The petition of passengers for decreased fares on the Boston & Worcester Street Railway was recently heard before the Public Utilities Commission. Edward R. Goodwin, who appeared for the petitioners said that the officials of the railway had increased the fares from 5 to 6 cents a zone on Feb. 15, 1927. He declared the Boston & Middlesex line, which serves Natick and Wellesley, charges 10 cents to Newton, while the Boston & Worcester charges 24 cents for the same trip. School children's tickets were also raised at the same time from 5 to 6 cents. For the railway, F. C. Lewis stated that the commuters' books had not been changed, the rate still being 3.7 cents per zone. James F. Bacon, counsel, pointed out that the company had lost $90,000 in the two years of receivership. Patrons had also appeared in protest of bus operation, in installing which the company had difficulty because of the necessity for securing the commission's permission. Bus service, he thought, would remedy some of the trouble. Decision was reserved.

Philadelphia Transit Plan Would Cost $519,300

Immediate extension of nine trolley and bus lines in various sections of the city of Philadelphia, Pa., is part of a recommendation made to the Public Service Commission on April 19 in a report filed by its Bureau of Engineering. The extensions cited as vital in 1927 by F. Herbert Snow, chief engineer of the commission, would entail a capital outlay of $519,300 by the Philadelphia Rapid Transit Company and additional operating costs of $287,950 a year. Dr. Snow's report follows a three months' exhaustive survey of the transit situation. The document is preliminary to a report which will cover criticism of existing service and a discussion of the taxicab situation, one-man trolleys and other phases of the Philadelphia Rapid Transit Company operations. In the increased service outlined by Dr. Snow 32 additional cars and two more buses would be required.

No Progress Reported in Seattle Revision Deal

Regarding the present negotiations of the city of Seattle, Wash., with the Puget Sound Power & Light Company for an extention of time for the payment of the principal of the bonds issued to that company when the city took over the local railway, Mayor Landes states that she has been assured that it would be impossible for the city to sell power to the railway at ½-cent a kilowatt-hour, as suggested by A. W. Leonard, president of the power company, in placing the offer for extension before the city. She states, however, that it is believed the power can be furnished at less than 1 cent, the present rate.

Los Angeles Interurban Fares in Effect for Four Months

In an order issued recently the California Railroad Commission authorized the Pacific Electric Railway, Los Angeles, Cal., to place in effect on one day's notice new rates of fare on its Glendale-Burbank line, the basis for determining these to be:

1. One-way fares shall be based on 2 cents per mile, using the nearest 5-cent multiple, minimum fare 10 cents except where the present one-way fare is 6 cents no change shall be made in such fare.
2. Round-trip fares shall be double the one-way fare where the one-way fare authorized herein is less than 15 cents. Where the one-way fare authorized herein is 15 cents or greater, the round-trip fare shall be 5 cents less than double the one-way fare.
3. Thirty-ride family commutation fares shall be 80 per cent of 30 one-way fares except that no 30-ride family commutation fares will be published between points where the one-way fare authorized herein is less than 15 cents.
4. Sixty-ride individual commutation fares shall be 120 per cent of the present 60-ride individual commutation fares except that no 60-ride individual commutation fares will be published between points where the one-way fare authorized herein is less than 15 cents.
5. Adjustments not specifically authorized in this order may be referred to the commission for determination.
6. These rates to remain in effect for a period of four months and longer if it is found that the revenue on this line does not lessen more than $4,000 per month, compared to the present revenue, but in no event are the temporary rates to remain in effect beyond the effective date of the decision on the original application.

The commission ordered the company to suspend during the pendency of those rates all ten-ride, week-day and monthly commutation fares now in effect on the Glendale-Burbank interurban line. The company was also ordered so to record the revenue that the effect may be analyzed.

The Pacific Electric Railway on Jan. 11, 1927, filed an application with the commission for an order granting permission to increase passenger rates and fares over practically all of its interurban and local railway systems. On March 8, 1927, authority was asked to put into effect, as a temporary experiment a schedule of reduced one-way, round-trip and 30-ride rates, with an elimination of all other commutation rates on a group of the shorter interurban lines.

During the hearings on the supplemental application, many of the communities protested the placing in effect of the proposed trial rates. Agreement was reached, however, between the applicant and representatives of the cities of Los Angeles, Glendale and Burbank that an experimental rate schedule as given above might be placed in effect on the Glendale-Burbank line.

Nebraska Company Seeks Higher Fares

The Omaha, Lincoln & Beatrice Railway, Lincoln, Neb., has asked the Nebraska Railway Commission for authority to increase its railway fares from 6 cents, plus 1 cent for the second zone, to 10 cents, plus a 2-cent zone fare. It also desires to sell four tokens for 30 cents, good on either its bus lines or cars, and for a 10-cent bus fare with 2 cents added for the second zone, which begins at 45th Street. The new rates asked are the same as those charged by the Lincoln Traction Company, with which it comes into active competition on the north side.

The company has never paid operating expenses, but under the management of J. M. Bramlette has been improving. Mr. Bramlette says that during the last twelve months, on a business exceeding $46,000, the company came within $1,606 of expenses.

Change Reported in Piedmont & Northern Route

Plans of the Piedmont & Northern Railway, Charlotte, N. C., to extend its service to points in North Carolina have been materially changed, according to a semi-official statement. It is probable now that the proposed extension from Charlotte to Winston-Salem and Durham will be built through the counties of Stanly, Randolph and Chatham instead of by way of Salisbury and Lexington. This route is 50 to 100 miles south of the one first proposed and is practically a direct route between Charlotte and Durham. It would leave Salisbury, Lexington, Winston-Salem and Greensboro far to the north.

It is learned that the application of the company to the Interstate Commerce Commission of extension of lines has been withdrawn and the reason given is that holders of land along the right-of-way proposed from Charlotte to Lexington have asked prices that the company considers exorbitant. The Southern Railway, however, operates from Charlotte to Lexington and on to Greensboro, part of its main line, and from Greensboro to Durham and Goldsboro, its most important branch line. If the Piedmont & Northern were built that way it would parallel the Southern practically all the way.

Pennsylvania Senate Defeats Paving Bill

The Senate at Harrisburg, Pa., by a vote of 22 affirmatives and 25 negatives on April 11 defeated the bill of Senator Painter which would exempt electric railways from paving for a certain distance on either side of their tracks. A constitutional majority of 26 votes was needed to pass the bill.

1926 Payments Swell Chicago Traction Fund

Close to $50,000,000 is now held in the traction fund of the city of Chicago as a result of the payment on April 9 of $2,617,399 to the City Comptroller by the Chicago Surface Lines. The amount represents 55 per cent of the net earnings of the Chicago Railways and the Chicago City Railway for the year ended Jan. 31, 1927. The check from the Chicago Railways, which is now in the hands of receivers, was for $1,631,030, while that of the Chicago City Railway was $986,368.

Under provisions of the 1907 ordinance, which expired on Jan. 31, last, and was extended for six months by the City Council, the Surface Lines are required to contribute 55 per cent of their annual net receipts to the city, such funds to be used either for purchase of the lines by the city or for municipal subway construction. With the payments for last year and some $350,000 in accrued interest, the traction fund now amounts to $49,747,019. The city's share for 1926 is an increase of more than $500,000, or 23 per cent over the amount paid the previous year.

Rapid Transit Act Killed in St. Louis

The adjournment of the Missouri General Assembly before the Senate could vote on the measure caused defeat of the rapid transit enabling act for St. Louis, Mo. However, C. E. Smith, consulting engineer for the city, who has made a study of the rapid transit needs, has expressed the belief that the Mayor under the existing city charter has the power to appoint a commission, subject to approval by the Board of Aldermen, and to provide funds for a complete survey of the city's transportation needs, the drawing of a definite subway or elevated plan, and to do practically everything the defeated bill authorized.

The chief purpose of the dead measure was to grant the city the authority to designate subways and elevated systems public works, within the legislative definition of public works, and to assess part of the cost against property alleged to be benefited through the rapid transit system.

City Denies Claims in Omaha

Every claim made to the federal court with respect to the legality and the perpetuity of the franchise of the Omaha & Council Bluffs Street Railway is denied categorically by the city of Omaha in its answer to the suit filed by the Guaranty Trust Company, New York. On behalf of the bondholders the trust company contended that the franchise is perpetual and asked an injunction against interference with its rights or granting permits to bus lines. The answer of the city takes up each step in the corporate development of the company and alleges that in none of the transfers was the law obeyed. It is also claimed that the perpetual rights granted the original company were lost through foreclosure proceedings. The city also contends that the suit is prematurely brought since the city has taken no action to oust the company nor to issue permits for competing bus lines.

City Attorney VanDeusen proposes to test the matter in the state courts and will ask the Attorney-General to bring *quo warranto* proceedings to test the company's rights to use the streets, claiming its franchise expires in 1928. He has frankly pointed out, however, that the city must recognize that the company has occupied the streets for 60 years without molestation, and that court decisions are not strong in their support of the city's position.

Deathknell Probably Sounded for Boston "L" Legislation

The deathknell of all Boston Elevated Railway legislation for the present year was sounded recently when the House ways and means committee voted to report "reference to the next annual session" on the bill which has already been passed by the Senate to extend public control for fifteen years.

An order had previously been introduced by Alfred E. Bliss asking the Supreme Judicial Court for an advisory opinion as to the Constitutionality of proposals made sometime ago. The Bliss order would ask the Supreme Court to advise the Legislature on the following points:

1. If the period of the lease of the property and franchises of said company to the Commonwealth, as provided in Chapter 159 of the Acts of 1918, is extended for a term of years, may the General Court provide that the Commonwealth shall guarantee the payment of principal and interest of any securities of the company that the trustees may be authorized to issue for the purpose of effecting economies in the fiscal management of the company and of promoting more efficient service to the public?
2. Would the fact that such securities might be outstanding after the termination of said period of public operation and management render such a guarantee inconsistent with the sixty-second article of the amendments to the Constitution or any other constitutional provision?
3. Is it constitutionally competent for the General Court to exempt said securities in the hands of their holders from all taxes levied under state authority?
4. Is it constitutionally competent for the General Court to require the retirement of any class or classes of the company's stock by the exercise of the power of eminent domain, or otherwise?
5. Under any extension of the present system of public operation and management of said company would the provisions of the sixty-second article of the amendments to the Constitution apply to the receipts of the company during the period of such operation and management?
6. Would any such extension be repugnant to the provisions of the sixty-ninth article of the amendment to the Constitution of the Commonwealth?

As a result of the introduction of the order, the Senate laid on the table the bill for extending and improving rapid transit facilities in Metropolitan Boston, proposed by the Metropolitan Planning Division.

Railway Man Again Honored

J. P. W. Brown, vice-president and general manager of the Nashville Railway & Light Company, Nashville, Tenn., was recently elected president of the Chamber of Commerce of Nashville. This latest of his honors came to him in recognition of his public service record, which Nashville declared had not been exceeded by any other individual. In 1925 Mr. Brown was unanimously voted by all civic clubs to be Nashville's most useful citizen.

Seattle & Rainier Valley Makes Proposals

Proposal that it be relieved of the payment of a franchise tax after Jan. 1, 1927; that it no longer be required to carry policemen and firemen free, and that it be given an exclusive right to operate buses on Empire Way and Seward Park Avenue has been made to the City Council of Seattle, Wash., by the Seattle & Rainier Valley Railway. The railroad is already in arrears $70,000 on franchise taxes. It asks that the plan advanced by Councilman Oliver T. Erickson for the payment of this back tax be adopted. This plan provides that the income from transfers be converted and that the city agree that all such revenues be applied to franchise taxes already in arrears until the amount is paid.

In return for the concessions asked, the company agrees to pay up its delinquent franchise taxes, to reduce from 10 cents to 8⅓ cents, the fare charged for rides which include right of transfer to the municipal railway, giving the city a larger share of the fare collected in these cases, and to do certain paving between its tracks.

Date Set for Oral Arguments in Indianapolis Labor Case

The Indiana Public Service Commission has fixed April 29 as the date for oral arguments in the arbitration case of James Green, an employee of the Indianapolis Street Railway appealing to the commission on grievances including wages, working hours and changes of contract.

As a closing argument recently in support of his claim for arbitration of wage disputes the employers have submitted affidavits to the commission purporting to show that the railway actually earned $9.75 on each share of preferred stock last year. This was in contradiction to the report filed by the company with the commission. Howell Ellis, commissioner, directed the accounting department to study the two statements.

No-Accident Week in Boston a Success

The "no-accident week" conducted by the maintenance department of the Boston Elevated Railway, Boston, Mass., from March 7 to 12 was marred by only two accidents, as compared with four for the corresponding week of 1926. For the purpose of stimulating competition the department was divided into fourteen units, as follows: Surface lines, road; surface lines, Division 2; surface lines, Division 3; surface lines, Division 4; surface lines, central; rapid transit lines, road; building; equipment; service cars; signal division; tie and timber; George Street yard; steel erection; welding. All of these were free of accidents for week, excepting "equipment" and "tie and timber," each of which had one minor accident. There were 1,100 employees this year, as compared with 1,125 last year, therefore the ratios of employees to accidents were 555 this year and 281 last year.

Hearing on Binghamton Fare Petition

A public hearing was held on April 19 before Commissioner Brewster on petition of the receiver for the Binghamton Railway, Binghamton, N. Y., to increase fares on its lines in Binghamton, Endicott, Johnson City, Fort Dickinson and intervening territory. The present fare is 7 cents. The company seeks an increase to 10 cents cash fare or ten tickets or tokens for 75 cents. The commission is petitioned to "fix such other rate of fare as will in its judgment result in a fair return on the minimum possible value of the property determined in any way that the commission desires."

The city of Binghamton was represented by Herbert H. Ray, first assistant corporation counsel, who objected to the proceeding on the ground that the commission had no jurisdiction inasmuch as an action is now pending in the courts as to franchise limitation of fare in Binghamton. Mr. Ray said briefs in this proceeding would be filed with the Court of Appeals within a few weeks and argument would be made within ten days thereafter. Testimony was presented by Elmer F. White, auditor of the railway, as to the accuracy of statements filed with the petition. The villages of Endicott, Johnson City or Fort Dickinson were not represented. Adjournment was taken to May 16 at Syracuse in the Courthouse.

Property Owners Demand Trolley

Residents of the Gravesend section of Brooklyn prefer electric railway service to bus service so strongly that they have just helped subsidize an abandoned rail line to get it.

The line involved runs from Avenue U to Nostrand Avenue. It was abandoned some time ago by the Brooklyn-Manhattan Transit Corporation. Residents pleaded for return of service, and when the Brooklyn-Manhattan Transit suggested installation of a bus service they protested. Finally the Brooklyn City Railroad agreed to operate cars if the residents would put the track in condition. This they gladly agreed to do, putting up $10,000 for expenses. Service started on April 16.

Prospective Car Service Between Camden and Philadelphia

That the Philadelphia Rapid Transit Company, Philadelphia, Pa., is ready to start negotiations for the right to operate cars across the Delaware River Bridge between Camden and Philadelphia was announced on April 15 in a statement by W. K. Myers to the Bridge Joint Commission. Mr. Myers told the commission that the company had made an agreement with the Public Service Railway to lease the tracks recently authorized by the Camden City Commission in Fourth, Fifth and Mickle Streets on the New Jersey side. These would be connected with the bridge tracks and operated by a subsidiary of the Philadelphia Rapid Transit Company. Following a discussion of present and future toll rates the commission referred the proposal to the executive committee for future hearing. The decision was approved at the March meeting of the commission to notify the Penn-Jersey Rapid Transit Company, another P.R.T. subsidiary, that the bus operating agreement for the bridge would terminate July 1.

One-Man Car Study in Washington

The Public Utilities Commission of the District of Columbia began a study on April 16 of statistical data on the operation of one-man cars in the principal cities of the United States. This is in view of the warning of the Capital Traction Company and the Washington Railway & Electric Company that only an extended use of this type of car in the district would forestall an increase in fare. The former commission placed itself on record as opposed to any increase in the number of one-man cars.

Court Reduces Railroad's Highway Assessment

Assessments against the Missouri Pacific Railroad by Road Improvement District No. 1 of Franklin County, Ark., for the construction of a new highway obviously were arbitrary and excessive. So the United States Supreme Court held on April 18, thus upholding the lower court, although the case was reversed and remanded with instructions for new proceedings to determine the amount the railroad properly might be charged. The assessment was $75,686 and the Supreme Court holds that it should not have been in excess of $15,000. Rolling stock and other equipment of the railroad were included in the assessment. The high court held that while the railroad will benefit by the highway, in increased traffic, it also will have losses through automobile competition. It is left to the lower court to determine how much, within the maximum of $15,000, the railroad should pay.

Fitchburg Company to Operate Over Worcester Abandoned Line

The Fitchburg & Leominister Street Railway, Fitchburg, Mass., has decided to operate over the recently abandoned line of the Worcester Consolidated Street Railway between Fitchburg and Leominster for a 30-day trial to begin April 24. No attempt will be made to re-establish the service between Leominster and the Summit in Worcester.

News Notes

Excursion Season On.—The Interstate Public Service Company started on April 3 its first excursion of the season from Louisville to Indianapolis. These excursions have become a regular institution with the Interstate patrons. The excursions alternate each Sunday, the one on April 10 running from Indianapolis to Louisville. To advertise this service the company used four billboards located in various parts of Indianapolis, where thousands of people look upon them daily. The railway department has prepared a very attractive envelope enclosure that is being mailed out to about 2,500 producers and manufacturers in Louisville and Indianapolis.

Would Discontinue Service on One Line.—The Pacific Electric Railway has applied to the California Railroad Commission for permission to discontinue service, and to remove its tracks on its Urbita Springs line in San Bernardino County.

Token Sale Discontinued.—The Capitol District Transportation Company, Inc., bus subsidiary of the United Traction Company, Albany, N. Y., by special permission of the New York Public Service Commission discontinued on April 1 the sale of five metal tickets for 35 cents, each token good for one 7-cent fare. The company has an application pending for a 10-cent fare.

Fares Increased.—Application of the Bamberger Electric Railroad for an increase in passenger fares between Salt Lake City and Ogden has been granted by the Public Utilities Commission of Utah, on the showing that the gross income of the road has decreased from $184,597 in 1920 to $89,344 in 1926. The commission authorized an increase in both one-way and round-trip fares, amounting to approximately ¼ cent a mile. On this basis the one-way fare between the two points will be raised, effective April 17, from $1 to $1.10, while the round trip rate will advance on the same date from $1.80 to $2. The increase does not in any way affect student fares, commutation fares and mileage books.

Motorman Pardoned.—Peter Tabor, a motorman on the lines of the Milwaukee Electric Railway & Light Company, Milwaukee, Wis., who had been sentenced to one year imprisonment for manslaughter in connection with an accident in which his car ran into a fire truck, killing one fireman and injuring several others, was granted a pardon recently by order of Governor Zimmerman. One newspaper had published a front-page editorial article stating that the punishment was too severe and alleging that the fire department was as much to blame for the accident as the motorman.

Ordinance Amendment Introduced.—At the request of the Pacific Northwest Traction Company, an ordinance has been introduced in the City Council of Seattle, Wash., amending the measure passed several months ago whereby the company was granted an extension of franchise to Jan. 1, 1950, and given the right to continue operation of its cars over the Westlake-Greenwood-Phinney Avenue municipal line and to extend its tracks on Stewart Street to its new terminal building at Eighth and Stewart. The proposed amendment provides that in event the city in the future should construct an elevated or subway along the route and require the railway to use the structure, the charge to the company should not exceed 25 cents per car-mile for the elevated or 40 cents for the subway.

Recent Bus Developments

Service Grows in Westchester

Leverett S. Miller, president of the County Transportation Company, a subsidiary of the New York, Westchester & Boston Railway, says the company's buses have been exceptionally well received and well patronized. Tentative plans are announced for electric railway abandonment in the Sound section of Westchester and the installation of motor coach service throughout this area of suburban cities and villages. Port Chester, N. Y., is the projected hub of the system. The carhouse of the New York & Stamford Railway in Port Chester is being converted into a modern terminal garage that will house upward of 74 motor coaches.

During March the County Transportation Company, a subsidiary of the New York, Westchester & Boston, made its appearance in the field of motor bus transit. On April 3 the local railway lines of the New York & Stamford Railway in Port Chester were abandoned and motor coach service was installed. On April 14 the County Transportation Company installed motor coach service for Milton Point in the Rye-Harrison-Rye Beach section of the county.

Indianapolis Street Railway Takes Over Peoples Motor Coach

The Indianapolis Street Railway, Indianapolis, Ind., asked permission of the Public Service Commission on April 16 to buy stock of the Peoples Motor Coach Company for $500,000. Filing of the petition followed agreement on the terms of sale between the railway and A. Smith Bowman, president of the coach company.

The petition declares that the street car company will merge the bus company and the railway to give the citizens of Indianapolis "adequate, sufficient, city-wide, comprehensive public service" and pledges that additions and extensions to the bus transportation system will be made "as public convenience and necessity may require." Due to independent operation, says the petition, there has been "a substantial and unnecessary duplication of expense" in furnishing required transportation, "which duplication could be eliminated by operating under a single management and with a single organization."

Robert I. Todd, president of the Indianapolis Street Railway, stated that the railway company was taking the Peoples Motor Coach Company over "as is." The present 10-cent fare schedule will remain in force until it can be determined just what has to be done.

The petition sets out that the railway company now operates about 30 buses and that the Peoples Motor Coach Company operates about 40 buses. The annual gross income of the motor coach company from passenger receipts is given as $425,000, and the net income as $15,000. Mr. Bowman said:

> Terms were agreed upon by the stockholders only with the distinct understanding that the present organization would be continued and the present service improved and extended. It will be a distinct advantage to Indianapolis if the present motor bus transportation provided by both the street railway company and the Peoples Motor Coach Company can be organized and operated together, with promise of such extension of lines and increase of service as shall be required by the growth of the city.

Charter Change in Louisville to Permit Bus Operation

Stockholders of the Louisville Railway, Louisville, Ky., have been asked by the directors to authorize a change in the charter of the company to enable it to operate buses, according to a letter sent out by James P. Barnes, president. This does not mean necessarily that the railway will go into the bus business, Mr. Barnes said. Buses are now operated through the Kentucky Carriers, an affiliated company.

The amendment which is proposed follows:

> 1. To operate direct or through subsidiary buses and other automobile vehicles supplementary to and also in co-ordination and conjunction with its rail lines for the carriage of passengers and freight within and without Louisville, Ky., to any extent that it may from time to time acquire local operating rights to do so, whether upon streets served with rail street cars or not so served to the end that it may furnish complete and comprehensive transportation for Louisville and its vicinity.
> 2. To acquire, buy, sell and transfer franchise and other operating rights.
> 3. To borrow money from time to time and to pledge its property and franchises to secure the various loans made by it.

Amended Contract Delays New York Bus Franchise

Another delay in the matter of awarding franchises for bus operation in New York City was necessitated on April 21 by the decision of the Board of Estimate to change the proposed form of franchise contract to give better protection in case the city should decide to recapture. Four weeks will be required under the law to advertise an amended form of contract. The board has set May 19 as the date when the bus matter will next come officially before it.

"Rubberneck" Service in Kansas City

Sightseeing bus tours of Kansas City are to be started on May 1, to run on twice-daily schedule and to begin each trip probably at the Union Station, according to a recent announcement of the Kansas City Public Service Company, operator of the railway and bus system.

The company will begin the service as the Kansas City unit of the Gray Line Motor Tours Association, under exclusive rights in the city.

Two buses will be assigned to the new service at the beginning. One of these, a single-deck coach of the street car type, and the other, a parlor coach, will start at 9.30 each morning, negotiating a 12-mile tour of the city in approximately one hour; beginning at 2 o'clock each afternoon one of these buses will cover a 25-mile tour in about 2½ hours.

Buses on Non-Profitable Runs.—The California Railroad Commission has granted a certificate to the Napa Valley Bus Company to operate auto stage service connecting Calistoga, Napa County, and Vallejo, Solano County, to be co-ordinated with the operation of train service by the San Francisco, Napa & Calistoga Railway, of which the bus company is a subsidiary. It is proposed to operate bus service in place of a number of non-profitable trains during the off-hours of traffic during the day, as a matter of economy to the railway and of convenience to the public. The commission denied the application of the California Transit Company for a certificate to operate auto stage service betwen Vallejo and Calistoga, finding the contention of public opinion in the Napa Valley that an unlimited bus competition would work disastrously to the railway is well grounded.

Petitions for Renewal of Bus Certificate.—In a petition filed with the Michigan Public Utilities Commission the South Shore Motor Coach Company sought renewal of the certificate of convenience and necessity granted in May, 1925, to operate intrastate passenger service between Benton Harbor, Mich., and the Michigan-Indiana state line, a distance of approximately 40 miles. This company is owned jointly by the Gary Railways and the Chicago, South Shore & South Bend Railroad. The recent service over this route, which is a part of a through route between downtown Chicago and Muskegon, Mich., consists of eight trips daily each way. Licenses for 35 motor coaches to be operated under the local permit are also sought in the company's application.

Bus Line on Madison Avenue Wanted.—A suggestion that Madison Avenue, New York City, be cleared of surface car tracks to make room for a bus line to be established for operation on Park Avenue was made on April 17 by the Fifth Avenue Association in a letter to the Board of Estimate. The association asked the board to delay decision on the award of bus franchises until the city had acquired the property and franchise rights of the Fourth and Madison Avenue surface lines, which have been offered to it by former Comptroller Charles L. Craig. The latter has options on this line and on the Ninth and the Eighth Avenue surface lines. The letter expressed general condemnation of the proposed bus system awaiting action by the Board of Estimate, in its discussion of the effect of the proposed crosstown routes on traffic on Park Avenue.

Asks Permit for Bus Line.—The Duluth-Superior Coach Company, a subsidiary of the Duluth Street Railway, Duluth, Minn., has asked for permission to operate a bus line between Superior and Duluth over the new Arrowhead bridge. The distance of the route is four-tenths of a mile. The company proposes to charge a 25-cent fare. The Minnesota Railroad and Warehouse Commission has taken the application under advisement.

Financial and Corporate

$2,500,000 Power Plant Sale at Kansas City

The sale of the power plant of the Kansas City Public Service Company, operator of the railway at Kansas City, Mo., was arranged between William G. Woolfolk, president, and Joseph F. Porter, president of the Kansas City Power & Light Company, purchaser of the plant, in a conference on April 14. The purchase price is announced as $2,500,000. Once the sale has been ratified by the Public Service Commission the railway will purchase power from the light company.

Anticipating the possibility of such a sale, the City Council inserted a provision in the recently voted railway franchise that any amount realized from the sale of the plant should be reinvested in the company's property within a period of twelve months.

According to Chester C. Smith, vice-president of the light company, two new frequency changers will be installed in the railway's plant, with a view to operating the railway from the Northeast power plant of the company in low-demand hours in the mornings. This would make it possible to shut down the railway plant six hours.

The amount to be realized from the sale is in addition to a sum of more than $1,250,000 which remains in the hands of the United States Court for the use of the company, said to be available within the next 60 to 90 days, after a similar amount in first mortgage bonds has been distributed among the personal injury claimants against the predecessor company, the Kansas City Railways.

Syndicate Takes B.-M.T. Bonds

Brown Brothers & Company, the Bankers Trust Company, J. & W. Seligman & Company and Hayden, Stone & Company, New York, were the purchasers of the $10,262,200 Brooklyn-Manhattan Transit Corporation 6 per cent bonds, due 1968, sold on April 19 by the War Finance Corporation. The bonds probably will not be offered to the public for several weeks.

The bonds acquired by the syndicate represent the balance of $19,000,000 bonds acquired by the War Finance Corporation on the reorganization of the B.-M. T. in 1923. The War Finance Corporation advanced $18,000,000 to the B.-M. T. in 1918 and on the reorganization acquired the $19,000,000 of bonds together with 25,000 shares of no-par $6 preferred stock in the B.-M. T. The preferred stock is still held by the War Finance Corporation.

Increased Excise Tax Bill Before Ohio Governor

The Ohio Legislature has passed the bill increasing the excise tax on certain public utilities from 1.2 per cent on gross intrastate receipts to 1.5 per cent. The bill is now before the Governor for his consideration and signature.

The utilities excise tax bill was a part of a program worked out by leaders of the Legislature to provide more revenue for the state. Other proposed items in the tax program include an increase in the gasoline tax of from 2 to 3 cents a gallon, an increase in the corporation franchise tax and the adding of ½ mill direct tax levy. The gasoline tax bill has passed the lower house. The direct tax revenue has passed both houses and the corporation franchise bill probably will be concurred in.

The increase in the excise tax will not affect electric railways as such, but will affect electric railways doing an electric light and power business.

International Utilities Would Buy Lethbridge Railway

An offer of $1,000,000 has been made to the city of Lethbridge, Alberta, Canada, by C. J. Yorath, Canadian representative, in behalf of the International Utilities Corporation, New York, for its 10½-mile railway system, electric light and power plants and all other capital assets. Another bidder for the Lethbridge Utilities is the Calgary Power Company. Both these proposals were turned down by the City Council.

Now the Calgary Power Company and the city are considering a proposal for co-operative conduct whereby the city would buy or sell power to the company as the situation warrants.

The International Utilities Corporation already controls the Canadian Western Natural Gas, Light, Heat & Power Company, familiarly known as the Calgary Gas Company, and the North Western Utilities, known as the Edmonton Gas Company.

Reorganization Terms Announced for Massachusetts Line

Conditions Reviewed Under Which Successor to Boston & Worcester Street Railway Will Be Organized—New Owners to Carry on Intensively, but Make No Predictions for Future

DETAILS have been announced of the plan for reorganization of the Boston & Worcester Street Railway, Framingham, Mass. The committee which drew the plan represents the first mortgage 20-year 4½ per cent gold bonds dated Aug. 1, 1903. Under the plan each depositor will receive the par value of his deposited bonds in new securities on the basis of 30 per cent in reorganization bonds, 30 per cent in preferred and 40 per cent in common.

The road appears to be in sore straits. This fact is not minced by W. Eugene McGregor, chairman of the bondholders' committee. Mr. McGregor says that the main problem of the officers of the successor company will be to adjust their policy to this situation created by the greater use of the private auto and the growth of the bus business. According to him the plan proposed provides means for the new financing necessary to convert "into realities whatever the possibilities may prove to be." While the situation is not such that the committee feels justified in making any predictions, there are possibilities. According to Mr. McGregor the fact that operation under receivership has shown a loss is neither surprising nor conclusive evidence of the future.

The chairman of the committee cites as bonds entitled to participate:

Boston & Worcester Street Railway first mortgage 20-year 4½ per cent bonds ($2,460,000 outstanding), accompanied by Aug. 1, 1923, coupons.

Framingham, Southborough & Marlborough Street Railway 5 per cent first mortgage bonds, dated Jan. 25, 1899 ($60,000 outstanding), accompanied by Aug. 1, 1923 coupons.

It is intended to form a new company in Massachusetts to acquire the property rights of the Boston & Worcester Street Railway and the property and rights, if any, now or formerly of the Framingham, Southborough & Marlborough Street Railway when sold under court authority.

The capitalization is subject to the approval of the Department of Public Utilities of Massachusetts. The engineer of the department has submitted a tentative estimate of $2,900,000. Using this as a basis, it is proposed that the new company shall have the following capitalization:

First mortgage 20-year 7 per cent bonds	$252,000
Reorganization bonds (to be secured by second mortgage)	756,000
Six per cent preferred stock	756,000
Common stock (an estimate merely, the total depending upon the total capitalization approved by the department)	1,388,000

A small amount, not exceeding $10,000, of 7 per cent prior preference stock may be issued. It is explained that this, if done, will be for the purpose of providing the directors of the new company with an additional possible medium for raising new money. It is further explained that under the Massachusetts statute it is important, if the use of such prior preference stock ever becomes practicable and desirable, that a few shares of such stock be issued at the beginning.

All the $252,000 of first mortgage bonds and part of the common stock are reserved for subscription, for the purpose of raising new money for expenses in connection with the receivership and reorganization, for working capital and for other purposes approved by the commission.

Bondholders who do not deposit their bonds will receive merely their pro rata share of the sale price less the expenses which are chargeable against this sale price. To provide the cash needed to pay non-depositing bondholders, a syndicate will receive in return for the cash furnished for distribution to syndicate participants whatever the non-depositing bondholders would have received, including the rights to subscribe for first mortgage bonds with the common stock warrants.

The remaining $126,000 of first mortgage bonds and the remainder of the common stock are reserved for sale if the directors determine that the proceeds are necessary for the purposes of the new company. If sold before Feb. 1, 1929, these reserve bonds (each with a proportionate amount of common stock reserved) are first to be offered to holders of the warrant previously mentioned. Bonds so reserved which are not sold before that date will remain available for issue by the new company, but the common stock reserved and not utilized before that date will be distributed to holders of the warrants proportionately.

Assuming that all bondholders deposit their bonds and that the whole of the first half of first mortgage bonds is subscribed, the distribution of securities (on the basis of a capitalization of $2,900,000 plus the first mortgage bonds) will be as follows:

First mortgage 20-year 7 per cent bonds sold $126,000; available for future sale $126,000; total..	$252,000
Reorganization bonds (to depositors on basis of $300 of reorganization bonds for each $1,000 of old bonds)	756,000
Six per cent preferred stock (to depositors on bonds of $300 preferred stock for each $1,000 of old bonds)	756,000
Common stock, to depositors on basis of $400 of common stock for each $1,000 of old bonds....	1,008,000
Bonus with first half of first mortgage bonds (estimated)	190,000
Reserved as bonus for second half of first mortgage bonds if sold before Feb. 1, 1929, otherwise to be distributed to holders of warrants (estimated)	190,000

It is explained that the amount of common stock available for bonus depends on the decision of the Department of Public Utilities as to the capitalization.

It will be recalled that Franklin T. Miller, receiver of the company, applied to the Massachusetts Supreme Court some time ago for permission to curtail electric railway operation. In order to give the bondholders time to consider the adoption of the plan, Judge Crosby of that court has continued the petition to May 3.

Abandonment Sought in Auburn

At a meeting of stockholders of the Auburn & Syracuse Electric Railroad on April 15 it was decided to abandon as soon as possible all the railway lines operated by the company in the city of Auburn and from that city to Lakeside Park. The action was taken at the recommendation of the directors following the annual report for last year, which showed a net loss of $87,684. Passenger earnings have dropped from $265,090 in 1920 to $162,730 in 1926.

Had the company wished to continue operation of its lines in Syracuse it would be forced to meet expenditures totaling approximately $290,000 for track relaying, repaving and replacements.

City officials have announced their determination to oppose the company's plea for abandonment before the Public Service Commission unless adequate bus service is guaranteed. The city is served now by buses supplementing the railway lines. No definite provision has as yet been made for new buses under operation of the Auburn & Syracuse or other concerns.

Conspectus of Indexes for April, 1927

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population. Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen, conductors and operators on 136 of the largest street and interurban railways operated in the United States, weighted according to the number of such men employed on these roads.

Refunding in Denver

Tramway There Also Cuts Amount of Bonds Outstanding by $848,000 —Review of Operation

Arrangements were made recently by the Denver Tramway, Denver, Col., to reduce the outstanding funded debt of the corporation by $848,000 through a refinancing program arranged with Boettcher & Company and the International Trust Company, Denver. The plan provides that all of the company's first mortgage extended 6 per cent gold bonds and first mortgage improvement extended 6 per cent gold bonds, due April 1, 1927, and totaling $2,598,000 be acquired from the holders.

Upon acquisition by the company all of the bonds will be extended, with the mortgage liens by which they are secured, until Oct. 1, 1933, and will be deposited as collateral with the International Trust Company, trustee, as security for a new issue of $1,750,000 to be known as the Denver Tramway 6 per cent first (underlying) mortgage collateral trust sinking fund gold notes, which will mature Oct. 1, 1933.

The difference between the $2,598,000 in old securities to be acquired by the company and the $1,750,000 of the new issue represents a reduction of $848,000 in the funded debt in the hands of the public. The source of the funds necessary for this reduction was not disclosed in the company's statement, but the money is understood to be available from a cash fund set up through assessments levied on common stockholders at the time of the tramway reorganization in July, 1925, and from money carried over from the reorganization and accumulation of depreciation reserves.

The material reduction in the funded debt will not only increase the equity for the general and refunding bonds and the preferred stock but there will be a substantial saving in annual interest charges, which will be utilized to reduce further the liens prior to the junior securities.

Holders of the maturing bonds were given preferential opportunity to acquire the new notes on a 6.25 per cent basis.

In describing the new notes the tramway statement said in part:

> The new collateral notes will be an unusually safeguarded medium-term investment at an attractive rate of interest, to be secured by a first lien on properties valued in excess of $5,900 for each $1,000 note, based on valuation of the United States district court, with earnings for 1926, before depreciation but after allowance for federal taxes, equal to 8.28 times the interest charges on all issues secured by underlying liens to be outstanding with the public after April 1, 1927.
>
> Under this plan there will be outstanding with the public only $2,552,000 principal amount of issues secured by underlying liens on Oct. 1, 1933. Such underlying liens are followed by $6,443,500 principal amount of general and refunding mortgage bonds; $10,416,400 par value of preferred stock and 61,240.8 shares (no par value) common stock, now outstanding in the hands of the public. The depreciated value of all properties owned by system, as of Dec. 31, 1926, was $27,445,668, based on court valuation of $23,514,769 for the city transportation properties as of Dec. 31, 1922.

The $2,000,000 of Denver City Tramway 6s originally matured in April, 1919, at which time the issue was extended to April, 1924, and the interest rate increased from 5 per cent to 6 per cent. In April, 1924, it was again extended to the present 1927 maturity with the 6 per cent interest continued. The bonds are a first mortgage on 103 miles and a second mortgage on 100 miles of the company's track.

The balance of the maturity is made up of $645,000 of Denver Tramway Power Company first improvement 6s, which originally came due in April, 1923, and were extended to April, 1924, also with an increase in interest from 5 per cent to 6 per cent. At the latter date a further extension to 1927 was secured.

Heaviest Traffic Ever

North Shore Road Again Breaks Records—Net Held Up Well —Improves Rolling Stock

Substantial progress was made in 1926 by the Chicago, North Shore & Milwaukee Railroad. According to the annual report of the company the volume of traffic, both passenger and freight, was the greatest in the history of the company and the gross revenue showed an increase of $718,197 over the previous year. The net income showed a decrease from the previous year of $49,203, owing to increased fixed charges resulting from heavy capital expenditures for additions to the physical property, particularly the building of the Skokie Valley route.

In 1926 the company carried 19,461,426 revenue passengers on its rail and auxiliary motor coach lines, an increase of 1,232,266 over the previous year. The freight business of the company totaled 656,754 tons, an increase of 120,659 tons over the previous year.

FACILITIES GREATLY INCREASED

The operating revenue was $7,568,362 and the gross income after deducting operating expenses and taxes was $1,814,290. The net income was $731,427. Dividends at the rate of 6 per cent on the $5,000,000 outstanding preferred stock and of 7 per cent on the $6,652,800 prior lien stock issued and outstanding amounted to $729,740. The report says:

> Construction of the new Skokie Valley route increased materially the fixed charges of the company, and while the new line greatly improved the Chicago-Milwaukee passenger service by reducing the running time of trains, and was a necessity because of the contemplated grade separation through the communities on the Shore Line route, some time will be required to develop the territory to make this line self-supporting.
>
> The outstanding feature of the year was the great increase in the facilities of the railroad to enable the company to give the public still better service, a policy which has been followed consistently under the present management.

COMPARATIVE INCOME STATEMENT OF CHICAGO, NORTH SHORE & MILWAUKEE RAILROAD

	1916	1920	1924	1925	1926
Operating revenue	$1,157,191	$4,193,669	$6,198,987	$6,850,165	$7,568,362

Dividends paid	729,740	
		$113,543
Surplus, Dec. 31, 1926		$919,507

A new method of handling freight in less than carload lots also was developed by the company during the year. It consists of specially built steel containers equipped with running gear, which after being loaded at the warehouse of the shipper are hauled through the streets by a tractor to the receiving stations of the railroad and there run on to flat cars to be hauled to their destination without having to dismount the bodies from the running gear. The method saves the time and cost of handling the merchandise at receiving stations.

ROLLING STOCK AUGMENTED

At the end of the year the railroad was operating 256 miles of single track, the opening of the new Skokie Valley route giving the company four main tracks from Chicago to Waukegan.

The company added to its rolling stock during the year twenty steel passenger coaches, three dining cars, five refrigerator cars and 24 freight cars. It now has a fleet of 47 motor coaches operating in connection with its rail lines and serving rural communities to a distance of 35 miles from the main railroad.

$2,904,600 of Cleveland Railway Stock to Present Holders

Notices have gone out to the stockholders of the Cleveland Railway, Cleveland, Ohio, about the proposed increase in the stock of the company and outlining their rights to subscribe. Rights adhere to holders of record of April 1 to subscribe at par for 10 per cent of the amount of stock previously held. Subscriptions are payable one-quarter or more on or before July 1, 1927, one-quarter or more on or before Sept. 1 and the rest in one or more installments on 60 days notice from the company. The right to subscribe expires on April 25. A syndicate will take such stock as is not subscribed by present holders.

As indicated previously in the ELECTRIC RAILWAY JOURNAL, the Public Utilities Commission has approved the issue and sale of $2,904,600 of stock. The purpose of the issue is to finance these improvements:

100 street cars	$1,200,000
50 motor coaches	600,000
4 automatic substations with equipment	1,000,000
West 117th Street operating station	350,000
Track in Pearl, State and Broadview Roads	262,000
Service buildings	207,500
Miscellaneous	20,000

The total of these items is $3,639,500, but the company has stock unissued but heretofore authorized by the commission sufficient to take care of the difference between the present issue and the total of the improvements listed.

Chicago & Interurban Suspends

Abandonment of operation by the Chicago & Interurban Traction Company, known locally as the "Kankakee Line," has been formally announced by W. W. Crawford, receiver. Service over its 54-mile route between 63d Street, Chicago, and Kankakee, Ill., will cease on April 23, at 11.59 p.m.

The Illinois Commerce Commission approved the abandonment in an order entered on March 9 and the Circuit Court of Cook County confirmed the authority in an order issued by it under date of April 12.

High operating costs and falling revenue due to the competition of automobiles and motor trucks and the greatly improved suburban service furnished by the Illinois Central Railroad as a result of electrification last summer are cited by the receiver as the reasons for the failure of the company to meet operating charges. Hard roads parallel the line practically its entire length. Wages paid employees are on the same scale as those of Chicago Surface Lines employees—a basis very high considering the character of the company's operations.

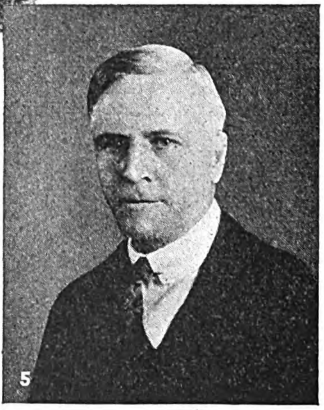
About 130 employees are affected by the abandonment order. Several independent bus companies, including the Schappi Bus Company of Calumet City, Ill., have been granted permits to operate in the territory previously served by the railway.

Personal Items

Who's Who in Kansas City

Careers Reviewed of Principal Operating Officials of the Successor Company to the Kansas City Railways—Subordinates in the Management and Operating Departments Already Serving

WHEN the Kansas City Railways receivership was terminated last fall and the property turned over to the new owners, the Kansas City Public Service Company, William G. Woolfolk, president of the new organization, published a list of the operating officials who were to serve under him. At the head of this list was F. G. Buffe, general manager of the property throughout the receivership, who was elected vice-president in charge of operations. The other officials were all retained, although the titles of some were changed. A list of the official roster was published in the ELECTRIC RAILWAY JOURNAL, issue of Oct. 23, 1926, page 786. Now that the reorganization of the company has been completed and the recently announced personnel is conducting the affairs of the successor to the Kansas City Railways under the new franchise, brief biographies of the principal operating officials are appended.



No. 1, W. G. Woolfolk
No. 2, F. G. Buffe
No. 3, P. C. Groner
No. 4, C. L. Carr
No. 5, N. S. Doran

William G. Woolfolk
President

After graduating from the Sheffield Scientific School of Yale University in 1899 Mr. Woolfolk sought employment with the General Electric Company and was placed in its Schenectady office. With two years of experience in the drafting room, testing department and power and mining engineering departments he went with the Knoxville Railway & Light Company as its general superintendent in charge of operation and reconstruction. He served in this capacity for three years, resigning in 1905 to become superintendent and chief engineer of the Philadelphia & West Chester Traction Company, operating a high-speed interurban service.

In 1906 Mr. Woolfolk entered the employ of Sanderson & Porter, engineers of New York and San Francisco, as an executive engineer. He served as assistant to President E. N. Sanderson of what is now the Republic Railway & Light Company, transacting general light, power and gas business for urban and interurban railway service in Youngstown and Niles, Ohio; Sharon and New Castle, Pa., and surrounding territory. In this capacity he had charge of the operation and reconstruction of these properties.

In 1909 he became financially interested in the Old Dominion Development Company, developing, constructing and operating coal mines in Virginia. As vice-president of this company he not only managed the property but spent a great deal of his time in the mines directing the work of the men. Later he joined again the firm of Sanderson & Porter. That was in 1913. The following year this firm opened a Chicago office and Mr. Woolfolk was placed in charge as Middle Western manager. Because of his wide experience in engineering fields the United States government in 1918 appointed Mr. Woolfolk chief of section in the chemical and explosive division of the War Industries Board at Washington, D. C., and in 1919 he was retained by the government and devoted six months in charge of salvaging surplus material for the Emergency Fleet Corporation. He returned to Chicago in the fall of 1919 and founded the firm of William G. Woolfolk & Company, Inc., transacting a general engineering business. This firm is still functioning and Mr. Woolfolk is its active head.

During the last eight years Mr. Woolfolk has served as consulting engineer to many utilities. In the ordinary course of business Mr. Woolfolk was invited to serve as adviser to the reorganization committee of the Kansas City Railways. Following the formation of a new company Mr. Woolfolk was elected president. The committee felt it needed a man of his experience and ability to refinance and reconstruct the electric railway property of Greater Kansas City.

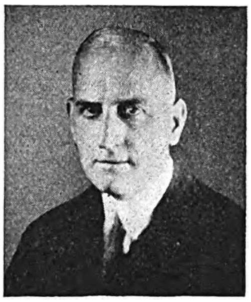
Fred G. Buffe
Vice-President in Charge of Operation

Fred G. Buffe, who was elected to the office of vice-president in charge of operation, entered the public utility field in 1908, being first employed by H. E. Chubbuck, then vice-president executive of the Illinois Traction System. He remained with this organization until 1917, first serving as publicity manager and later as assistant to Mr. Chubbuck. He went to the Kansas City Railways in 1917 as assistant to President Philip J. Kealy. In 1919, when James Gibson, general man-

A. E. Harvey

R. W. Bailey

D. L. Fennell



E. E. Stigall

H. H. Cloyd

ager of the property, resigned, Mr. Buffe was appointed general manager. He served in this capacity until the receivership, and one of the first official acts of Senator Wilson and Colonel Fleming, as receivers, was to select Mr. Buffe as their general manager. Last October when the new company took charge of the property he was appointed to his present official position.

The present official and operating organization of this property, recognized as one of the finest in the country, was organized and built up largely through Mr. Buffe's efforts. He is the author of the Employees' Representation Plan, inaugurated there in 1919, which has been copied and placed in effect in many other cities. Mr. Buffe was also responsible for the organization of the Brotherhood and many other employee co-operative activities extant on the property.

Mr. Buffe has a wide acquaintance in utility circles, and is well known throughout the United States through his activities in railway association work. He is the author of numerous papers and articles on electric railway and bus subjects and has addressed many meetings of railway executives and employees in the last ten years.

He was born in Franklin, Morgan County, Ill. He attended Whipple Academy and Illinois College and is a graduate of Illinois Wesleyan University and the Kansas City School of Law. Although admitted to the bar of Missouri, Mr. Buffe has never practiced.

After leaving college he engaged in newspaper work as reporter for the Denver *Post* and the Denver *News and Times.* Later he became part owner and managing editor of the Peoria *Herald Transcript.* It is this experience that has enhanced his reputation as a public speaker, made him one of the best public relations men in the electric railway industry and made his formal presentation of transportation subjects not only forceful but also colorful.

Powell C. Groner
General Counsel

Powell C. Groner acted as counsel for the reorganization committee of the Kansas City Railways and at the termination of the receivership was appointed general counsel for the present company. He is one of the youngest executives in the street railway field and his outstanding work in connection with the reorganization of this property stamps him as a brilliant corporation attorney.

He was born at Norfolk, Va., Feb. 13, 1892. He received his academic and law education at the University of Virginia, specializing in corporation and public utility law, and was graduated from that famous institution with the class of 1913. From the date of his graduation until 1922 Mr. Groner engaged in general practice in both New York and Chicago, representing the Fifth Avenue Coach Company, among others, during that period. In 1922 he joined the firm of Newman, Saunders & Company, Inc., public utility operators and investment bankers, and has been a member of that organization since then.

C. L. Carr
General Solicitor

Charles L. Carr became connected with the street railway property in October, 1918, as an assistant trial attorney and later became the trial attorney, trying cases in the trial courts and briefing and looking after same on appeals to upper courts.

When Clyde Taylor resigned as general counsel, the latter part of 1919, Judge Richard J. Higgins, who had been general solicitor, was made general counsel and Judge Higgins transferred Mr. Carr from the trial department to the general counsel's office as his assistant. Mr. Carr served in this capacity until shortly after the commencement of the Kansas City Railways' receivership on Sept. 9, 1920, when Judge Higgins resigned as general counsel and became attorney for the trustees under the first mortgage of the Kansas City Railways. At the same time Judge Kimbrough Stone appointed Judge James E. Goodrich as general counsel for the receivers and Judge Goodrich in turn selected Mr. Carr as his assistant.

Mr. Carr was born in Quincy, Ill., on April 1, 1890. He was graduated from the Quincy High School in 1909 and that same year entered the Northwestern University at Evanston and Chicago, Ill. He was graduated from the liberal arts department of the University at Evanston in 1913 and from the law department in Chicago in 1915. From October, 1915, until October, 1918, he was deputy circuit clerk of Kansas City, Mo., assigned to Division No. 3.

Rufus W. Bailey
General Superintendent of Maintenance

Rufus W. Bailey on Oct. 15 last assumed charge of the power generation and distribution departments, the way and structures, equipment and bus maintenance departments. In addition to these duties Mr. Bailey will supervise all methods and standards, the laboratory, power conservation, electrolysis investigations, surveys and studies. He went to the Kansas City Railways under F. G. Buffe as assistant to general manager in charge of the Kansas properties in 1919. Early in 1920 he took over the distribution work and in December of the same year assumed charge of the power plant. When H. S. Day resigned in 1922 Mr. Bailey took over the shops and mechanical departments and a little more than a year later, when R. L. Weber left the organization, the research and engineering departments were placed under his supervision.

Under Mr. Bailey's direction the power and equipment departments have reached a high state of efficiency, hundreds of improvements have been made both in working conditions and types of

J. D. Cornell

C. A. Kincade

L. R. Carson

H. M. Smith

H. W. Smith

machines used, and plant accidents have been reduced to a minimum. Many of the safety features incorporated on the buses purchased a year ago by the receivers were invented and patented by Mr. Bailey. He also has applied for patents on the new periscopes and loud speakers now in use on the Kansas City buses.

Mr. Bailey was born in St. Louis, Mo., on Aug. 22, 1877. He was graduated from the high school there and attended the University at Providence, R. I. During vacation periods he was employed by the old Sixth Street car line and the Olive Street line in St. Louis. For two years after leaving school he did erecting work for both the General Electric and Westinghouse companies out of St. Louis, building numerous electric light plants for them.

He served in Cuba throughout the Spanish-American War.

In 1909 Mr. Bailey joined the East St. Louis & Suburban Railway as superintendent of construction. He served in various capacities with this organization, finally being appointed general superintendent of the Alton Division. In this position he also acted as supervisor of a number of properties owned by the E. W. Clark interests. In 1907 he went with the McKinley interests in Peoria and was general superintendent there until he went to Kansas City in 1919.

Neal S. Doran
Comptroller and Assistant Treasurer

Neal S. Doran, comptroller and assistant treasurer of the Kansas City Public Service Company, first went to Kansas City in 1893 as auditor of the Texarkana & Fort Smith Railroad. He later was connected with various construction companies in building the Kansas City Southern Railway, the Suburban Belt Railroad and the Kansas City & Independence Air Line. He was appointed secretary and auditor of the Kansas City, Mexico and Orient Railroad at its organization in 1901 and continued in that same capacity until June 1, 1920. On that date he was appointed auditor of the Kansas City Railways and remained in that position throughout the receivership.

Mr. Doran was born on July 4, 1870, in Iowa. He received his education in the Pittsburgh, Pa., schools.

Ernest E. Stigall
Purchasing Agent

Ernest E. Stigall entered the employ of the Kansas City Railways & Light Company in May, 1904, in the accounting department of the light and power division. In 1909 he was appointed cashier and chief clerk of the light and power company and in May, 1911, was promoted to the position of purchasing agent for the Kansas City Railways & Light Company.

Following the granting of a new franchise in 1914, which provided for the separation of the Kansas City Railways from the light and power company Mr. Stigall was appointed purchasing agent for the Kansas City Railways and he has remained with the organization in the same capacity since that time.

Mr. Stigall was born in Stewartsville, Mo., on Dec. 24, 1883. He was graduated from William Jewell College at Liberty, Mo., in 1903 and in the same year went to Kansas City and took a course in Spalding's Commercial College.

A. E. Harvey
Chief Engineer

A. E. Harvey is a graduate of the University of Illinois, having received his degree in 1891. In 1894 he received the degree of C. E. from the University of Illinois. During his college vacation periods and for two years after graduating Mr. Harvey sought employment with firms where he could gain construction and engineering experience and in April, 1894, was employed by the Illinois Central Railroad in numerous capacities, from that of instrument man to division engineer and road master. In April, 1902, he entered the employ of the Chicago Great Western Railway as division engineer in charge of maintenance and construction. From April, 1905, until February, 1906, Mr. Harvey held similar positions with the Illinois Central Railroad and the St. Louis & Iron Mountain Railroad. In February of 1906 Mr. Harvey became associated with R. A. Elzy in the general railroad contracting business. From 1908 until 1910 Mr. Harvey was superintendent of the Western Division of the Chicago Great Western Railroad in charge of operation and maintenance and from 1910 until early in 1911 was division engineer for the Kansas City Southern Railway. In April, 1911, Mr. Harvey entered the service of the Metropolitan Street Railway as chief engineer and he has been on the property since that date in the same capacity but under different titles. At present he has charge of the construction work of the Kansas City Public Service Company.

Daniel L. Fennell
General Superintendent of Transportation

Daniel L. Fennell is the only operating official of the company who has never been employed by any other than the railway organizations of Kansas City. During his summer vacation periods of 1902 and 1903, Mr. Fennell was employed as a material clerk on track construction. In June, 1904, he entered the service permanently, being employed as a rodman in the engineering and construction department. While still in this department he served for several months as assistant foreman on track construction. In 1905 he was appointed time keeper and material clerk on track and power plant construction, remaining in this capacity until 1907, when he was transferred to the shops as chief clerk under the master mechanic.

It was on May 1, 1909, that Mr. Fennell joined the transportation department and his first position was assistant division superintendent at 48th and Harrison, the largest division on the property. On June 1, 1910, he was promoted and made division superintendent at 31st and Holmes, remaining there until Oct. 1, 1912, when he was transferred back to 48th and Harrison as division superintendent. The next promotion came on Dec. 13, 1913, when he was made secretary and assistant to the general superintendent. He was appointed superintendent of traffic on Dec. 1, 1916, and organized the present traffic and schedule department.

Mr. Fennell became assistant superintendent of transportation on May 16, 1918, and from Dec. 1, 1918, until March 1, 1919, served as acting superintendent of transportation. On the latter date he received a permanent appointment as superintendent of transportation, and since then has served continuously in the same capacity. For a number of years he has been an officer of the Kansas City Safety Council and the present success of that organization is in a great measure due to his efforts. He was also one of the organizers of the Mid-West Electric Railway Association and served as its first president. Mr. Fennell is 40 years of age.

Hardy H. Cloyd
Assistant to Mr. Buffe

Hardy H. Cloyd was first regularly employed as construction foreman for an Omaha contractor and in this capacity he had charge of the construction of a number of electric light plants in Nebraska and Oklahoma. Later he moved to Trenton, Mo., where, after rebuilding the gas and electric plants, he was appointed local manager for the holding company. He occupied this and other similar positions with the same company until moving to Kansas City in 1911. His first position there was with the electric light company, but later he was transferred to the railway company in charge of the metering equipment. He has since been connected with various departments and in different capacities, going into the general manager's office in May, 1924, as statistician.

Mr. Cloyd, was born in Hastings, Neb., on Aug. 26, 1883, and lived there until after finishing his education, which included a two-year university course in electrical engineering. He spent his vacations and other spare time while attending school working in a small foundry and machine shop, which, in addition to a general repair shop, manufactured a line of small electric motors.

J. D. Cornell
Freight Traffic Manager

J. D. Cornell began his railroad work in 1890 in the car accountant's office of the Chicago, Burlington & Quincy Railroad at St. Joseph, Mo. From 1892 until 1900 he was employed in the accounting department of the St. Joseph & Grand Island Railway at St. Joseph. He went to Kansas City in 1900 and for seven years served in the general freight department of the Kansas City Southern. In 1907 he was selected to take charge of the compilation of tariffs for the Southwestern Tariff Committee at St. Louis, and he served in this capacity until 1910, when he became traffic manager of the Rock Island Southern Railway (Electric) at Davenport, Iowa.

During 1905 and for several years following Mr. Cornell served as traffic manager of the Joplin & Pittsburgh Railway and the Southwest Missouri Railway, electric interurban roads operated in the metal mining district of Missouri. He has held the position of freight traffic manager at Kansas City for the last seven years.

C. A. Kincade
Superintendent of Distribution

C. A. Kincade entered the service of the Metropolitan Street Railway, Kansas City, on May 22, 1900. His first work with this company was as a gripman on the old Twelfth Street cable line. In September, 1903, he was promoted to the position of assistant superintendent of the Twelfth Street division and as such his duties included the handling of trainmen and carhouse men as well as the work now taken care of by the timekeeper and cashier. Mr. Kincade was transferred to the electrical department in September, 1904. In 1905 he was appointed assistant to the electrical engineer. At that time his work included timekeeping and power despatching as well as clerical and general office work. Still in the capacity of assistant electrical engineer, in 1907 Mr. Kincade was placed in charge of all overhead and underground construction and maintenance work. At that time the power houses and substations were handled by his department.

In March, 1918, he was appointed superintendent of the electrical distribution department and he has handled those duties since then. On May 22 next Mr. Kincade will celebrate his twenty-eighth anniversary as an employee of this property.

Mr. Kincade was born and reared in Mason County, West Virginia. He removed to Kansas City in 1900.

Howard W. Smith
Superintendent of Way and Structures

Howard W. Smith was employed in various capacities with road surveying parties in both the states of Michigan and Missouri from 1902 to 1906. In the latter year and until 1909 he was resident engineer in the construction of the Pacific Coast extension of the Chicago, Milwaukee & St. Paul in Dakota and Montana.

Mr. Smith was first employed by the street railways in Kansas City in 1911 as assistant engineer of the way and structures department and he has been in that department continuously since that date with the exception of four months in 1918 in war service. In 1916 he was appointed assistant superintendent of way and structures and served in that capacity until last October, when he was appointed superintendent of the department, reporting to R. W. Bailey.

Mr. Smith was born in Grand Rapids, Mich., in 1883 and lived there until 1903, when he moved to Kansas City.

R. S. Neal
Superintendent of Equipment

R. S. Neal, superintendent of equipment, went to the Kansas City Railways on March 16, 1918, from the Kansas City Power & Light Company and was first employed in the way and structures department. Following several assignments in the engineering field, he returned to the Kansas City Railways on Nov. 12, 1920, to take charge of the engineering work for the mechanical department. He organized the engineering department, which includes all the designing work, making up of specifications, shop work plan and general drafting work. This position he held until April 1, 1922, when he was appointed assistant superintendent in charge of the mechanical department, reporting to R. W. Bailey.

J. A. Harder

L. M. Boschert

D. E. Druen

Harry M. Smith
Assistant Superintendent of Transportation

Harry M. Smith entered the electric railway field as a despatcher with the Lorain & Cleveland Railway, Toledo, Ohio. This was not a big property and Mr. Smith, after several years of experience, was appointed auditor of the road, holding that position until it was merged with the Lake Shore Electric Railway, which operated between Cleveland and Toledo. Following the merger Mr. Smith was appointed chief train despatcher and later division superintendent. After six years with this property Mr. Smith was employed by J. M. Bramlette of the Michigan United Railways as interurban superintendent. This property operated in the city of Battle Creek, and from Jackson to Kalamazoo, a distance of about 70 miles. He held this position for seven years, when he resigned to accept an offer as superintendent of the Mexico Tramway in Mexico City, Mexico. He remained with this road for five years and then returned to the states and went direct to Chicago, serving for a year and a half as director of service for the Willys-Overland Company.

One day in Chicago Mr. Smith met his old friend J. M. Bramlette, who was then with the Lincoln Traction Company of Lincoln, Neb., and Mr. Bramlette prevailed upon him to return to the electric railway field as his superintendent of transportation. After three years at Lincoln, Mr. Smith went to Kansas City and in November, 1919, joined the organization as assistant superintendent of transportation, the same position he now holds.

Mr. Smith was born in Swanton, Ohio. He received his high school education in Toledo.

I. R. Carson
Assistant Superintendent of Transportation

I. R. Carson went direct from a farm in Ellsworth County, Kansas, to Kansas City and a year or so later he entered the service of the Metropolitan Street Railway on May 30, 1906, as a motorman serving in that capacity until 1911, when he was made day office clerk. The next year he became the assistant division superintendent at Ninth and Washington and in 1913 was transfrred back to 48th and Harrison as assistant division superintendent under D. L. Fennell, who is now at the head of the entire transportation department.

In 1914 Mr. Carson was appointed superintendent of the Kansas City & Westport Belt Railway, a subsidiary of the old Metropolitan Street Railway. In 1915 he was transferred back to Ninth and Washington as division superintendent, where he remained until July 1, 1918, at which time he was placed in charge of work trains and freight service. Exactly a year later, on July 1, 1919, he was appointed assistant superintendent of transportation. He has held that position continuously since then. Mr. Carson was born in Brooklyn, N. Y.

E. W. Holmes Promoted at Buffalo

Edward W. Holmes has been appointed assistant treasurer and assistant secretary of the International Railway and International Bus Corporation, the railway subsidiary, Buffalo, N. Y. Mr. Holmes brings to the post a wealth of transportation experience, having been engaged in the business for practically his entire career. In 1906 he became connected with the company as a clerk in the auditing department. Through successive promotions he became secretary to the president, at that time Thomas Penney. When Mr. Penney resigned in 1912, Mr. Holmes continued as secretary, as well as office manager of the legal department. From 1921 to 1924 he occupied the position of secretary to the International Railway voting trust, and continued there until his apointment to his new position.

E. G. Grimes is serving as division superintendent of the Union Traction Company at Marion, Ind. He joined the forces of this company in 1907, working on the Broad Ripple line for three years. He was then promoted to interurban conductor. When in the fall of 1917 C. S. Keever was appointed superintendent of transportation he appointed Mr. Grimes division superintendent at Fort Harrison. After this position was abolished Mr. Grimes was made instructor on all divisions and afterward was made freight claim investigator.

Action on Fifteen Cars for San Francisco Expected

The public utilities committee of the Council of San Francisco, Cal., on April 15 postponed until its next meeting action on a recommendation by the Board of Public Works that $290,000 be set aside for the purchase of fifteen new cars for the projected Judah Street line of the Municipal Railway.

Completion of the line, in connection with the new Duboce tunnel, is partially contingent upon approval of proposed municipal line extensions at the coming bond issue election. It was said at the meeting, however, that the line might be completed out of the railway funds if the issue should not be approved by the voters. Investigation of this possibility was ordered before the next meeting.

It was explained that the cars should be ordered eight months in advance of the expected date of their need in order to insure delivery on time. Action on the matter is not expected to be longer delayed.

Economic Trend to Be Discussed at Chamber of Commerce Meeting

President Coolidge and Secretary of Commerce Hoover will be among the speakers who will address the fifteenth annual meeting of the Chamber of Commerce of the United States to be held in Washington May 2 to 5. This national gathering of business leaders from all parts of the United States has been called to discuss the important economic changes that have taken place in the business life of the nation during the past few years. The discussions will center around the major topic "The New Business Era."

President Coolidge's talk will be delivered before a joint meeting of the national Chamber of Commerce and the Pan-American Commercial Conference. The latter conference will be attended by representatives from the Latin-American countries and will be held in Washington during the week of the meeting of the national chamber.

In many respects the meeting will be one of the most important ever held by the chamber. A statement says:

> American business, sweeping forward under the play of new economic forces, finds it more necessary than ever to look into the future. What do changes that are taking place foretoken? How sharp is the break from the conditions before the war? In what direction are we headed? Are we approaching ever more important readjustments than we have seen in the recent past?
>
> The new business era demands the careful weighing of many problems. It calls for study of complicated relationships. Trades and industries are entering new fields. Business units and conditions are changing. New points of contact with government and within commerce and industry are being developed.
>
> Business is achieving so many new things even the best observers cannot keep abreast of them all. Industries are changing with new inventions and the application of new methods. Selling goods at home and abroad is bringing out new features of distribution.
>
> The annual meeting of the national chamber will survey economic trends with the purpose of determining their meaning, with the hope of throwing light into the future. Leading business men will bring forward new problems within their industries. Newly arising questions that are bothering large sections of the country will be discussed.

Simplified Invoice Drafted by U. S. Commerce Committee

Accompanied by an acceptance blank, the simplified invoice recently adopted by the joint committee of invoice simplification is being distributed by the Department of Commerce. The new invoice was unanimously chosen by the committee at a meeting held Feb. 16 and is the result of a series of meetings held during the past few months. The committee has given considerable study to the problems of the vendor and the customer, and it is of the opinion that all contingencies and the best features of both the uniform and the national standard have been taken care of in the form now circulated in the mails. In addition to the invoice set up as shown elsewhere on this page, the committee has circulated the following instructions:

To conform to standards:

> "Customers' Use" block must be exactly as shown.
>
> Designations must all be shown.
>
> Sequence and position of designations must be as shown.
>
> Sizes—8½ in. from side to side; 7, 11, and 14 in. from top to bottom.

Optional for user's convenience:

> Size and arrangement of space for vendor's name, address, trademark, etc., may be changed as desired.
>
> Spacing both horizontal and vertical to left of both Customers' Use block may be changed if desired.
>
> "Ship To and Destination" may be arranged for window envelopes.
>
> "Quantity," "Description," "Price," and "Amount" columns may be subdivided as desired.
>
> Invoices for retailers should provide a column ⅞ in. wide to the right of the "Amount" columns and headed "For Retailer's Use."

Another note reads: "In case of multiple billing, provide columns here for order number. If not so used, this space may be added to the width of the other columns." The space indicated is at the left of that portion of the form used for detailing items. The committee also requests that the users of either standard or uniform forms adopt the simplified invoice form when the supply of their present forms is exhausted.

D. H. Moore Promoted by Ohio Brass

David H. Moore, since 1925 electrical engineer and assistant to the secretary of the Ohio Brass Company, Mansfield, Ohio, has been appointed district sales manager of the company with headquarters at 50 Church Street, New York City. Mr. Moore's appointment took effect March 21. He will handle steam railroad accounts in parts of New York, New Jersey, Pennsylvania and the New England states.

Before going to the Ohio Brass Company Mr. Moore spent seven years with Day & Zimmermann, Inc., Philadelphia, in consulting and general engineering work. For eight years prior to that he was connected with the Schenectady and Pittsfield Works of the General Electric Company.

Seattle's Mayor Wants Car Bonds Sold Locally

Mayor Bertha K. Landes of Seattle, Wash., has suggested that since the city has been unable to reach any agreement with the St. Louis Car Company in regard to its taking city bonds in payment for 80 new cars contracted for by the Municipal Railway the bonds be sold locally. She says this plan would speed up the purchase and enable the city to buy the cars at a lower figure.

The Mayor said that after conferring with representatives of the car company and St. Louis bankers she was convinced that a deadlock had been reached. The company is unwilling to take the bonds without a priority agreement in view of the litigation pending against the railway in the federal courts. The issue totals $1,420,000.

Manhattan & Queens Railway Relocating Tracks

Work of relocating the track of the Manhattan & Queens Traction Corporation on Queens Boulevard, Borough of Queens, N. Y., has begun. The Eastern Construction Company, New York, is doing the work. It calls for relocating the tracks from Van Dam Street, Long Island City, through the communities of Winfield and Woodside to Fifty-sixth Avenue, Elmhurst, L. I.

At present, following the path of the old Queens Boulevard, the tracks of the railway alternate between the southbound and northbound side of the vehicular roadway. When the present work is completed and the old tracks removed those sections will be repaved and then two wide highways with one-way traffic on each will be available for motorists.

Porto Rico Railway Gets Six New Two-Man Cars

Following are specifications of the six new two-man, single-end cars delivered on March 3 to the Porto Rico Railway, Light & Power Company, San Juan, Porto Rico, by the Perley A. Thomas Car Works of High Point, N. C.:

Date order was placed	Oct. 14, 1926
Date of delivery	March 3, 1927
Type of car	Single-end, front-entrance, center exit, two-man
Weight:	
Car body	14,500 lb.
Trucks	8,278 lb.
Equipment	6,222 lb.
Total	29,000 lb.
Bolster centers, length	26 ft. 0 in.
Length over all	45 ft. 11 in.
Truck wheelbase	5 ft. 2 in.
Width over all	7 ft. 8½ in.
Height, rail to trolley base	10 ft. 7⅝ in.
Body	All steel
Interior trim	Mahogany
Headlining	Agasote
Roof	Arch
Air brakes	General Electric Co.
Axles	Taylor Electric Truck Co.
Bumpers	Channel
Car trimmings	Thomas
Center and side bearings	Taylor Electric Truck Co.
Conduits and junction boxes	Duraduct
Control	General Electric K-75-A
Couplers	Car builder
Curtain fixtures	Curtain Supply Co.
Curtain material	Pantasote, double-faced
Destination signs	Hunter
Door operating mechanism	Car builder
Fare boxes	Johnson
Fenders	Consolidated
Finish	Duco
Gears and pinions	General Electric Co.
Hand brakes	National Brake Co.
Headlights	Electric Service Supplies Co.
Journal bearings	Taylor Elec. Truck Co.
Journal boxes	Taylor Elec. Truck Co.
Lightning arresters	General Electric Co.
Motors	G.E.264-A, inside hung
Sanders	Ohio Brass Co.
Seats	Heywood-Wakefield Co.
Seating material	Leather
Springs	Taylor Electric Truck Co.
Step treads	Kass
Trolley catchers	Ohio Brass Co.
Trolley base	General Electric Co.
Trucks	Taylor Electric Truck Co.
Wheels	Cast iron, 24 in.

Commodious seating plan for cars

Track Improvement Begun by East Chicago, Ind., Railway

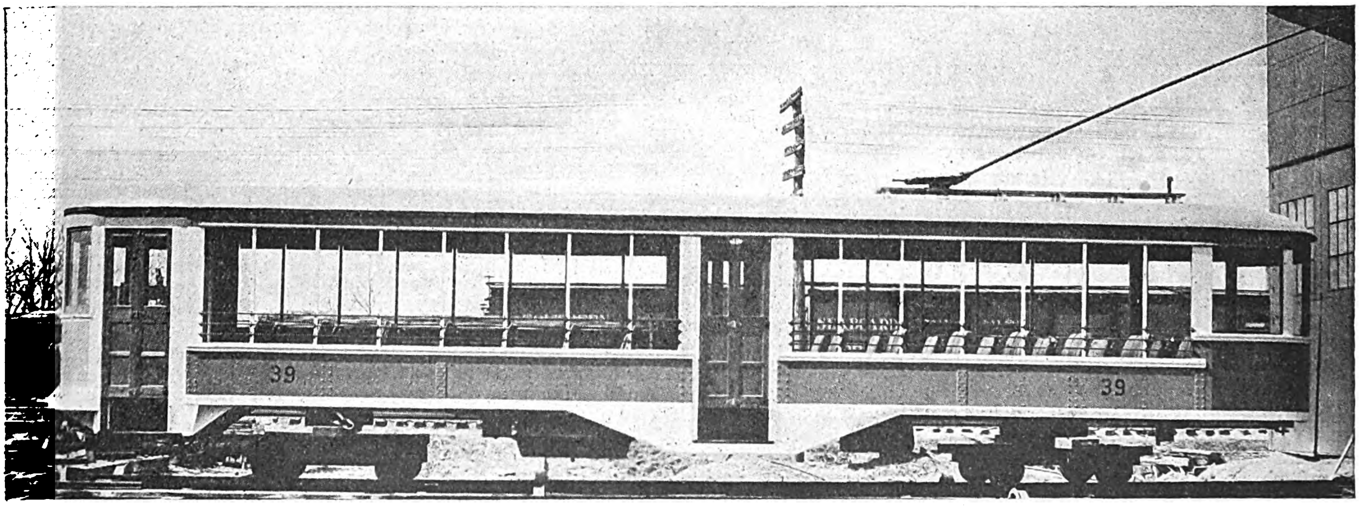
Improvement of its right-of-way on Forsyth Avenue in East Chicago, Ind., from 150th Street to the northern city limits, a distance of about 3½ miles, is being made by the Hammond, Whiting & East Chicago Railway. The project includes realignment and paving of tracks over the entire route, according to Charles E. Lawrence, general manager.

At the request of property owners along Main Street, East Chicago, and the Board of Public Works, officials of the railway and of the Gary Railways are also considering plans to pave their right-of-way along that street. Due to the narrowness of the thoroughfare and the parking of automobiles along the curb, motorists are compelled to use the tracks. Property owners have asked the companies to pave the right-of-way in order to furnish a well-paved thoroughfare from curb to curb.

Heavy Buying in the Copper Market

A large volume of copper buying after seven weeks of unusual dullness was the outstanding feature of the non-ferrous metals market for the week ended April 20. On this date the price seems to be fairly well established at 13⅛ cents delivered in Connecticut. Business in the other metals was only moderate and prices for lead and zinc are lower than a week ago. Antimony is quiet but firm, tin is quiet and steady and quicksilver is dull and easier. A further reduction in the price of platinum was made during the week, the market for all of the platinum group of metals being stagnant.

The issuance of March copper statistics showing a decided improved position in respect to stocks and current production started a buying wave April 13 that continued for five business days, reports *Engineering and Mining Journal.* The total volume of sales has been greater than the aggregate of the four preceding weekly periods and was exceeded by only one week since the first of the year. Deliveries have been specified principally for May and June, with a lesser quantity for prompt and



Typical exterior of steel car bodies built by the Perley A. Thomas Car Company for service in San Juan, P. R.

some as far ahead as July. In spite of the activity, it seems improbable, however, that the "Slack" created in the last seven weeks has been taken up, and sellers look for further buying in reasonable volume. Most of the Eastern business was placed at 13 cents until Monday, when all but two or three sellers increased their price to 13⅛ cents. A little 13-cent metal hung over until April 19, but on the day following 13⅛ cents appeared to be the bottom and some were talking of even higher prices. Foreign business has likewise been good and effective; April 20 the price of the export association increased to 13.50 cents c.i.f., the former figure being 13.35 cents. The f.a.s. market is quiet at about 13.20 cents. Domestic buying April 20 was quiet, but a breathing spell is to be expected. One large consumer took the attitude that he could afford to wait now until he sees whether the curtailment in output shown by the March figures will persist in April.

With no apparent curtailment in mine output in Joplin, a reduction in the ore price to $42 a ton, prime Western zinc, had eased during the week in a quiet market. Galvanizers are still backward buyers and on April 20 metal was available at from 6.30 cents to 6.325 cents. High grade is quoted at 8.25 cents delivered in New York and continues dull.

LEAD DOWN TO 7 CENTS, NEW YORK

Lead is indubitably weaker and no one seems to be optimistic as to the price trend in the immediate future. Sales in the last week have been of fair volume but current consumption is disappointing compared with last year and is almost certainly below the rate of production. Production, incidentally, shows no signs of declining in the March statistics, and without such curtailment there can be little hope of better prices. Mexican production, which it was supposed had been cut, actually showed a substantial gain.

On Monday, April 18, the American Smelting & Refining Co. reduced its contract price for New York lead from 7.25 cents to 7.15 cents. Reductions were also made by sellers in the Middle West from 6.90 cents, St. Louis basis, to 6.80 cents. Even at the reduced levels few buyers could be found, battery makers continuing out of the market. A little interest was shown by paint manufacturers, who report a good though seasonal improvement in their business; two or three days ago, for example, a fair sized order for corroding lead was placed at 7.05 cents, Chicago basis. Late this afternoon, a further reduction was made by the Smelting Co. to 7 cents, New York, practically no business having been done at the higher level.

METAL, COAL AND MATERIAL PRICES
F. O. B. REFINING

Metals—New York	April 19, 1927
Copper, electrolytic, cents per lb	12.87
Copper wire, cents per lb	15.25
Lead, cents per lb	7.15
Zinc, cents per lb	6.71
Tin, Straits, cents per lb	68 625
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.325
Somerset mine run, Boston, net tons	1.925
Pittsburgh mine run, Pittsburgh, net tons	2.25

Central, Ill., screenings, Chicago, net tons	2.00
Kansas screenings, Kansas City, net tons	2.50
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft	$5.50
Weatherproof wire base, N. Y., cents per lb.	16.75
Cement, Chicago net prices, without bags	2.05
Linseed oil (5-bbl. lots), N. Y., cents per lb.	11.2
White lead in oil (100-lb. keg), N. Y., cents per lb	14.50
Turpentine (bbl. lots), N. Y., per gal	$0.66

TIN DROPS AFTER QUIET WEEK

The Easter holidays in London have interfered with the tin market, with the result that until April 20 prices showed little change, though sellers were firm. The marked drop in London on that date was unexpected in view of the rather strong tone here; it brought New York prices for prompt Straits to the neighborhood of 68 cents, with forward tin about 1½ cents less.

Steel Castings 62 Per Cent of Shop Capacity

March bookings of steel castings, as reported to the Department of Commerce by the principal manufacturers, were 62 per cent of shop capacity, as against 69 per cent in February and 81 per cent a year ago. The production of steel castings was 73 per cent of capacity in March, as against 64 per cent in February and 83 per cent a year ago. The 123 reporting concerns have a present monthly capacity of 133,000 tons and represent over four-fifths of the commercial castings capacity of the United States, of which 60,100 tons are usually devoted to railroad specialties and 72,900 tons to miscellaneous castings.

Rolling Stock

Johnson City Traction Company, Johnson City, Tenn., is reported to have bought two new cars.

Charleston Consolidated Railway & Lighting Company, now a subsidiary of of the South Carolina Power Company, Charleston, S. C., will add nine new Birney safety cars to its equipment, according to a newspaper statement by Stuart M. Cooper, vice-president and general manager. Some of the cars have already been shipped and will probably be delivered shortly, it was stated.

Evanston Railway, Evanston, Ill., according to press reports, will add six new street cars to the thirteen now in service in the city. The new cars, estimated to cost $12,000 each, will probably be put into service in the next two months.

Track and Line

Milwaukee Electric Railway & Light Company, Milwaukee, Wis., has started special track reconstruction work on East Wisconsin Avenue. Temporary rails have been laid along the curb so that service will not be interrupted.

Municipal Railway, Seattle, Wash., will make two track extensions in the city if a recent recommendation of the city utilities committee is adopted. One extension is designed to reduce traffic congestion on University Way and the other to provide additional means of travel between Montlake and the University business district. The new work will cost $17,000 and will be paid for by sale of railway warrants.

South Carolina Power Company, Charleston, S. C., is reported as spending $100,000 for new rails on several of its lines. Work is now being done on Meeting Street. Later operations will extend to King Street in Charleston.

Kansas City Public Service Company, Kansas City, Mo., is reported to have begun work on laying temporary tracks from Nineteenth to 24th Streets on Southwest Boulevard, Kansas City. The new tracks and paving of the right-of-way are in advance of the paving of the boulevard. Bids on paving the boulevard received some time ago by Matthew S. Murray, director of public works, call for one of four constructions, a 3½-in. brick top, 3½-in. top of asphalting, 2-in. top of asphaltic concrete or Warrenite bitulithic on the present concrete base.

Shops and Buildings

Wisconsin Valley Electric Company, Wausau, Wis., recently broke ground for a new 96 x 185-ft. concrete and steel carhouse to be erected at First and De Kalb Streets, Wausau. The new structure, estimated to cost $42,000, will replace one twenty years old.

Knoxville Power & Light Company, Knoxville, Tenn., according to a recent press report, will shortly occupy two additions which have been built to its carhouse located at the intersection of Magnolia Avenue and Jessamine Street in Park City. Brick, steel and concrete are being used in the construction of the carhouse and brick and concrete will be used in the garage addition. The additions will cost $12,000.

Trade Notes

Rome Wire Company, Rome, N. Y., has opened a new warehouse at 622 West Adams Street, Chicago, Ill. F. R. Weaver, district manager, is in charge.

Billings & Spencer Company, Hartford, Conn., has transferred J. H. Coyle, formerly supervisor of engineering, to be directly in charge of sales engineering in New York, Pennsylvania and New England. His headquarters will be at Hartford.

American Hammered Piston Ring Company, Baltimore, Md., has added H. W. Marshall to its sales force. Mr. Marshall's territory will include Kansas, Oklahoma, Arkansas and part of Missouri.

United States Rubber Company, New York, is responsible for a new publication, the *U. S. Tire Retailer*, of which Vol. 1, No. 1 appeared on March 1, 1927. E. F. Underhill is editor and Donald Fairbanks associate editor. The magazine is primarily designed to serve the tire dealers in the United States. Its size is 8½x12 in. Excellent illustrations and heavy glazed stock add to the attractiveness of the interesting text matter.

The Four Horsemen Ride Again

THEY are riding again!—those apocalyptic horsemen of destruction. This time their diabolical forms are reflected in the swishing, sucking torrent of the Mississippi. They cackle with glee each time a levee breaks! They rock crazily in their saddles as home after home topples and then goes careening down the flood.

From Missouri to the Gulf these enemies of mankind are being fought with heroic effort and undaunted courage. While most of us sit in safety on the highlands, history grim and glorious is being made. Among its makers are hundreds of public utility men and women. That they have gone and will go beyond the call of duty is assured. That their heroic deeds will be set down is not so certain unless those who could only stand and wait will write what the actors were too modest to record. A flood of the present magnitude is bound to develop engineering and operating problems never before experienced. Each situation will add to the storehouse of knowledge. Each problem conquered will doubly arm the nation against the time the Four Horsemen ride again!

A Little Book with a Big Message

VERY often much more attention than it really deserves is attached in business to the value of appearances as reflected in the clothes a man wears. It is appalling to think of how much business has been lost through officials, secretaries and office boys turning down the poorly dressed visitor, or what intellect and acumen have been steered toward poorhouses, jails and cemeteries by reason of the same false evaluation. For this reason one is elated to note that in a recently published brochure, "Our Part in Public Service," the Nashville Railway & Light Company is telling its employees that "clothes don't make the man."

Furthermore, it is backing up the action with a true story which is prefaced with these remarks: "Deal just as promptly, as willingly and just as courteously with the person of poor appearance as you would with one dressed in finery. Appearance means nothing in our business. The humblest citizen is entitled to and must receive the same courteous attention as the person with social standing or prosperous appearance."

But such a sound principle as this is only a tithe of what this vest pocket compendium of good manners contains. Among other paragraphs that make it stand out from the ordinary run of courtesy creeds is the one devoted to the subject of how to say "hello" without keeping the "hell" in it. In this particular, much has been written about telephone courtesy, but the JOURNAL does not recall any text so far that has so skillfully or convincingly pointed out what a vital part voice inflection plays in this phase of public relations.

Those responsible for the little book do not hesitate to attack quite seriously one of the great curses of big business, i.e., departmental jealousy. On this subject, and one captioned "The Public Is Fair When Fully Informed," there are rare expressions of good, hard common sense. Thirteen hundred of the booklets have been distributed among employees of the company, and it is no exaggeration to state that this distribution could be multiplied by a hundred to the ultimate benefit of all those who in our field are striving to bring about a deeper and keener understanding of the public relations problem. Had "Our Part in Public Service" been published in the era of the Latins they would undoubtedly have pronounced it *multum in parvo.*

Wanted— A Maintenance Exhibit

EVEN though the Cleveland convention is still more than five months away, it is none too early to get exhibit plans under way. All signs indicate that this will be the greatest convention ever held by the industry. It is significant that several operating companies have already notified Director of Exhibits F. C. J. Dell that they are planning to show new cars and equipment developed on their properties. Likewise, progressive and wide-awake manufacturers are making preparations to show the most recent improvements in their apparatus so as to be identified with the march of progress in the industry.

That this year's car exhibit will exceed in size the record-breaking showing of last year seems more than probable, as the result of the energy and enthusiasm which J. H. Alexander, chairman of the exhibit committee, is putting behind this phase of the convention. That it will far exceed last year's exhibit in the showing of radical developments in car body and truck design is already assured by the several construction experiments which are under way.

There is, however, one important phase of an electric railway exhibit which has in the past been obviously deficient in comparison with its importance as a major item in successful operation. That is the showing of tools and equipment which decrease maintenance costs and improve workmanship. Electric railway shops are notoriously lacking in modern tools and machines. This is in part, at least, attributable to neglect of the field by the manufacturers of such equipment. True, electric railways have been poor buyers of tools and machines. They have in the past worried along with old machines as best they could and have overlooked the savings which modern shop equipment make possible. Part of this situation is attributable to their depleted finances, but another important factor has been neglect of the market by the tool manufacturers. There is a feeling among them that one large automobile manufacturer is a better prospect for machinery sales than is the electric railway field. In a measure, there was in the past some basis for this viewpoint, because the progressive motor manufacturer does not hesitate to throw out old machines to make even a small reduction in his manufacturing costs.

Today, however, the electric railway situation is changing rapidly. There is a growing interest in all phases of modernization. There is under way an active campaign for better methods, increased efficiency and improved performance. In addition, the bus has become an important part of the transportation industry, and with its introduction efficient maintenance machinery takes on increased importance. Wide-awake maintenance equipment manufacturers may well afford to interest themselves in the opportunity for showing their products under the favorable conditions that will exist at Cleveland.

Figures for 1926 Very Encouraging

SIGNIFICANT, indeed, is the interpretation of the facts contained in the association's statistical study of the earnings of the electric railways for 1926, abstracted elsewhere in this issue. It is apparent, for instance, that companies other than the large ones are beginning to share in the improved conditions of the industry. The affairs of the very small companies, however, are still bad, but it should be borne in mind that these companies constitute only a fraction of the total. In fact, their influence on any statement reflecting the operations of the whole industry is practically negligible.

While the electric railways are increasing their bus services they are not curtailing their rail lines, but are giving more rail service measured in car-miles than they ever did. And they are doing this even though on the whole fares are not what they should be. The average fare per passenger in 1926 was 7.10 cents. In order to produce the same net today as in 1912 the average fare should have increased 56 per cent instead of 35 per cent; in other words, the average fare should be 8.22 cents instead of 7.10 cents. Since the railways have shown their confidence in the public's integrity by expending the money necessary to provide additional service, the obligation of the public, as the JOURNAL has repeatedly pointed out, is of course to pay for that service so that the railways may receive a fair return on the money they are investing.

The author of the article commenting on the figures makes no bones of the fact that many electric railway managements have neglected to take advantage of improved methods and equipment which might have helped them to better their conditions. It is his idea that they have been especially derelict in the field of public relations. On the other hand, the more progressive managements among both the larger and the smaller properties, with operating conditions identical with those of the rest of the industry, have by their skill and their readiness to adopt new ideas succeeded in holding or increasing their traffic and enlisting the co-operation of their patrons, so that as a result they have been able to secure more equitable consideration from the public authorities. This is very encouraging. Despite all the seeming cross-currents the conclusion is inescapable that the companies comprising the great bulk of the industry, while by no means prosperous, are nevertheless confidently going forward with plans for the future and that there is every reason to take heart.

Another Year of Legislative Debate at Boston

FINALLY all the thunder on Beacon Hill with its promise of legislation for the Boston Elevated Railway has proved to be nothing but a dud. The Legislature has come to the end of its session, has wasted a great deal of time with matters affecting the Boston Elevated, rejected one proposition after another, and at last discarded everything. Nothing suited the lawmakers. Never in the history of Boston railway legislation has a case been more thoroughly prepared than was the Elevated situation this year, with most comprehensive plans from commissions and individuals of recognized merit.

Gov. Alvan T. Fuller was insistent upon some action, but the only thing that has come out of it all is a request to the Department of Public Utilities to value the road. Even that was a hurried afterthought. There were all the extremes, from a 50-year extension of public control of the Elevated to an immediate return of the property to the stockholders, and between these extremes came numerous compromises, resulting in bitter clashes among factions in the Senate and the House. It was earnestly argued that even if no legislation could be agreed upon regarding the control and financing of the company there must be no failure to provide for the physical extension of the rapid transit system. Even this has gone by default.

Montreal Takes a Step Ahead in Power Conversion Equipment

DURING the past decade, in the power supply for electric railway service, changes have taken place from the manual substation to the automatic synchronous converter station, which has become almost standard for a large number of railways. Much more recent is the development of the mercury-arc rectifier for this class of service. The installation of rectifiers made by the Montreal Tramways represents what is probably the first fully automatic substation in America using rectifiers. Certainly it is the first automatic rectifier station in Canada.

While it is not to be assumed that the rectifier is a fully perfected piece of apparatus, it has gone a long way from the small glass bulb device. Save the principle, the latter has little in common with the steel inclosed rectifiers that have been developed for conversion of hundreds of kilowatts. Perfection of rectifiers such as these used in Montreal may be regarded as another triumph of engineering.

It is yet too early to know the results from the use of the Montreal rectifiers over long periods of time in heavy service. Similar equipment has been used in Europe for several years with satisfactory results, and the operating problems are well on the way to solution. It is to be hoped that the experience in Montreal will go far toward determining the applicability of the device in electric railway power circuits. The simplicity from an operating standpoint and the ease of providing full automatic control make it ideal for railway service.

Two Small Railways Come Into Their Own

BEFORE the calamity howlers of the daily press again draw the diapason of disaster and begin the final fugue of the funeral march over the electric railways in small communities they should ponder well the cases of the companies in Williamsport, Pa., and Fitchburg, Mass., reported in the JOURNAL for April 23. True, peace and plenty are not likely to flow forth in these places for the railways as they did from Ceres' cornucopia, but these two instances do show what railway men of leonine heart, aided and abetted by their communities, have done to restore to these roads the prestige they deserve. In the past things were not what they might have been in these towns from the standpoint of transportation, but all this has changed, changed because, unlike Trilby, the local people were not tone-deaf.

It is a different scene now to which "Williamsport Welcomes You" and upon which Fitchburg felicitates itself, different because responsible local people were unwilling that their railways, like those in some other communities, should be permitted to slip into the slough of innocuous desuetude. All the electric railway in the small community asks is a square deal. It is entitled to that and nothing less. It doesn't want pity and it doesn't need it. Far too many railways in cities the size of Williamsport and Fitchburg have, however, been permitted to go from bad to worse, not because of any unwillingness of the responsible railway managers to do their part, but because local people of power and influence have been as destitute of backbone as a banana.

Track Developments Keep Pace With Rolling Stock Improvement

NOT to be outdone by the equipment engineers who recently have made notable innovations in rolling stock design, way engineers are busily occupied trying out new methods of track construction. An outstanding instance of this kind is the development of a base plate joint by the Eastern Massachusetts Street Railway. Details of its construction and a summary of the results obtained are given in this issue by Frank B. Walker, chief engineer.

Use of a welded base plate in addition to a pair of fish plates is not new. In these experiments, however, the fish plates have been omitted and only the base plate is used. Theoretically this scheme places the metal where it will do the most good. With a suspended joint the rail heads in contact carry any compression stresses and the welded base plate takes the tension.

Bending tests made at the Massachusetts Institute of Technology indicate that this type of joint is at least as strong as the ordinary welded fish plate joints, which have given satisfactory service for a number of years on this railway. Its strength appears greater than that of the rail itself, as numerous failures in the tests occurred by fracture of the rail rather than yielding of the joint.

It is too soon to draw conclusions as to the ultimate effect of these experiments on design of the track structure. If the base plate joint proves to be an acceptable substitute for other types now in use, it will mean a substantial saving for the railways. Developments of this kind are perhaps less spectacular than the recent ones made in car design, but they too play an important part in keeping the electric railway industry abreast of the times.

Detroit Takes a Step Backward

GLEE is a great thing—when it isn't misdirected. In gloating over the defeat of the paving relief measure in favor of the municipal railway in Detroit, the *Free Press* appears to have started off with the wrong foot. It is not the first time this paper has done that very thing. There is no need for ELECTRIC RAILWAY JOURNAL to reiterate that it holds no brief for municipal ownership, but while the *Free Press* does the same thing it leans over backward in its effort to stand up straight. The same paper says that in turning down the paving relief measure the electors rose above specious arguments and showed that they understood the significance of the question at issue. They are said to have displayed "discrimination and discretion." According to the *Free Press* "the cost of paving between tracks is a natural and legitimate charge against the railway system, and by retaining it as such the voters insist that municipal transit facilities be operated and financed according to the methods and principles that would be adhered to if the lines were privately owned."

Indeed, and who told the *Free Press* that? It sounds like ancient of days. Doesn't that paper know that the thing the municipal railway sought is the very form of relief five states and more than 50 municipalities have already granted to private companies? If it did know it and did not say so, it was unfair, to say the least. If it did not say so because it did not know it, then that paper was ignorant.

The arguments in favor of paving relief are so well known to JOURNAL readers that there is no need to reiterate them. Paving burdens imposed upon the railways, if they ever were justified, are an anachronism in the present day and generation. The measure of relief extended to the railways proves that they are being increasingly so accepted. And if they are an anachronism as applied to private companies, surely they are no less an unwise exaction in the case of a municipal railway. They are a charge that the rider must meet, and to the very extent that such payments are exacted they are a factor in increasing fares.

No, in defeating the relief measure at Detroit, the voters there did not show they really understood the significance of the question at issue. They showed discrimination but not discretion. Their discrimination was not only against the municipal railway but against themselves. As for the *Free Press,* it wrote itself down as either ill-informed or prejudiced. It is one thing to be against municipal ownership. But it is quite another not to be willing to concede to the municipal railway relief from onerous exactions properly but gradually being lifted from the backs of the privately operated companies. That is all there is to it. But that is quite enough.

The mercury rectifier substation is located on one of the main streets of Verdun. On account of the absolute quietness of the equipment no objection was raised, and no precautions were necessary to inclose the doors and windows

First Canadian

Automatic Rectifier Substation

Installed by Montreal Tramways

Two 1,200-kw. mercury arc rectifier units supply power for operation of a section of the Montreal system at 600 volts d.c. Power from a 12,000-volt, three-phase circuit is converted without use of rotating equipment

CANADA'S first automatic mercury-arc rectifier substation has been placed in operation in the city of Verdun by the Montreal Tramways. During the past year the loads on this portion of the railway system have been increasing, and trouble was experienced on account of low voltage in Verdun and the wards of St. Ann, St. Gabriel and St. Paul in the city of Montreal.

Equipment of various kinds is used in the power system, so that any new substation would have to work in parallel with all of the existing apparatus. The major portion of the power for the operation of the Montreal Tramways is taken from the system of the Montreal Light, Heat & Power Company, being supplied in bulk at the Hochelaga power house, as shown on the map of the system. Here the power company has an outdoor station for changing from 66,000 volts to 12,600 volts for local distribution in Montreal and vicinity. The distribution for the tramway system is all at the lower potential, and except for a small distance is all carried in underground conduits owned by the tramway.

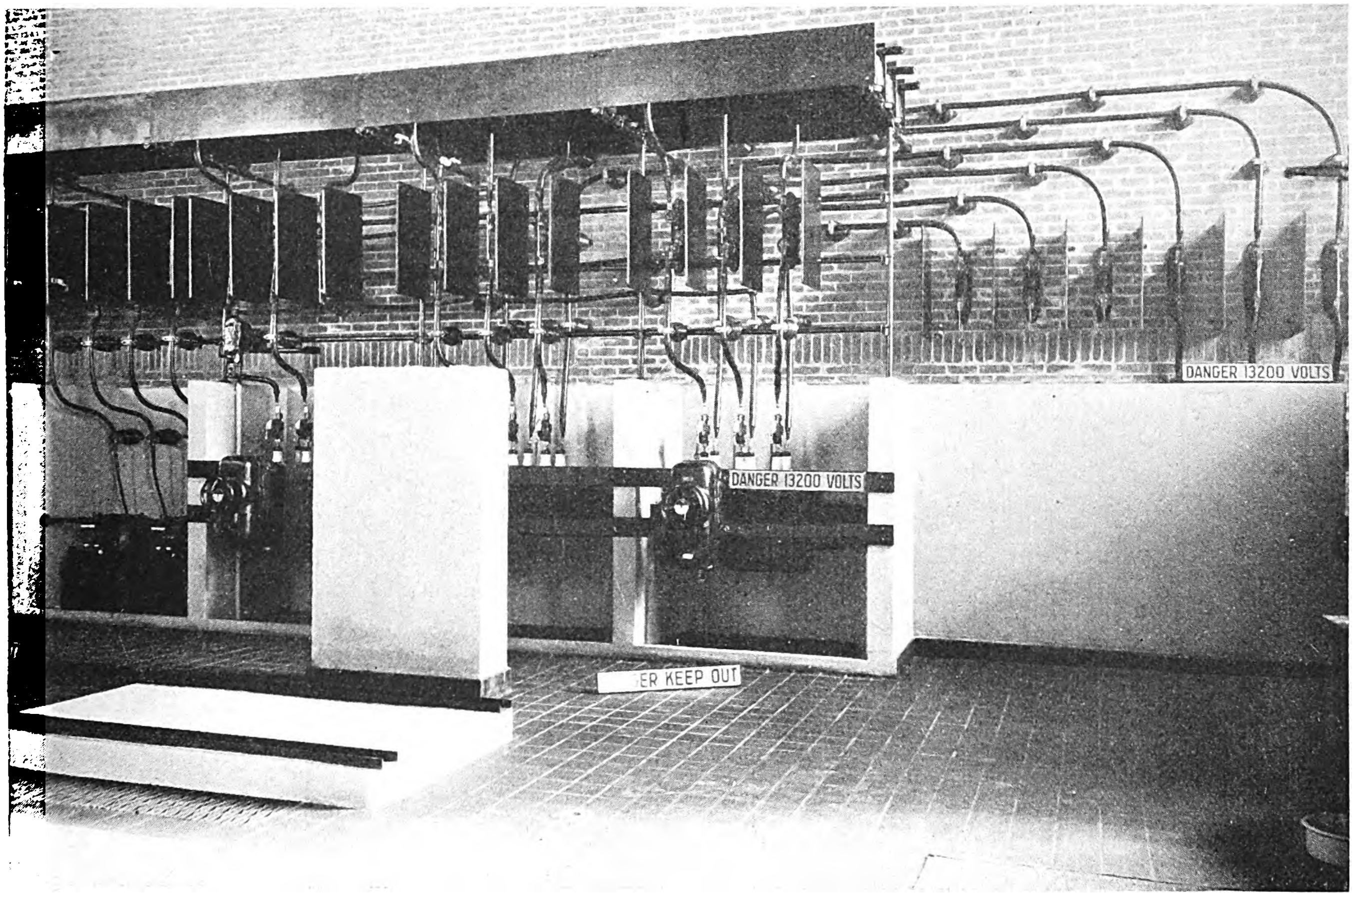
The Montreal Tramways maintains a power station at Hochelaga, which contains two 12,500-kw. turbo-generators, supplying three-phase alternating current at 12,600 volts, 60 cycles, and also a direct-current standby plant, containing two 1,000-kw. and one 2,000-kw., 600-volt direct-driven units. This power station is not used in regular service, the boilers being banked during the winter. They are called on only occasionally. In summer purchased power is used exclusively.

Synchronous converters, synchronous motor-generators and induction motor-generators are all used for conversion of the power to direct current, in addition to the new rectifier units. Rating of equipment in the various substations is given in the accompanying table.

The new substation is situated at 3980 Wellington Street, in the center of the business district of Verdun. The engineers of the tramway decided that on account of the location it would be imperative to install equipment free from the ordinary noise and vibration usually associated with power stations. It was also considered desirable to provide full automatic operation, in line with the policy of the company for utilizing this class of apparatus wherever possible.

The station has been constructed and was placed in service on Feb. 10, the control switches being closed by Mayor J. P. Dupuis of Verdun in the presence of a large number of prominent civic representatives and tramway officials. The effect of placing the station in operation has been to improve materially the power distribution system of the company in this section.

The equipment is housed in an attractive brick building, 34 ft. 3 in. x 75 ft. 8 in., inside measurements. As shown in the interior views, the high-tension switching



these two views. The alternating current enters through the high-tension
rrent through the feeder lines at the left

3. Low cost of maintenance.

4. Simplified control as compared with the apparatus for starting and synchronizing rotary converters or motor-generators.

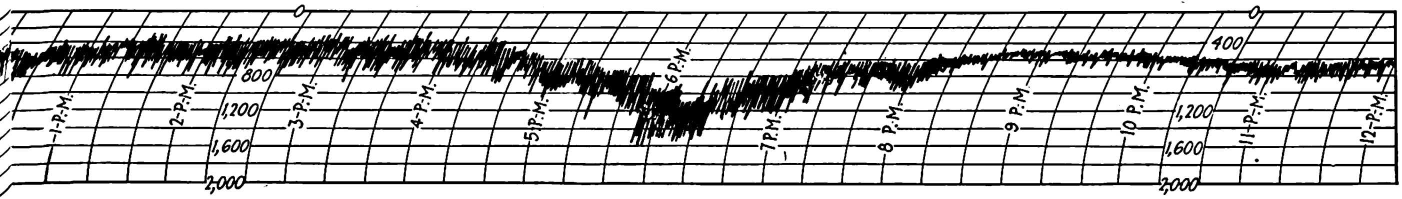
5. Absence of noise and vibration.

Four mercury-arc rectifiers, each rated at 600 volts and 1,000 amp. d.c., with the necessary transformers and control equipment, make up the installation. These rectifiers are assembled in pairs, each with a single three-phase transformer, in order to simplify the wiring and control equipment and to reduce the cost. There is provision for a third set of rectifiers, which will bring the station capacity up to a total of 3,600 kw. of direct-current output.

At present three-phase, 62½-cycle, 12,000-volt power is taken from the Montreal Light, Heat & Power Company's lines at Gate Avenue and Bond Street, at a point near the Montreal water works aqueduct, from where it is carried in an underground No. 00 three-conductor cable running directly to the substation. The line terminates in a pothead in the basement, from where the three leads are carried to a set of hand-operated 300-amp. disconnect switches at the front of the station. Provision is made for the entrance of a duplicate power line when needed. These may be seen at the extreme right of the general view of the main floor. The current then goes through a three-pole, single-throw, 250-amp., 24,000-volt oil circuit breaker, operated by Brown-Boveri type N-4 motor control. It is controlled by the line voltage through a potential transformer. The breaker is closed automatically when there is voltage on the line and is tripped by a no-voltage relay when the voltage is off. It can thus be controlled from the power station. The breaker is protected by type H-4 series overload relays which are set for a definite time. If these relays operate they trip and lock out the breaker, which cannot reclose until the lockout is reset manually. Through selectivity with the breakers between the a.c. bus and transformers the line breakers will trip by overload only in the event of a short circuit on the a.c. bus and under these conditions it is not desirable to reclose them.

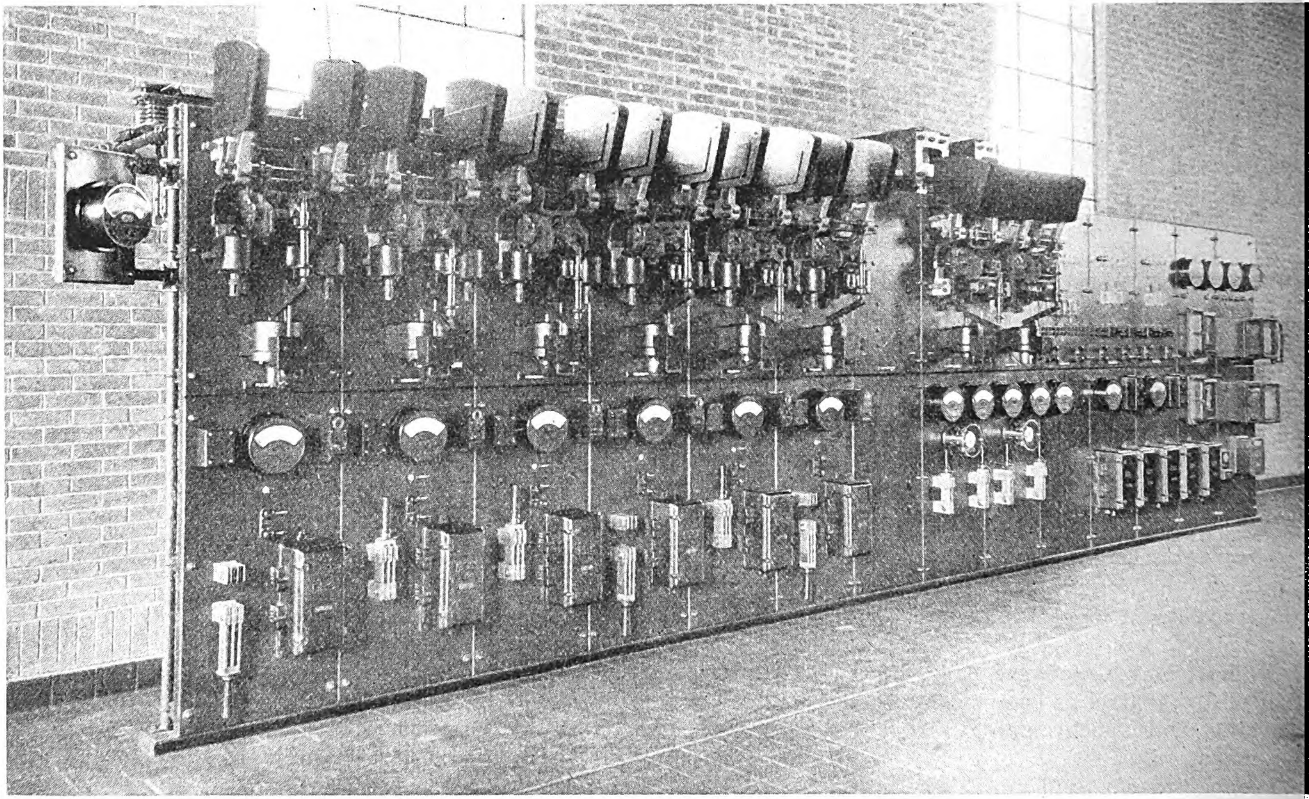
A second set of disconnect switches on the station side permits the line breakers to be cut out of circuit entirely for inspection or setting. From the main alternating-current bus the current is taken through a set of disconnects and circuit breakers to the primaries of the 1,800-kva., three-phase, 12,600-volt transformers, where the pressure is stepped down to a value suitable for the rectifiers, and also is converted to six phase.

The circuit breakers between the a.c. bus and rectifier



me on again at 5:20 a.m. when the voltage drop on the line became sufficient to actuate the starting relay transformers are operated by type N-4 motor control and are protected by H-4 overload relays set for instantaneous tripping on overload. If tripped by overload these breakers will reclose after intervals of ten seconds, one minute and three minutes. If tripped after the last closure the breakers will lock out and will not close again until the lockout is reset.

Each transformer has twelve secondary terminals and a neutral, as the windings are in duplicate to supply the two rectifiers independently. The neutral is grounded and forms the negative side of the d.c. circuit. The mercury cathode forms the positive d.c. terminal, and is connected to the 600-volt bus through suitable switches and circuit breakers.



General view of the direct-current switchboard. The feeder panels are at the left and the control for the rectifiers at the right

RECTIFIERS AND VACUUM PUMPS

The conversion units are Brown-Boveri type GRZ-56 mercury-arc rectifiers, each rated at 1,000 amp. and 600 volts d.c. output. Two of these rectifiers make up a unit which is rated at 1,200 kw.

Each rectifier is incased in an airtight steel shell which contains six anodes, each connected to one of the transformer terminals. The single cathode consists of mercury in a receptacle at the bottom of the pot. Auxiliary anodes are included to insure continuity of the arc and for starting the action when the rectifier is switched into circuit.

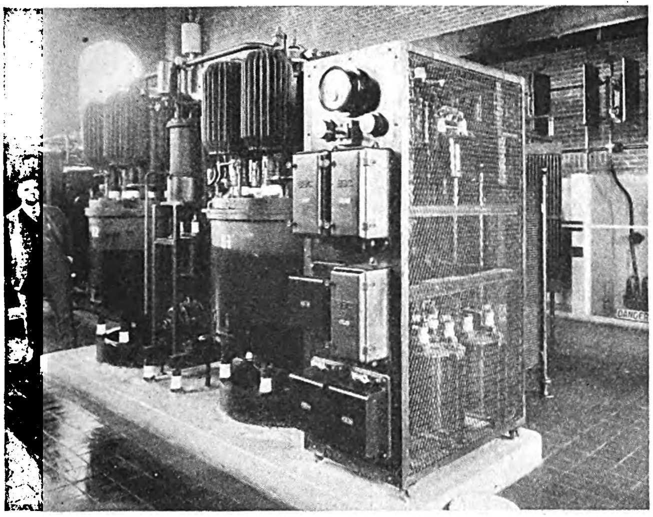
Since the casing of the rectifier is entirely of steel and the interior is not lined with insulating material the pot is at the potential of 600 volts above ground. It is therefore necessary to protect against accidental contact with the casing, which is done by the metal screens which surround the apparatus.

Successful operation of the rectifiers demands that a pressure of the order of 0.01 to 0.001 mm. of mercury be maintained. Since it has not been found practicable in commercial rectifiers to prevent small infiltration of gases it is necessary to pump them out as fast as they enter the case. For this purpose a high-vacuum mercury pump is connected in series with a rotary oil-immersed pump. The rotary pump is driven by a $\frac{1}{2}$-hp. a.c. motor and forms the only normally moving part in the entire station. Their operation is independent of the rectifiers and they will maintain the vacuum whether or not the latter are connected to the circuit.

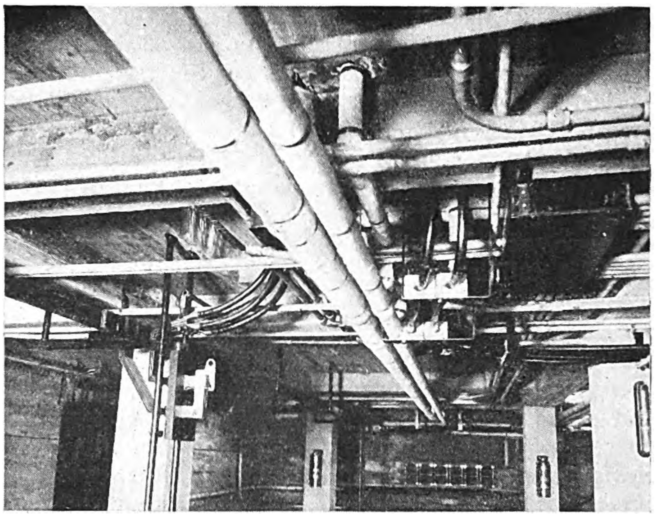
The current that may be drawn from the rectifier is determined mainly by the temperatures that may be endured by the working parts. In order to make the rating as large as practicable, the rectifiers are cooled by means of water circulated through jackets. This water, which is drawn directly from the city mains, is first passed through the cathode base, from there to the jacketing around the large cylinder and the anode plate, after which it passes to the jacket surrounding the condensing cylinder and then out to the sewer. The quantity of water required is about one-third gallon per minute per 100 amp. d.c. at an intake temperature of 15 deg. C. A small additional amount for the vacuum pump is needed. In view of the small amount of water and the desire to eliminate moving machinery wherever possible, it was decided not to attempt the use of a recooling system. It also was considered inadvisable to attempt recooling during the severe winters, as the heat loss in the station is so small that there would be insufficient protection against freezing.

CONTROL AND PROTECTIVE DEVICES

The rectifier station is cut out of circuit entirely if the current falls below a predetermined value. This value is now under process of determination so that the station will go off the line during the hours of the night when the demand is lightest. The station is cut



Near view of one of the mercury-arc rectifier units. Each of the rectifiers is rated at 600 kw., so that the set has a total capacity of 1,200 kw.



This view was taken directly beneath one of the rectifier units to show the connections and the pipes for conveying the cooling water

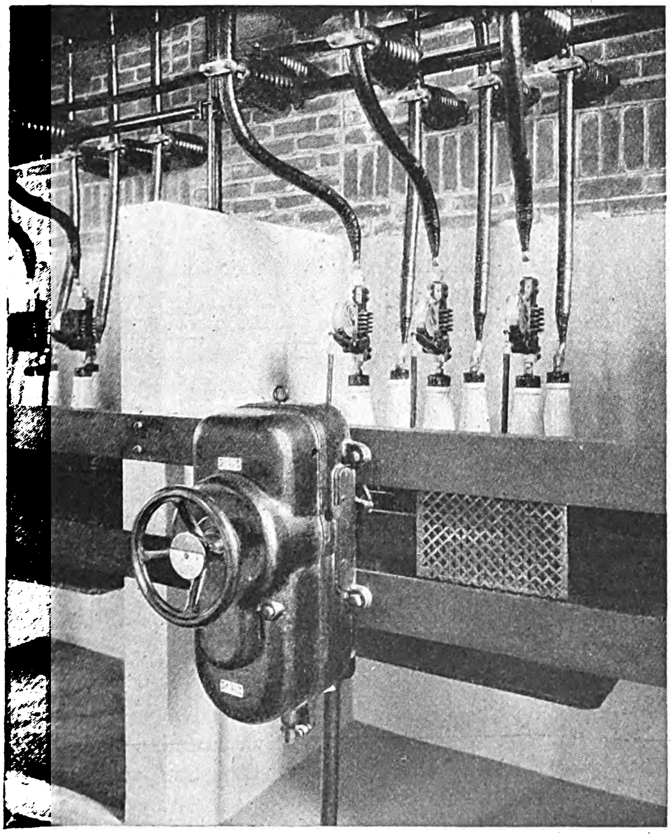
in automatically by low voltage, so that it comes on the line in the morning when the cars begin regular day service. The value for this relay setting is likewise being determined.

As the current drawn from the a.c. line passes full load on the first rectifier unit (2,000 amp.) the second unit is cut into circuit automatically. It is also possible to arrange the relays so that the second unit will be cut in and out of circuit by means of a time clock. At present the latter method is being followed.

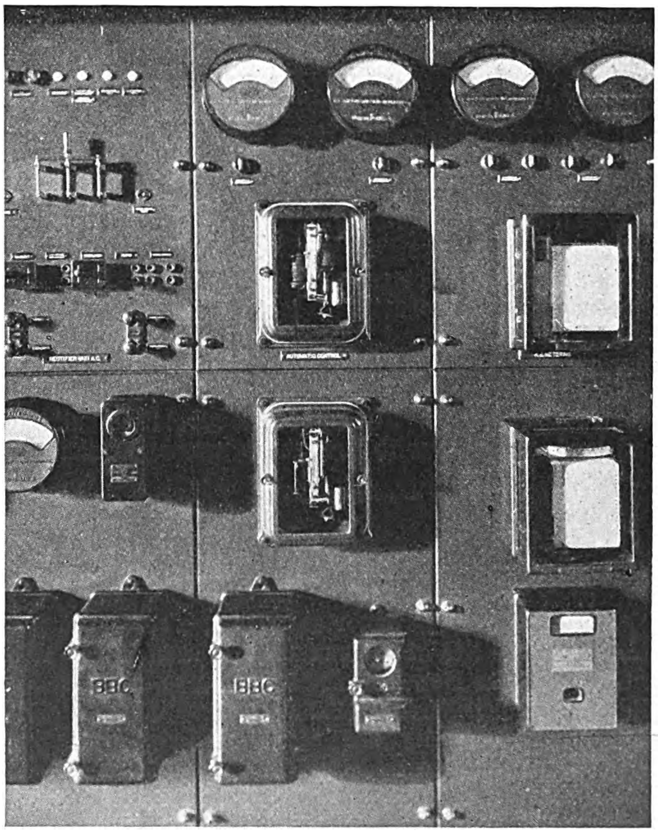
A full set of automatic devices prevent damage to the equipment if load should become excessive or if some part should fail. The action of the oil circuit breakers has already been described. If the breakers on one of the rectifier units are locked out the second group immediately will come into service. Thermal relays in the rectifiers and transformers protect against prolonged overheating. Low vacuum or failure of the cooling water supply will also automatically lock out the rectifiers.

Signal lamps on the switchboard indicate the positions of the circuit breakers. Each rectifier group has five four-point selector receptacles on the switchboard, so that the rectifiers can be started by clock, low voltage, low current or manually, as desired, depending on the position of the plug in the receptacles.

Efficiencies guaranteed for the equipment, as meas-



One of the oil circuit breakers and the alternating-current time-element relays on the incoming 12,600-volt line



The automatic control relays for the mercury-arc rectifiers are located on the main switchboard. At the right are the graphic watt-hour meters ured between the incoming 12,600-volt a.c. lines and the d.c. bus, including the transformers and all auxiliaries, were as follows: At 1¼ load, 93.5 per cent; at full load, 94 per cent; three-fourths load, 94 per cent; half load, 93.5 per cent; quarter load, 91.4 per cent. For the period between Feb. 15 and Feb. 28 the ratio of total output of the station to total input was 89.2 per cent. During this period the load factor was very low and there was relatively little time that the rectifiers were carrying full load.

PUTTING THE EQUIPMENT IN SERVICE

After the rectifiers had been installed they were operated at greatly reduced potential to dry them out and permit the vacuum to be raised to the operating maximum. This was accomplished by means of a water rheostat load of 1,000 amp. at 89 volts, which was continued for about 30 hours on each of the four rectifiers in turn. By this means the occluded gases and water vapor were driven out of the anodes.

The only difficulty of any moment that has been encountered in the operation of the station is interference with some of the telephone lines of the local system. The difficulty occurs on party lines with grounded equipment. In some instances there is a high-frequency note, which has been identified as the sixth harmonic of the alternating current wave. Through co-operation of the telephone company it is expected that the trouble will be eliminated in the near future.

A feature of operation that seems inherent during the first few months of operation of the converters is what are known technically as "backfires." While it is not possible to observe the phenomenon directly, it appears to be in the nature of a short circuit between the cathode and one or more of the anodes. When this occurs, the effect is to throw out the a.c. rectifier breaker and in some instances the incoming line breaker. This immediately extinguishes the arc and the rectifier goes back on the line within ten seconds. In no case has this momentary interruption caused any trouble. As the rectifiers remain in service these backfires are becoming less pronounced, and experience with rectifiers in other installations indicates that in the course of a few months they will disappear entirely.

The rectifying apparatus was manufactured by Brown, Boveri & Company of Baden, Switzerland, and the American Brown Boveri Company of Camden, N. J. The installation was made by Griswold & Company, Ltd., of Montreal, while the layout, general engineering and building design were carried out by the engineers of the Montreal Tramways. The cost of the substation building and land, complete with equipment, was approximately $140,000.

Data on Rochester Property Reveals Railway's Importance

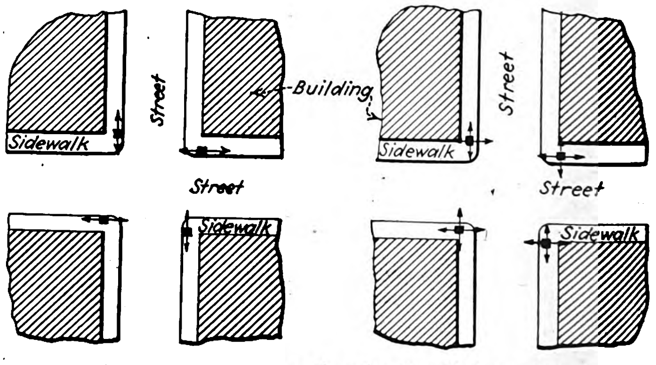
EVIDENCE of the important rôle of a railway industry in the life of a community is seen in the 1926 activities of the New York State Railways in Rochester. These lines purchased materials and supplies totaling $843,171 in the city and paid the following taxes: $43,729 on real estate, $143,980 on special franchise, $7,056 on sprinkling, $41,078 for snow removal and $166,371 for paving.

There are 1,700 employees on the Rochester lines of the New York State Railways and the payroll annually totals $2,841,840.

Chicago's Traffic Lights Shine Four Ways

FOLLOWING nearly a year's experiment with the co-ordinated lights installed in the Loop at Chicago, the city determined that better results would be possible if the signals were displayed in all four directions and the change was effected overnight late last year. As originally installed, each traffic standard was designed to exhibit signals in two directions only, as shown in the upper diagram. Pedestrians who congregated at the curb about to cross could not readily observe whether the traffic signals were green or red unless they looked diagonally across the intersection. The change effected was to install additional sets of lamps on the heretofore blank sides of the signal units so that now the signal is exhibited from all four sides of each standard. This has been found an improvement, principally in the aid of pedestrian traffic at the intersections. At present there is no ordinance in Chicago compelling pedestrian observance of traffic signals. Traffic police are urging observance, however.

Typical signal light standard in Chicago Loop as it now appears changed to shine in four directions



Typical street intersection in the Chicago Loop

The view at left shows the location and direction in which the signals were exhibited in the original installation. The view at right shows the situation after the change made by adding lights so that the signals would be shown in all four directions, chiefly to aid pedestrian traffic.

The lamp pedestals were made in standard units so that by removing blank plates on the sides and substituting reflectors, lamps and hoods the new lamps were readily installed.

An article on the co-ordinated lights in the Chicago Loop district appeared in the March 27, 1926, issue of the JOURNAL.

Base Plate Joint Developed by Eastern Massachusetts Street Railway

By Frank B. Walker
**Chief Engineer Eastern Massachusetts Street Railway,
Boston, Mass.**

Some of the special welded rail joints made by the Eastern Massachusetts Street Railway and tested in the Riehle machine at the Massachusetts Institute of Technology

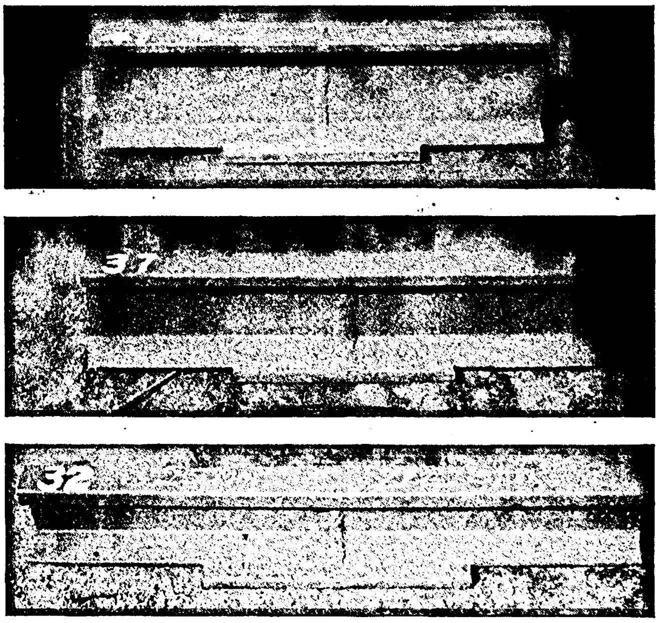
Bending tests show average strength to be approximately equal to or greater than that of fish plate joint. Internal stresses due to heat are eliminated. Cost greatly reduced. Repair of broken rails simplified

EXPERIMENTS recently made by the Eastern Massachusetts Street Railway lead us to believe that a simple rail joint using only a single welded base plate can be built adequately strong at about one-half the cost of a fish plate joint. During the course of our experiments we have welded and broken in a testing machine a large number of joints of various designs. Data from these tests are presented in this article for constructive criticism and in the hope of encouraging experimentation by others. We realize, of course, that the relative durability of the new and old joints can be determined only after actual installation in track, but we feel that the new type has great possibilities.

Undue importance frequently has been attached to strength in a welded rail joint. Nevertheless, strength tests are the only quick means of comparing different types of joints. We know that fish plate joints for 9-in. grooved girder rail, 7-in. high tee rail and 75-lb. low tie rail are strong enough. We have over 110,000 of these joints in our tracks, and since 1921 we have had a breakage of less than one joint per 1,000 per year on the 9-in. and 7-in. rail. In bending tests with 30-in. span, our welded fish plate joints on 75-lb. rail carried an average of 80,600 lb. Among the many joints of this type on our property failures have been extremely rare. Even the weaker joints on old 48-lb., 56-lb. and 60-lb. rails have given us very little trouble. The yearly rate of failures of all standard fish plate joints in service has been about three-tenths of 1 per cent. Each year's record has been better than that of the preceding year. We believe, therefore, that the strength developed by the present joints may be considered sufficient.

Although strong enough, the present joints do not make efficient use of the available metal. Wheel loads on a suspended rail joint cause compression in the head and tension in the base. Wheel loads on a supported joint cause tension in the head and compression in the base. In either type there is little stress in the web. The metal in the fish plates, therefore, is poorly placed to do its work efficiently. As we nearly always suspend our joints between ties, a welded base plate provides metal where it will carry the tension most efficiently.

The use of base plates in addition to fish plates in welding joints is common practice. We have used them from time to time on our system, but we never con-



Base plate joints developed by Eastern Massachusetts Street Railway

At top, 9-in. grooved girder rail with 1-in. x 7-in. x 16-in. plate.
In center, 7-in. tee rail with 1-in. x 7-in. x 16-in. plate.
At bottom, 75-lb. tee rail with $\frac{7}{8}$-in. x 7-in. x 16-in. plate.

GENERAL SUMMARY OF BENDING TESTS

Rail	Load at Yield, Pounds Fish Plate Joint	 16-In. Base Plate Joint	 36-In. Base Plate
9-in. grooved girder...	266,300	246,500	....
7-in. high tee........	163,750	177,750	307,750
75-lb. tee............	80,600	110,000	135,500

length eliminates two tie plates. Rail heads are kept in contact to provide for compression. Together, the beading and the base plate take the shear and tension caused by temperature changes.

BASE PLATE JOINT SHOWS STRENGTH EQUAL TO OR GREATER THAN FISH PLATE JOINT

This joint is at least equal in strength to the fish plate on 9-in. grooved girder rail and superior to it on 7-in. and lighter tee rail. Even in the event of reversal of stresses, this type of joint seems strong enough, as indicated by a test wherein a load of 75,000 lb. was carried with the joint upside down. Data presented in an accompanying table and the photographs reproduced show in detail the results of our experiments. The results of the bending tests are summarized in the tables on this page.

SUMMARY OF TESTS ON 9-IN. GIRDER RAIL

Standard Joint with ¾-In. × 36-In. Welding Bars; Top and Bottom Seams

Test No.	*Cost	Load in Pounds Yield Point	 At Failure	Remarks
18	$5.59	285,000	287,500	Broke through plates, at center on one side, through bolt holes on other.
19	5.75	225,000	313,000	Deflected 11/16-in. but did not break.
38	6.33	222,700	222,700	Broke plates through bolt holes.
Average....	$5.89	266,300	274,440	
Joint with 1-In. × 7-In. × 16-In. Plate Welded to Base and Web; Base of Joint Seam Welded				
11	$2.70	240,000	240,000	Broke through welding. Seams very light.
12	2.70	292,000	292,700	
20	2.30	256,800	256,800	Broke rail from joint at head to end of base plate.
41	1.20	197,100	197,100	Broke through rail outside of base plate.
Average....	$2.23	246,500	246,600	

*Costs include all labor and material except rail.

SUMMARY OF TESTS ON 7-IN. TEE RAIL

Standard Joint with ¾-In. × 26-In. Welding Bars; Tops and Bottoms Welded.

Test No.	*Cost	Load in Pounds Yield Point	 At Failure	Remarks
16	$4.12	145,000	159,000	Did not break.
17	4.12	150,000	177,000	Did not break.
34	4.18	184,800	184,800	One plate broke at joint.
35	4.21	155,200	155,200	Broke through plates at joint.
Average....	$4.15	163,750	169,000	
Joint with 1-In. × 7-In. × 16-In. Plate Welded to Base and Web; Base at Rail Welded				
14	$2.05	269,200	269,200	Broke rail from rear joint at head to near end of plate at base.
36	1.54	134,350	134,350	
37	1.93	128,100	128,100	
Average....	$1.84	177,220	177,220	
Joint with 1-In. × 7-In. × 36-In. Base Plates				
28	3.48	303,000	362,500	Defl. 1⅜ stretched plate
29	3.67	312,500	358,000	

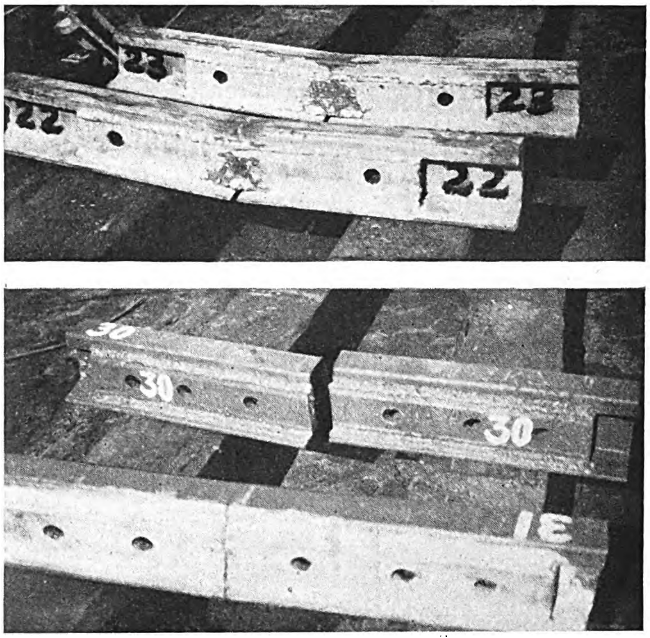
*Costs include all labor and material except rail.

SUMMARY OF TESTS ON 75-LB. RAIL

Standard Joint with ¾-In. × 24-In. Welding Bars; Top and Bottom Welded

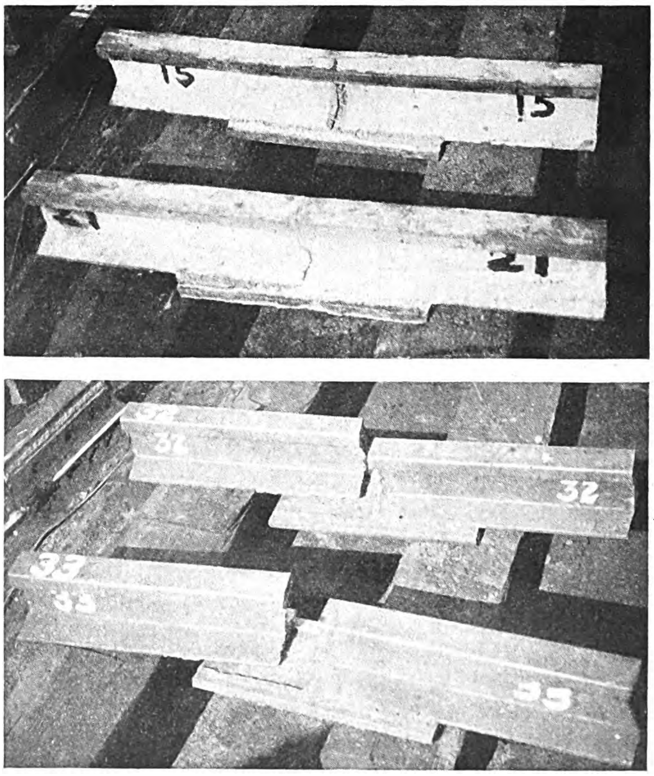
Test No.	*Cost	Load in Pounds Yield Point	 At Failure	Remarks
22	$3.11	77,600	77,600	Deflected 1-in. but did not break.
23	3.11	81,400	81,400	Did not break.
30	3.13	82,700	82,700	Broke through plates.
Average....	$3.12	80,600	80,600	
Joint with ⅞-In. × 7-In. × 16-In. Plate Welded to Base and Web; Base of Rails Welded				
15	$1.86	124,700	124,700	Cracked through welding, seams very light (single).
21	1.98	120,000	120,400	
32	1.49	99,000	99,500	
33	1.94	96,000	97,900	
Average....	$1.82	110,000	110,600	

*Costs include all labor and material except rail.



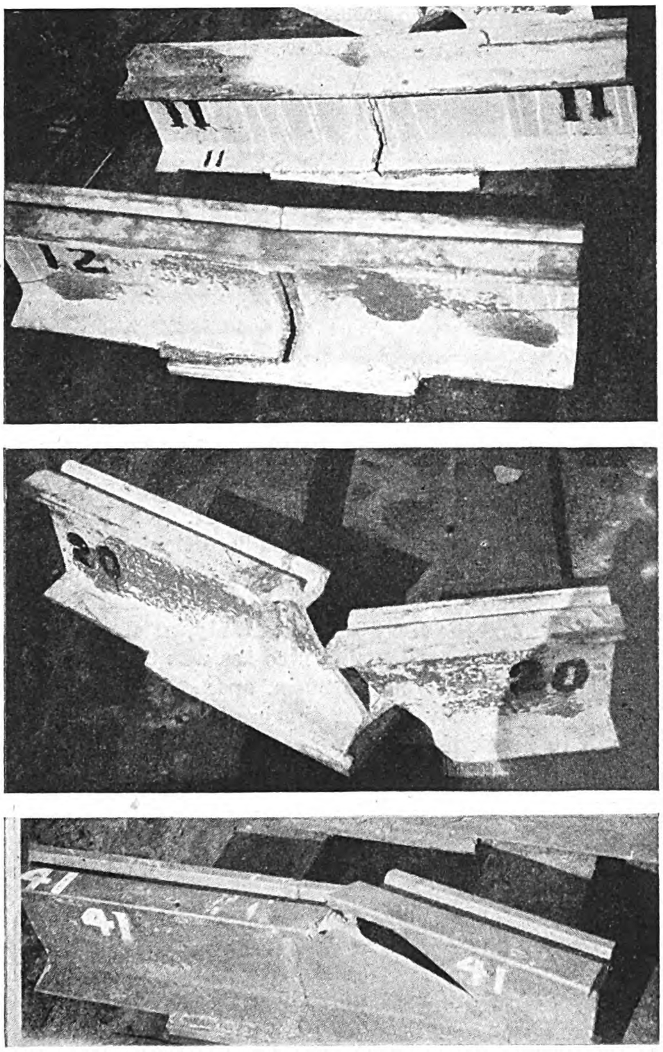
Standard joints Nos. 22, 23 and 30 with ¾-in. x 20-in. fish plates on 75-lb. tee rail failed at an average load of 80,600 lb.

The bending tests were made at the Massachusetts Institute of Technology by Prof. H. W. Hayward and the writer on the 400,000-lb. Riehle machine. While in some instances the distance between supports was 20 in. and in others 30 in., the data included in this article are for the 30-in. span only, as it appeared that the influence of shearing stresses was too great for satisfactory results on the 20-in. span. Tests on this span, however, showed that the base plate was strong enough to break the rail.



Joints Nos. 15, 21, 32 and 33 with ⅞-in. x 7-in. x 16-in. base plate on 75-lb. tee rail failed at an average load of 110,600 lb.

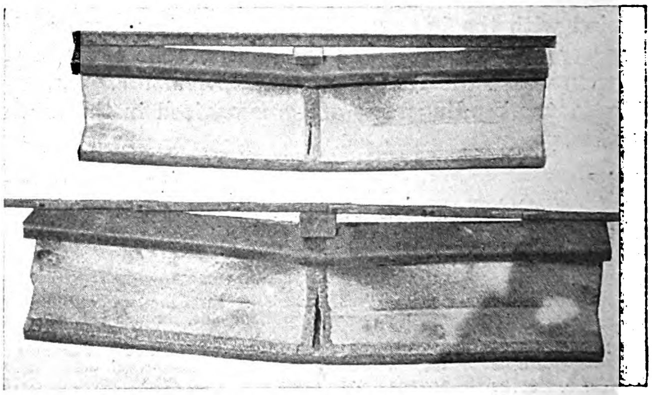
Our series of test joints were made with three types of rail, 9-in. girder section 104-401, 7-in. high T-section 91-282 and 75-lb. T-section A.S.C.E. Welding was done by this company with the metallic arc, using a $\frac{5}{32}$-in. rod and by the Thomson Research Laboratory of the General Electric Company with the hydrogen or shielded arc. Eight kinds of joints were made: (1) Rails V'd out and welded together without plates; (2) with fish plates only; (3) with 6-in. x 6-in. x $\frac{3}{4}$-in. base plate only; (4) with 7$\frac{1}{2}$-in. x 10-in. x $\frac{3}{4}$-in. base plate only; (5) with 7-in. x 16-in. x $\frac{3}{4}$-in. base plate only; (6) with 7-in. x 16-in. x $\frac{7}{8}$-in. base plate only; (7) with 7-in. x 16-in. x 1-in. base plate only; (8) with 7-in. x 36-in. x 1-in. base plate only. No pressure was put upon the rails before or during the welding to bring the heads under compression. The short sections of rails were simply laid together on ties and the plates welded in the usual way, on alternate sides to relieve stresses.



Joints Nos. 11, 12, 20 and 41 with 1-in. x 7-in. x 16-in. base plate on 9-in. grooved girder rail failed at an average load of 246,600 lb.

Two joints on 7-in. tee rail with 7-in. x 36-in. x 1-in. base plates were tested. The first had a yield load of 312,000 lb. and carried a maximum load of 358,000 lb. The second had a yield load of 303,000 lb. and a maximum load of 362,000 lb. These loads are almost double those carried by the fish plate joints and the 16-in. base plate type. The results of these two tests lead us to believe that a 7-in. x 28-in. x $\frac{3}{4}$-in. base plate joint will have adequate strength for all practical purposes. We are proceeding with the installation of this type joint in our track.

Some of these joints were made with single and some with double beads. The work was done at two locations by different welders. This variation was intentional in order to secure a wider range of data. Some were made with good and some with poor head contact. Welding was carelessly done on a number of joints. Some joints were made with head welds and in others the webs of the flanges were welded together. For example, one had no welding on the web and was so cut that the rails were separated about $\frac{1}{4}$ in. The head was sawed at a slight angle so that there was only a partial contact. Others had no head contact when welded, but the head gap was later filled in with thin steel inserts.



Two joints on 7-in. tee rail with 7-in. x 28-in. x $\frac{3}{4}$-in. base plates carried maximum loads of approximately 360,000 lb.

It will be noted that in the tests on the standard fish plate type of joint there were no rail failures, whereas on the base plate type a number of the rails failed. Failure of the rail itself shows that it is weaker than the joint and therefore the rail failures with base plate joints indicate that these joints are stronger than the fish plate joints which did not cause rail failure. As a result of observing the actual tests and the character of the failures, we believe that they were tension failures due to bending, although there may have been a combination of bending and shearing.

Our experiments lead us to the conclusion that the base plate joint has great possibilities. In addition to the advantage of low cost, it has the added virtue of eliminating internal stresses due to heat, a serious fault in the welded fish plate joint. Moreover, as a result of our tests information has been secured which will enable us to repair broken rails with greater confidence than was possible heretofore.

Suggests Eliminating Parking in Downtown Grand Rapids

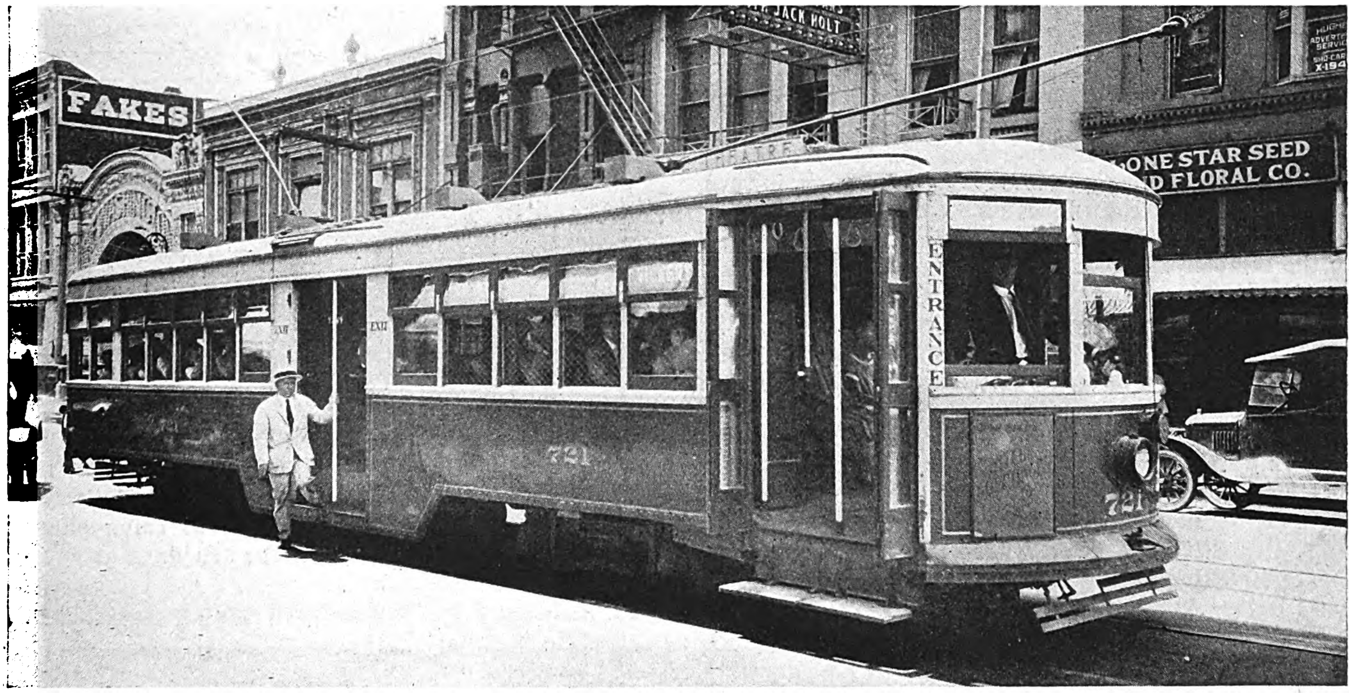
GRAND RAPIDS, Mich., is considering its traffic congestion problems and the important factor of parking in the downtown district. Much research has been carried on in safety and traffic circles regarding the solution of the problem and Safety Director Sinke is studying the theory of Fred M. Deane, a business man of the city. Mr. Deane's decision is based on the belief that 75 per cent of the automobiles parked downtown are not needed during the business day and deprive others of valuable space in the crowded area.

Making Partners of Our Customers

The Dallas Railway & Terminal Company has sold 7,604 shares of 7 per cent preferred stock to 1,996 car riders and employees. About 98 per cent of the regular employees bought stock

By Richard Meriwether

Vice-President and General Manager Dallas Railway & Terminal Company
Dallas, Tex.



New cars of the type illustrated were placed in service at the start of the campaign, 30 cars costing $15,500 each being received in the fall of 1926

One of the outstanding papers presented at the convention of the Southwestern Public Service Association held at New Orleans this week was Mr. Meriwether's story of the enrollment of citizens of his city as stockholders in the local railway company. His paper, of which this article is an abstract, tells of the methods used in this successful campaign for customer ownership.

CUSTOMER ownership of public utilities has had an amazing impetus in the past ten years. During 1926 more than $350,000 of new money for capital investment by the utilities was secured through the sale of preferred stock to customers. Customer ownership increased from 4,044 new customer-owners added in 1914 to 300,000 added in 1925. From statistics I have been able to gather the number added in 1926 was approximately 400,000.

Utility stocks sold to customers are becoming more and more widely distributed. Each new stockholder in 1924 purchased an average of 22.8 shares. In 1924 the average was 8.3 shares. In other words, the stock is now being sold in small lots to a greater number of customers. At the beginning of 1927 approximately 8,000,000 customers of public utilities in the United States owned their securities. This applies, however, in only a very limited sense to the stock of companies engaged solely in the operation of street railways, very few of them having sold stock to their customers.

The situation with reference to street railways is not due to apathy on the part of the management of such companies, but since the World War the rates which have been in effect have very generally been inadequate and, consequently, the net earnings have been such that street railway securities have not been attractive investment. However, in recent years the financial condition and earnings of a limited number of street railways have been such that a few companies have been able to offer their stock to their customers.

The Dallas Railway & Terminal Company is one of the companies operating solely a street railway system which has offered its stock to its customers. During the fall of 1926 this company, after having revamped its financial structure, offered a block of its 7 per cent cumulative preferred stock to its patrons and employees in Dallas. The stock selling campaign, extending over a period of more than 3½ months, was eminently successful. During this time 953 employees purchased

1,779 shares and 1,043 customers purchased 5,825 shares, or a total of 7,604 shares to 1,996 stockholders. About 98 per cent of the regular employees of the company purchased stock.

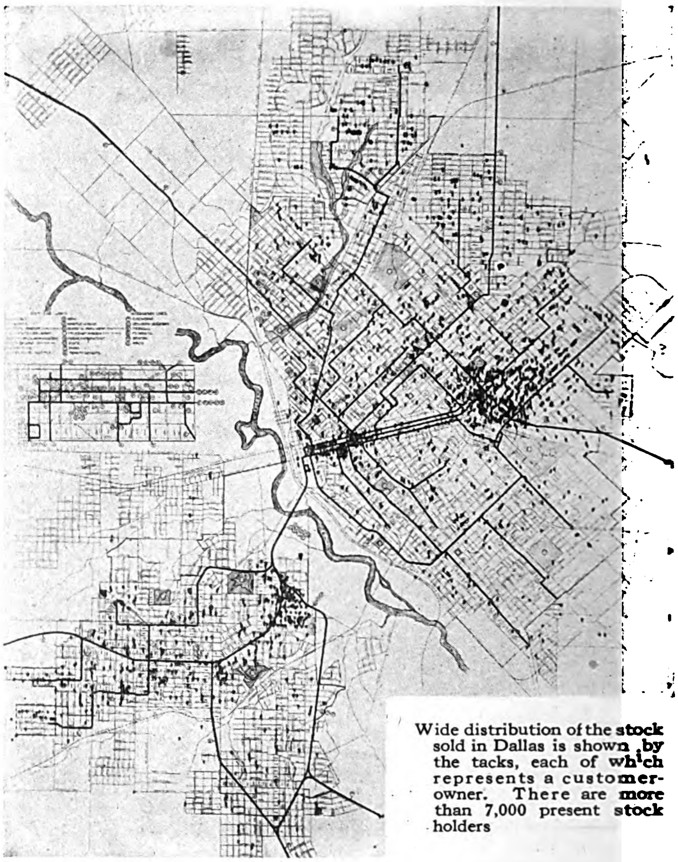
The stock is a 7 per cent preferred stock, selling at $98 and accrued dividend. It could be purchased either for cash or on a monthly payment plan at $10 per share down and $10 per month per share until paid out. Employees selling the stock were allowed a commission of $3 for the first share sold for cash to any one customer and 50 cents per share for additional shares sold to the same customer. On the time-payment plan they were allowed $2 for the first share and 50 cents per share for additional shares sold to the same customer. The commission on the time-payment plan was due only after 40 per cent of the payment had been made by the customer.

ENTIRE CAMPAIGN HANDLED BY COMPANY'S OPERATING ORGANIZATION

The campaign was carried on entirely by the operating organization, under the direction of the company's executives. First, the department heads were called together and the plan explained in detail. They, in turn, held meetings of the employees in their respective departments, at which complete information with respect to the company, in printed pamphlets, and helpful suggestions as to selling the stock were furnished the employees. The employees were encouraged to buy the stock themselves, as well as to try to sell it to their neighbors, friends and acquaintances and all those with whom they came in contact.

Six of our street cars were painted white, and the following inscriptions in black appeared at different locations on the cars:

"Invest in Our Preferred Stock.
"It Pays Over 7 Per Cent.
"It's Safe.
"Ask Any of Our Employees."



Wide distribution of the stock sold in Dallas is shown by the tacks, each of which represents a customer-owner. There are more than 7,000 present stock holders

These white cars were placed in regular service the morning our campaign opened and served as a startling announcement to the public that the Dallas Railway & Terminal Company preferred stock was being offered to them. These cars were run for ten days after the opening of the campaign.

In addition, two double-faced posters, carrying a

SAFETY
STATE
ASK ANY OF OUR EMPLOYEES
IT'S SAFE
INVEST IN OUR PREFERRED STOCK
IT PAYS OVER 7%
IT'S SAFE

Six of the Dallas cars were painted white as moving billboards announcing the stock-selling compaign. These cars were run on all routes of the system for ten days at the beginning of the drive

In his paper MR. MERIWETHER *gave the advantages to investor and management of customer ownership. Briefly stated, these are:*

Advantages to the Investor

1 The small investor having only a few hundred dollars is just as welcome a stockholder as the man with thousands. Facilities are accorded for partial payments, so in time a fair-sized investment may be made without a heavy burden on the man of moderate means.

2 The customer-owner invests in something he can see from day to day. Knowing how his money is being spent, he has a feeling of security greater than if the property were not under his personal observation.

3 Since the utilities are usually subject to public supervision there is little chance that the investor stands to lose on account of improper handling of the funds or manipulation of the stock.

4 The business being a public necessity its earnings are fairly consistent throughout the year. This reduces the possibility of failure to pay dividends at regular intervals.

5 The stock of the utility is well known in the community and is readily accepted by banks as collateral, or can be sold readily.

Advantages to the Management

1 Customers becoming part owners of the utility take a greater interest in its affairs and problems. Being better informed they are more inclined to be sympathetic and helpful when adverse conditions arise affecting their company, whether due to unjust treatment through political activities, inadequacy of rates, or any other situation which unfavorably affects the progress and prosperity of the utility.

2 Customer-ownership campaigns always result in enrollment of a large number of employees as investors. This lessons likelihood of labor troubles, as employees will inform themselves of the company's problems and be less inclined to make unreasonable demands. Greater loyalty is induced by the participation in the profits of the company through the medium of dividends.

3 The general public benefits because dividends will usually be spent or invested in the locality where they are earned, thus adding to the local wealth.

4 Wide distribution of the securities of a public utility in the community it serves is a potent safeguard against municipal or goverment ownership agitation.

message to the public, were pasted on the windows of each car in service. During the progress of the campaign these posters were changed from time to time. Car cards on the inside of each car asked the public to buy the preferred stock from the motormen and conductors.

Looking east on Main Street from Field. The lines of the Dallas company come into the business district through this crevasse in the Texas city's wall of skyscrapers

Just prior to the opening of the campaign a four-page circular, announcing the sale of the stock, was mailed to a large selected list of possible investors. On the day the campaign opened full page ads, announcing the first sale of the company's stock to the public, were run in all the daily newspapers. Newspaper advertising was used regularly throughout the period of the campaign.

Weekly meetings of the employees of each department, at which stock-selling ideas were exchanged, and the progress of the campaign reported, served to keep up the "pep" and enthusiasm of the employee-salesmen. The campaign developed an interest among the employees in the company's affairs that could hardly have been accomplished in any other way; and the time-payment plan has encouraged many employees to save who heretofore had squandered much of their surplus.

With its patrons and the public generally, the selling of its stock locally has established the company as a home institution in the community, and it occupies a position of high regard and favor.

Special Committee Works Toward Uniform Traffic Signs

LEON R. BROWN, safety director of the New York State Railways, Rochester lines, is head of a special committee of the Rochester Engineering Society which will work with the American Engineering Council in establishing a uniform system of traffic signs, signals and markings in Rochester. The committee is making a survey, the results of which will be sent to the national council. The Rochester Safety Council and the Automobile Club of Rochester also are co-operating in the enterprise.

350,000,000 Passengers a Year

Transit Commission Presents Figures of Traffic Carried Into and Out of New York City in 1926 by the Railroads and Ferries

RAILROADS and local ferries carried 350,000,498 passengers into and out of New York during the calendar year 1926, according to figures just compiled by the Transit Commission. As this figure represents two-way traffic, the actual number of passengers was 175,000,249. Counting a year as 340 full traffic days, 514,556 passengers of all sorts daily used the railroads and ferries for round trips to and from New York, of whom 385,253 may be classified as commuters. The difference between the two figures, or 129,303, probably in a measure represents the figure of the average daily number of visitors to New York City.

The figures compiled by the Transit Commission were furnished by the railroad and ferry companies in connection with investigations and studies undertaken by the commission concerning the local commutation problem. For the most part, they are based upon actual counts made by the railroads. They bear particularly upon the commuting problem, which has grown rapidly within recent years.

The figures show that the trunk railroads entering New York or approaching on the New Jersey side in 1926 carried a both-way passenger traffic of 248,138,573 passengers, including commuters, as against 241,900,498 in 1925. In 1926 most of the railroads included in the list showed an increase. Commutation traffic increased decidedly in the year. In addition to the above total of steam railroad passengers carried into and out of the city for 1926 there were approximately 51,894,146 local or rapid transit passengers carried on the lines of the Hudson & Manhattan Railroad and 49,967,779 passengers entering and leaving the city during 1926 on the several ferries, excluding the ferries between boroughs and excluding the railroad passengers using railroad ferries. The inclusion of the Hudson & Manhattan and the local ferry figures gives a total traffic into and out of New York by railroads and ferries of 350,000,498. The steam railroad commuters numbered 160,110,648, and with the Hudson & Manhattan and local ferry traffic, both of which are practically entirely commuting in character, made a net grand total of railroad and ferry commuters of 261,972,573.

The following tabulation represents a comparison of traffic upon trunk line railroads to and from New York in the years 1925 and 1926:

	1925	1926
Baltimore & Ohio	575,000	500,000
Central of New Jersey	15,935,303	16,137,473
Delaware, Lackawanna & Western	22,465,970	22,398,500
Erie	32,293,140	31,719,290
Lehigh Valley	933,153	719,004
Long Island	67,128,993	70,744,844
New Haven	18,717,587	18,180,068
New York Central	35,392,861	37,876,232
New York, Ontario & Western	549,804	532,621
New York, Westchester & Boston	6,628,298	7,390,724
Pennsylvania	41,280,389	41,939,817
	241,900,498	248,138,573

The Hudson & Manhattan Railroad carried a total of 107,054,102 passengers during 1926, of which 70,649,035 were to and from the Cortlandt Street terminal and 36,405,067 were to and from the several uptown stations of this system. This was all exclusive of traffic which began and ended solely in New Jersey or in New York. The traffic to and from the St. George terminal of the Staten Island Rapid Transit lines is also not included.

The following table shows railroad traffic in 1926 upon the various systems:

TABULATION OF STEAM RAILROAD TRAFFIC TO AND FROM NEW YORK FOR THE YEAR 1926

	Commuter, Zone and Family Trip	Other Traffic	Total Traffic
Baltimore & Ohio		500,000	500,000
Central Railroad of New Jersey	12,667,916	3,469,557	16,137,473
Delaware, Lackawanna & Western	16,572,762	5,825,738	22,398,500
Erie	28,811,700	2,907,590	31,719,290
Lehigh Valley			
Pennsylvania Station	59,142	433,074	492,216
Jersey City	159,342	67,446	226,788
Total—Lehigh Valley	218,484	500,520	719,004
Long Island			
Flatbush Avenue	17,325,000	10,444,302	27,769,302
Pennsylvania Station	30,348,000	11,852,133	42,200,133
Long Island City	500,000	225,409	775,409
Total—Long Island	48,223,000	22,521,844	70,744,844
New York Central			
Main Line*	8,415,889	5,084,041	13,499,930
Harlem Division*	12,070,425	2,558,952	14,629,377
Putnam Division†	742,786	170,067	912,853
West Shore‡	7,645,411	1,188,661	8,834,072
Total—New York Central	28,874,511	9,001,721	37,876,232
New York, New Haven & Hartford			
Grand Central	9,293,441	8,203,898	17,497,339
Pennsylvania Station		644,728	644,728

Jersey City	2,743,554	1,077,552	3,821,106
(*a*) Via Hudson & Manhattan	9,640,069	16,906,766	26,546,835
Total—Pennsylvania	12,783,024	29,156,793	41,939,817
Grand total all lines	160,110,648	88,027,925	248,138,573
(*b*) Hudson & Manhattan			
Cortlandt Street		70,649,035	70,649,035
Uptown stations		36,405,067	36,405,067
Total Hudson & Manhattan		107,054,102	107,054,102
(*c*) Staten Island Rapid Transit Railway	4,144,672	8,855,639	13,000,311

(*a*) This traffic is included in the Hudson & Manhattan total.
(*b*) Exclusive of intrastate traffic in New York and New Jersey.
(*c*) Traffic almost wholly within New York City.
* Includes 125th Street. † Via Sedgwick Avenue. ‡ Via West Shore Ferry.

The Long Island's traffic into and out of the Pennsylvania Station was nearly four times as great as the Pennsylvania Railroad's own traffic to and from that station.

The following table presents graphically the traffic at the principal railroad terminals in 1925 and 1926:

	1925	1926
Grand Central		
New York Central Railroad	23,955,800	26,164,717
New York, New Haven & Hartford	18,028,176	17,497,339
Total Grand Central	41,983,976	43,662,056
125th Street		
New York Central	1,840,276	1,964,590
Pennsylvania Station		
Pennsylvania Railroad	10,787,816	11,571,876
Long Island Railroad	39,038,975	42,200,133
Lehigh Valley Railroad	633,255	492,216
New York, New Haven & Hartford	619,054	644,728
Total Pennsylvania Station	51,654,100	54,908,953
Hudson & Manhattan		
Cortlandt Street	67,005,171	70,649,035
Uptown stations	38,205,544	36,405,067
Long Island Railroad		
Flatbush Avenue station	27,212,747	27,769,302
Long Island City	877,271	775,409
Woodside	2,801,000	3,081,100
Jamaica, including Union Hall Street station	3,466,800	3,986,820
East New York	1,600,000	1,440,000
Staten Island Rapid Transit Railway		
St. George Terminal	12,443,909	13,000,311

Ferry traffic into and out of New York during 1926 showed an increase, passing the 102,000,000 mark for the first time, the total being 102,164,827, an increase of 1,377,000 over 1925. The number of local passengers was 49,967,779, while railroad ferry passengers were 52,197,048 in number.

Maintenance Notes

Street Congestion Increases Car Repairs

By F. E. Geibel
Assistant Superintendent of Equipment
Pacific Electric Railway, Los Angeles, Cal.

WITH additional traffic, the number of flat wheels on our lines has increased considerably during the last few years. A high braking per cent is desirable in order to prevent accidents. Even with brakes in good condition, much depends on the speed, condition of rails and motormen in keeping down the flat wheel expense.

Traffic congestion has also added considerably to control maintenance cost. The following of traffic necessitates throwing the controller drum on and off many more times than if the track were clear ahead. This throwing off of power is usually during the acceleration period or at slow speeds when the current is high and so the burning of contacts is increased. The braking of these high currents causes arcing at the contact tips and results in heavy renewals.

Fender expense is another item that has been increased considerably with street congestion. Frequently on our system it is found necessary to take off 50 or 60 bent fenders a day for repairs. This expense for fender repairs amounts to $15,000 a year. Another expense is that for keeping dash signs in condition. These are subject to considerable abuse and increased traffic congestion has made repairs necessary at more frequent intervals.

Street congestion also makes it necessary to clean cars at more frequent intervals. Daily cleaning is now done on our system at many points. The general cleaning consists of a thorough washing, both inside and out, at which time trucks and equipment underneath the car are sprayed with paint.

> *A car clean a day will keep the health officer away.*

Chart Shows Progress of Paint Shop Work

JUST how many cars are in the Waterbury paint shop of the Connecticut Company, what cars they are, and the length of time they have been there, can be told by a glance at a chart hanging on the wall of the office of W. S. Dixon, division master mechanic. For this purpose a large sheet of cross-section paper is used. Each vertical column represents a day, and each horizontal line a car. Series numbers of cars are listed at the left. When a car enters the paint shop a heavy red line is drawn across the column for that day, opposite the number of the car. This line is continued day by day as long as the car remains in the shop. When it leaves, the line is terminated. Bus painting is charted in the same way as car painting, on the same sheet. Notations are made to account for any unusual lapse of time while a vehicle is in the paint shop. When a number of weeks have passed and the lines on the chart have become distant from the car numbers at the left-hand edge, a new column is begun in the middle of the sheet. This chart not only shows

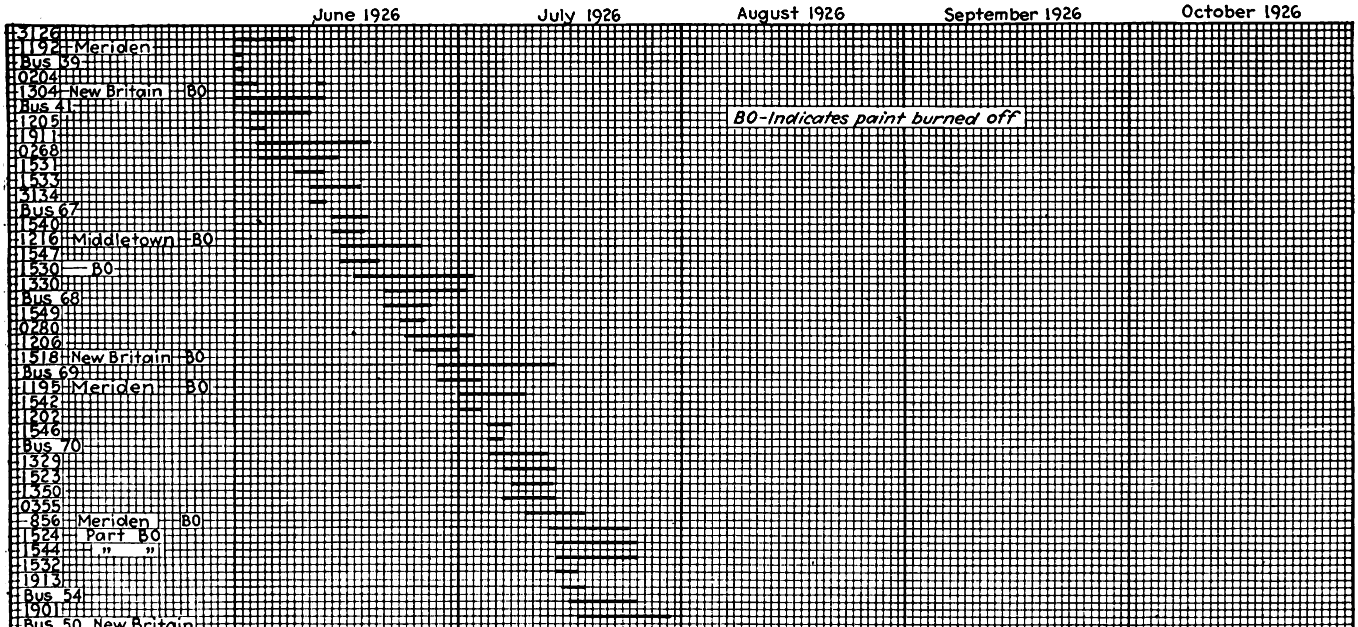

Chart showing day by day the cars and buses in the paint shop of the Connecticut Company at Waterbury existing conditions in the paint shop, but serves also as a permanent record of the work done.

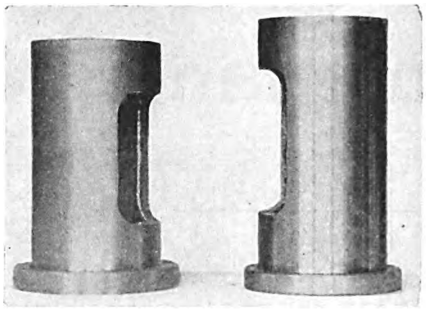
Smooth Surfaces an Aid to Tight Bearings

By John S. Dean
Renewal Parts Engineer Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.

Quite commonly loose armature bearings in service turn and shut off the oil feed. Operators seem to depend entirely upon the keys or dowels to keep bearings from turning and do not give sufficient attention to the pressed fit that is desirable when a bearing is placed in its housing. There are a number of reasons why these bearings lose their fit in the housing, but the principal one is that a smooth-fitting surface is not provided when the bearings and housing are first machined for installation.

The importance of machining the outside of bearing shells and in the inside bore of the bearing seat in the housing so as to provide a fine, smooth finish cannot be emphasized too strongly. This is essential to get a tight fit of the bearing and to provide the proper initial allowance which will permit of frequent removal of the bearing shells for rebabbitting and reinstallation. With a smooth machined surface, a good metal-to-metal fit and a large contact area will be obtained.



Of two bronze bearings with $\frac{1}{16}$-in. lining of babbitt for a railway motor the one on the left with a poorly machined surface will not maintain a good fit, while that on the right with polished surface will remain tight in the shell

If the surfaces are left rough for the press fit the bearing shell may be tight when first assembled, but after it has been pressed out for repairs the high spots will be sheared or torn off and the allowance for press fit will be destroyed. Then when the bearing is replaced in its housing a loose bearing shell will result. The accompanying illustration shows two bearings. The one on the left has a rough finish and is an improper job of machining. The one on the right has a relatively fine finish with a smooth polish.

Experience with wheels and gears has shown that if the finished surface of the bore is machined smooth, when they are pressed on car axles no keys are needed to keep them from turning. In order to provide the smooth surface desirable many railways grind the gear and wheel seats in order to get a good tight dependable press fit.

It is the practice of manufacturers

An Opportunity to Serve and Profit

First Prize, $200 **Second Prize, $100**
Third Prize, $50 **Twelve Monthly Prizes, $25 each**

Enter the Electric Railway Journal contest at once. Send in as many of your maintenance ideas as you like. The Journal will pay $5 for each item published, whether it wins a prize or not.

Any employee of an operating electric railway or electric railway bus subsidiary may compete for the prizes to be given by Electric Railway Journal for short maintenance items. Full information is given in the April 16, 1927, issue, pages 700-701.

The author does not necessarily have to be the originator of the idea or device. An article may be submitted by several persons or by a department and need not be written by the person in whose name it is submitted.

Articles may treat of any maintenance practice or device used by any department of an electric railway and should be preferably 100 to 200 words in length and accompanied by one illustration. Brevity consistent with a proper presentation of information will be given weight in judging articles. In no event should they be longer than 400 words with more than two illustrations.

Manuscripts should be mailed to the editor of Electric Railway Journal, Tenth Avenue at 36th Street, New York, N. Y. To be eligible for the capital prizes, the envelope must bear a postmark dated before Aug. 1, 1927.

In addition, a prize of $25 each will be awarded each month, beginning with the May 21, 1927, issue. Articles submitted will be published in the Maintenance Data Section of Electric Railway Journal.

If sketches accompany the manuscripts they may be in pencil, or blueprints will be accepted. Each item submitted should bear the name or names of the individual or individuals by whom it is submitted and to whom awards are to be made.

The announcement of the winner each month will be made in the issue devoted to maintenance and construction, the third issue of each month, following the one containing the item.

The winners of the capital prizes will be announced in the Annual Convention Number of Electric Railway Journal, to be published in September, 1927.

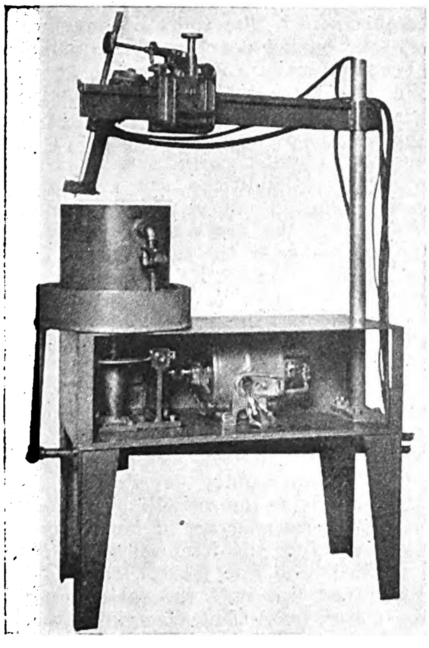
Maintenance men, here is your opportunity! The more items you send in the more chances you have of winning a capital or monthly prize. Get started at once. Articles published in the Maintenance and Construction Issue for May will have the first chance to win one of these prizes.

of modern railway motors to machine to a smooth finish the outside of bearing shells and the bores for the bearing seat in the housings. This practice should also be followed by the railways themselves for any work of this nature which they do, as it is essential to secure the maximum metal contact and so retain a good press fit in assembly.

New Equipment Available

Machine-Driven Arc Welder

RAPID extension of the field of usefulness of electric arc welding has induced manufacturers of this type of equipment to bring out many new and interesting welding machines. The accompanying illustration shows a new carbon arc welding machine built by the Lincoln Electric Company, Cleveland, Ohio, which is cooled by water circulating in tubs around the revolving table. The machine will weld circular seams with diameters up to 12 in. The piece on which the welding is done may be partially or totally immersed in water during the welding operation.



Carbon arc welder has cooling tubs around the welding work

The cooling arrangement used was developed to meet the requirements when welding high grade alloy steels on which the heat disturbance due to the welding must be reduced to a minimum. For 12 per cent manganese steel the welding may be done with the piece totally immersed in water and the arc submerged. This cooling arrangement is well adapted to the welding of manganese steel, since the rapid quenching of the molten metal gives it the physical properties expected in 12 per cent manganese steel. The frame and details of the machine are all made of welded steel.

Many Improvements in Small Milling Machine

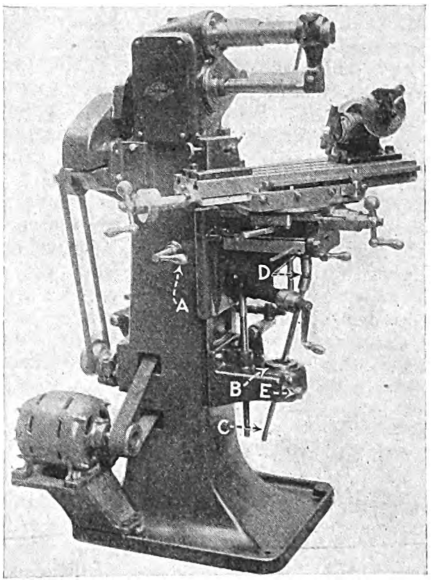
INCORPORATING many novel features, the Artisan Manufacturing Company, Cincinnati, Ohio, has recently placed on the market a small universal milling machine, with a table travel of 14 in., cross-travel of 5 in. and knee elevation of 11 in.

The machine, as shown in the illustration, has a self-contained countershaft mounted on the right-hand side provided with single friction pulley, which also serves as a brake. When belt-driven, power is transmitted directly to the friction pulley from the drive pulley on the line-shaft, and a ½-hp. motor is mounted on a housed bracket bolted to the friction clutch pulley. Handle *A* controls the friction and brake, thus enabling the operator instantly to start and stop the spindle from his regular position.

A three-step cone pulley carrying a 1¼-in. belt is attached to the countershaft and transmits its power to another cone pulley on a jackshaft which rotates more than twice as fast as the spindle. This jackshaft is offset from the spindle and runs in bronze bearings. Its speed produces a high drive-belt velocity and gives the spindle more than double the amount of torque obtained by mounting the pulley directly upon it. A sliding backgear, intermediate of the jackshaft and spindle, provides six spindle speeds.

The spindle has tapered bearings and the spindle nose is threaded. A feed gear in the rear end of the spindle operates through a reverse plate, thus providing power feed to the table in either direction. The reverse plate has gear changes which, with the three-step cone feed pulley, permit of six feeds. The feed belt drives a lower feed cone which is swung in a bracket for taking up belt slack. This lower feed cone drives shaft *E*, which passes through the column and carries a steel worm which engages worm-wheel *B*, through which passes feed shaft *C*. Feed shaft *C* is universally driven within worm-wheel *B* and the upper half of universal joint *D* and is provided with a snap socket so that it can be attached readily for driving either the table or the cross feed. The illustration shows the cross feed in use, and an adjustable dog on the bar seen just below the saddle automatically trips this feed in either direction. The saddle is square-gibbed with narrow guideways having a tapered gib for sidewise wear.

The table has a working surface of 6 in. x 18 in. and may be swiveled to a 45-deg. angle. The table feed shaft, seen directly back of *D*, receives power from it when attached, and an adjustable dog automatically disengages the table feed. The table feed screw is arranged to receive change gears for driving a dividing head in spiral milling, and self-locking micrometer dials, graduated in thousandths, are provided for table, saddle and knee adjustments.



No. 6 Artisan universal milling machine

The machine, without motor, weighs 650 lb. and is adapted to light toolroom work. The power cross feed makes it particularly valuable for jig boring. Regular equipment includes over-arm, ⅞ in. arbor, oil pot and necessary wrenches, but a complete line of extra attachments, such as dividing head; graduated swivel-base vise, oil pan, pump and piping, is obtainable at slight additional cost.

Association News & Discussions

Southwestern Association Meets in Historic New Orleans

President Sawyer and Managing Director Storrs of the American Association Tell How to Improve Conditions in the Electric Railway Industry

"TODAY is a different day in the electric railway industry," declared President W. H. Sawyer of the American Electric Railway Association, speaking before some 500 delegates and guests who braved threatening flood conditions to attend the joint convention of the Southwestern Public Service Association and the Southwestern Geographic Division, N.E.L.A., held at New Orleans, La., on April 26-29.

An appropriate setting for the story of today's electric railway situation was afforded by the South's picturesque Queen City, located within one of the very coils of the mighty Father of Waters, which is both the city's pride and terror. While the great river, gorged with the rainfall of 31 states, lashed at its confining levees and threatened to overwhelm man and his works, there was staged before the very eyes of the utility men a heroic struggle against the forces of destruction. Here, then, was an inspiring setting for a stirring call to action which was sounded by both President Sawyer and Managing Director Storrs in speaking before the assembled utilities regarding the electric railway industry's outlook.

CONDITIONS HAVE CHANGED, SAID PRESIDENT SAWYER

"Conditions of today are different from those under which we built and learned to operate electric railways," said President Sawyer. Under these conditions there is need for a different kind of men; for a different kind of thinking. The solution of our many problems requires experts—specialists. The methods of the past are no longer effective.

"But in the very difficulties of the job to be done lies the inspiration for us all. We have made some progress—are making progress, but we have only started. There is in the electric railway industry today an unlimited demand for skill and initiative. Are we doing the best job that can be done to meet today's changed conditions? Are we doing the best we know how to do? Are we taking advantage of the progress made by others and applying to our problems the methods which have already achieved improvement under like situations on other properties? Until we do all these things we are not doing today's electric railway job. That job requires the best that is in us. The very difficulties with which we contend afford us inspiration. In the solution of our baffling problems lies the greatest opportunity that was ever offered to the men of an industry.

"Hard luck stories have no place in the discussions of electric railway men. We make no progress in bemoaning the difficulties through which we have come or those which lie ahead. The day of consoling ourselves with hard luck stories has passed. With the coming of this new day our eyes are turned to the front and there is courage and hope in our hearts. Electric railway transportation has come through a fire of adversity which has tested the very core of the industry. Despite all of our difficulties; all of our burdens and all of the obstacles to progress which still lie in our path, one incontrovertible fact stands out above everything else. The very life and progress of modern communities depends on the provision of adequate and efficient public transportation. In the foundation-shaking test to which present transportation agencies have been subjected nothing has been found to take the place of the electrically propelled rail-borne car for moving masses of people rapidly and efficiently between their homes and their occupations.

COMING MEETINGS OF *Electric Railway and Allied Associations*

May 3-5—**United States Chamber of Commerce, annual meeting, Washington, D. C.**

May 6—**American Electric Railway Association, Metropolitan Section, Engineering Societies Building, New York City, 8 p.m.**

May 9—**National Conference on City Planning, Washington, D. C.**

May 11-12—**Central Electric Railway Master Mechanics' Association, meeting, Webster Hall Hotel, Pittsburgh, Pa., 9 a.m.**

May 18-19—**Central Electric Traffic Association, meeting, Tuller Hotel, Detroit, Mich., 9 a.m.**

May 31—June 1-2—**Canadian Electric Railway Association, annual convention, Winnipeg, Man.**

June 6-8—**American Association of Engineers, annual convention, Tulsa, Okla.**

June 19-23—**International Street and Interurban Railway Association, annual conference, Copenhagen, Denmark.**

June 24-25—**New York Electric Railway Association, annual meeting, Hotel Champlain, Bluff Point, N. Y.**

June 29-July 1—**Central Electric Railway Association, summer meeting, Book-Cadillac Hotel, Detroit, Mich.**

June 30-July 1—**Tramways and Light Railways Association, annual meeting, Bath, England.**

July 27-29—**Association of Equipment Men, Southern Properties, 12th semi-annual meeting, Atlanta, Ga.**

Oct. 3-7—**American Electric Railway Association, annual convention and exhibit, Public Auditorium, Cleveland, Ohio. Exhibits open Oct. 1 at noon.**

"Transportation is a vital community requirement. The roots of our industry are buried deep in the foundation of community prosperity and growth. We have cause to be proud of our jobs and have every reason for throwing our spirit and our energy into the work of keeping abreast with the march of progress. Conditions are changing—yes, changing, not yearly or monthly, but daily. We are public servants in the true sense of the term and by dedicating ourselves to the community's interest we aspire to that greatest of achievements—the service of mankind. The electric railway industry must and will go forward."

Utility men, power and light as well as railway, were urged by President Sawyer to take an interest in the electric railway situation because of its relation to community development and consequently to the growth of their own business. An abstract of Mr. Sawyer's address before the joint session will be published in a later issue.

In direct line with the same thought Mr. Storrs said that electric railways are becoming convinced that they cannot sell 1910 service in 1927.

"The success of the industry," he said, "depends on attracting enough additional revenue over the minimum which comes from necessity riding to put transportation on a profitable basis."

MODERNIZATION IN ALL LINES URGED BY MR. STORRS

Mr. Storrs joined with President Sawyer in urging modernization of equipment, methods and thought. He urged upon railway men their responsibility for taking the lead in the study and relief of traffic congestion. As the representative of 75 per cent of the people who use city streets he held that the transportation company must provide talent and initiative for joining with public and civic representatives in the relief of the serious situation brought about by growing traffic congestion. An abstract of Mr. Storrs' address before the joint session of the two associations will be published in a latter issue.

A tribute to the efficiency and spirit of co-operation displayed by the New Orleans Public Service Company was paid by Mayor A. J. O'Keefe of New Orleans in welcoming the utility men to the city. In responding, J. F. Owens said that the issue of the hour in American business is that of protecting private initiative by keeping government out of business. W. S. Vivian, Middle West Utilities Company, held that the Utilities should act in meeting the question of public ownership before it becomes an issue in the public mind. "After a subject of this kind becomes an issue," he pointed out, "there is a tendency to discredit what is said."

Activities of the two associations during the year were outlined by Harold E. Borton, president Southwestern Public Service Association, and H. B. Flowers, president Southwestern Division N.E.L.A. Mr. Flowers in his address also took occasion to emphasize the importance of refuting the theories of public ownership advocates and of adopting a vigorous policy of combating this threatened menace to the continued development of the Utility industry.

In the absence of Chairman W. H. Burke, Past-Chairman W. W. Holden, superintendent transportation lines, San Antonio, presided at the railway sectional meetings. The program was divided into general subjects of outstanding importance, each being covered by prepared discussions and comments from the floor. The subjects were as follows: "Telling the Transportation Story (a) To the Employee; (b) To the Public"; "Traffic Control"; "Modernization of City and Interurban Equipment." A supplementary report covering the discussion of these subjects will be published next week. A. B. Paterson, vice-president New Orleans Public Service Company, was elected chairman of the railway section for the ensuing year.

Meeting Postponed

DUE to the recent death of the president of the Pennsylvania Street Railway Association, Jilson J. Coleman, the executive committee has decided to postpone to a later date the annual meeting of the association which was planned to be held in Scranton the early part of May. The date of meeting will be decided at the next meeting of the executive committee.

H. L. Mitchell, president of the West Penn Railways, Pittsburgh, has been appointed president of the association to fill the unexpired term of Mr. Coleman.

Plans for U. S. Chamber of Commerce Meeting

FOLLOWING the usual plan, the fifteenth annual meeting of the Chamber of Commerce of the United States, to be held in Washington next week, will be divided into groups. Monday will be devoted to general sessions of the National Councilors. Tuesday there will be a general session beginning at 10 a.m. At 1 p.m. there will be a series of group luncheons with discussions on agriculture, civic development, finance, insurance and manufacturing. At 8:20 p.m. there will be a general session held jointly with the Third Pan-American Commercial Conference, at which the President of the United States will be the principal speaker.

Wednesday morning there will be a general session beginning at 9:40, devoted to business problems from the viewpoints of the various sections of the country. At 1 p.m. there will be a second set of group luncheon meetings, the topics being domestic distribution, foreign commerce, transportation and communication, and natural resources. The annual dinner will be held at 7:30 p.m. Secretary of Commerce Herbert Hoover will give the address.

Thursday morning at the concluding general session reports from the various sections will be presented, following which there will be the usual business of the session and election of officers for the ensuing year.

American Association News

Heavy Electric Traction

PROGRESS reports on the various assignments were considered at a meeting of the committee on heavy electric traction of the Engineering Association held in New York on April 28. Members present were H. F. Brown, chairman; A. H. Armstrong, J. M. Bosenbury, Morris Buck, W. L. Barclay, Jr., representing H. W. Cope, A. H. Daus, J. C. Davidson, J. H. Davis, E. P. Chase representing J. V. B. Duer, H. H. Febrey, J. O. Madison, M. W. Manz and L. S. Wells.

Standards will be reviewed by a subcommittee of which Mr. Wells is chairman. This will include catenary construction as distinguished from the lighter type used for trolley roads. It was agreed that Mr. Wells will confer with other committees also concerned in this work.

Considerable discussion occurred on the subject of track and third-rail bonds. It was proposed to send out a questionnaire to obtain information from which can be made a classification that may lead to a subsequent standard of bonds of this general type. Several suggestions were made regarding additional subjects for study by this subcommittee and it was agreed that these will be looked into for possible inclusion in the annual report.

An expression of opinion on the subject of the bibliography on heavy electric traction was considered. In a letter ballot the members were strongly in favor of obtaining the co-operation of the New York Public Library, which has made a proposal for the publication of the material without cost to the association. After considerable discussion it was voted to recommend to the executive committee that the library's proposition be accepted.

Mr. Armstrong reported for the subcommittee on branch line electrification. His sub-committee is obtaining material for a tabulation of costs of gas-electric rail cars and locomotives, which will be submitted at the next meeting of the committee.

A written report of the committee on train operation with articulated trains was presented by Mr. Daus. This shows information on the latest articulated units in the United States and abroad.

Information is being collected for the tabulation of electrified steam railroad mileage and electric locomotives by Mr. Cope's sub-committee, and it is planned to have the material in the hands of the members before the next meeting.

The next meeting of the committee is planned for the second week in June, the place to be decided on later.

Noise Reduction

SPECIAL Rolling Stock Committee No. 9 on reduction of noise in car operation held a meeting at Springfield, Mass., on April 14, 15 and 16. Reports as to future plans and progress were outlined and a test was made on the new Springfield car. Members present were H. S. Williams, chairman; C. Bethel, N. R. Brownyer, C. A. Burleson, F. L. Hinman, T. H. Minary and H. L. Rogers.

In connection with the development of the noise measuring apparatus, considerable time has been spent on development of the condenser type of sound pick-up. The construction and adjustment were of such minute proportions that the apparatus did not lend itself readily to portability. In order to overcome this it was decided to use a magnetic type of loud speaker for the pick-up. Difficulty was also experienced with the previous apparatus using the micro-ammeter and it was considered highly desirable to use a recording type instrument instead of an indicating type. The apparatus was changed to use a hook-up which permits the use of a recording voltmeter to register the amplitude of the sound vibrations.

Tests which were begun last year and considered tentatively in last year's report are to be run through to completion. It is expected that the final report will contain information on gear noise.

The committee discussed new developments which have been put forward towards the reduction of noise in car operation, the most comprehensive being the truck designs of the Springfield car and that used at Joliet, Ill. Other suggestions made were for noise reduction. These included carrying the entire motor weight on springs, use of rubber supports in which the rubber is vulcanized between two steel bushings, resilient steel wheels, development of a composition brakeshoe, bolting material to the web of wheels, and use of full elliptic springs with cast-on blocks instead of the bolted scroll ends.

The News of the Industry

Advance of 1½ Cents for Eastern Massachusetts Men

A new working agreement has been made between the public trustees and the employees of the Eastern Massachusetts Street Railway, Boston, Mass., effective on May 2 for one year, under which the employees are to receive 1½ cents an hour increase in the basic wage rate of 62½ cents.

The blue uniform men, on the other hand, agree not to ask for time and one-half for work performed on snow plows, which was awarded them last year by an arbitration board of which Judge John C. Leggat was chairman.

The 5-cent differential for one-man car operation remains the same. More than 95 per cent of the blue uniform work is performed on one-man cars.

Under the 1926 award, the blue uniform men receive 8½ hours pay for eight hours work, but now the company promises it will make as many straight eight-hour runs as practicable and reasonable and the men agree that they will operate them with no demand for pay for work not actually performed.

With the understanding that runs of eight hours and fifteen minutes will be kept down to a minimum, the men further agree to operate them without demand for time allowance.

Seniority rights for blue uniform men which continued for six months after layoff will be extended to one year. In all other essential respects the present contract is renewed.

The new agreement was reached after a series of conferences between the company's labor representative and the wage committee of the carmen's union, composed of William O. McGowan of Brockton, John F. O'Brien of Lawrence and Thomas J. Powers of Lowell and John H. Reardon of Worcester, chairman of the executive committee of the International Carmen's Union.

By referendum vote the negotiations have been approved by the local unions in Lowell, Lawrence, Haverhill, Salem, Lynn, Chelsea, Melrose, Woburn, Quincy, Weymouth, Brockton, Taunton and Fall River.

New Fare Scheduled for Kansas City

William G. Woolfolk, president of the Kansas City Public Service Company, Kansas City, Mo., on April 18 filed with the Public Service Commission application for authority to rearrange the schedule of fares charged by the railway in Kansas City, to make the schedule conform to promises in connection with the new franchise. The application asks that the commissioner authorize the new schedule so that it will become effective May 1.

The present schedule is 8 cents cash fare, two tickets for 15 cents, seven for 35 cents, with one-half of these rates for children between the ages of eight and twelve and children less than eight years old free. The new schedule as provided in the ordinance is a single cash fare for adults of 8 cents, two tickets for 15 cents, ten tickets for 70 cents or fifteen tickets for $1; children less than eight years old, free; between the ages of eight to twelve years old, 4 cents for single fares; four tickets for 15 cents; ten tickets for 35 cents and thirty tickets for $1, with two children without tickets to be carried at the price of one single cash fare for an adult.

Survey of Transportation Situation in Chicago

Prospects of Immediate Consolidation of Chicago Transit Systems Denied by Company Officials—Effect of Home Rule and Terminable Permit Uncertain

RUMORS current in the local press on April 25 that agreements had been reached between the new city administration in Chicago and local traction officials for immediate consolidation of the surface, elevated and bus lines on the basis of indeterminate franchises were later denied.

Leonard A. Busby, the Chicago City Railway president, asserted that "we have no oral agreement or understanding of any kind with any one regarding a settlement of the traction question." He said:

> We are in favor of a unification of these properties and enabling legislation which will authorize the city to grant a modern type of franchise to permit a consolidation, but so far as I know no attempt to draft or submit legislation of this kind has been made at the present session of the State Legislature.

The steady rise in prices of traction securities since the election of Mayor Thompson is probably responsible for the circulation of these misleading reports, city and company officials believe. A recent tabulation of market prices reveals that first mortgage bonds of the Chicago City Railway which sold on Feb. 1, the date of franchise expiration, at 76, and on April 6, the day after election, at 78½, are now selling at 85. Chicago Railways series A bonds in the same period have gained nearly seventeen points, or from 53¼ to 70.

Mayor Said to Desire Quick Settlement

Evidence that the new Mayor desires a quick settlement of the problem is found in his campaign addresses and subsequent statements. Although his advocacy of home rule is quite well known, at no time since the recent mayoralty contest was begun has he announced any definite or constructive transit program. In his inaugural address on April 11 the Mayor merely reiterated his campaign pledge to give his very best thought to the matter and intimated he would have something further to say in a later communication to the City Council.

In the meantime, however, the McCluggage and Durso bills, the former providing for the return of utility control from the state commission to all Illinois cities over a certain population and the other for local control in the city of Chicago, have been sent to a subcommittee by the General Assembly at Springfield after discussions lasting several months. The measures were vigorously opposed by representatives of the steam railroads and public utility companies of the state. The shelving of the two bills undoubtedly means that no further action will be taken in the matter during the present session of the Legislature. Defeat of Mayor Dever, who was a leader in the fight for home rule, and the failure of Chicago voters to approve the home rule proposition, together with the natural assumption that the new Mayor was unfavorable to home rule, are said to be the reason for the Legislature's sudden decision to sidetrack the bills.

Concern over the outcome of the Chicago mayoralty election, as in the case of the home rule bills, is also reported to have been responsible for the long delay in the presentation of a terminable permit bill in the Legislature at Springfield. The committee appointed to investigate the subject of indeterminate permits made its report to the Senate several months ago after an extensive junketing trip. The report declared that sentiment for such a policy was distinctly favorable wherever it had been tried out. Several members of the committee from the House of Representatives, however, declined to sign the report.

Inasmuch as home rule and the terminable permit legislation were regarded as the very essence of the negotiations for a successful traction settlement at the time the matter was dropped by the local transportation committee of the City Council last February, doubt is now being expressed as to the course of action the City Council will take. At the present time the city has no power to issue a terminable permit to the surface lines or bus lines, and power to consolidate these lines, together with the elevated lines, into a single vast system and to bring them under local regulation must also be obtained from the Legislature. The various plans which are still pending before the transportation committee are (1) the Lisman plan, sponsored by F. J. Lisman and associated New York banking interests, involving the Chicago Surface Lines and based on a twenty-year grant; (2) the consolidation plan, advocated by the former Mayor and providing for a consolidation of surface and elevated lines on the basis of a terminable permit and home rule, and (3) the proposal made by the Chicago Motor Coach Company, which provides for substitution of buses for street cars in exclusive city-wide service. The two first plans are now in the form of tentative ordinances. At the last meeting held by the committee the companies were asked to agree among themselves on a plan of merger or working agreement with unified service and universal transfers.

While the city is awaiting action by the new Mayor and the local transportation committee, which is again headed by Joseph B. McDonough, the original Dever appointee, the date of expiration of the six months extension of Chicago Surface Lines franchises draws rapidly onward. Only a little more than twelve weeks remains for them to run. If no agreement is reached or ordinance passed before the extension lapses, on July 31, there will arise the question of valuations and many other important matters.

At the present time Samuel Ettelson, newly appointed Corporation Counsel, is making a study of the various traction plans, including subway construction projects, the result of which will be submitted to the Mayor on his return from New Orleans next week.

St. Louis Resists Higher Fares

That the operating costs of the United Railways, upon which is based the petition for a straight 8-cent fare in St. Louis, will be materially lowered when the system emerges from receivership and the properties return to private management is contended by the city, which is resisting before the Missouri Public Service Commission Receiver Wells' latest application for higher fares. The city's protest against the higher fare was filed with the commission by City Counselor Muench on April 22. The petition of the city points out that the United States Court has ordered the sale of the company's properties on May 25.

Receiver Wells also seeks to have the valuation for rate making increased from $51,781,348 to $75,000,000 and claims that an 8 per cent return should be permitted. The present income permits only a 3.3 per cent return on the $75,000,000 and only 4.27 per cent on the $51,781,348 valuation. The city is also opposed to the $75,000,000 valuation. It contends also that the city car riders should not be forced to carry the burden for unprofitable operations in St. Louis County; that the annual depreciation charge of $1,500,000 is excessive by at least $300,000, and that the insurance reserve set up by the company is unduly burdensome.

Change in Control Said to Impend in Oakland

Change in the control of the Key System Transit Company, Oakland, Cal., looms as the result of the election of two new directors at a meeting held on April 22. The new directors are A. J. Lundberg and Gustav Epstein. They replaced A. Crawford Greene and B. H. Dibblee, elected at the annual meeting a month ago.

Messrs Lundberg and Epstein are members of the investment firm of J. Barth & Company, large stockholders of the Key System. Barth & Company were unrepresented on the board up to last November, when H. C. Clayburg was elected a director. It is hinted that the members of this concern will now play a prominent part in guiding the financial destinies of the railroad. The size of the executive committee has been increased from five to seven members so as to include Messrs Clayburg and Lundberg.

Stock of the Key System has been declining steadily in the market during the last year, especially the prior preferred and the preferred. Moreover, the quarterly dividend on prior preferred has been passed. In announcing the decision of the directors to skip this dividend President Lester S. Ready stated:

> It has been the aim and hope of directors and the management that this would not be necessary, but the conditions that have developed during the past year have convinced them that the best interests of the company and of the stockholders will be served if this action is taken.

Mr. Ready cited as factors in the present financial status of the company the $400,000 annual increase in operation expenses through the higher wage award made by the arbitration committee a year ago; the expenditure of $6,000,000 for capital additions and betterments in 1925 and 1926 and the failure of the new revenue provided through an increase in railway and trans-bay ferry rates to meet the higher operating expenses and cost of improvements. In a statement made by him Mr. Ready said:

> It was contemplated that following the increase in rates some loss of passengers would result, but it was expected that within a few months the traffic would recover, especially in view of the added track facilities and improvements in track and equipment.
>
> To date the passenger traffic, due to material increase in ownership and use of automobiles, has not increased to an extent to offset the added costs. In addition a temporary depression of gross revenue has occurred during the first three months of 1927, owing to the more than normal rainfall.

Rumors are rife in San Francisco that the Hill interests are maneuvering to get control of the Key System as part of their transcontinental system and make their terminal in the Key mole. These reports, however, are contradicted by statements that the Key and the Southern Pacific are shortly to merge so as to eliminate present costly duplication of service.

Surveys with this object made by engineers are now being studied by the officials of both roads. An announcement centering around the Key and Southern Pacific lines seems certain in the near future.

In the meantime the Key officials are making plans for formal application for a higher fare. Hearing on this matter will come up before the Railroad Commission on May 10. At this hearing it is likely that there will be a hot fight, as John L. Davie, Oakland Mayor, who is none too friendly to the Key System, has just been re-elected for another four-year term, defeating Frank Colbourn. The latter was a member of the arbitration committee that awarded the car men of the Key System a higher wage in 1925.

Traction Settlement Looms Again in Toledo

Action looking toward a settlement of the railway difficulties in Toledo, Ohio, may be sought before the voters at the primary election in August. Demand to this end has been made in conferences between officials of the Community Traction Company and representatives of the city administration. Recent discussion indicates that action must be taken on the contention of the Street Railway Board of Control that between $2,000,000 and $3,000,000 must be written off the capital value of the company to take care of abandonments, obsolescence and correct some of the evils in valuation adopted under the Milner plan. Concessions in the way of power rates are to be asked in return for a monopoly of bus and railway service. Following the Riggs survey two years ago an effort was continued to draft a new franchise keeping the salient factors of the Milner plan but correcting many of its defects brought to light in six years of operation.

The result of these negotiations between attorneys from the New York office of Henry L. Doherty & Company and the city law director was unfavorable to the Board of Street Railway Control, which has had direct contact with the operations during the entire life of the Milner franchise ordinance. Since this stand was taken negotiations have been intermittent, with conditions getting worse.

The city has a program of about $3,500,000 of new paving and reconstruction of streets which involves the traction company at several points. The Board of Control has asked for revision of power rates, new bus lines and extensions, and in the meantime the company has continued to lose business to private automobiles and competing independent bus lines.

After weeks of effort to arrive at a decision Service Director William B. Guitteau has had legislation introduced in the City Council providing for the repaving of St. Clair Street in the downtown district by the city if the railway refuses to go ahead with the work inside of 60 days. Abandonment of this stretch of track was recommended as a part of the Riggs plan, but J. Frank Johnson, general manager, says the abandonment can come only as a part of the general plan.

Before the City Council are three or four plans for complete bus service for the city and it is believed that they constitute one way out of the tangle in the event the railway situation is not brought to a settlement in a few months.

Wiring Havoc in New York Subway

Fire broke out on the afternoon of Sunday, April 17, in the new subway under construction by the city of New York under Eighth Avenue. The fire started at 36th Street, damaged cables and subway construction to an extent estimated by the builders at $500,000 and almost completely stopped telephone and light and power service in a large section of the mid-town business area. Police and fire signals were put out of commission, and grave hazards faced the firemen who poured water into the excavation.

Fire in the Eighth Avenue subway gave New York firemen a hard fight

For three hours or more several large hotels were deprived of utility service, newspaper offices were hampered, at least one hospital was without electricity, and trolley service was somewhat crippled. Despite the fact that it was Easter Sunday, wiremen and other utility workmen were recruited from the forces of the telephone and light and power companies from all over the city and contiguous territory to repair damage and restore service, and the torn-up and undermined streets beneath which the new subway is to run showed even more sub-surface activity than on weekdays.

On Monday morning the fire broke out again with even worse results than the day before, paralyzing 15,000 telephones, darkening tens of thousands of electric light bulbs and stopping elevators throughout the district between 34th and 38th Streets and Seventh and Ninth Avenues. The disruption of telephone, light and power service halted business activities in the district almost as completely as if that zone had been visited by an extensive disaster. All electric power was cut off from a twelve-story department store covering most of a city block. Many business places shut down for the day or closed early, and it was estimated that twenty thousand workers were forced to be idle. In the section affected is housed a large part of the garment industry of the city. When night fell residents in side streets had to resort to oil lamps and candles and watchmen of loft buildings carried lanterns and flashlamps.

The New York Edison Company made final connections of feeder cables sufficient to carry full-capacity load of 100,000 kw. late on Tuesday evening, and when the business buildings were opened on Wednesday morning there was energy for elevators and electric lights in all establishments, but many buildings were still cut off from telephone communication.

New Franchise Sought in Sandusky

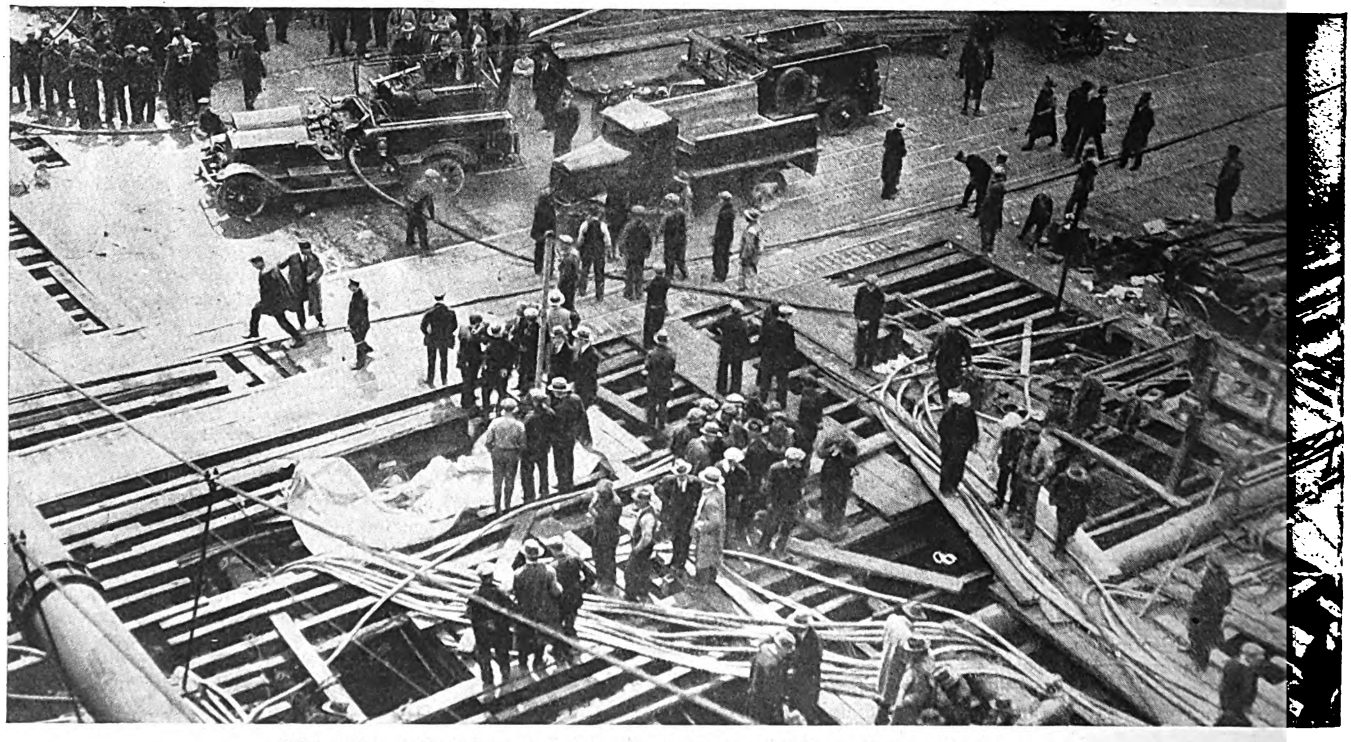
A franchise to take the place of the one that expired nearly a year ago was submitted to the City Commission of Sandusky, Ohio, on April 18 by F. W. Coen, president, and L. K. Burge, vice-president and general manager of the Lake Shore Electric Railway. The draft was discussed behind closed doors and its provisions were withheld. It is understood, however, that it makes provision for a fare higher than 5 cents.

"Making Transportation Pay"

"Making Transportation Pay" is the title that has been chosen this year for the digest of the presentations made by electric railways in 1926 for the Charles A. Coffin prize. This title was selected because it epitomizes the present trend of managerial thinking. The book shows that transportation is being made to pay and how it is being done.

Complimentary copies are being sent to a selected list, including public utility commissions, investment bankers and public and college libraries, as well as members of other organizations interested in the electric railway industry. A limited number of extra copies of the book are available to others at the cost price of $2.

This is the fourth volume of the series of "Electric Railway Practices" issued since the establishment of the award by the Charles A. Coffin Foundation.



This view of the second fire shows great patches of planking torn up and temporary electric cables installed

Transportation Tied Up in Peterboro

Peterboro, Ont., is being supplied with transportation service by a local cartage company. The Peterboro Radial Railway, operated by the Hydro-Electric Power Commission of Ontario, has been closed since March 31. The city and the commission were unable to come to terms on a price for the utilities. The commission placed a price of $575,000 on the gas and railway utilities and the City Council countered with an offer of $150,000. It is desirable to sell the railway, the commission declared, because it is losing $50,000 a year, an amount borne by all hydro municipalities in the Central Ontario System. The railway is valued at $475,000, and if it is junked, which to some seems probable, this loss will have to be absorbed by the other hydro municipalities in the system.

Meanwhile the city is handicapped by lack of transportation and a further difficulty was encountered when the Mayor announced that the Hydro commission's contract with the Gotfredson Bus Corporation did not expire until May 20.

Bill Against One-Man Cars Lost in Tennessee

One-man cars are to continue to operate in the cities of Tennessee due to the action of the House of Representatives in rejecting the bill offered by various delegations of the larger cities which would have prohibited their usage in all cities of 30,000 population or over. The Knoxville delegation, backed by the smaller counties, opposed the bill and in rejecting an amendment to permit the cars in all towns under 30,000 population brought about the defeat of the bill.

Summer Excursion Rates Announced by South Shore

Anticipating a large volume of summer travel to Indiana Dunes State Park, newly created reservation, the Chicago, South Shore & South Bend Railroad will provide low week-end rates from Chicago. The round trip rate to Tremont, park gateway, will be $2; to Miller, $1.50, and to Wilson, $1.75, the two latter places also being popular with summer visitors to the Dunes. The tickets sold on this basis will have a return limit three days following date of sale. The South Shore Line is the only line providing regular service to these Dunes points.

Tract on Courtesy Bristles with Interest

"Our Part in Public Service" is the title of a handsome vest pocket booklet on public relations issued by the Nashville Railway & Light Company, Nashville, Tenn.

The booklet has been distributed to 1,400 employees. It covers every phase of public relations work, both in the operating and electric accessories field. In a modest preface, J. P. W. Brown, vice-president, explains that while the principles set forth are not new, having been discussed in employee group meetings, nevertheless they are essential to the company's success.

The text matter of the little code of principles bristles with interest and attacks many new phases of contacting with the public. Of outstanding significance are the paragraphs devoted to definition of courtesy, telephone speech and the opportunities for public service.

News Notes

Interurban Lowers Wages.—A reduction of 10 per cent in wages of all officials and employees of the Buffalo & Erie Railway has been ordered, effective May 1. This company operates an interurban between Buffalo, N. Y., and Erie, Pa.

Adjustment Department Formed.—A new department of the Kansas City Public Service Company, Kansas City, Mo., has been formed. It is known as the adjusting department. It replaces the old claim department of the company. The new department is under the supervision of Arthur T. Bagley, who will be superintendent of personnel and manager of this department for the company.

Reprints of Interview. — "Three Classes of Service," which appeared in the ELECTRIC RAILWAY JOURNAL, issue of Feb. 26, 1927, has been reprinted in pamphlet form. The number now in circulation is 85,000. The article was an interview by Charles Gordon, editor of the ELECTRIC RAILWAY JOURNAL, with T. E. Mitten.

Seeks Ten-Cent Fare. — A petition was presented recently to the City Council of Ames, Iowa, by the Fort Dodge, Des Moines & Southern Railway calling for a 10-cent fare on cars and buses operating between the loop district and Iowa State College.

Would Provide Study of Transit Needs.—A bill to create a special commission to study the city's transportation needs, particularly a rapid transit system, will be presented at once to the new St. Louis, Mo., Board of Aldermen. Samuel L. Wimer, chairman of the special committee on rapid transit of the old board, will be sponsor for the new measure.

Official Credited with Idea.—The rebate slip for passengers who inadvertently or accidentally drop more change than is necessary in the Johnson fare boxes is being used effectively on the lines of the Southern Colorado Power Company in Pueblo, Col. The details of the idea, reference to which was made in the ELECTRIC RAILWAY JOURNAL, issue of April 9, 1927, page 669, were worked up and carried out by W. C. Porter, superintendent of transportation.

Facts on One-Man Car Operation.—The Toronto Transportation Commission, Toronto, Ont., has recently published in the daily newspapers a series of announcements presenting data on the one-man cars. Publishing such information is in line with the practice of the commission of taking the public into its confidence in all important developments in regard to the system. The purpose of the announcement was to correct any false impression and to win the public over to use the rear exits of the "treadle" cars and otherwise co-operate with the operators by using the car so that the service they provide might be convenient and efficient.

One-Man Car Service Extended.—Cars on all the lines of the Valley Railways, Harrisburg, Pa., are run now on the one-man basis, following the extension to two lines on April 18, and part of a third line which formerly had two-man operation.

Would Elect and Not Appoint Members.—A bill has been introduced in the Wisconsin Assembly providing for the election of Railroad Commission members instead of their appointment by the Governor, as is the case now. The bill states that at the general election on April 1, 1928, the voters shall determine by referendum whether or not Railroad Commission members shall be elected by the people.

Seeks Ten-Cent Rate on New Line.—The Public Service Railway will provide bus service for the lower east side of Union City between Hoboken and Grantwood, N. J., if the City Council of Hoboken agrees to a 10-cent fare for the run up the viaduct the same as on the Hillside line. This is the claim of W. H. Shepherd, divisional manager of the company, at a conference on the transportation situation at the committee of the whole session at City Hall on April 18. The proposed extension of the Hillside Line would mean the rerouting of buses of some of the present fleets. The willingness of the company to expand its service was disclosed by Mr. Shepherd. He referred to his going to that section a year ago and of an increase of 7,500 miles in daily mileage under his direction and of intention to continue that policy within reason as a means of increasing revenue for his company.

Foreign News

Austrian Electric Line Completed.—Service has commenced between Woral and Innsbrück, Austria. This line, 45 miles long, is a section of the Austrian State Railroad and is part of the line included in the electrification program which has recently been completed on this system.

New Swiss Electric Locomotives.—The first of a new and improved type of electric locomotive has lately been turned out from the Brown-Boveri works at Munchenstein, Switzerland, for service in hauling the heavy express trains between Berne and Zurich. The engine, which runs on seven pairs of wheels and weighs 115 tons, is said to have attained a speed of more than 62 m.p.m.

Flood Lighting at London Stations—According to the London Underground Railways, the experiment of flooding the stations with light is proving successful at the City and South London

Railway extension and will be introduced at the Finsbury Park station of the Great Northern, Piccadilly & Brompton Railway. Powerful searchlights are placed also on the roofs of the outdoor stations to emphasize their position.

Railroad Electrification in Holland.—Electric trains will soon begin to run from Haarlem to Rotterdam and Haarlem to Ymuiden in Holland. By next October it is expected that the Amsterdam-Rotterdam line will be completed.

London County Council Re-equips Cars.—Fifty cars in London have been re-equipped with upholstered cross seats. Operation of these cars has proved so successful that the London County Council will extend the program to 50 more cars. About 250 cars are in line to be improved. Total cost for the work will be £54,000.

London Underground Railways to Use One Guard on Trains.—All trains operating in the London Underground Railways will in the future have only one guard to a train. This system has been used on four and six-car trains only in the past, but according to recent official news of the Underground more men will be added to the staff to direct the traffic, and automatic devices will be substituted in place of guards. Experiment is now being made of a telephone to be used for communication between the motorman and the guard. This change of system is a process which will take at least two or three years to carry out, the time allowed for equipping all of the cars.

Tramways Association Meet at Bath.—Bath, England, is the meeting place chosen for the annual conference of the Tramways & Light Railways Association to be held June 30 and July 1.

Express Buses for Manchester.—Manchester Corporation Tramways department has started experimental express bus service to parallel each of the tramway routes. Fares on these buses, however, are twice those charged on the tramway lines, but the buses do not stop between the tramway fare zone points, which are about ¾ mile apart. The service will be linked up so that beyond the range of the tramways the buses will stop at all intermediate points and ordinary fares will be charged.

Glasgow's Plans for New and Improved Cars.—Purchase of 50 new cars and the improvement of 150 cars now in service were recommended by the Glasgow Town Council, and approved on April 14. The cost is estimated at £345,000. For twenty years Glasgow has made little change in car design. In the report submitted by L. Mackinnon, general manager of the Glasgow Corporation Tramways department, it was stated that the speeding up of the service in Glasgow had emphasized the necessity for bringing the cars up to date by the introduction of modern motors to give increased acceleration and retardation and higher running speeds. At the present time, according to the report, there are 1,004 Glasgow built cars in stock, including 332 constructed less than seventeen years ago, 235 built between seventeen and 22 years ago and 437 more than 22 years ago.

Recent Bus Developments

Right of Philadelphia to Tax Interstate Buses Upheld

The fight of the city of Philadelphia, Pa., for local jurisdiction over interstate buses has been carried to a successful conclusion in the United States District Court by James F. Ryan, Assistant City Solicitor.

The American Transit Company and the American Motor Coach System, both Delaware corporations, with local offices in Philadelphia, had obtained a temporary restraining order preventing the city from collecting the $50 fee per bus authorized by Council. P.R.T. buses, local and interstate, all pay that fee.

The city, contending that the aggregate annual collection of $12,500 for the 250 buses engaged in interstate traffic would scarcely meet the expenses of proper regulation in the public interest, went before the court in an endeavor to make a test case of the operators' action.

Judge Thompson dismissed the injunction. In ruling in favor of the city, he pointed out that the bus was a new factor in transportation. He cited increased population, narrow streets, and the occupation of roadways by buses of more than ordinary weight and size as a modern problem. These buses, he said, carrying as many passengers as possible, would become a menace to the city unless properly regulated. The court said:

> It is essential to the orderly supervision of traffic, that the route, stop, start and loading points of these interstate buses should be clearly designated. Each bus also should bear a city license plate. The designation should be filed for immediate reference in an appropriate office.
>
> A $50 fee for each bus is certainly not unreasonable, in view of the testimony from two companies that monthly receipts for twelve buses averaged between $18,000 and $20,000.

The court pointed out that Congress had not yet dealt with the interstate motor vehicles in Philadelphia, and while it might do so in the future, it was now within the province of the states to provide reasonable police regulation.

As a result of the decision abolition is likely to follow of all existing ordinances regulating passenger-carrying motor vehicles in Philadelphia and enactment by Council of a new measure providing complete police jurisdiction over interstate as well as local buses will be effected shortly.

More Bus Substitutions in Massachusetts

The Selectmen of Ware, Mass., have granted a permit to the Conlin Bus Lines, Worcester, to connect Enfield, Ware and West Brookfield by bus. At the latter point the buses will connect for Worcester and Boston. There will be summer and winter service. The State Department of Public Utilities is expected to approve the plan so that service can start on May 1. The matter of granting a permit to the Springfield Street Railway to operate buses between Ware and Palmer was discussed by the Selectmen and it was decided to propose to the railway that it take up the rails in Ware but leave the ties in place. If the proposition is acted upon favorably by the railway the bus permit will be granted.

Prospective Bus Line to Be Under Hamburg Railway Management

Petition has been made to the New York Public Service Commission by William D. Allen for the operation of a bus line between Orchard Park and Lafayette Square in Buffalo traversing Buffalo, East and West Quaker Streets in Orchard Park, Orchard Road in East Hamburg, Orchard Park Road and Potter Road in West Seneca to the intersection with Orchard Park Road at the Buffalo City Line. The petition states that it is ultimately planned to form a corporation for the running of the bus line, the management to be the same as that of the receiver of the Hamburg Railway. As soon as the Ridge Road is opened across the railroad east of the Lackawanna city line it is proposed to secure permission to operate buses in alternate trips over the Ridge Road to South Park Avenue and to co-ordinate this line with the service given by the Hamburg Railway. Three large railway bondholders have agreed to take sufficient stock adequate to finance the operation of the new line.

Southern Pacific Supplements Service with Bus Auxiliary

Entering the highway motor transport field for the first time, the Southern Pacific Company on April 19 filed with the Secretary of State at Sacramento articles of incorporation of the Southern Pacific Motor Transport Company, a California corporation, to operate as an auxiliary to the railroad activities. San Francisco is named in the articles as the business center of the proposed new corporation and the purpose of the organization is outlined as being "to own, hold, control, lease, purchase, sell, operate and manage motor stages and motor trucks in streets and highways, public or private, within and without the State of California."

Speaking of the action of the company, Paul Shoup, executive vice-president of the Southern Pacific, said that the competition of privately owned machines and of bus companies in connection with the construction of good highways in the territory served had so decreased the earnings from certain trains, especially those engaged in branch-line service, as to necessitate taking off these trains. The Southern Pacific Motor Transport Company has been organized as a separate corporation with independent operation. This service will be developed as the need arises. The company will be empowered to engage in all forms of transportation.

Would Operate Buses in Batavia

Batavia is soon to be added to the list of smaller up-state New York cities supplanting trolleys with buses. The Batavia Traction Company at a meeting of the Common Council asked permission to operate buses and discontinue its trolley system, which has served the city since 1901. The Council held the matter in abeyance pending investigation, although it is a foregone conclusion that the days of the street railway are numbered.

If the Council grants the request immediate application will be made to the State Public Service Commission for permission to make the change. Stephen W. Brown, president of the corporation, and other representatives of the railway stated that the company could no longer stand the drain on its finances in keeping the railway line in operation. The equipment consists of only four cars. Mr. Brown said that the company had lost more than $60,000 in thirteen years. It was stated that there were no funds in the utility's treasury even for current expenses and that a bus system was the only solution.

While city officials and public sentiment generally are favorable to the shift, the question of fare is to be threshed out. The present fare is 5 cents. There is some sentiment for municipal bus operation, but it is expected that the Batavia Traction Company will continue to be the city's transit agency, but with buses instead of trolleys.

Bus Bill Signed by Pennsylvania Governor

Governor Fisher of Pennsylvania on April 18 signed the Parkinson Senate bill which permits any electric railway incorporated heretofore under the laws of Pennsylvania and owning at least two-thirds of the capital stock of any motor company or street railway now or hereinafter organized under the laws of the state to acquire the latter. Acquisition must be subject to the approval of the Public Service Commission.

Bus a Vital Co-ordinating Factor in Detroit's Transportation

The most practical and proved panacea for the traffic and transportation ills that are at present the most pronounced growing pains of the city of Detroit is the bus. In voicing this opinion Del A. Smith, general manager of the Department of Street Railways, claims that the bus is a vital adjunct to the electric railway system. He says engineering skill has accomplished no greater or prouder task than in bringing the bus to its present high state of development.

In the Detroit *Times* of April 5 Mr. Smith outlines the phenomenal growth of the bus in general and particularly in the locality of Detroit. The department established 116 miles of bus routes in June, 1925, and is now operating more than 160 route-miles employing 310 buses for these routes. In this great wave of modernism and improvement Mr. Smith believes that the department should go slow in stocking itself with equipment that may be impractical and obsolete tomorrow. He is watching closely experiments in other cities, both in the matter of developing the bus and in meeting the competition from independent lines. Mr. Smith favors the Mayor's plan of some day taking over the Detroit Motor Bus Company's routes and equipment. He said that would be the fairest and most practical plan, but any harsh or summary action in that direction would not be fair to stockholders or in accord with the original agreement with the private company.

Discontinuance Application Dismissed.—The California Railroad Commission has dismissed the application of the Pacific Electric Railway for permission to discontinue a portion of its Upland-San Antonio Heights motor coach line between 24th Street and San Antonio Heights, upon request of that company.

Seeks to Operate Bus Line.—Authority to operate a bus line between Ogden, Utah, and the Utah-Idaho state line is asked by the Utah-Idaho Central Railroad in a petition recently filed with the Public Utilities Commission. The contemplated service would cover both freight and passengers. According to its petition the company would continue its rail service and would operate its bus lines in addition to this equipment, if granted a certificate of convenience and necessity.

Abandons Bus Route.—The bus route of the Worcester Consolidated Street Railway, Worcester, Mass., over Burditt Hill, Clinton and through West Boylston has been abandoned. Instead of this two-hour service by that route the Consolidated is running buses hourly through Boylston Center. The company gives as a reason for the abandonment of the line that better time can be made on the new route, which is 3 miles shorter, and there is not sufficient riding on the Burditt Hill route.

Bus Charter Granted.—A certificate has been granted by the California Railroad Commission to the Los Angeles Railway to operate motor coach service between Seventh and Los Angeles Streets, in the city of Los Angeles, and the intersection of Whittier Boulevard and Simmons Avenue.

Petition Shows Railway-Bus Agreement.—The Jamestown-Dunkirk Transit Company, Inc., has petitioned the New York Public Service Commission for an amendment to its certificate for a bus line in Dunkirk to permit it to change the route over which the line operates. With the petition there is filed a copy of the resolution of the Common Council of Dunkirk, wherein it is shown that an operating agreement has been made between the transit company and the Buffalo & Erie Railway as to the operation of buses and cars in the city. This agreement has been approved by the civic authorities.

Ruling Reduces Speed of Buses.—The Board of Public Service of St. Louis, Mo., on April 6 decided to limit the speed of buses operated on Waterman Avenue between Union and Skinker Boulevards at 15 m.p.h. The former limit was 25 m.p.h. The ruling was the result of numerous protests from certain residents who had contended that the double-deck, solid-tired buses operated by the People's Motorbus Company were shaking their houses and causing damage to the property.

Buses for Week-End Rushes.—Eight bus runs from Framingham to Boston, Mass., have been eliminated on the Boston & Worcester Street Railway, but three additional railway runs have been placed in operation over the same route. This practically amounts to hourly service between the two points. The buses are being held in reserve for week-end rush runs and other special occasions.

Buses in Oswego.—Territory never before reached was opened up at Oswego, N. Y., on April 22 when buses replaced the local railway. The fare was 5 cents. The Empire State Railroad Corporation abandoned its railway operations and auxiliary buses in that city after 40 years of service, carrying out an order of the Public Service Commission which permitted abandonment of the lines on the basis of several years financial losses with a 7-cent fare. Oswego is a city of 22,000.

Opposes Bus Charter. — The plan of the Reading Railway for a subsidiary company to operate buses supplementary to steam train service in 24 Pennsylvania counties was opposed on April 22 by the Philadelphia Rapid Transit Company, Philadelphia, Pa. Its protest with the Public Service Commission at Harrisburg was filed after the Reading Transportation Company, the subsidiary company, had applied for a state charter. The traction company's counsel said action was based upon a determination to protect the electric railway bus rights in suburban districts of Philadelphia and in adjacent counties. The plans of the Reading Railway to enter the bus field were upset last year when Governor Pinchot refused to ratify an application for a charter.

General Transfer System to Be Adopted.—The International Railway and its subsidiary, the International Bus Corporation, Buffalo, have informed the City Council they will adopt a general transfer system covering all bus and car routes if the municipal authorities will approve the company's application for the proposed Kensington-Bailey bus line. If the proposed franchise is granted, the company will not seek to amend existing bus consents covering restricted transfer privileges, but merely will modify its operating rules to give a universal transfer.

Would Abandon Bus Line.—The Key System Transit Company has applied to the California Railroad Commission for permission to abandon operation of its bus service between the intersection of Los Angeles Avenue and Spruce Street and Alta Road and Spruce Street in the city of Berkeley. This bus line has been operated as an experiment by the company and the earnings have been found insufficient to justify its further maintenance. The company asks the commission, in the event that permission to abandon the line is not granted, to charge a fare of 10 cents, with free transfer privilege to the Spruce Street car line, and a 3-cent transfer charge from the Spruce Street car line to the bus line.

Financial and Corporate

Sale of United Railways Set for May 25

The properties of the United Railways, St. Louis, Mo., including trackage, franchises, rolling stock, lands and all appurtenances, will be sold by Special Master William L. Igoe, acting for the United States District Court on May 25.

The property will be bought in for the St. Louis Public Service Company, organized by the reorganization committee of the United Railways to take over and operate the system when the receivership is terminated. The property will be bought subject to the lien of the United Railways general bond issue and the consolidated first mortgage of the St. Louis & Suburban Railway. The property has been in receivership since 1919.

On application of the Mercantile Trust Company, Judge Faris on April 19 set May 23 as the date for a hearing on a proposed amendment of the allowance of interest on approximately $3,000,000 of unsecured claims against the United Railways. These claims include $2,396,322 on mill tax judgment with 6 per cent interest to Aug. 5, 1926, due St. Louis. A federal law is said to prohibit the payment of interest on claims during receivership. The Mercantile Trust Company, trustee for the St. Louis Transit bonds, has asked interest be allowed only to April 12, 1919. Counsel for the trust company informed Judge Faris that court orders allowing the claims with interest up to Aug. 5, 1926, have been oversights by the attorneys who drew up the papers. With interest to date the city's mill tax claim aggregates $2,600,000.

Another Liquidation Dividend by Toronto Railway

Shareholders of Toronto Railway, Toronto, Ont., which has been in process of liquidation for several years, will be notified in the next few days of a disbursement of $1.50 a share on the capital stock of the company. This interim payment will bring the total liquidation dividend so far paid to $115.50 a share.

The work of winding up the company awaits disposition of two suits at law, one by the company and one against it. The first is a claim for about $55,000 from the Niagara Parks Commission, representing a deposit and accrued interest. This deposit was made many years ago on behalf of the Electrical Development Company as a guarantee against claims for physical damage to concessions, etc., in the park while certain work was in process. The time for the filing of claims against this fund expired more than ten years ago. The park commission has declined to pay over the amount until final settlement of claims made by the city of Niagara Falls. It is understood that the railway is willing that the commission settle the claim out of court for what it considers a reasonable amount.

The suit against the company has been brought by an engineer formerly employed under the chief engineer of the railway. The plaintiff in this action claims $25,000 on account of patents developed while he was connected with the railway. He also contends that he did not receive proper notice of dismissal from the employ of the railway company.

These two matters are the only ones which are delaying the final wind-up of the Toronto Railway.

The property of the Toronto Railway was taken over by the city and is now included in the municipal system under the direction of the Toronto Transportation Commission.

Bids Received for Sale of Detroit Carhouse Property

In response to the request of the Street Railway Commission at Detroit, Mich., for bids for the sale of property for which the department has no practical use adjacent to the Woodward Avenue carhouse, a high bid in the amount of $460,000 was obtained. The property has a frontage of 500 ft. on Woodward Avenue and a depth of 100 ft. The plot is opposite the Highland Park plant of the Ford Motor Company. The sale at this price, which was the highest of several bids received, was not approved by the Council.

Some time ago Del A. Smith asked approval of the expenditure of $280,000 for a west side carhouse site as a step in carrying out plans to split the Grand River-Jefferson Street car line into two lines. A site of 14 acres on Coolidge Avenue was suggested for the carhouse, together with a garage for Grand River line buses. A new carhouse having a capacity of 50 trains was planned.

Railways Not Earning Fair Return on Investment

Statistics Covering Operations in 1926 Reveal Increase of Nearly 23,000,000 Car-Miles and 46,000,000 Bus-Miles—Total Service Mileage 2,087,282,159—Return on Investment Slightly Over 4 Per Cent for Total Group—Fares Are Still Too Low

TABLES summarizing the operations of the electric railway industry in 1926 show that the confidence of the electric railways in the future of their business is increasing. They are expanding their service and believe in their future. In particular the results shown in the separate statements for city lines indicate that their intensive efforts to develop their service are having their effect in increased earnings. Their net income was $24,933,183 in 1926, compared with $22,996,661 in 1925, an increase of 8.42 per cent.

Furthermore, many other companies are beginning to share in this improvement, among them smaller companies which heretofore have had very little share in the better conditions which the large companies have been experiencing. This is brought out when the statement for the city companies is broken down into groups according to the size of the companies.

The intermediate group, comprising companies earning from $250,000 to $1,000,000 a year, showed an increase in their gross income, before fixed charges, of 2.21 per cent, which compares favorably with the decrease of 1.63 per cent in this item reported by the large city companies earning more

Statistics Compiled by American Electric Railway Association

COMBINED OPERATIONS OF 353* COMPANIES

	1926	1925	Increase or (D) Decrease	Per Cent Increase or (D) Decrease

than $1,000,000 per year. Unfortunately for the smaller companies, they were unable to reduce their fixed charges as the larger companies did, but on the contrary had an increase in these charges of 5.51 per cent, which produced a decrease in their net income of 6.08 per cent, compared with an increase in the net income of the larger companies of 8.99 per cent. The failure to reduce their fixed charges is a misfortune that can probably be remedied by a careful study of their capital structure.

Edmund J. Murphy, the chief statistician of the American Electric Railway Association, writing in *Aera* for May, says that the significant thing to be noted is that in so far as purely operating results are concerned, this group was able to effect a greater improvement during the year than the larger companies did.

SMALL COMPANIES LOSING GROUND

The companies in the third city group, earning less than $250,000 a year, have not yet begun to experience the better conditions which have had a favorable effect on the other two groups. These small companies are still losing ground. However, it should be borne in mind in connection with these companies that they constitute only a fraction of the electric railway industry. Out of a total of 8,919,016,768 passengers carried by 231 companies that have been classified into groups only 80,484,333, or about 0.9 per cent, were carried by companies in the Class C group. Their influence on any statement reflecting the operations of the whole industry, therefore, is practically negligible.

In terms of vehicle-miles operated, the industry rendered more service in 1926 than in any previous year of its history. The 353 companies operated 22,887,278 more car-miles last year than they did in 1925. The total revenue car-miles operated in 1926 was 1,963,934,988, compared with 1,941,047,710 in 1925. In addition these companies operated 123,347,171 bus-miles, 46,919,235 more than in 1925. The total service-miles operated, therefore, was 2,087,282,159 in 1926, as against 2,017,475,646 in 1925, an increase of 69,806,513 service-miles.

INCREASED SERVICE AT INCREASED EXPENSE

The figures clearly indicate that the electric railways are using the motor bus to extend their transportation service. On the other hand, it is made equally clear that they are not curtailing or reducing their rail service, but on the contrary are giving more rail service, measured in car-miles, than they ever did. The number of miles of single track operated by these 353 companies in 1926 was 32,096, about 60 miles less than they operated in 1925. It represents about 78 per cent of all the electric railway track in the country. The number of miles of bus route operated in 1926 was 5,650, an increase of 1,800 miles. It is practically all additional service.

This additional service, of course, meant increased expenditure on the part of the railways. Operating costs remained approximately the same in both years; the average cost per car-mile was 33.77 cents in 1926 compared with 33.55 cents in 1925, an increase of only 0.7 per cent. The number of cars operated and the number of miles of track, as already indicated, were also approximately the same. The additional miles operated over this track, however, added about $7,000,000 to the expense. In the bus end of the business 1,220 new buses were added during the year. If the investment per bus is put at $7,500, as has been suggested by one authority, the probable amount of new money put into the business in this one year was $9,100,000. The additional mileage operated by the buses cost the companies about $12,500,000 in increased operating expenses. As Mr. Murphy sees it the increased service rendered cost the companies $19,500,000 in increased operating expenses and $9,100,000 in new equipment, or a total of $28,600,000.

On their rail and bus lines in 1926 these 353 companies alone carried 14,660,626,195 passengers, 236,997,968 more than they carried in 1925. Analysis of the complete returns makes it unmistakably clear that the revenue received does not cover the cost of the service. According to Mr. Murphy the return to the companies, taking the group as a whole, is in no way commensurate with the magnitude of the service rendered; is not sufficient, in fact, to enable the industry to finance itself properly. After expatiating on the facts, the author concludes that "with more than half of their capitalization represented by funded obligations, and with the cost of money running up to 7 per cent to them, it is not hard to understand why there is so little left for the stockholder." Out of 231 companies reporting only 45 paid any dividends.

INADEQUACY OF FARES DISCUSSED

In extenuation of this idea it is pointed out that the average fare per revenue passenger in 1926 was 7.1 cents. It was the same in 1925. There was no change. In 1912 the average fare per revenue passenger was 5.27 cents. In the intervening years, therefore, the average fare has risen about 35 per cent. At the present time, according to current indexes, the cost of materials used by electric railways is 53 per cent above pre-war levels, while wages are up approximately 110 per cent. Weighing these in the proportion

in which they enter into the cost of operation, 93 per cent is reached as the average increase in cost of materials and labor. In order to produce the same net today as in 1912, therefore, the average fare should have increased 56 per cent instead of the 35 per cent it has increased. In other words, the average fare of this group of companies should have been 8.22 cents instead of 7.10 cents.

The author says:

FINANCIAL STRUCTURES IMPROVED

> Undoubtedly this failure to raise fares in proportion to the increase in the cost of operation has been an important cause, if not the most important cause, of the present condition of the electric railways. On the other hand, it cannot be denied that many electric railway managements have neglected to take advantage of improved methods and equipment which might help them to better their condition. They have been especially derelict in the field of public relations, which is undoubtedly the master key to the solution of their problems. This is proved by what has been accomplished by the more progressive managements among both the larger and smaller properties.
>
> Operating under conditions identical with those of the rest of the industry they have by their skill and their readiness to adopt new ideas succeeded in holding or increasing their traffic and enlisting the co-operation of their patrons so that as a result they have been able to secure more equitable consideration from their public authorities. Fortunately more and more managements are learning from these examples that at least part of their problem is solvable by their own efforts and they can be counted upon to put forth greater efforts along better directed lines in the future than they have in the past.

As the author sees it, the companies are making serious efforts to recast their financial structures along more conservative lines as was recommended in the report of the Advisory Committee on Electric Railway Finance. As a result of this reduction in fixed charges the net income of these companies was only slightly less than in 1925, $630,010, or 2.71 per cent less. The final net income in 1926 was $22,587,221, as compared with $23,217,231 in 1925. As has already been pointed out, if the city companies in the intermediate group could have effected a reduction in their fixed charges similar to that of the "A" companies this net income would have been increased materially.

Practically all of this net income was earned by the city companies alone. The straight out interurban lines as a group operated at a deficit of $3,692,565, while the combination city and interurban companies earned a net income of only $1,346,603, which was a decrease of 62.66 per cent from the net income of $3,605,885 earned in 1925. Presumably this net was produced by the city operations in this group as distinct from the interurban divisions. It does not entirely offset the deficit in the straight interurban group. This was done by the city companies, which earned a net income of $24,933,183, an increase of $1,936,522, or 8.42 per cent, over the net income of 1925.

NET INCOME EARNED BY CLASS A COMPANIES

Practically all of the net income of the city companies was earned by the Class A companies, the large companies having annual operating revenues of $1,000,000 or more. This group produced $24,212,808 of the net income of the whole city group, an increase of $1,997,080, or 8.99 per cent. The Class B group of city companies, having annual revenues between $250,000 and $1,000,000, earned a net income of $768,071, a decrease of 6.08 per cent from 1925, while the Class C group, with annual revenues of less than $250,000 per

year, had a deficit of $47,696, which was $10,805 greater than in 1925. All of the groups of the interurban companies operated at a deficit, while among the combination companies only the Class A group earned any net income. It amounted to $2,388,006 and represented a decrease of 50.48 per cent from 1925.

It is quite apparent from the foregoing that only the larger city companies made any money in 1926—those in the class earning more than $250,000 per year. This is the class that has been freest from competition and has been least affected by the use of the private automobile. It is also the class whose problems have received the most careful consideration, probably for the very reason that no satisfactory competitive service was available. In consequence the companies in this group, not all of them, perhaps, but some of them, have succeeded in securing rates that in some measure meet the cost of service.

The rest of the companies in the other groups are struggling, with varying degrees of success, to give a service the cost of which is not covered by their revenues. Either these companies must receive adequate revenues or the service they give must be curtailed. The companies are making a commendable effort to improve and extend their service wherever there seems to be the faintest chance of justifying it; these efforts must receive the co-operation of the traveling public expressed in an adequate system of rates.

This is particularly true in the smaller communities and outlying districts. The tables show that the smaller companies are in a precarious situation, are not in fact earning their fixed charges. Their condition is of course due to the omnipresent private automobile, whose inroads into the passenger traffic of the local street railways during the past ten years have cut down their sources of revenue. The problem presented is a serious one both to the companies themselves and the public they serve. In the case of the former there is a large investment at stake, while in the case of the public a decision has to be made as to whether they want and are willing to pay for a common carrier service, to which they have become accustomed but which they no longer patronize as intensively as they once did. It is a question of adequate rates or no service. When a certain fraction of the patrons of a railway cease to use it, the remaining fraction must naturally pay a higher per capita rate if they

want the service continued, especially if, as is actually the case, the cost of operation has meanwhile increased. If the rate necessary to maintain service is more than the service is worth to the people of the community, service must be abandoned.

This is true whether the line be a bus line or a railway. In communities where the riding habit is low and the density of traffic consequently below a certain minimum, the bus undoubtedly is more economical, but the point to be made here is that neither vehicle can hope to operate successfully at the fare which formerly sufficed for the railway. When only a fraction of the former patrons now use the service, rates must be recast on a new basis. And in view of the fact that in many of these small communities there is some doubt as to whether any rate which patrons are willing to pay would yield a return on the investment, it would seem logical in these cases to leave the operator free to charge whatever rate he wants to so that he may experiment to determine if there is any rate that will yield a fair return. It is no longer a question of confiscation or extortion, but of whether or not there is an economic demand for the service.

The smaller companies as a group are not earning their fixed charges—are operating at a deficit which was larger in 1926 than in 1925. Their traffic continues to fall off rapidly. The paramount question with respect to them is whether or not they will survive. Unquestionably it would seem to be the part of wisdom for any of these small communities that want to keep their street car service—and the evidence is that all of them do—to relieve them of all burdensome restrictions and taxes and give them a free hand to see if they can work out their own salvation.

In conclusion Mr. Murphy says:

> The problems of these small companies are, as has already been said, acute and serious, but at this point, perhaps, it should be said again that they constitute a very small fraction of the electric railway industry and what has been said about them in no way vitiates the statements that were previously made about the indusry as a whole.
>
> The other companies, the great bulk of the industry, while by no means prosperous, are nevertheless confidently going forward with plans for the future. For them the year 1926 was marked by unusually steady,

even operating conditions and some progress was made by certain companies in improving their situation. Their future progress depends upon the general attitude of the public toward them and the degree of sympathetic co-operation extended to them. There are signs that the peak of the public enthusiasm for motor buses was reached in the latter part of 1925 and that since then there has been a lot of sober second thought on the advantages of encouraging bus operation at the risk of jeopardizing the existence of the street railways. If this means that the problems of the latter are to receive more adequate consideration in the future, the confidence of the railways in increasing their service may be justified.

Net Income Higher.—For the nine months period ended March 31, 1927, operating revenues of the Brooklyn-Manhattan Transit System, Brooklyn, N. Y., were $34,732,911, against $33,295,344 for a similar period ended March 31, 1926. Total operating expenses increased from $21,709,745 to $22,477,848 for nine months period ended March 31, 1927. After consideration of income deductions net in 1927 was $4,686,588 and $4,096,251 for 1926.

Chicago Surface Lines Report Increased Business in March

Total rides on the Chicago Surface Lines in March were 137,027,327, compared with 131,839,632 in the corresponding month in 1926 and 123,768,252 in February of this year. Service was increased to the extent of 432,760 car-miles, or 19,127,922 seat-miles, compared with the similar month of last year, much of the increase being in the off-peak hours to meet increased demand for service in the middle of the day and in the evening. There has been an increase in riding during the first three months of the current year of approximately 2.8 per cent over the corresponding period of 1926.

Gross earnings for the month of March were $5,334,409, compared with $5,127,371 for the similar month last year. Divisible receipts were $387,898, compared with $154,141 in March, 1926. In February gross earnings were $4,842,125 and divisible receipts were $304,380. The companies spent $687,291 during March on right-of-way, structures and equipment.

Balance in Detroit Increases

For the year ended March 31, 1927, the total operating revenue of the Department of Street Railways at Detroit, Mich., was $24,588,298, against $24,009,932 for the year ended March 31, 1926. These figures included a railway operating revenue and a coach operating revenue in 1927 of $21,999,438 and $2,588,859, against $22,895,754 and $1,114,178 respectively. Total revenue from all sources was $24,866,897, against $24,217,265 in the 1926 period. Total operating expenses were $19,007,825, against $18,231,202. The 1927 expense figure included a railway item of $16,619,335 and a coach item of $2,388,489. The 1926 total expense figure was made up of $17,132,113 for railway and

$1,099,088 for coach. Net revenue from all sources was $5,859,072, against $5,986,062 for the period ended March 31, 1926. The net income was $3,189,417, against $3,319,150. Balance for the period ended March 31, 1927, was $589,189, against $572,038. Railway passengers numbered 471,992,768 in 1927 and 492,491,738 in 1926. Coach passengers numbered 32,576,380 for the year ended March 31, 1927, against 14,827,100 for the year ended March 31, 1926. Railway revenue car-miles totaled 51,043,152 in 1927, against 54,729,579 in 1926. Coach-miles totaled 10,312,493, against 4,817,942 in the 1926 period.

Ohio Road Sold Under Foreclosure

J. P. Longon purchased the Cincinnati, Georgetown & Portsmouth Railroad at receiver's sale on April 25 for $225,000, the appraised valuation. No other bid was offered. Title will not pass to the new owners until the sale has been approved by Judge Stanley Struble of the Common Pleas Court. The sale was ordered as the result of a suit to foreclose the mortgage filed by the Union Savings Bank as trustee for the bondholders after continued failure to earn interest on bonded debt.

The C., G. & P. is a 42-mile interurban connecting Cincinnati with Georgetown, Ohio. Indications are that operation will continue under control of the new owners, said to represent the bondholders.

Disposition of Broadhead Properties Discussed

Accounting made to the court in connection with the estate of S. B. Broadhead, largely interested in the electric railways centering in Jamestown, N. Y., shows that except for two which were abandoned the lines have become self-sustaining from an operating viewpoint and now require no further advances from the estate for their operation. There have been, however, and must continue to be some substantial advances for capital expenditures such as new cars and equipment in order to render the roads successful from an operating viewpoint.

As to the Jamestown, Westfield & North Western Railroad, the report contains a large amount of operating detail but summarizes the position of the administrators as follows:

> It was realized that this road was dependent upon its freight business for its future success as the passenger business was diverted by private automobile. An appeal was made to the manufacturers of Jamestown to sustain this railroad by giving it a fair proportion of their freight. This appeal met with a substantial response, the freight revenues of the road have largely increased, a new locomotive has been built entirely in the shops of the company from old materials on hand and the company is now in position to handle large quantities of freight.
>
> It is recommended, and unless instructed to the contrary, your administrators will continue its operation until further accounting. But unless its operation yields better net results than heretofore, it will not recommend its continuance indefinitely. Permanency of operation can only follow from two things. First, substantial increase in freight patronage; second, relief from exorbitant taxation—it being assessed in nearly every tax district out of all proportion to its earning value. Effort will be directed to accomplish both.

As to the Jamestown Street Railway, the report states that the company enjoyed an increase of $25,778 in net revenues in 1926 as against 1925. The report recommends the continuance of the Jamestown Street Railway and of the Jamestown Motor Bus Company by the estates.

Rockford Property Acquisitions Expanded

Milton J. Ellis and his associates, operating the local railway at Rockford, Ill., and the interurban system, have purchased the interurban line between Belvidere and Elgin, Ill., with about 36 miles of track from Bion J. Arnold and will take over the property on May 1. The Rockford & Belvidere Railway and the Elgin & Belvidere Electric companies are consolidated by the deal and offices will be established in Rockford. Negotiations are now under way with the Chicago, Aurora & Elgin third-rail system for through service from Chicago to Freeport and this deal is said to have been favorably received by the third-rail officials. A new company will be formed to operate the line, working with $1,000,000 capitalization, which will issue $400,000 of 6 per cent mortgage bonds and $600,000 common stock. Rehabilitation of the line and establishment of freight service between Rockford and the eastern points are contemplated. Some of the eight new and fast interurban cars now being manufactured for the Ellis lines will probably be put in service on the Freeport-Elgin line.

$55,953 Added to Youngstown Value.—Value of the Youngstown Municipal Railway, Youngstown, Ohio, was increased $55,953 when the Youngstown City Council approved plans for a garage on Mahoning Avenue. The money is to purchase pumps, large storage tanks and equip a machine shop to make repairs on all buses.

To Increase Capital.—The American & Foreign Power Company, Inc., under the supervision of the Electric Bond & Share Company, has called a special meeting of stockholders for May 2 to vote on an increase in the authorized stock. This company controls railway properties in Cuba. It proposes to issue 200,000 shares of a new class of $6 preferred stock and to increase the second preferred stock, series A, to 1,600,000 shares from 120,000 shares and to increase common stock to 8,300,000 from 1,800,000 shares. Plans are being formulated and steps taken looking to the acquisition by the company of additional hydro-electric power and other utility properties in foreign countries.

Service in Peterborough Ceases.—Negotiations between the city of Peterborough, Ont., and the Hydro-Electric Power Commission looking toward the sale of the Peterboro Radial Railway System failed and service has ceased. It is claimed by the Hydro-Electric that the railway is operated at a loss of $50,000 a year. The city offered $150,000 for both railway and gas works. The price set by the Hydro-Electric is $575,000 for the two. It is believed an offer will be made to a private bus company. If the Hydro-Electric fails to operate cars for 90 days the franchise lapses and the city may take over the system.

Profit in Ogden.—A profit of $8,613 was realized by the Utah-Idaho Central Railroad, Ogden, Utah, for the period between Nov. 21, 1926, and Jan. 1, 1927, according to a report for that period made to the Public Utilities Commission of Utah. This company took over the property of the old concern, known as the "Utah-Idaho Central Railroad Company" at that time, the old company reporting to the commission for the preceding months of the year. Operating revenues of the new concern from Nov. 21 to the last of the year amounted to $78,081, while operating expenses are listed at $60,644. This left a net operating revenue of $17,437, from which taxes amounting to $8,039 had to be deducted. Non-operating income for the period was $23, which brought the gross income to $9,421. From this sum $807 interest on the funded and unfunded debt was deducted, leaving the balance noted.

Deficit in Toledo in March.—Weather propitious for walking and increased use of private automobiles brought about a decrease in patronage for the Community Traction Company at Toledo, Ohio, in March and resulted in a deficit from operations of $12,190 after caring for various funds set up in the Milner service-at-cost ordinance. The total deficit in the stabilizing fund is now $960,834.

Would Scrap Certain Lines.—The Hudson Valley Railway plans to curtail further its lines in the district of Albany, N. Y., if the stockholders and the Public Service Commission approve. The plan is to scrap the Fort Edward-Stillwater line and to do away with the Glens Falls-South Glens Falls line and the South Street railroad station line in Glens Falls. These proposals will be submitted to stockholders at a meeting in New York City on May 25. The commission some time ago denied the application for discontinuance of the Lake George-Warrensburg line and the Greenwich-Thomson line. There has been a renewal of this petition.

Gross Earnings Show Increase.—For the first time since the city of Seattle, Wash., has been operating the Seattle Municipal Street Railway system a quarterly report shows an increase in gross earnings. The financial statement for January, February and March gives the total gross revenue as $1,426,646, an increase of $1,902 over that of the first three months in 1926. The expense of operation for the first quarter of this year was $1,000,501, against $1,088,040 in 1926, a decrease of $87,539. The payroll total was $730,725, which is $85,705 less than one year ago.

Net Income Lower.—For the nine months ended March 31, 1927, passenger revenue of the Brooklyn City Railroad, Brooklyn, N. Y., was $8,519,645, against $8,462,853 for a similar period of the year previous. Operating expenses and taxes increased from $7,226,214 in 1926 to $7,421,084 in the 1927 period. After the consideration of income deductions the net corporate income was $862,561, against a net income of $1,050,388 for the nine months ended March 31, 1926.

Personal Items

Personnel Changes Announced in Duluth

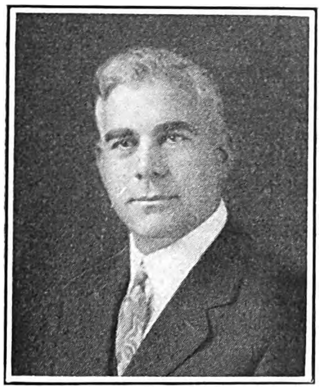
With the recent resignation of H. H. Brown as superintendent of the Duluth Street Railway, Duluth, Minn., announcement was made by Herbert Warren, vice-president and general manager, of several changes in the company's organization. W. S. Byers will be Mr. Brown's successor and B. G. Noah will fill Mr. Byers' present position as assistant to Mr. Warren. The changes are effective on May 1.

Mr. Byers, who will take charge of the superintendency of the Duluth division, has been an employee of the railway for more than 26 years. He has been assistant to Mr. Warren for a number of years and is well known throughout the city.

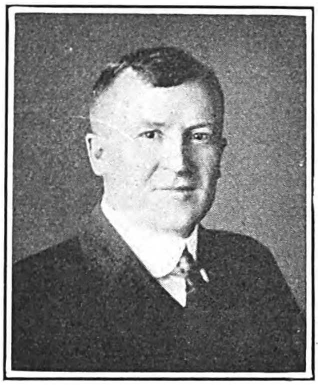
B. G. Noah, who is now a resident of Chicago, will go to Duluth on May 2 to assume his duties. He was in the employ of the Chicago City Railway and the Chicago Surface Lines from January, 1914, to February, 1917, as engineer of tests. The duties of this position consisted of making electrical and mechanical tests of substation transforming and converting equipment. In February, 1917, and up to July, 1917, he was engaged by the sanitary district of Chicago as testing engineer in charge of electrolysis mitigation. During the next two years he was in the aviation corps of the army and saw sixteen months service in France.

From July, 1919, up to the present time he has been with the Chicago Surface Lines as engineer of tests in charge of substation design and installation, his duties including the preparation of power statistics and distribution engineering. While in the employ of the Chicago Surface Lines he has also been consulting engineer for the Hammond, Whiting & East Chicago Railway. Mr. Noah completed his high school education in Kansas City, Mo., and in 1914 completed a four years course in electrical engineering at the Armour Institute of Technology.

H. H. Brown, who leaves the traction field to become associated with a large Eastern manufacturing concern, went to Duluth in 1911 as a clerk in the general manager's office. He has been superintendent since 1916 and has taken a leading part in the safety campaigns in the city. He is chairman of the statistical committee of the Chamber of Commerce safety bureau and has been on the executive committee ever since the organization of the safety division. Most of his time will be spent in Chicago.



H. H. Brown



W. S. Byers

B. G. Noah

J. A. Greig Resigns from Toledo Company

James Ashton Greig has resigned as sales manager of the Community Traction Company, Toledo, Ohio, in charge of the new commercial department. He will leave this post on June 1. At the time of his appointment at Toledo, Mr. Greig had been editor of *Electric Traction* for three years. His work in Toledo was to help secure the proper balance between production and marketing, for he had had many years of experience in railway and merchandising work.

In his early days Mr. Greig decided law was to be his calling and to study for this career he took a position with the Marconi Wireless Telegraph Company, now the Radio Corporation of America. His radio experience shifted his viewpoint to engineering and in 1913 he received his engineering degree at the University of Wisconsin. He later was employed by the Western Electric Company. Then the war came and he was assigned to Radio Company A, 89th Infantry Division. At the close of the war he went to Chicago and was employed by the Fred M. Randall Advertising Agency as merchandising manager.

Mr. Greig joined *Electric Traction* in 1922 as editorial assistant. Later in that year he was made associate editor and the following year editor.

James Ashton Greig was born in Chicago in 1892. He completed his high school work at New Rochelle and later moved to Chicago. He was graduated from Northwestern University in the course of letters and science. During his summer vacations he served as newspaper reporter.

Herbert Tuohy Assistant Traffic Manager at Springfield

Herbert Tuohy, former traffic commissioner of the Springfield Chamber of Commerce, has been appointed assistant traffic manager of the Illinois Traction System. Mr. Tuohy has offices at Springfield and Chicago, but devotes the major portion of his time to the Springfield office, in charge of W. H. Wylie, traffic manager.

Because of an extensive and varied experience in transportation and rate matters, Mr. Tuohy is especially well fitted for the new position, which is created as part of the Illinois Traction System's plan for intensive promotion of its services. The Illinois Traction System is continually entering a wider range of transportation activities, especially in the handling of through freight shipments, which requires an augmented staff of transportation experts.

Mr. Tuohy's first railway experience was gained in Peoria, Ill., where he was associated with the Rock Island, Chicago & Alton, and Illinois Central railways. In 1915 he went to Springfield, first as rate clerk and then as examiner and transportation expert for the Illinois Commerce Commission. Since 1921 he has served as traffic commissioner for the Springfield Chamber of Commerce, in which position he has been especially successful in maintaining relations between the shippers and the railways and at the same time protecting the interests of the city from a rate standpoint. During the World War Mr. Tuohy served with the A.E.F forces in France.

Amon Ing has been reappointed by Governor Baker of Missouri as a member of the Missouri Public Service Commission. His term will expire on April 15, 1933. Judge Ing was appointed to the board several years ago to fill an unexpired term.

Space Applications for Cleveland Show Ready

Applications for show space at the Cleveland convention will be mailed to all members of the American Electric Railway Association on May 16. Thirty days are allowed for filing. All applications received up to the close of business on June 15 will be awarded space by the exhibit committee, which is scheduled to meet June 22 to make the official allotment. If any space remains unsold after the initial allotment has been made, it will be assigned by the director of exhibits in the order in which applications are received.

Exhibits will occupy both floors of the Cleveland Auditorium as well as the entire new west wing. The two buildings will be connected with a covered passageway in which there will be operating maintenance of way exhibits. Track space for the display of street cars will also be provided.

Railway materials, cars, buses and bus accessories, shop tools, garage equipment, etc., will be shown as well as many other items pertinent to the transportation industry. An unusually large and varied display is expected.

Hotel circulars giving rates for the convention together with application forms for reservations have just been mailed to the membership. This is the 46th annual gathering of the association. The convention dates are Oct. 3-7, inclusive. The show opens at 12 noon Saturday, Oct. 1, affording exhibitors an additional day and a half to show their wares.

$500,000 Car Building Program in Milwaukee

With its new Burlington-East Troy cut-off scheduled for completion by midsummer and a still greater use of its Waukesha - Oconomowoc - Watertown Rapid Transit line looked for this year preparations are under way by the Milwaukee Electric Railway & Light Company to have sufficient equipment on hand to meet any demands made upon it by the public. For the present, plans in this direction include the addition of nineteen cars identical to those now in use on the Rapid Transit line to cost $442,000. All of this equipment, which will comprise fourteen motor cars and five trailers, will be built in the company's Cold Spring shops, except four all-steel motor cars which are now being built by the St. Louis Car Company for delivery in July.

Completion of the present car construction program will give the company a total of 45 de luxe cars, interchangeable from one line to another. Improvements in cars provide for the installation of treadle equipment, together with new seating and lighting equipment on 45 city cars. Conversion of these cars for one-man operation will cost approximately $117,500. With this work completed more than half of the company's city cars will be of the one-man type.

Chicago Surface Lines Adds New Automatic Sub

A new 4,000-kw. automatic substation, the first of its kind ever used on the system, has recently been completed and placed in operation by the Chicago Surface Lines on Grimm Avenue, Chicago. It furnishes power for three important cross-town lines in the north and northwest portions of the city, all formerly fed from the substation at Crawford and Ravenswood Avenues.

The new substation was built at a cost of approximately $143,000. It is equipped with two 2,000-kw., 600-volt, 60-cycle synchronous converters. The various units cut in automatically as the need for additional power is felt. The station is equipped with a high-speed supervisory control system which enables the operator at the Crawford Avenue substation, 2½ miles distant, to control both units and all feeder sections.

The erection of the substation is in line with the policy of the Chicago Surface Lines management to keep pace with demands, in spite of the handicap of an expiring franchise. The addition of 445 new cars and an increase of about 500,000 seat-miles operated in more than three years necessarily calls for a marked increase in power. Power consumed by Surface Lines operations last year was approximately 560,000,000 kw.-hr.

Metal Prices Sag in Dull Market

COPPER, lead, zinc, tin, silver and platinum were all selling on April 27 at lower prices than last week, both in New York and in London, but the lower prices are not attracting many buyers.

Copper was held at 13⅛ cents Valley delivery last Thursday, but as early as Friday at least one seller was willing to book orders at 13 cents and did a fair business during the next few days at that level, as most others were quoting 13⅛ cents. Producers' ranks gradually weakened to the 13-cent level, however, and that price was general on April 27.

Business has reverted to the quietude that characterized the market in March and no great activity is expected until the April statistics are issued about May 10. Indications are that these will be distinctly favorable and will confirm the March trend. Companies manufacturing brass and sheet copper report a continuance of excellent business, fully up to the 1926 rate, though wire business is slack. May copper seems to be pretty well contracted for; producers are well sold on this position and consumers do not seem anxious for prompt shipment. One good block of copper was sold for delivery as far ahead as July and August.

The export market has been lifeless until April 27, when the export association reduced its c.i.f. price from 13.50 to 13.35 cents, resulting in a little more buying. Most of the inquiry abroad is for prompt shipment.

CURTAILMENT IN ZINC PRODUCTION

Zinc sold at varying prices between 6.25 and 6.35 cents at St. Louis on April 21, with the largest volume at the lower limit. Since then the market has gone as low as 6.10 cents for all deliveries, at which level a fair business was done on Monday and Tuesday. Sales have been at about the same rate as during the last five weeks and well below the average rate for the year to date. Further curtailment in production is likely as ore approaches $40 a ton, $41 being last Saturday's figure; this is the logical remedy for the situation. High grade is now offered at 8 cents delivered in the East.

A moderate volume of lead business was transacted in the St. Louis market during the week ended April 27, though at definitely lower price levels, 6.55 cents being the prevailing figure since April 25. The New York market has been exceedingly dull and except for contract sales very little lead has brought the Smelting company's official New York price of 7 cents. A price of 6.55 cents in St. Louis is equivalent to 6.90 cents in New York and this is very close to parity with London for foreign ore lead.

The speculative situation in London caused a decline in tin to a low of 66½ cents for prompt Straits on April 25. Since then both the foreign and domestic markets have recovered some of the lost ground.

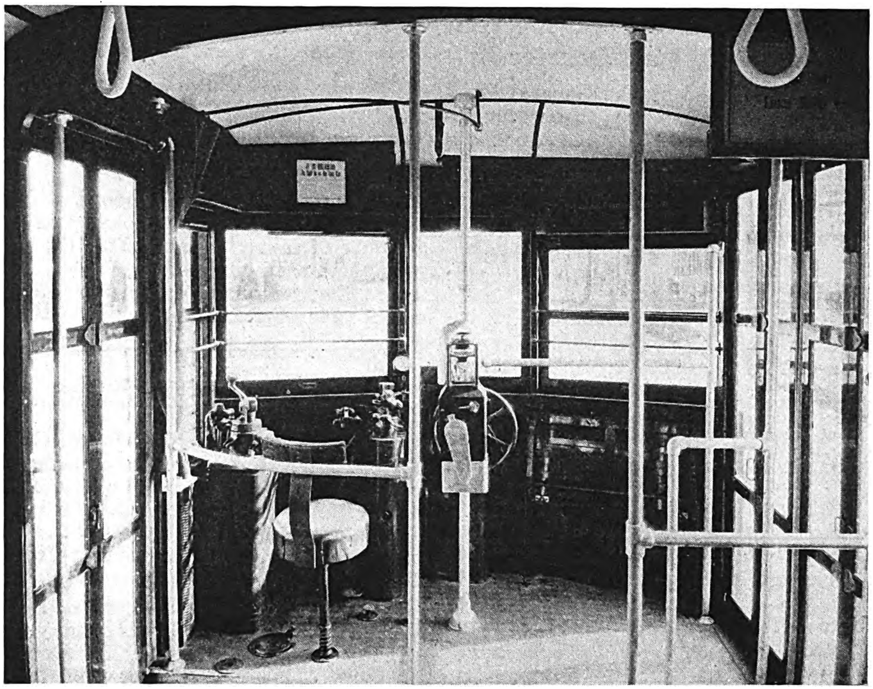
METAL, COAL AND MATERIAL PRICES
F. O. B. REFINING

Metals—New York	April 26, 1927
Copper, electrolytic, cents per lb	12.775
Copper wire, cents per lb	15.125
Lead, cents per lb	6.95
Zinc, cents per lb	6.46
Tin, Straits, cents per lb	66 75
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.475
Somerset mine run, Boston, net tons	1.875
Pittsburgh mine run, Pittsburgh, net tons	2.25
Franklin, Ill., screenings, Chicago, net tons	2.50
Central, Ill., screenings, Chicago, net tons	2.00
Kansas screenings, Kansas City, net tons	2.50
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	$5.50
Weatherproof wire base, N. Y., cents per lb.	16.75
Cement, Chicago net prices, without bags	2.05
Linseed oil (5-bbl. lots), N. Y., cents per lb.	11.30
White lead in oil (100-lb. keg), N. Y., cents per lb	14.50
Turpentine (bbl. lots), N. Y., per gal	$0.645

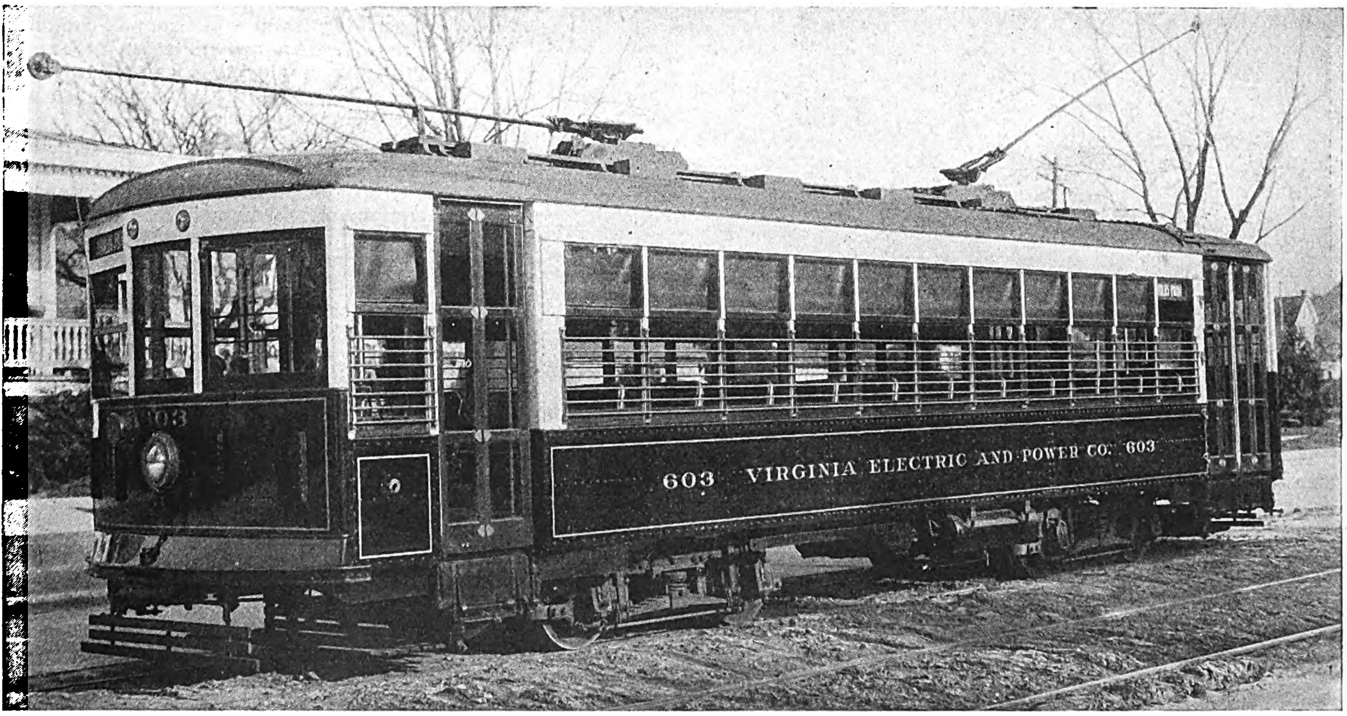
Virginia Electric Power Company Operating New Cars

As recorded in the JOURNAL for March 26, the American Car Company of St. Louis has delivered five of the ten cars ordered in December, 1926, by the Virginia Electric & Power Company, Norfolk, Va. The new rolling stock is of the closed, city passenger, semi-steel type with a seating capacity of 44. Almost immediately upon receipt the cars were put in service on the Port Norfolk and Pinners Point line of the Portsmouth division. Prior to this, the company staged a parade for the new equipment, and had as its guests City Manager Hanrahan, representatives of civic associations, and the press. The hosts on this occasion were J. Frank McLaughlin, then vice-president Norfolk division; T. Norman Jones, general manager Norfolk division, and S. J. Pope. Before the trial run and parade, an inspection was held at the intersection of High and Court Streets, Portsmouth. The trial trip was made around the Crawford Street loop, thence to Mount Vernon Avenue on High Street and return. Complete specifications are as follows:

Type of car	One-man, two-man, motor, passenger, city, single-end, double-end, double-truck
Builder of car body	American Car Co., St. Louis, Mo.
Date of order	Dec. 1, 1926
Date of delivery	March 1, 1927
Weight, total	36,000 lb.
Bolster centers	19 ft. 7½ in.
Length over all	41 ft. 8½ in.
Truck wheelbase	5 ft. 4 in.
Width over all	8 ft. 5 in.
Height, rail to trolley base	11 ft. 0 in.
Body	Semi-steel
Roof	Arch
Doors	End
Air brakes	Westinghouse
Armature bearings	Plain
Axles	Brill
Bumpers	Channel
Car signal system	Faraday
Car trimmings	Statuary bronze
Control	Westinghouse K-25
Couplers	Pocket
Curtain fixtures	National Lock Washer ZO
Curtain material	Pantasote
Destination signs	Hunter
Door mechanism	National Pneumatic
Doors	Folding
Fare boxes	Johnson
Finish	Enamel
Floor covering	Linoleum
Gears and pinions	Westinghouse
Hand brakes	Peacock staffless
Hand straps	Rico
Heaters	Consolidated
Headlights	Ohio Brass ZP
Headlining	Haskelite
Interior trim	Mahogany
Journal bearings	Plain
Journal boxes	Symington
Lightning arresters	Westinghouse
Motors	Four Westinghouse, No. 510, inside hung
Safety car devices	Safety Car Devices Co.
Sanders	Ohio Brass
Sash fixtures	O. M. Edwards
Seats	Heywood-Wakefield
Seating material	Genuine leather
Slack adjusters	Westinghouse
Springs	Brill
Steps	Folding
Step treads	Feralun
Trolley catchers	Ohio Brass
Trolley base	U. S. No. 20
Trucks	Brill No. 177 E1X
Ventilators	American Car Co., six per car
Wheels	Standard 27 in.
Wheelguards	H-B lifeguards
Special devices	E. Minier window cleaners



Front platform showing control equipment of the new Virginia Electric & Power Company's cars, five of which were delivered late in March by the American Car Company of St. Louis. These cars were immediately put in service on the Port Norfolk and Pinners Point line



Latest city type passenger car to be placed in service by the Virginia Electric & Power Company on its Portsmouth division

$77,550,581 in General Electric Orders in First Quarter

Orders received by the General Electric Company for the three months ended March 31, 1927, total $77,550,581, compared with $86,433,658 for the same quarter in 1926, a decrease of 10 per cent.

The statement of earnings for the first three months of 1927 follows:

Net sales billed	$72,474,474
Less: Cost of sales billed, including operating, maintenance and depreciation, charges, reserves and provision for all taxes	63,641,300
Net income from sales	$8,833,173
Other income, less interest paid and sundry charges	2,838,557
Profit available for dividends	$11,671,731
Less: Cash dividends on special stock	643,587
Profits available for dividends on common stock	$11,028,143

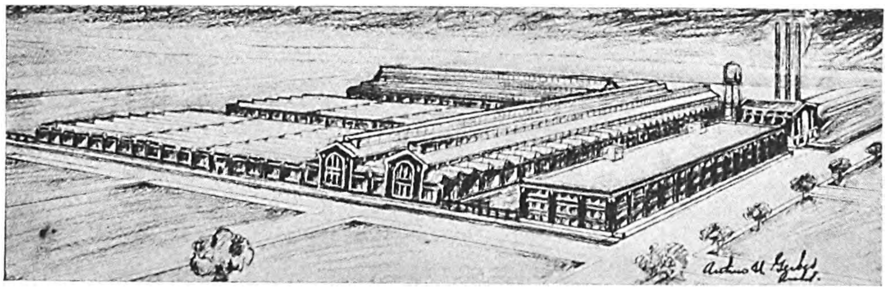
The net earnings are equivalent to about $1.53 a share on the 7,211,481 shares of no par value common stock outstanding.

$4,500,000 for Shops for Chicago Rapid Transit Company

A $4,500,000 shop construction program has been launched by the Chicago Rapid Transit Company in Niles Center, with the ultimate object of consolidating all shops in this one location.

Ten separate units covering an area of 15 acres are included in the completed project. The structures will be so laid out and connected as to afford the utmost efficiency in the handling of cars and equipment.

Construction work is now under way on the first unit of the big group, which will be one of the most complete and extensive mechanical plants in the country. This unit is the paint shop, which is 200 ft. x 224 ft. in outside dimensions. Present indications are that this building will be ready for occupancy some time in May.



Architect's drawing of new Niles Center shops

All the buildings in this comprehensive construction program have been designed with a view to making them architecturally attractive and in harmony with other structures in this suburban community. The walls are of Old English mission brick with cast stone trimmings. B. J. Fallon, vice-president, said:

> Consolidation of all the shops of the Rapid Transit lines in one convenient location is a logical step in development and expansion of our properties. When the elevated lines were brought under one management it was necessary to continue use of the various shops scattered over the city. Present requirements, however, call for a centralized plant where all work can be done with the greatest efficiency and despatch.
>
> The new shops will greatly facilitate the work of keeping our rolling stock in perfect condition and thereby increase our ability to give the people of metropolitan Chicago the utmost in safe, fast and reliable transportation service.

The present divisional shops will be used for inspection purposes and the making of minor repairs after the new plant has been completed. Provision is made for adequate expansion of the new shops as necessity arises.

Track and Line

Piedmont & Northern Railway, Charlotte, N. C., is reported as considering an extension of its electric line from Charlotte to Danville, Va. Plans call for an extension from Charlotte to Lexington, N. C., and from Winston-Salem, N. C., to Danville by way of Reedsville.

Milwaukee Electric Railway & Light Company, Milwaukee, Wis., has been granted the right by the City Council to build a rapid transit cut-off for a distance of ten blocks in the city limits. As part of the new work the company will relocate part of its Milwaukee-Waukesha and Watertown rapid transit line for a block south of the right-of-way, instead of along Fairview Avenue. Gates will be placed at all crossings.

Trade Notes

Chicago Fuse Manufacturing Company, Chicago, Ill., manufacturer of Union and Gem fuses and conduit fittings, announces the appointment of W. A. Wilcox as district sales manager, with headquarters at St. Louis. Mr. Wilcox will have charge of sales over southern Illinois, eastern Missouri, western Tennessee, Mississippi, Arkansas and Louisiana. Prior to this appointment Mr. Wilcox was associated with the Economy Fuse & Manufacturing Company for more than eight years.

Earl E. Knox, who for twenty years has represented Bury Compressor Company in the Pittsburgh district, has been appointed general sales manager, in full charge of sales and advertising, and will be located at Erie, Pa.

Joseph V. Smith, formerly general manager of the shovel interest of Hubbard & Company, Pittsburgh, has been appointed Pacific Coast manager for the electrical materials department of the company with headquarters at the Oakland, Cal., plant.

Pittsburgh Testing Laboratory, Pittsburgh, Pa., to serve better its many clients in the rapidly growing Youngstown district has equipped its branch there for all kinds of physical lists on engineering and construction materials. A part of the equipment is a 200,000-lb. Universal Olsen testing machine. H. L. Christman, a resident in that section for many years and well known to the manufacturing interests there, is in charge of the plant. Mr. Christman has been identified with the testing and inspection profession for more than twenty years.

Tuco Products Corporation, 30 Church Street, New York City, announces the appointment of Carl H. Kadie as successor to Frank N. Grigg, who for the past fourteen years has represented the company in the Southeastern territory. Mr. Grigg resigned on account of ill health. His successor's appointment took effect April 1.

New Advertising Literature

Sullivan Machinery Company, Chicago, Ill., has published bulletin 81-I, second edition, on Sullivan concrete breakers. It describes two types of tools, a 75-lb. or heavy-duty buster and a 48-lb. light buster. The bulletin is liberally illustrated to show different applications of concrete breakers in many parts of the country. In addition to the familiar uses, for breaking up pavement or building walls, etc., pictures are shown of busters digging a tunnel in hard sandstone, driving sheet piling, excavating slag under an open hearth steel furnace, used as a pneumatic spade for digging hard pan, breaking down a mountain of furnace slag, which rock drills would not handle, and trimming the walls of a trench for electric conduits.

Crouse-Hinds Company, Syracuse, N. Y., is mailing a decorative circular describing its new "Obround" condulets Form 7. An orange color scheme is skillfully employed to set off the various cuts. The new condulets are also listed in catalog No. 2100.

Martindale Electric Company, Cleveland, Ohio, issued on April 1 Catalog No. 8 describing its motor maintenance equipment. Among other things the catalog includes a center-page spread of a carbon brush maintenance and trouble chart.

Sullivan Machinery Company, Chicago, Ill., has published bulletin 76-G, second edition, on Sullivan electric portable hoists. Sullivan single and double drum electric portable hoists are described, together with many application pictures. The adaptability and power of these small machines, having a 6½-hp. motor, is graphically shown. The single-drum hoist is used for such jobs as car pulling, erecting steel on derricks or with gin poles, decking logs from railway cars, pulling coal cars in mines, unloading box cars with a scraper, while the double-drum unit is employed for jobs requiring two ropes such as scraper loading in mines, trimming coal piles at power plants, operating conveyor systems in coal mines or hauling sawmill refuse with a drag line and power rake.

Long Live Will Livelong!

FOR 30 days and 30 nights the destinies of children, pedestrians and automobilists in the city of Philadelphia have been watched over and guarded zealously by a Safety Sage of wide repute, by name Will Livelong. The month of April was dedicated to the task of insuring greater street safety. Any such ambitious program as this is always a task, due to the apparent reluctance of the average human being to be concerned with the safety of himself and his fellow men while on the highways. Undismayed by the magnitude of the undertaking, a number of agencies in the city most directly concerned with the accident problem laid out extensive plans for conducting an intensive safety campaign.

To enlist the sympathy of the public and the man in the street there had to be an appeal to his sentiment and to his logic. In the safety campaign conducted in New York several years ago this appeal was made through the mythical character "Aunty J. Walker." The campaign just concluded in Philadelphia went a step farther. As recounted in this issue, the central figure was a kindly, wise old man dubbed "Will Livelong," the Safety Sage. Being an actual person, it was possible for the safety committee to stimulate much general speculation as to his identity, and to disclose it only at the end of the campaign. This interest was built up until, when April 30 rolled around, Mr. Livelong was probably the best-known and most popular character in the city. By ascribing all safety messages and slogans to the sage, the safety committee which directed the campaign was able to take all the sting out of the warnings and to place the educational work on a plane of friendly interest rather than one of officious interference.

Results obtained from the campaign were good. Philadelphia was ripe for a concerted effort such as this, coming just when the warm spring days brought thousands of automobiles out on the streets and induced a spirit of joyous and carefree abandon in the breasts of pedestrians, young and old. The coverage of the campaign was amazing when it is considered that only $10,000 was spent. This sum, of course, covered only materials and was not used to compensate the members of the safety committee for their long and arduous labors in the cause of safety. It shows what can be accomplished when the community backing of a worthwhile movement may be obtained.

It is interesting to note that it took more than 2½ weeks of concentrated effort to overcome the momentum of the ever-rising accident toll and to start the trend downward. In the final analysis such a campaign as this is of little economic value unless its effects are fairly permanent. Encouragement is seen in the decision of the various organizations most active in the April campaign to carry on the work of safety education throughout the year. The lovable old character, Will Livelong, will probably find himself much in demand in Philadelphia and elsewhere in the months to come. As things stand now, were he politically ambitious he probably could be elected mayor!

Should Government Ownership Propaganda Be Ignored?

SOME difference of opinion seemed to develop at the recent meeting of the Southwestern Public Service Association and the Southwestern Geographic Division of the N.E.L.A. as to whether or not the utility industry should actively take the field against the threatened campaign by a radical group in Congress for government ownership of utilities. Sentiment on the part of some in the meeting was that even by attacking it, recognition was given to what is at present only a nebulous attempt to organize a movement for government ownership. Others in the meeting advocated openly attacking political ownership—for that is what it amounts to—and exposing the motives of its proponents.

There is no fundamental difference of opinion between these two groups of utility men. They both agree on the need of crushing, as one would crush a rattlesnake, this sinister threat against the security of American business through undermining its foundation of private initiative. The issue at stake is greater even than the utility industry. Political ownership of utilities would be merely the first thrust of the unscrupulous seekers for self-aggrandizement into the heart of all American business. Light and power would be only the beginning. That is the logical starting point for these champions of the "peepul," because light and power is a young and growing industry. Its very achievements, which read almost like a fairy tale, offer the necessary appeal to popular imagination for building up the story of "grasping corporations." But others would feel the attack quickly. Next would come city transportation, railroads, telephones and telegraph, coal, steel and other basic commodities, and finally business itself. What is there in favor of political ownership of the one, compared with regulated private enterprise, that does not apply equally well to all basic services and commodities and then to all business?

Ridiculous on its face? Certainly. But nevertheless the threat of a government ownership campaign has been made and the utility faces the responsibility of forewarning the public in order that it may know how to deal with those who would feather their own nests while pretending to serve the country's interest. The question is when and how? The answer is immediately by every medium that is available for reaching the public. But a word of caution is advisable. There is no issue on government ownership in this country at the present time. There is no movement under way which is worthy of recognition as such. The utility story should be merely the facts of private ownership and operation. But the time to tell it is before an issue arises.

More Recreation Makes Better Railroaders

"WE DON'T keep bankers' hours in this office" was the boast of the old-time railway executive. Nowadays sentiments of this kind are voiced less frequently. This is not because transportation men today keep "bankers' hours," whatever they may be, but rather because the thinking of the industry has changed in regard to the proper relation between work and recreation.

After all, it is not the number of hours a man puts in that counts, but the amount of work that he accomplishes. Recreation, often confused with amusement, really means a renewal of energies. To offset the severe drain on his physical strength made by concentrated efforts, it is necessary that a man have recreation, that he be "re-created" from time to time. This fact is attested by scientists, teachers and physicians. It is constantly receiving wider recognition in the electric railway industry.

Moreover, recreation presents an opportunity for making more contacts with other people. In this respect the average railway man has been notably deficient in the past. It gives him a better understanding of what his neighbor is thinking—including his attitude toward the railway. The value of personal contacts and knowledge is inestimable.

The transportation business, of course, cannot be run always on a basis of regular hours of work such as prevail in many other industries. Storms, accidents and other emergencies are bound to occur, often requiring long-continued strenuous efforts by every one before the cars are again running smoothly. Under normal conditions, however, the transportation man ought to pause long enough from his work to take regular recreation. He should regard this not as a waste of time but rather as a vital necessity.

Parking Should Be Allowed —On Some Other Street

IN EVERY city the advocates of a general policy of liberal automobile parking regulations are legion. But they do not agree as to where parking should be allowed and where it should be forbidden. Each one favors it everywhere except in front of his own door. Theater patrons want to be able to park their automobiles close by. On the other hand, the man who lives near a moving picture house objects to having his own curb lined with the automobiles of strangers. Merchants desire to encourage automobile trade by liberal parking privileges, but they are opposed to any regulations that permit vehicles to block the approach to their own stores.

The absurdity of the position taken by some of the advocates of parking has seldom been more clearly demonstrated than during a recent hearing at Philadelphia. A prominent merchant appeared before the City Council in opposition to the parking ban in the downtown business district. He declared that the merchants in his neighborhood were practically unanimous in favor of automobile parking. He admitted, however, that some time previously he had asked the Police Department to place "no parking" signs in front of his own store. His explanation was that he did not think it practicable to permit parking in front of his particular store, but that he believed it should be allowed elsewhere.

As an isolated incident the testimony of this merchant before the Philadelphia City Council is rather ludicrous. But it betrays the existence of a situation that is far from ludicrous. Too many people are thinking about traffic problems in terms of their own personal convenience. No solution will ever be found by that means. Traffic and transportation are community problems that can be solved only by community thinking—the submergence of the individual in favor of the public.

How Are We Going to Accommodate Them?

BY THE year 2027 the world's population will have multiplied itself 32 times. Such is the astounding statement of Prof. A. E. Ross, the noted University of Wisconsin sociologist. In other words, Professor Ross predicts that in that year there will be 60,800,000,000 of the *genus homo* running all over the globe. According to this authority the population of the world has doubled in the last 90 years with a birth rate of 45 per 1,000 and a death rate of only 15 per 1,000.

While, of course, most of us won't have to worry about standing room in 2027, we will, on the other hand, have to watch our step as to what we must do in the next 25 years to transport these millions yet unborn.

Seriously, this is a new angle and at the same time a powerful argument for better transportation service. How are we going to accommodate these millions that are drifting toward this globe from the land of shadows? Unquestionably, they are going to require bigger and better and more de luxe transportation; that is, if the rapid change of tastes of this generation is any criterion. What is the solution? It rationally is new cars, better cars and an unceasing study as to how we can improve our construction practices in order not to be swamped by the human deluge.

Don't let us make the mistake of laughing up our sleeves at the professor, especially when we see how the fanciful flights of Jules Verne have become common realities today. When we are prone to plan for ten years ahead when we should plan for twoscore, let's remember that 2,635 years ago Nahum, the prophet, wrote, "The chariots shall rage in the streets, they shall jostle one against the other in the broad way. They shall seem like torches, they shall run like lightning." Possibly had he been heeded instead of razzed, the steam train and the automobile would have been developed centuries ago, and maybe—who can tell—there would be no such thing as a 30-ft. street or a traffic cop.

We have the handwriting on the wall before us. We must realize that super-transportation is knocking at our doors; that in the next decade we may have four-decked streets; that every railway right-of-way will be double decked; that street cars will be operated with dining car service between the home and office; that the gigantic influx of population will demand millions of street cars, taxis, buses, private cars and airplanes; that competition will engulf us if we do not build better track, better cars; if we do not plan and develop in the super sense. All about us are frontiers to which we must bring the thin but determined line of progress. It is a great task that Professor Ross' prediction outlines for us. It will take colossal energy and the unselfish co-operation of every man in the electric railway industry.

Let's Not Ride a Willing Horse to Death

NOTABLE progress has been made recently by electric railways in securing relief from paving obligations. Five states have enacted legislation lifting this burden from the shoulders of the car riders, and many individual municipalities have made similar agreements with the companies operating within their limits. In so doing the public authorities have taken a reasonable attitude, and have shown their willingness to meet the companies half way in the solution of the transportation problem.

Because a railway has been granted partial relief, however, it should not assume that it no longer has any paving obligation whatsoever. Some of the new agreements stipulate annual lump sum payments in lieu of paving. Sometimes the obligation is to pave only a narrow strip, or merely to maintain the track pavement. But in every instance where details are available, a certain measure of responsibility for paving continues to rest on the railway.

Scrupulous care must be exercised to see that the remaining obligation is carried out. Quibbling over details, resort to technicalities to postpone execution of the work, disavowal of damage actually resulting from car operation, will serve only to make public officials regret that relief was granted to that railway. Word of it will quickly reach other localities where relief from paving burdens is under consideration. The fair-dealing company in one city may thereby be prevented by the actions of a delinquent company in another city from securing just and reasonable relief.

The Politician Is Not So Bad as He Is Painted

NOT so long ago the public relations problem of a large railway had reached such an acute stage that it was simply impossible for the utility to come to an understanding with the city council on any large question involving its right to conduct business at a profit. A change in management became imperative.

Shortly after the change things began to hum. Civic organizations went on record as favoring the company's viewpoint, the newspapers called for prompt agreement and within a few months an overwhelming majority of the councilmen passed a series of ordinances that had been hanging fire and under fire for more years of bickering than these months of harmony.

What lay at the root of the former management's failure? Poor service, excessive fares or lack of civic interest could not be blamed. The fault lay in an attitude—a state of mind. The management kept proclaiming and declaiming that all politicians were crooks; that its motto was: "Millions for defense but not one cent for tribute." It fostered the belief that the only barrier between the company and the public was the politician's itching palm.

The sequel has proved that this attitude was due to a gross misconception of the average politician's point of view. Instead of assuming that the politicians were either crooked or stupid, the new management went on the basis that they were decent human beings who simply needed a man-to-man approach instead of a shower of brickbats. Painstakingly the wants of each district were studied in association with the councilmen. Then, when an agreement was in prospect, it was possible to give to these so-called politicians a very large degree of credit for the contemplated improvements in service.

Was the Umph Street line to be extended? Yes, through the untiring efforts and ingenuity of Aldermen Snibble, it was. Were five of the new soft-cushion seated cars to go on the Woof Avenue line? Sure, Alderman Waffle's arguments had not been in vain. Would transfers be given between the trolley and the bus routes? They would be, thanks to the clarion cry of "One City, One Fare" originated by Alderman Ginpeel.

Instead of calling the aldermen harsh names, the newspapers commended them; nor have we heard that any of these gentlemen were refused re-election because they voted for ordinances that actually allowed the utility to grow and prosper in the proportion that it helped its community grow and prosper.

Another Call to Join the Art Movement

WHILE arguments fly back and forth concerning the advantages or disadvantages of standardization in industry, an exposition of Art in Trade was held in a large Eastern city from May 2 to May 7 inclusive. As a result of this effort the movement for transforming commonplace things into objects of beauty has advanced a step further and will likely add to its roster many new adherents. Although the exhibit itself was directed more particularly to home furnishings and household utilities, its purpose embraced all industries in an alliance between the manufacturer and the fine arts.

Assuming that every railway manager as an individual has a dormant capacity for art, consider how broad and varied is his field for expressing it! Take the trolley car itself, formerly a mere mechanical contrivance for carrying people, but now a transportation vehicle, in the development of which no effort has been spared to combine beauty and utility. That manager has joined the industrial arts crusade who paints his vehicles artistically as well as economically, who is an unrelenting purist in the matter of car windows, who replaces the old-fashioned hideous posters with those of artistic design, enticing the riders to travel to the end of the line; who dismisses the agent slatternly in appearance and sluggish in response and replaces him with the neat, courteous and willing salesman. In numerous other details the alert railway manager has opportunities to inject art into his industry.

If he has been slow to accept the doctrine in the past let him get back of the movement now, for industrial arts today is on a plane with the fine arts. In the words of Robert W. De Forest, president of the Metropolitan Museum of Art, New York, addressing the recent exposition, industrial arts is no longer an orphan. Though much is to be said about the standardization of industry, the individual at heart has often been a Muse, although his capacity sometimes seems latent. May this latest effort sound the tocsin to arouse laggards to a realization that, whether the product be soap or railway service, consideration of the subject of industrial arts as a potent fact in every-day life can no longer be ignored.

"Make April Safe"

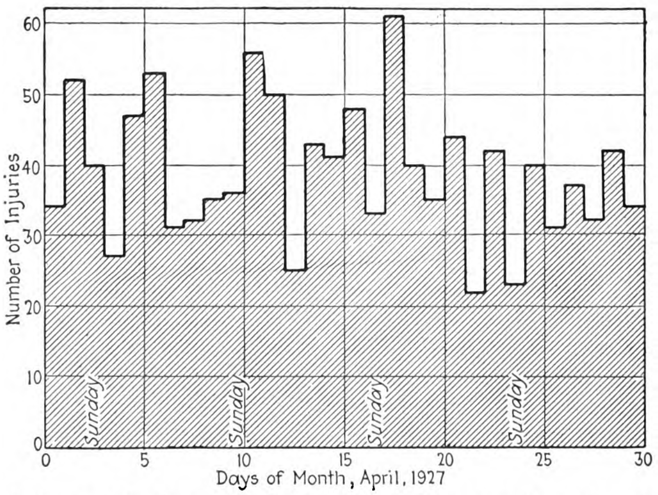
Was Philadelphia's Slogan

Under the genial sponsorship of "Will Livelong," the Safety Sage, an intensive month-long campaign was carried on to reduce street accidents—Enthusiastic support to the movement was given by all progressive elements in the community

SOMETHING out of the ordinary in safety campaigns was carried on during April in Philadelphia, when a real, flesh-and-blood character was used to typify the kindly old Safety Sage of a community movement to reduce street accidents. For a period of 30 days the quizzical glance of "Will Livelong" rested upon young and old, autoists and pedestrians, everywhere in the Quaker City. His common-sense advice and gentle admonitions were heard and seen by all but the deaf and the blind. As a result, Philadelphians were awakened to a degree of accident consciousness never before attained. Street fatalities during April, the "safety month," showed a decrease of 26 per cent from the number recorded for the same month in 1926. The rising tide of injuries was stemmed and, for a time at least, started downward once more. April was a month of intensive effort and of gratifying achievement.

Backed by the Philadelphia Rapid Transit Company, the citizens' safety committee of the Philadelphia Chamber of Commerce, the public schools, the automobile clubs, the Department of Public Safety, and numerous other civic bodies, the campaign got off to a good start on April 1. Prior to this, very definite plans had been laid out by the safety committee to carry the campaign through a number of distinct weekly phases during the course of the "safety month."

The first problem was that of finding a suitable character around which the warp and woof of the whole campaign might be woven.



Injury peak days and the general injury trend continued to rise until the eighteenth day, when a marked decline set in

By a happy inspiration the name "Will Livelong" was hit upon. To fill this rôle of a kindly old safety philosopher, an admirable choice was made in the person of W. F. Hogan, a venerable retired engineer, who, many years before, had been active in the construction of the cable and horse car lines in various sections of Philadelphia. From the very outset he was a popular and fascinating personage. No announcement as to his true identity was made until the very end of the campaign. That, however, only whetted the public taste and increased the popularity of the character.

Having established "Will Livelong" in the public eye as a character whose advice on matters of street safety was worthy of careful attention, the campaign committee proceeded with the various phases of the month's drive, always using the Safety Sage as the mouthpiece for any and all slogans and messages which were to be presented to the public.

As street accidents may roughly be divided into three general classifications, those involving children, pedestrians and general vehicular accidents, it was decided to assign a full week to a specific drive on each of these prolific sources of casualties. After a two-day introductory period, the month was divided as follows:

April 3 to 9—Children's Safety Week.

April 10 to 16—Pedestrian Safety Week.

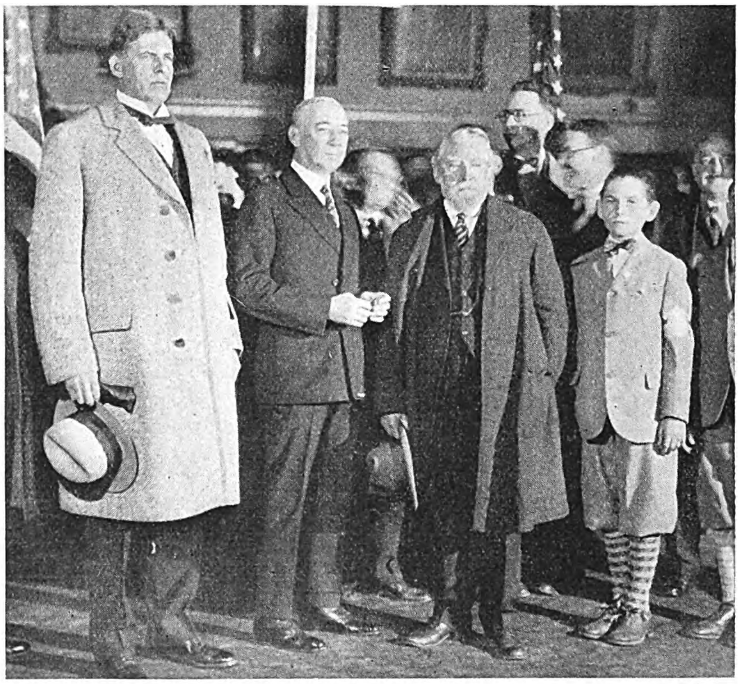
April 17 to 23—Automobile Safety Week.

April 24 to 30—A period for warring on all forms of street accidents in which to perpetuate the safety work throughout the year.

During the introductory period of two days efforts were made to line up every possible factor in the community which might be persuaded to assume some part, great or small, in helping to put over the campaign. Letters were sent to more than 250 clubs in the city asking that resolutions be voted indorsing the movement and pledging the active participation of the groups and of their individual members in the city-wide effort to reduce the street accident hazard. A meeting of newspaper representatives from the large city dailies was called and plans for the campaign were discussed with them in detail. In addition, some forty community and foreign language papers were contacted with and asked to give their full support to the general campaign, as well as to undertake a more localized drive among their own readers. It might be said here that the backing given to the safety movement by the press, particularly by the smaller community and foreign language papers, was more than gratifying.

The seven broadcasting stations of Philadelphia and station WCAM in Camden also gave unstintedly of their time "on the air" to speakers furnished by the safety committee. Equally gratifying was the assistance rendered by the moving picture and legitimate theaters. Advertising space in the programs was donated by the companies and many of the theaters used safety slides on their screens.

Each year the accident toll in Philadelphia had risen and there appeared to be real need for a concentrated effort to make the people "accident conscious." The Philadelphia Rapid Transit Company, which conceived the idea, realized, of course, that far more comprehensive results could be obtained from such a drive if it were sponsored and participated in by every factor in the community, which was directly concerned in the street accident problem, than would be possible if it were undertaken by one agency. Therefore, while the campaign was financed largely by the transportation company, an appropriation of $10,000 being set aside for this purpose, and while a major portion of the actual work of conducting the campaign was done by members of the P.R.T. organization, the company itself figured publicly only as one of the "co-operating bodies." Special letterheads were prepared, carrying the names of the principal organizations which were active in the work. Special "Will Livelong" Safety Campaign press release sheets were used in making announcements to the papers. Those employees of the transportation



A reception was held in the Mayor's office. From left to right are Fred W. Johnson, chairman of the citizens' safety committee; Mayor Kendrick and Will Livelong (W. F. Hogan)

Will Livelong was accompanied to the City Hall on the 29th by a guard of honor composed of Safety Patrol officers from the various Philadelphia schools

NEW 'SAFETY FIRST' DRIVE OPENS FRIDAY

Score of Civic and Commercial Groups to Conduct Campaign Throughout April

"WILL LIVELONG" IS BOSS

A new "Safety First" movement, participated in by a score of Philadelphia civic and commercial organizations and motor clubs, will start on Friday.

During April an effort will be made to call the attention of every man, woman and child throughout the city to safety ideas to reduce accidents of every description.

The Philadelphia Rapid Transit Co. has joined in the movement. Industrial concerns have promised their services and motion picture theatres will help by showing special safety films, particularly on Saturdays.

MR. "WILL LIVELONG"

Behold, the Safety Sage, who will reduce accidents by his wise counsel during the safety campaign in Philadelphia.

Here's a wonderful chance to meet a great old fop with smiling optics, gray hair and a head full of wisdom

A CRUSADE FOR SAFETY

Alliteration's artful aid may assist the new Safety First Campaign to avoid all accidents in April. What more appropriate month could be named for the purpose? The motorists are picking out new pathways, if they can find them. The children are finding new joys in playing out of doors. The housewives are thinking about spring cleaning and it is well to keep an eye out for a rolled up rug, a misplaced broom handle or a bucket on the stairs. Ladders are being brought into play and they are dangerous weapons. The jaywalker is one of the early birds of spring and with the lassitude of the spring and with the relaxation

No April Fools

Will Livelong Heads Campaign to Make Month Safe

The keen blue eyes, ruddy face, silver hair and pipe of "Will Livelong," the safety sage, will soon be known to Philadelphians. You will see him all around town. On the billboards, trolley cars, elevated lines, automobiles, street crossings and, in fact, anywhere

"WILL LIVELONG" TEACHES SAFETY

"Make April Safe" is Maxim of Merry Individual for the Public

WHISTLES BLOW FOR SAFETY

Factories Urged to Enter "Will Livelong" Campaign Today

"Blow Your Whistle and Save a Life Day!"

Every factory and industrial plant equipped with a siren or whistle is urged to carry out the above slogan today by sounding a signal for a full minute, beginning at 3 P. M. The appeal is made by the "Will Livelong" safety campaign as a feature of Automobile Safety Week. "This is the zero hour for children when schools all over the city are dismissing their pupils and the youngsters are starting on their homeward journeys,"

Careless of Their Future

Will Livelong, the Sage of the safety campaign now in progress throughout the city, today said: "Kids that play in the street have no respect for their future. The sidewalk is the safest. Make April safe."

"Watch your step!"

SAFETY CAMPAIGN GETS UNDER WAY

Widespread Drive to Reduce Accidents Here Will Last Whole Month

MANY ORGANIZATIONS AID

A widespread safety campaign was started today in Philadelphia and the vicinity. Many civic and commercial organizations will participate in the campaign during the month. An attempt will be made to call the attention of every Philadelphian, adult or child, to safety ideas which will reduce accidents of all kinds, especially on the streets.

WHISTLES TO SOUND SAFETY REMINDER

Will Blow for One Minute at Every Industry on Friday Afternoon at 3

"Will Livelong" Plans Signal as Schools Close for Effect on Motorists

Every individual plant in the city will be asked to blow its whistle for one full minute at 3 o'clock next Friday afternoon in a test to ascertain the psychological effect upon motorists as a safety plan.

At that moment school children will be departing

SAFETY PATROL of Thomas School, 8th and Clearfield streets, under Captain Charles Dessaler, makes crossings safe for pupils

FOR COMMON SAFETY

Reinstatement of the Salus anti-pistol bill on the Senate calendar seems to indicate a change of heart among some of the twenty-five Senators who voted against its final passage Monday evening. Arguments that prevailed against the appeals of Judges, District Attorneys and police officials appear to have been punctured.

SIGNALS SAY STOP, BUT JAY WALKERS GO

This is said to be one of the worst intersections in the city. Market street at 8th, where three large department stores attract large crowds. Traffic is moving east and west and at the same time pedestrians are attempting to cross between the two lines of cars. Traffic policemen say jay-walkers cause more accidents than motorcars, because of their utter disregard of signals and of the reckless way in which they take chances in crowded streets

Hearty co-operation was given by the Philadelphia press, many stories and editorials similar to those shown above being used. The foreign language and smaller community papers were particularly helpful

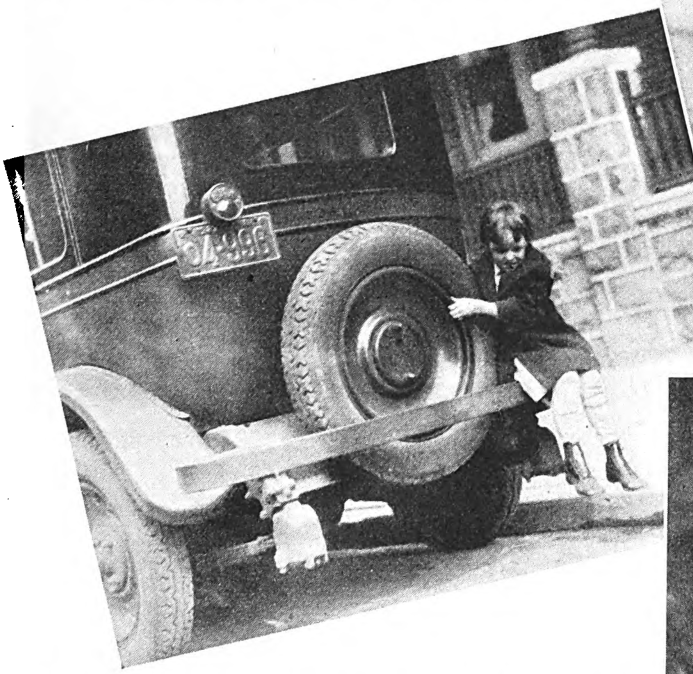
Here are shown typical examples of the car, bus and taxi signs, window posters, letter stickers and handbills used during the campaign company whose time was devoted almost wholly to the work of the safety campaign were in a sense temporarily divorced from the company and were simply a part of its contribution.

Representatives of the various participating bodies spoke frequently from the different radio stations and were invaluable in lining up still other organizations behind the campaign, so that it took on the aspect of a rolling snowball, ever increasing in size and momentum.

WHAT P.R.T. DID WITHIN ITS OWN ORGANIZATION

At the outset of the campaign the transportation company undertook an intensive drive within its own ranks, with a view to reducing to a minimum the total of car and bus collisions during the safety month. Its officials addressed groups of employees at the various carhouses and bus garages for several days, until complete coverage had been obtained. A special issue of the employee organ, the *P.R.T. Co-operator*, was distributed among the 12,500 men and women of the organization. In it appeared a number of safety articles. Coverage in the Yellow Cab Company organization, also operated under Mitten Management, was secured through a special safety supplement of the *Yellow Age* and by safety talks and special cab cards bearing sayings of the Safety Sage.



Probably the most widespread medium of publicity used in the campaign was the carrying of dash, bulkhead and ceiling rack signs on all of the street cars, dash signs on the buses and various types of signs on the subway-elevated cars and on the station platforms. Thus the picture of Will Livelong and his various messages were carried into every section of Philadelphia and into many of the outlying communities. They were seen by literally millions of people, and also, of course, had a distinct psychological effect upon the P.R.T. employees as well.

Safety posters were used on all of the company bulletin boards. Weekly reports on the per cent reduction in car collisions were also posted, so that the men might know what results were being shown by their own efforts.

As a result of this intensive work inside the company, an excellent record for reductions in car and bus accidents was established during April. There were fourteen less collisions in April of this year than there were in the same month in 1926. This was a reduction of approximately 30 per cent.

ASK ANY AMBULANCE DRIVER WHAT HE THINKS OF RECKLESS MOTORISTS

Left and above—Pictures such as these were used in the papers and in the schools to show children how not to play. At right—These two rubes, "Will Livelong's Country Cousins," distributed safety buttons and handbills on the downtown streets for several days

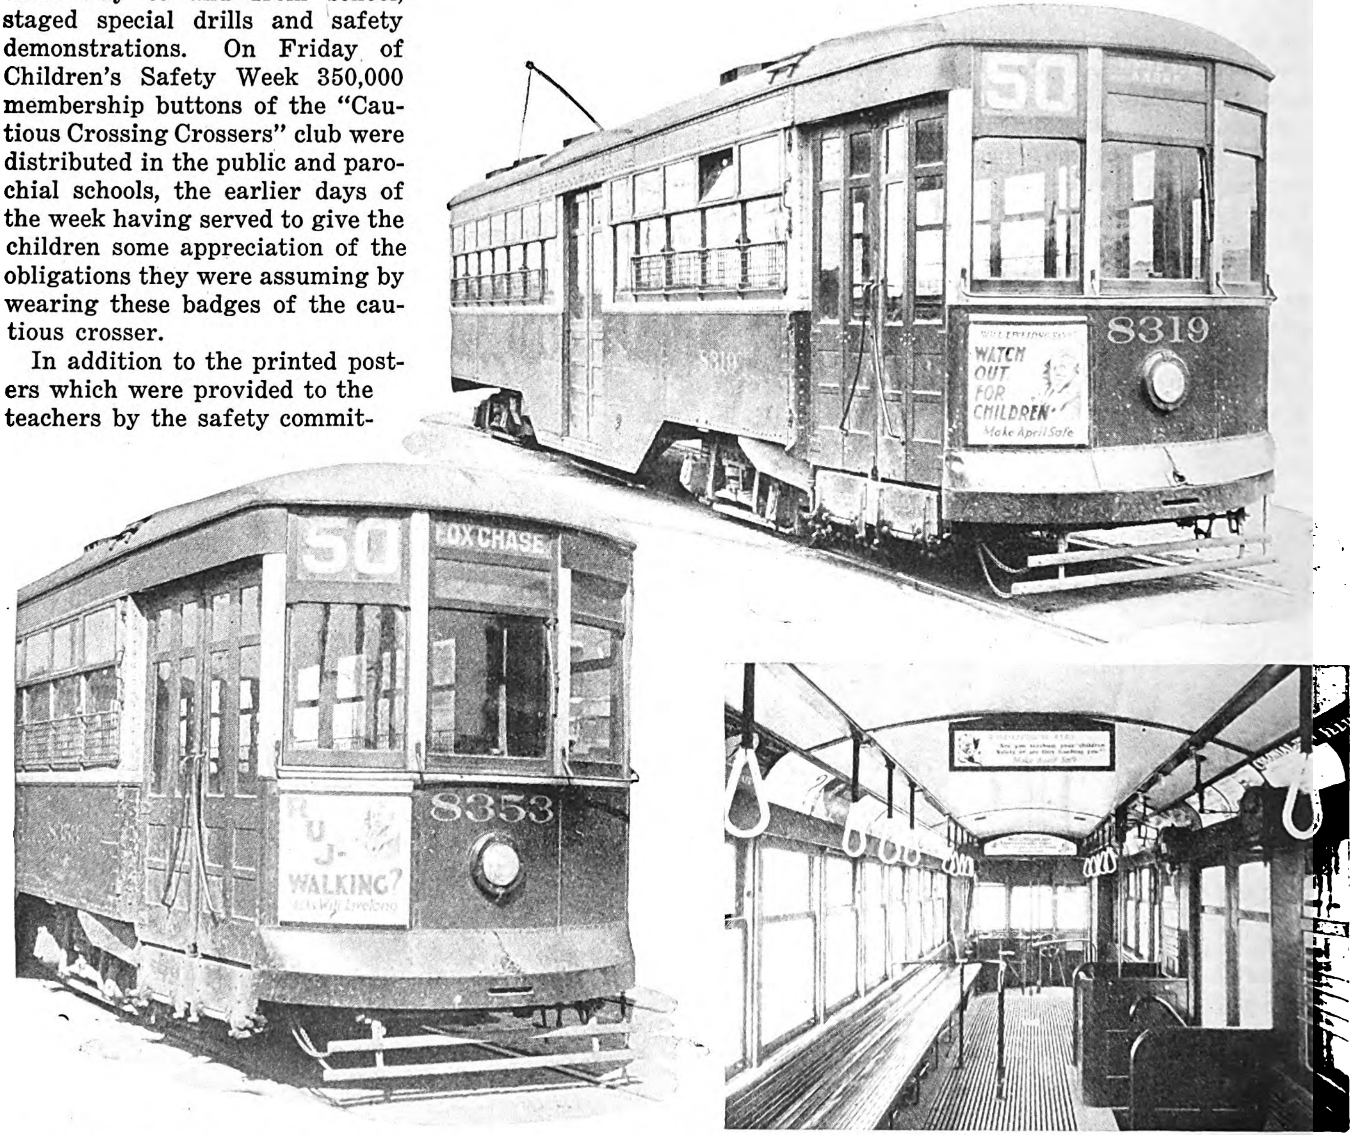
Fleet owners who operate large numbers of trucks were urged by the citizens' safety committee to conduct safety educational campaigns among their drivers, since a large proportion of vehicular accidents occur through the carelessness of non-owner drivers. Many companies, thus solicited, co-operated very effectively in the work.

CHILDREN'S SAFETY WEEK ACTIVITIES

Through the whole-hearted co-operation of the public and parochial schools and the organized safety patrols, the attention of practically every child in the city was focussed on the matter of street safety during the week April 3 to 9. Talks by members of the safety committee were given before assemblies and individual classes in many schools. In the English, drawing and penmanship classes special emphasis was placed on exercises which would further encourage the observance of rules for safe conduct on the streets.

The Safety Patrols of the various schools, composed of picked groups of older boys whose duty it is to safeguard the street intersections while children are on their way to and from school, staged special drills and safety demonstrations. On Friday of Children's Safety Week 350,000 membership buttons of the "Cautious Crossing Crossers" club were distributed in the public and parochial schools, the earlier days of the week having served to give the children some appreciation of the obligations they were assuming by wearing these badges of the cautious crosser.

In addition to the printed posters which were provided to the teachers by the safety committee, pupils were encouraged to submit designs and slogans of their own, the best of these being sent in to the campaign headquarters and duly acknowledged by a representative of Will Livelong.



Dash, bulkhead and ceiling rack signs were used on all of the street cars and subway-elevated trains. With each weekly phase of the campaign the text of the signs was changed

PEDESTRIAN SAFETY WEEK

During Pedestrian Safety Week, April 10-16, intensive efforts were made to reach as many individuals as possible among the Philadelphia public by means of radio talks, addresses before luncheon clubs and other groups, newspaper publicity and a widespread distribution of printed safety rules. These latter consisted of five specific rules for children's safety, five for pedestrians and five for autoists. Speakers before groups of business men took supplies of these printed rules with them, as well as safety window posters, and the business men were urged to make use of this material among their patrons to as large an extent as possible. Eighteen thousand window and bulletin board posters and more than 50,000 printed safety rules were distributed during the month.

All of the street cars and buses of P.R.T. carried dash signs bearing the slogan "'R U J Walking?' asks Will Livelong." Since the foolish actions of J-Walkers are sins of the individual rather than of the group, as is of course true of children's and automobile accidents as well, the appeal to avoid pedestrian accidents was directed wholly at the individual. He was reminded that he is endangering the happiness of his dear ones, as well as his own well-being, by taking unnecessary chances on the streets.

AUTOMOBILE SAFETY WEEK

During this week the Keystone Automobile Club and the Automobile Club of Philadelphia were particularly active in bringing to the attention of their members the appalling toll of vehicular accidents in Philadelphia and throughout the country. The point was emphasized that a very large proportion of these accidents might be eliminated by exercising proper care in operating vehicles, by according ordinary road courtesy to the "other fellow" and by sacrificing a few moments of time in order to safeguard not only the driver but also all other users of the highway.

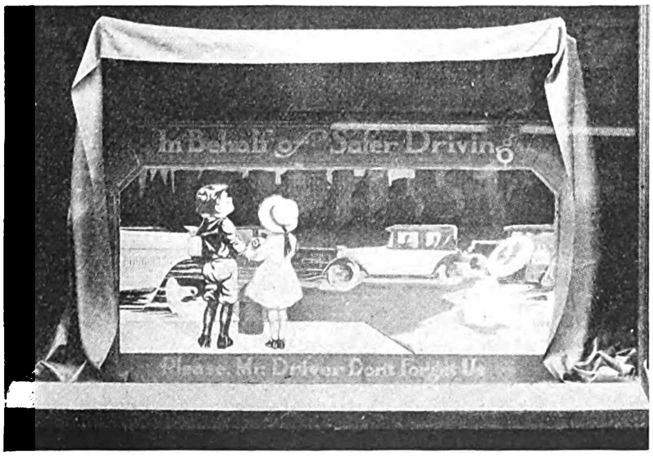
As an attention-attracting stunt two men dressed as rubes and plainly labeled as "Will Livelong's Country Cousins" distributed "Cautious Crossing Crosser" buttons and the printed safety rules throughout the center of the city for several days during the week. These men also attended the opening ball game at Shibe Park between the Athletics and Yankees, as well as the game on the day following, and distributed large quantities of safety material to the thousands of fans present.

Friday, April 22, was designated as "Blow-a-Whistle-and-Save-a-Life Day." Requests were sent to 3,600 factories and industrial plants in and around Philadelphia asking them to blow their whistles or sound their sirens for one minute at exactly 3 p.m. on this day. The purpose of this "safety chorus" was to remind the autoists of the thousands of children being dismissed from their schools at this hour, and to remind the children to exercise the necessary care while crossing streets. An excellent response was made by the various industrial plants and very favorable comment was received from the press and from individuals who wrote in to express their interest and sympathy with the movement.

FINAL WEEK

As an opening gun in the closing week, Sunday, April 24, was designated as "Safety Sunday." All members of the Philadelphia clergy were requested to mention the subject of street safety from their pulpits on this day. Bible classes, young people's organizations and similar discussion groups in the churches were also asked to give consideration to the problem of insuring to a greater degree street safety. So interested were the ministers that a number of them requested information concerning the procedure to be followed in establishing Safety Patrols in their church schools as an extension of the excellent work carried on by the public school patrols.

With a view to building up public interest in the announcements of Will Livelong's real identity on April 29, all radio talks and other talks before clubs and groups of children during this week were worded to stimulate curiosity on this point. It was announced that Will Livelong's 74th birthday would be celebrated on April 30 and all were urged to show their appreciation for his work in making the streets safer by sending him birthday greeting cards. A large number of these cards were received, showing that Philadelphians generally were glad to do him honor upon this auspicious occasion.



In Behalf of Safer Driving
Please, Mr. Driver, Don't Forget Us

Many different types of window displays were used in store windows to emphasize the safety idea

KEEP HIM DOWN!
I AM A CAUTIOUS CROSSING CROSSER

Cuts, electros and mats such as these were sent to the co-operating newspapers. More than 350,000 of the buttons were distributed

On Friday, April 29, Will Livelong made his first public appearance when he called at the City Hall to meet Mayor Kendrick. He was escorted there by a guard of honor, composed of Safety Patrol officers from various of the Philadelphia schools. Representatives of the various co-operating bodies were also on hand at the reception by the Mayor and they were officially thanked for their contributions of time and effort in helping to put over this community movement.

April 30, the closing day of the Safety Campaign, was also the opening day of Boy Week. The activities of the two movements were to have been smoothly merged by having 250 safety banners and signs carried by marchers in the Boy Week parade. A driving rain on the 30th made it necessary to postpone the parade until the following Saturday, May 7. However, the safety banners and signs were to be used just as had been planned for the earlier date. As a further tie-in between the Safety Campaign and the Boy Week activities dash signs on half of the street cars and buses during the closing week of the Safety Campaign bore pictures of a typical boy and the phrase "Boy Week April 30-May 7, Be His Pal. Will Livelong says: 'Keep Him Safe.' "

A tie-up in another direction was made with Clean-up Week. The other half of the cars and buses carried dash signs which stated " 'Rubbish Causes Accidents. Clean Up,' says Will Livelong."

GENERAL PUBLICITY FEATURES OF THE CAMPAIGN

Safety stickers carrying a picture of Will Livelong, the Safety Sage, and the phrase "The wife of a careless man is almost a widow. Make April Safe" were printed in large quantities and distributed to hundreds of stores and other business firms throughout the city for use on their outgoing mail and packages during the month. Press releases, mats of safety cartoons and electros of Will Livelong's picture were sent to newspapers, house organs and local magazines. The Stanley Company of America and other news reel companies sent photographers to the safety demonstrations and to the Mayor's reception to Will Livelong. These pictures were shown in the downtown and community theaters and added much to the interest of the campaign. The *Evening Bulletin* ran a daily series of sayings by the Safety Sage and the other papers also co-operated quite extensively by means of news stories, editorials and photographic displays. The city of Philadelphia did its share by supplying radio and school speakers and by instructing its police officers to be particularly vigilant in insuring the safety of all users of the highways during the month.

DEFINITE RESULTS FROM THE CAMPAIGN

As shown in the chart on page 806 the trend of the accidents during the first 2½ weeks of the campaign continued slowly to rise. Following the two preliminary days, the toll of injuries for the four weeks was 265, 299, 277 and 239 respectively for the four weeks of the campaign. Following the high record of the second week, the reduction in the third week was in sharp contrast, but the number of injuries in the fourth week was far below previous records. It is significant that so long a time is required to arrest this ever-mounting accident toll by even the most concerted of efforts on the part of the whole community. The peak occurred on April 18. Then the trend took a downward path, and it is probable that this continued decrease in street accidents will continue for some length of time after the close of the campaign proper. In the matter of fatalities, as well, the record achieved during April was exceptionally gratifying. From a total of 30 fatalities in April, 1926, the number was reduced to 22 for the same month this year.

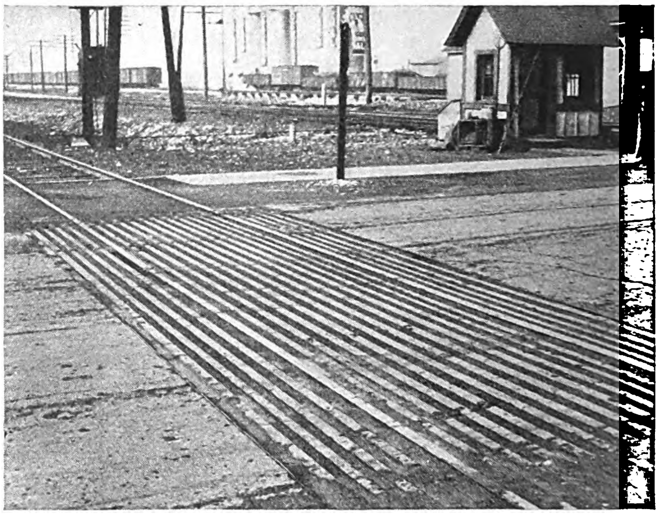
Durable Highway Crossing Made of Old Rail

By S. CLAY BAKER
Engineer Maintenance of Way East St. Louis & Suburban Railway
East St. Louis, Ill.

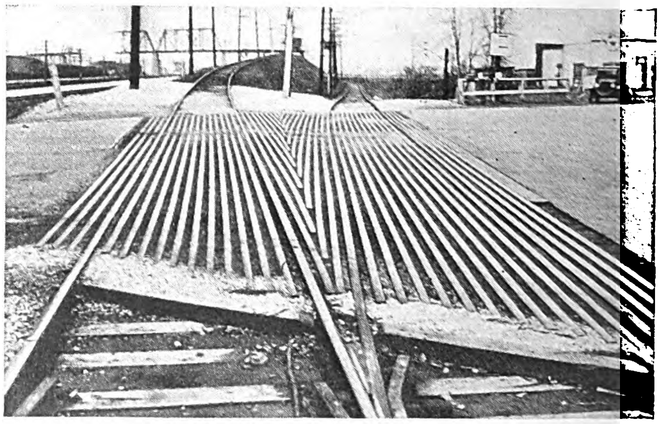
WHERE state highways and other heavily traveled routes intersect the lines of the East St. Louis & Suburban Railway a great deal of trouble has been experienced in maintaining suitable crossings. During the days of light vehicular traffic, the old-style plank crossing or track filled with fine macadam was satisfactory. Provided frequent inspections and repairs were made the plank had a long, useful life. A macadam crossing was economical and serviceable, although it required frequent inspection and refilling.

Since the advent of heavy automobile traffic, however, the life of a plank crossing has been substantially shortened. Moreover, good quality plank has become scarce and expensive. The macadam crossing nowadays requires constant attention to be kept filled. With either of these types it is difficult to maintain a smooth riding crossing and avoid complaints from automobilists resulting from broken springs, etc.

To solve the problem thus created brick and granite paving were installed at some intersections between the rails and outside the rails to connect with the highway pavement. These types are expensive and it has been found difficult to make a satisfactory installation with the T-rail used. Finally, it was decided to construct a crossing of old T-rail of the same height as the running rail. In building this crossing the track was brought to grade about 1 in. above the surface of the concrete pavement. Lengths of old rails were then set on the ties between the running rails and outside of them. They were placed as close together as possible, leaving space only for spikes between. After this had been done the spaces between the rails were filled with fine macadam. This type of crossing is somewhat more expensive than the types formerly used, but after completion requires practically no maintenance. It is favored by the highway officials. Two crossings of this type have been in use for two years and have given satisfactory service.



Standard right-angle highway crossing along the lines of the East St. Louis & Suburban Railway. Old T-rails in 30-ft. lengths were laid on the ties between the running rails. The intervening spaces were filled with fine macadam



Acute angle crossing at a junction of two heavily traveled state highways was built by cutting and beveling the old rail with an acetylene torch

---

Co-operates in Improvement Work

THE Puget Sound Power & Light Company, Olympia, Wash., is removing all poles from the main downtown streets to alleys and side streets. The company is also co-operating with the city in paving streets between its tracks, although its franchise with the city does not call for paving. More than $50,000 has been spent in paving.

Determination of
Ton-Mile Freight Cost

By A. B. Cole
Commercial Consultant, Pittsburgh, Pa.

Factors to be considered in rate making. Analysis of the units of cost in electric freight transportation. Consideration of principles for allocation of expenses between passenger and freight operating service

WHAT is my ton-mile cost? No doubt this question has come up from time to time in the mind of practically every electric railway freight operator in the country. It is an important operating fact which he should know in order to determine correctly and intelligently whether or not his freight operation is paying.

With the modern methods of electric railway accounting in use, practically all data for determining the ton-mile cost may be found in the files of the public utility, when supplemented by the intimate operating knowledge of the official in charge. It is the intent of this article to outline the procedure followed in determining the ton-mile cost on an electric railway property, as well as especially to emphasize the important operating elements involved. While these latter may at first seem known to all, the interpretation given in this article is to bring out particularly certain operating fundamentals.

Transportation, as we know it, is well defined in the words quantity times distance, as expressing the work done, or

Transportation = Quantity × Distance,

and since we have two kinds of transportation we have

Freight Transportation = Tons × Miles

and

Passenger Transportation = Passengers × Miles

The basic units for transportation, then, are the ton-mile and the passenger-mile, and while each is a true measure of the kind of transportation to which it refers, neither of its individual factors alone is a measure.

It is in these units, fundamentally, that transportation is sold to the public, but in the case of freight transportation, the sale is expressed in a slightly different manner.

The average revenue ton-mile is an exceedingly variable unit, when one road is compared with another, and even on the same road when the record of one year is compared with that of previous years. This last statement is particularly true when we consider the factor which determines how the ton-miles may vary in an infinite number of ways. This factor is the kinds of commodities offered for transportation. They are almost innumerable, and each kind of commodity could have a rate of its own at some time or other. Of course, the number of classifications is being constantly reduced wherever possible, but a uniform classification, while used by some electric railways, is not only impracticable, but impossible from the standpoint of good business.

The first consideration in rate making is the character of the freight to be handled, and this in turn means a charge according to its value, and particularly all that a specific traffic will legitimately and fairly bear. Thus, in rate making, we have to consider:

1. Cost of service to perform the work required.
2. The competition present.
3. The value of the service performed, as compared with the value of the freight to be handled.

The all-important question of fixing transportation prices is usually determined by two or all of these factors, one of them being dominant at one time, and another factor at another time.

While carload freight is a very desirable kind to handle, the profit of such business depends obviously on the commodities to be transported in bulk.

The electric railway is an important carrier of short-haul and less-than-carload freight, and this class of traffic brings a higher rate than the same freight offered in carload lots. This less-than-carload service involves terminal expense and should pay more than service not involving such expense. Moreover, practically all electric railway freight movements are equivalent to express service at freight rates.

With the ton-miles unchanged, the average ton-mile revenue will be increased by anything that tends to decrease the number of large shipments and increases the number of small shipments of the same class of freight.

With character and quantity of the freight equal, it will be found that the transportation charge varies more or less with the distance an article is carried. Obviously, the longer the haul the greater the carrying cost per ton, but the additional cost does not vary directly with the additional mileage. Thus, interstate commerce is governed by the so-called long and short-haul clause which forbids a greater charge for a longer haul to the same point than for a shorter haul. Other things being equal, we find the charge per ton-mile will vary inversely with the length of haul.

Therefore, it readily may be seen that the revenue per ton-mile is the product of many variable factors, and in determining the cost of transportation, it is reasonable to assume that the rates or prices of transportation have been previously settled.

Running trains (one car or many) on a railway is the only way transportation can be produced. Thus, train-distance (train-mile) is the unit of transportation service done by a railway.

In practically no industry is the unit of service ever the unit of production. Thus, the ton-mile may possibly represent much more work done on one road than another or upon the same road at one time than another, and the energy necessary for its production is by no means constant. Thus, the unit of railway service must have factors corresponding with those in the unit of production, which have been shown to be

Tonnage or quantity × miles or distance.

But how is this tonnage or quantity obtained or carried? By a car or train, either single cars or motor cars and freight trailers, multiple-unit trains or cars hauled by a locomotive? All are conveyances of service. Therefore a good "unit of service" is provided by:

Conveyance × distance = train-miles.

Why should not the car-mile be considered as the unit of service? This is a logical question, since so much freight in many localities is carried by single-car trains. The car-mile cannot be used alone but must be converted into train-miles, which represents service done by:

1. Motor car or locomotive.
2. A definite number of trailers or freight cars, plus a caboose when used.
3. Train crew.

In producing the train-mile, the quantity of energy tends to be constant; while that spent per car-mile (where train or locomotive operation) does not vary considerably without any variation in the work done.

A large amount of preparatory work must be done on any railway system before the production of transportation begins. This usually is switching and making up trains in yards or at terminals, which may be called switching or work mileage to distinguish it from revenue train-mileage. Thus train-mileage is best measured by the number of miles train crews actually travel from point to point.

PRODUCTION OF TRANSPORTATION

Transportation is produced only when a railway makes revenue-ton-miles, for only then does it start to earn money. As previously indicated, a great deal of work must be done by a railway before it can begin to produce units of service, train-miles, and this work cannot be measured in train-miles. This work includes:

1. Terminal service and switching.
2. Maintenance of way.
3. Repairs to the entire railway plant (buildings, shops, machinery) and other items governed by different factors than those governing transportation.

From this, it will be seen that the unit of service, the train-mile, cannot be looked on as the complete unit of service, or possibly as a unit of cost. In each unit of service there are usually a great number of units of transportation, and the determination of the cost of these is very complicated, as it includes many factors that are not materially interdependent. Despite all of this, the whole theory of transportation depends on the cost per unit of transportation sold.

Since a railway performs work almost universal in character apart from the actual furnishing of transportation, there exists no opportunity to use a single "unit of cost" in the transportation business. Thus there are two main divisions of work done:

1. Revenue train-miles, and
2. Work preparatory and complementary to production of train-miles.

Therefore, the operating expenses may be divided into those (1) directly incurred by producing revenue train-miles; and (2) those not directly incurred. Thus it will be seen that the expenditures of an electric railway may be divided into four general classes:

A. Actual production of transportation, the unit of which is the revenue train-mile.

B. General direction, clerical work, and supervision, measured in per cent of total revenue.

C. Collection and handling of freight and passengers at stations, terminals and intermediate points, with the units, ton and passenger.

D. Maintenance and operation of the whole railway plant, not dependent upon the movement of trains. The unit for this class of expenditure is the mile of track.

After these are established, a division of expenditures between freight and passenger operation becomes necessary to determine the cost and profit of the ton-mile and the passenger-mile. Preferably this allocation should be made as the expenses occur. Where this has not been done previously, *A* and *D* may be divided according to train-mileage (where locomotives are used, "locomotive-mileage should be added); while the proper proportion between *B* and *C* depends on the relative amounts required by freight and passenger operation.

The next step is to apply to these expenses the units of cost already mentioned, thereby getting the following units for freight expenses: (1) Cost per freight train-mile, in cents; (2) cost in per cent of freight revenue; (3) cost per ton, in cents; (4) cost per mile of track, in dollars. In further considering the cost per freight train-mile, it must be remembered that this all-important unit is dependent upon: (a) Cost of power (delivered at the rail); (b) equipment maintenance; (c) maintenance of way; (d) train service, including supervision; (e) loss and damage.

IMPORTANCE OF TRAIN-LOAD

Thus it is evident that the most important element in the ton-mile cost is the relation between the number of ton-miles carried and the number of train-miles run, which means the revenue freight train-load.

The train-load is the supreme factor in determining the cost of the ton-mile, as well as the profit in the production of transportation. It thus becomes the one factor above all that makes for economical railway operation. The train-load determines a greater proportion of the ton-mile cost than all the other factors put together.

The train-load is governed by: Character of tonnage; condition of equipment; condition of permanent way, and vigilance of the management.

There are four important units of railway expenditures and an approximate method of properly prorating the expense between freight and passenger operation. From an electric railway report containing detail operating data it is possible to determine the principal units of cost. Thus a value may be found for the freight train-mile, for the handling of a ton of freight at stations and terminal points, for the maintenance of the fixed part of the whole railway plant or system and for the relation between general expenses and general revenue. The total of the ton-mile costs (in cents), of each, gives the average ton-mile cost for the whole system, as these figures would represent the average result of all business done by the electric railway.

It will readily be seen in the division of expenses that those under *B*, *C* and *D* are not necessarily affected by the ton-mile, and do not tend to uniformity of ton-mile cost, for there is only a very loose and general connection between the number of ton-miles carried and expenditures for maintenance of permanent way, buildings, etc., or between the number of ton-miles and the expenses at terminals, stations, etc., or between the number of ton-miles and administration expenses. But there is a general connection, predicated on the fact that a road needs so much plant (road as a whole) and so much general force to do about so much business.

As the ton-mile is a measure of revenue, and a road can afford to spend only so much for these last three classes of work, there should be approximate uniformity in the ton-mile cost for these items. Of course, in the train-mile expenditures, no such relation exists.

To effect economies in ton-mile cost in *B*, *C* and *D*, the expense must be considered by itself, apart from the ton-mile.

Generally speaking, money is not wasted by electric railways in manufacturing train-miles, but there is often a great deal of waste in the use of train-miles once they have been produced. Distinct recognition of this fact would produce a great saving on both electric and steam roads.

Therefore, in order that the electric railway man may estimate his ton-mile cost he should know:

1. Cost per average train-mile (expenses in *A* divided by the train-miles).
2. Average proportion of expenses in *A* to all freight expenses.
3. Average proportion of freight expenses to freight revenue per ton-mile.
4. Average proportion of empty car-miles.
5. Freight train density (ton-miles, divided by miles operated).
6. Train-loads (ton-miles, divided by freight train-miles).
7. Tonnage per car yearly.

What many electric railways operating freight service need to do is to increase the density of their freight business, in order to make the factors that are valuable in determining economies in ton-mile cost effective. For, as the density of business decreases, these factors become relatively less valuable, and as business is increased they tend more accurately to measure and regulate the cost.

It will be noted from what has been said, that after having established the four main units of railway expenses and allotting expenses between freight and passenger operation, this discussion has related primarily to freight operation. However, the same methods may be followed in determining the cost per passenger-mile, after the proportions in *A*, *B*, *C* and *D* chargeable to freight and passenger operation respectively have been determined. Thus, the units of cost in passenger expenses may be applied as follows:

A = Cost per passenger train-mile in cents, based on the use of one or more cars per train.
B = Cost in per cent of passenger revenue.
C = Cost per passenger in cents.
D = Cost per mile of track in dollars.

Simplified Pass Form in Norfolk

SIMPLIFICATION of a weekly pass was accomplished by the Virginia Electric & Power Company, when this form of transportation was inaugurated for its Norfolk lines on Jan. 1 of this year. A complete reversal of the old policy of putting rules and regulations and restrictions on the face of transportation tickets has been effected. The first tickets, reproduced in the illustration, were printed in green on white ticket paper, except for the date reading "January 1 to January 9 inclusive," which appeared in red.

Instead of cluttering up the back of the ticket with restrictions and notices of penalties, there is a plain invitation to use the pass, written in the second person.

This pass, which sells for $1.50, is one of the three types of fares in use on the property, the two others being a cash fare of 10 cents and a ticket fare of 8¾ cents, four for 35 cents. This new fare schedule was started on Jan. 1, and supersedes the old fare of 6 cents on buses, 6¼-cent tickets and 7-cent cash fare on the cars. The zone fares existing prior to this last change have been eliminated and the entire system is now included in a single zone. The same fares apply to both buses and cars and transfers are given to passengers changing between them.

JAN. 1 to JAN. 9 1927
inclusive
WEEKLY PASS
Price $1.50
J. Frank McLaughlin
VICE-PRESIDENT

YOU MAY LEND ME TO MOTHER, FATHER, DAUGHTER, SON, SISTER, BROTHER, FRIEND OR DOMESTIC. I BELONG TO THE FAMILY—ONE AT A TIME.

A simplified pass adopted in Norfolk, Va. On the reverse side of the pass is an invitation to use it as extensively as possible

It will be noticed that the first pass is good for nine days, the extra two days included in the first period being necessary to reconcile the Sunday-to-Sunday pass with the fare change which took place on Saturday, Jan. 1. This was utilized as a "bargain day" feature to encourage buying the pass for the first week of its existence. The pass form is an evolution of that used first in Jacksonville.

Chicago Extends Construction of Concrete Loading Platform

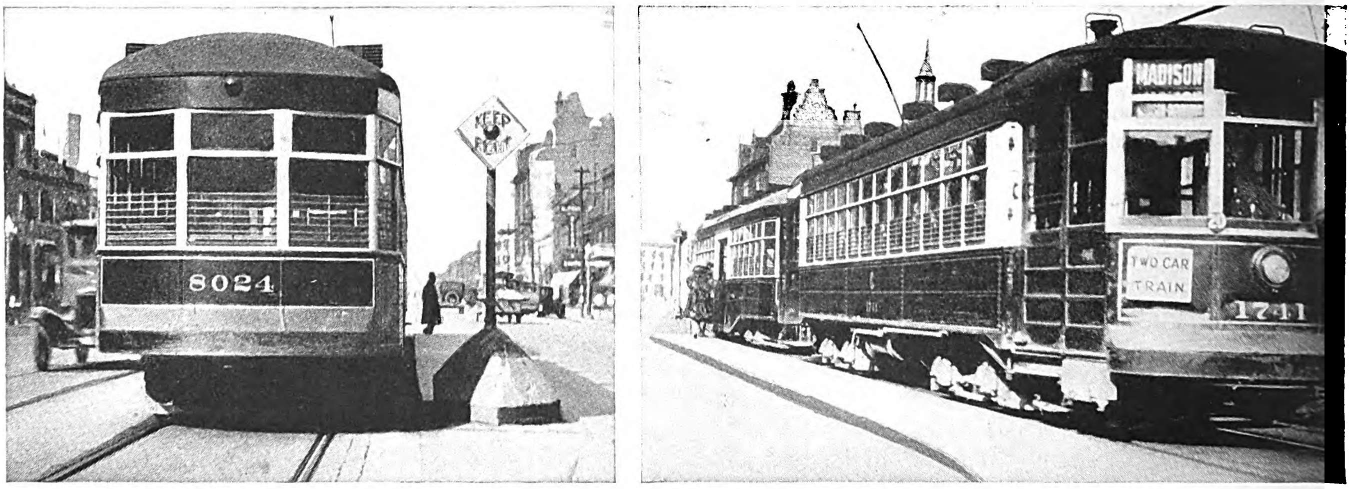
Experience with Sample Installations Leads to Adoption of This Safety Feature as Part of Street Improvements—Bulkheads and Flashing Signs Add Safety

By L. M. Traiser
Special Traffic Engineer Chicago Surface Lines

SATISFIED with the first installations of concrete loading platforms on wide car line streets, the city of Chicago will include similar facilities for the convenience and safety of surface car riders in more than 7 miles of street improvement this year. These permanent loading platforms were introduced in Chicago last summer on more than 3 miles of street in two sections of the city.

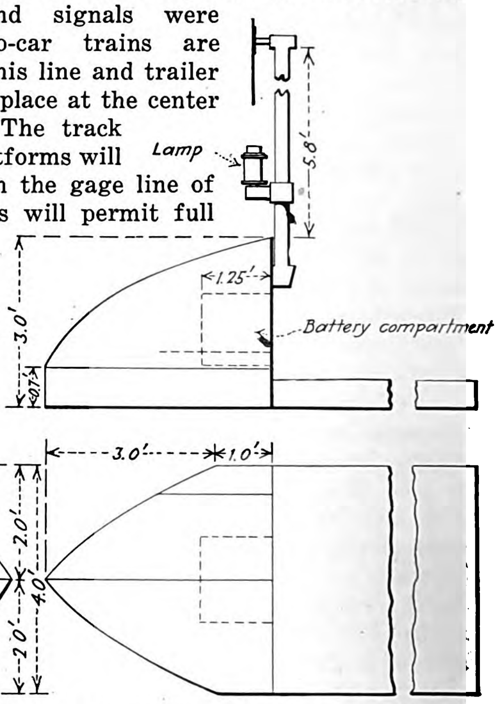
Eight months use has brought wide approval from both motorists and car riders. Vehicles can pass loading street cars and car riders are given protection while boarding and alighting. Elevation of the safety zone above the street level affords a clean, dry, walking surface. A platform width of 4 ft. permits easy movement to and from the cars.

The first group of these safety islands was built with ends sloping to the street level. At many locations on the up-street end of these platforms reinforced concrete bulkheads have been built and mounted with flashing "Keep to the Right" signs. Power for illumination is furnished by a battery located conveniently in the bulkhead and above the street level. With only slight changes, this measure of protection will be included at all locations, built according to the new design.



Concrete bulkhead and flashing signs increase safety of Chicago loading platforms, which are long enough to accommodate a two-car train

The accompanying drawing includes the principal dimensions of the platforms except over-all length. This has been determined by the type of equipment to be used on each line. Platform length of present and proposed installations is given in the accompanying table. Safety islands previously installed on West Madison Street were constructed 73 ft. in length at intersections where bulkheads and signals were placed. Two-car trains are operated on this line and trailer loading takes place at the center of the car. The track side of the platforms will be 33 in. from the gage line of the rail. This will permit full use of the loading zone without danger of being brushed by the moving cars.



A battery carried in a compartment in the end bulkhead is used to illuminate the concrete platform. The length of the structure varies with the type of equipment operated

DATA ON RAISED CONCRETE LOADING PLATFORMS IN CHICAGO

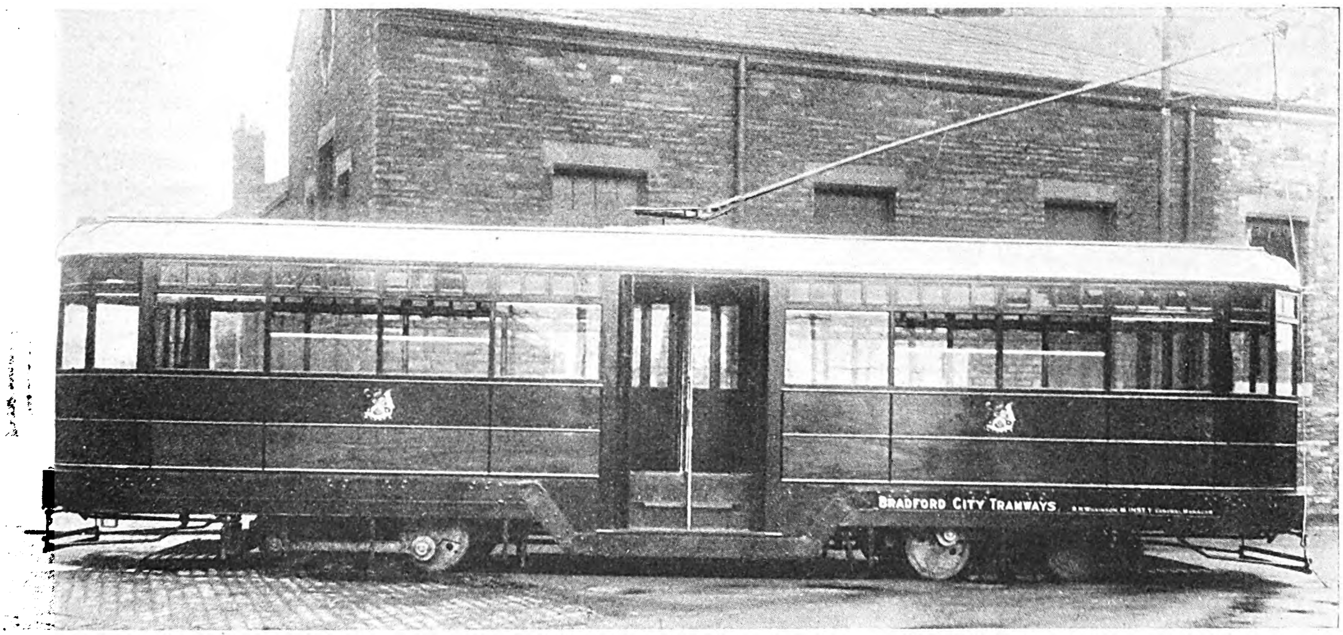
Car Line	Roadway Width, Feet	Number of Plat-forms	Length of Plat-forms, Feet	Bulkhead and Signal
1926 Installations				
Clark Street	94	13	70-80	Without
Madison Street	80	41	70-90	Part with and part without
To Be Installed (During 1927)				
Ashland Avenue	70	44	100	With
Western Avenue	70	31	100	With
South Chicago Avenue	60	11	100	With
Milwaukee Avenue	78	32	100	With

When built as a part of street improvements the first cost of these raised loading platforms is small, and when maintenance comparison is made they are expected to show economy over many types. This improvement has been designed by the Bureau of Streets of the city of Chicago in co-operation with the Chicago Surface Lines.

Acknowledgment of the important position and permanent nature of street railway transportation in Chicago is shown by this expenditure for platforms to give greater convenience and protection of street car riders.

British Car Designed for Quiet Operation

Single-deck, double-truck vehicle built at Bradford has two 63-hp. motors spring suspended from the car underframe. Remote axles are driven by propeller shafts



Bradford new worm-drive car with side guards removed to show connecting rods

PROGRESS in local transportation methods lately has been following two parallel lines in England. On the one hand there has been an extension of bus operation by the tramway managements, while, on the other hand, notable improvements have been made in rail car design. The latest step taken in this direction has been the construction of a high-speed, single-deck, worm-drive car for the Bradford Corporation Tramways.

Permission to undertake extensions of bus operations has been sought by more than twenty municipalities at this session of Parliament. Among the cities making application for wider bus use was Bradford, Yorkshire, the home of the woolen trade. Its application was the first to be acted upon by Parliament when, on March 3, it was turned down by a large majority.

General Manager R. H. Wilkinson of the Bradford Corporation Tramways, however, had not put all his eggs into one basket. While the arguments for bus extension were being heard before Parliament, he designed and built a new type tram car with which to compete against the independent bus operators if the municipality was refused permission to operate its own buses. Like a good general, he chose carefully his time for springing this surprise. On the day preceding the parliamentary debate concerning buses Mr. Wilkinson startled the inhabitants of the city of Bradford by personally operating his new car on a trial run through the city.

The standard type car used on this system is a double-deck vehicle, rather noisy and slow. Thus the appearance of a single-deck car traveling at high speed with practically no noise was a genuine surprise. Yorkshire sat up and took notice. Newspaper men haunted the streets in the hope of getting a second view, for at first glimpse they had been too much surprised to snap the shutters of their cameras. Others called in a body at the Thornbury depot, where the car had been built, to get particulars. One and all were disappointed, however. It was not until some time later that the management was willing to divulge details concerning its construction.

The outstanding feature of the new car is the location of the two motors, spring suspended from the underframe. Each motor drives the remote axle of one truck through a flexible propeller shaft and worm gear. Wheels on the other axles of each truck are driven by connecting rods.

The motors are rated at 63 hp. and weigh 1,340 lb. each. This is only about 21 lb. per horsepower, a considerable reduction from usual British practice. The motors are series wound and specially designed by the English Electric Company to eliminate hum. Indications are that noise has been reduced to a marked extent. Dick-Kerr controllers are used, the only departure from standard practice being an arrangement for field shunting on the last notch.

Connecting rods operate on ball bearings around the crank pins. Journal bearings are inside the wheels, which are of 26-in. diameter. The wheels are counterbalanced to prevent hammering on the rail on account of the eccentric weight. Axles are of high tensile strength steel, slightly tapered, as shown in an accompanying drawing.

Single-deck, center-door arrangement of new Bradford car is a novelty in British tramway practice

The truck frame is of 8-in. x 3½-in. rolled steel sections. Trucks are spaced 19 ft. between centers. The wheelbase of each truck is 4 ft. 6 in. It has been found by experiments that the car can negotiate a curve of 29-ft. radius without difficulty. The drive from the motor to the axles is through a propeller shaft with Spicer universal joints at each end. The worm is of steel and the worm wheel of phosphor bronze. A gear reduction of 5¾ to 1 is provided.

Spring arrangements are extremely simple. Each truck is equipped with two longitudinal semi-elliptic springs bearing on plain shoes. There is also one transverse spring, as shown in an accompanying drawing. Plain journal bearings with ordinary oiler pads are provided. Side thrusts are taken on a phosphor bronze washer between the wheel and the axle box. The center bearing consists of a rubber buffer, in the center of which is a phosphor bronze molding tube. The rub-

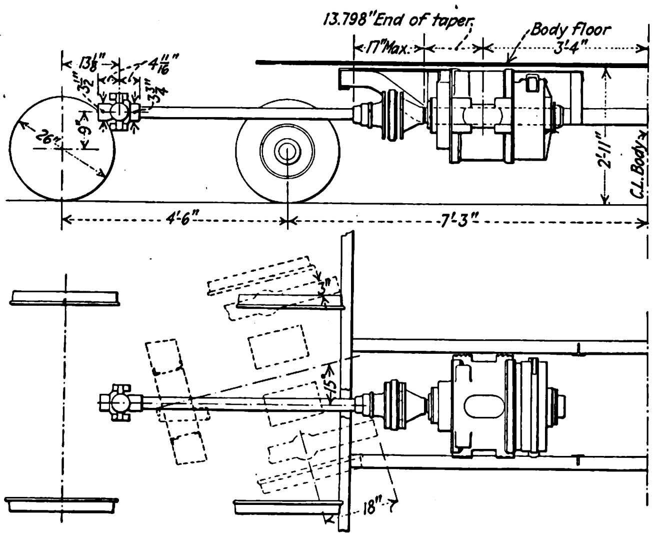
Assembly of inner axle showing brake drums which are placed in position before the wheels are pressed on

ber buffer cushions all shocks, while a loose phosphor bronze thrust washer at the bottom takes care of any downward thrust.

Straight air brakes are provided as well as hand brakes of the usual type. The air brakes are fitted with asbestos-lined shoes, pressing on two cast-iron drums mounted on each of the inner axles. This arrangement is shown in an accompanying drawing. For cooling purposes each brake drum has an interior vane. Eight outlets are provided for sand, one alongside of each wheel.

The length of the car is 39 ft. 3¾ in. over buffers. The width is 6 ft. 10½ in. at the belt rail and 7 ft. over the roof. Natural grain mahogany is used for exterior finish, while moldings, etc., are painted dark red. The roof is white. Entrance and exit are by means of double folding center doors. These are pneumatically controlled by the motorman and are interlocked with the control.

Three low steps give access to the center vestibule. The side members of the underframe are bent downward to form a well on each side. When the doors are closed hinged flaps drop into position at the floor level, making half of the vestibule always available for standees. Seats are provided for 34 passengers and it is estimated that 26 more can be comfortably accommodated standing. Seats are upholstered in red leather. The interior finish is mahogany. The ceiling is of birdseye maple finished in natural grain. Pale green linoleum covers the floor. Single-stroke bells operated at 500 volts are provided for communicating with the motorman.



The motor is spring suspended from the underframe and connected by a flexible propeller shaft to the outer axle. Dotted lines indicate position of wheels on the curve of 28-ft. radius

This is the first car of its particular type to be operated in Great Britain, although certain of the individual features are not altogether new. Single-truck cars with worm drive are in use in Halifax and Hull. Experiments have been made with single-deck cars in Glasgow and elsewhere. It is expected by the tramway management that the comfortable fittings of this car, its high speed and quiet operation will give it a popularity equal to or greater than that of its bus competitors.

Light Metal for Car Construction in Europe

EUROPEAN, as well as American, car builders are turning their attention more and more to the use of light-weight alloys in car building. There is no doubt that demand for the use of such materials in automobiles and their necessity in aircraft have assisted in the development of light-weight alloys and their use in car construction, where appreciable savings in power are gained with the reduction of every pound in weight of the car. From a review of the situation in Germany in a recent issue of *Verkehrstechnik* the following is taken:

There are now available two types of light-weight alloys, each of which has a distinct range of application: "Aeron," "skleron" and various modifications of "duralumin" represent the high-grade alloys, suitable for stamping, rolling and forging, with strength comparable to machine steel, and "silumin" and "cetal," which lend themselves to castings, but having only about one-half the strength of steel. Pure aluminum castings have only one-quarter of the strength of steel.

These alloys are from fifteen to twenty times more expensive by weight than steel, which makes it obvious that the ratio of material cost to finishing labor cost is of much less importance than with steel. Even if the alloys are used properly and the weight of a given piece is reduced to one-third or one-fourth of an equivalent steel construction the material cost is still six times as much. A very considerable reduction of the material is therefore essential. This can be accomplished with the high-grade alloys and relatively simple shapes to such an extent as to cut the over-all cost in half. Wherever possible, high-grade alloys should therefore be chosen, while castings are in order only for complicated pieces. Car framing members and panel sections call, therefore, for aeron or skleron, while hardware parts and fixtures should be made of silumin castings. The latter should be considered as an equivalent of steel castings or forgings, but it has the advantage of much lighter weight and the possibility to shape it by bending or rolling.

When the high-grade alloys are used as girders, closed U or box sections are recommended, and the sides of these members can be perforated with holes to save material. Beading the edges of these holes helps greatly to strengthen the girders. Attention must always be paid to the fact that these alloys are much softer than steel. A hammer blow will leave a much deeper mark, a key is more liable to work loose and come out, a bolt in an oversized hole will soon pound the hole to a much larger diameter where the structure is one subject to shocks, etc.

Nevertheless, by the use of these metals the weight of a 54-ft. steam railroad car was reduced to one-half of that of a steel car. Where steel or iron is also used a direct metallic contact between the alloys and the steel or iron must be avoided to prevent dangerous electrochemical destruction.

One of the greatest advantages of light-weight alloys is their much greater ability to absorb energy when subjected to shock. This is due to their small elastic modulus, which is only one-third that of steel, so that if a car, made substantially of these alloys, runs against an end stop, its main sills will compress lengthwise three times as much as if of steel. The impact energy, of course, varies with the square of the speed, according to the formula $KE = \frac{1}{2}mv^2$. To give a practical example based on a 15-ton alloy car, such a car operating at a speed of 14 m.p.h. can hit an end stop without more damage to the car than would be met by a similar steel car weighing 30 tons, at a speed of 6 m.p.h. Aluminum alloys are therefore about equal in strength to steel, but have a much larger capacity to absorb energy.

"Dress-Up" Day Sponsored by Cleveland Southwestern

With every motorman, conductor and station agent attired in a new uniform of dark gray whipcord, with gilded buttons, the Cleveland Southwestern Railway & Light Company, operating approximately 200 miles of track between Cleveland, Wooster, Mansfield and Bucyrus to the south, and Elyria, Oberlin and Wellington to the west, observed "Dress-Up Day" on March 31 as part of its general program for property and service improvement.

Realizing that a neatly dressed trainman is one of the best advertisements, the management of the company submitted a proposition to its employees whereby it would furnish one complete new uniform if the individual also would buy a complete uniform at the same time. This proposition was readily accepted by the trainmen. The idea of two uniforms is to insure that the employees will have a neatly pressed uniform at all times.

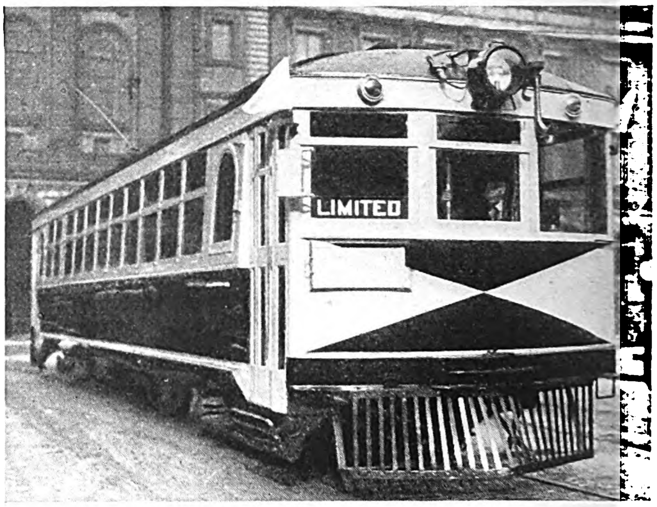
On "Dress-Up Day" many service stripes adorned the sleeves of trainmen on the line. Each stripe represented five years of service, and not a few trainmen proudly displayed as many as five gold service stripes.

In addition to this movement, headed by Frank H. Wilson, president of the company, the management has rightfully felt that the employees could not sell the service to the public unless they themselves were first sold. Thus by means of a series of meetings the problems and hopes of the management were laid before the men, who were quick to grasp the situation and organize as live salesmen for the Cleveland Southwestern company.

One of the many new moves to stimulate business is an arrangement whereby every ticket agent may earn a bonus each month. The business done at each station each month in 1926 is used as a quota basis for 1927, and the ticket agent and his force are paid a 5 per cent commission on all sales in excess of the quota.

Marked success has attended the putting into service of two rebuilt and redecorated light-weight interurban cars by the company. A color scheme of blue, ivory and yellow was worked out for their exteriors. The interior color scheme is in two restful shades of gray, with the floor covering of dark red linoleum. Bucket-type seats upholstered in taupe mohair and gray leather were installed. These seats were equipped with double cushions. Before placing the cars in service they were exhibited in numerous towns along the line and inspected by hundreds of people. In Cleveland, city and county officials and newspaper men were taken on a special trip, which was arranged so that the car would pass through downtown sections during the noon hour. Favorable comment was received from all sources upon the attractiveness of the cars.

This is not the first attempt of the Southwestern to improve the appearance of its cars. A de luxe parlor car service was inaugurated connecting Cleveland, Mansfield and Galion by the company about two years ago. The company's shops at that time rebuilt two cars for this special service, the cars being finished with the highest type of floor covering and seats, and the Pullman plan being followed in operating them, seats being sold from a diagram and passengers having the opportunity of making advance reservations. That this service was appreciated by the public is shown from the fact that during 1926 excess fare of $11,550 was paid by 32,000 passengers on these parlor cars.



One of the remodeled interurban cars of the Cleveland Southwestern Railway & Light Company which helped the company in its recent "Dress-Up Day"

During 1926 the company reballasted more than 60 miles of its tracks and overhauled 38 of its cars. A year prior to that the company purchased twelve new light-weight cars of the latest design to replace heavy and obsolete equipment. As a result there was a marked saving in every phase of operation. At the same time the company put its transmission lines into first-class condition, stringing more than 100 miles of new aluminum high-tension wire. In addition all bridges were rebuilt.

Owl Cars on "S" Line

The Los Angeles Railway, Los Angeles, Cal., has started operating owl cars on the "S" line on a 60-day trial basis. If the travel justifies, the service will be continued, according to R. B. Hill, superintendent of operation, and L. A. Racape, superintendent of schedules. Decision to give this service was reached after complaints from working men.

The Readers' Forum

Mr. Shoup Comments on Graham Articles and Bus Experience

PACIFIC ELECTRIC RAILWAY
SAN FRANCISCO, April 15, 1927.

To the Editor:

I have read with much interest articles in ELECTRIC RAILWAY JOURNAL of Feb. 26 and March 5 entitled "Fitting the Bus to Its Proper Place," by R. N. Graham, manager of railways Pennsylvania-Ohio Electric Company, and have noted your request for discussion thereof.

So far as the arguments and facts set forth by Mr. Graham with reference to his properties are concerned in the operations of urban transportation, and as they would apply to similar properties, there is little ground for discussion of the subject matter, as his exposition of facts and details relating thereto are very conclusive and convincing, and they have been beneficially applied to the Pennsylvania-Ohio Electric Company, but from experience of several years I am convinced that a large part of Mr. Graham's plan, as well as his deductions, would not apply to the urban transportation of the Pacific Electric Railway for the following principal reasons:

First—The transportation units of the Pennsylvania-Ohio Electric Company are of similar type, namely, Birney cars and single-deck buses, whereas urban service upon the properties of this company is performed by a variety of equipment, ranging from cars of the Birney type to that of steel interurban type, and for the further fact that in a number of instances both local and interurban service are operated over the same tracks.

Second—Mr. Graham is an exponent of the flat fare per ride, regardless of the distance to carry, which would probably be a satisfactory fare within the 3-mile single zone encompassed in his Youngstown situation, but we are convinced that price should be predicated upon distance traveled, and our operation in Los Angeles under that basis is satisfactory both to ourselves and to the public served, thereby overcoming (through the zones) to some extent, the lack of seat resale such as would be obtained by local lines operated through a metropolitan area where change of load and resale of seats was of more frequent occurrence.

PASADENA GIVES SOME COMPARISON

The only service we have comparable with that of the Pennsylvania-Ohio Electric Company in Youngstown is in the city of Pasadena, where we are operating a unified rail and motor coach service, Birney cars and 25-passenger White coaches. The same fare is charged on both carriers, with a general interchange of free transfers. Pasadena has a population of approximately 75,000. Every line, whether bus or rail, commences in the center of the city, and in some cases, particularly on East Colorado Street, the coaches parallel the rail service for a considerable distance. Both the buses and cars, as well as the tracks on which the cars operate, are in first-class shape. Our experience in Pasadena is much the same as found by Mr. Graham, in that the choice between the rail and the bus is mostly a matter of convenience to the passenger. Elderly people prefer the buses due to the fact that they pull up to the curb. Among the middle-aged and younger folks there is probably a slight preference for the street cars.

We are operating about 39 Birney cars and about 50 coaches in the Pasadena service. The primary motive for the establishment of bus lines was that a number of rail lines in that city had reached the point where they had to be rebuilt and large expenditure in that connection was not justified from the revenue received. In other cases additional service was necessary owing to the development and extension of the city. The rail lines which were worn out and for which bus service was substituted were not making net earnings and are not at this time, under bus operation, showing net revenue. Service upon such routes, however, is a necessary part of the local transportation plan in Pasadena.

OPERATING COST OF BUSES AND CARS IDENTICAL

Our experience in Pasadena is that we are operating 32-passenger Birney-type cars in rail service with practically the same cost as the 25-passenger White buses, and this comparison includes every item of expense—operating expenses, taxes, depreciation and interest on investment. The traffic, however, on the rail service routes is much heavier than on the motor coach routes; in other words, the motor coaches cover the lighter traffic lines. At the present rate of fare, namely, 7 cents, with eight tickets for 50 cents, the rail service is operated profitably, about or perhaps a little more than offset by the losses in the motor coach operation.

The Pacific Electric operates no special service on bus lines such as is contemplated by Mr. Graham, and which would be "de luxe service" as compared to the regular service, and for which a much higher fare would be charged than that imposed by regular buses and rail service.

From time to time during the past several years our views have been made known at conventions of the A.E.R.A. and through articles in electric railway publications, and these views have not been materially changed through experience; and these include the view that the place of the bus on the electric railway properties is of the auxiliary or supplementary nature. It has been, and is, the practice of the Pacific Electric to establish and maintain bus lines simply as feeders to the main rail traffic arteries for the bringing of these people to the "metropolitan area," or in urban territory where traffic is light, in contrast to the plan submitted by Mr. Graham which indicates bus lines also entering the metropolitan area direct.

Bringing these buses into the metropolitan district would add very materially to the already highly congested street traffic and further impede traffic movement of the rail lines. The traffic congestion at this time is one of the most serious problems faced by this railway, both in local and interurban operations.

In several instances this company has acquired from other owners by purchase competing bus routes, but the service, with the approval of the public, has been made feeder to that of the electric cars. Feeder lines to our main rail lines are established in Pacific Electric territory when the need for such service is made manifest by surveys and where there is the probability that the line will pay its way; if not immediately, then within a reasonable time. It is our policy to abandon such service if, after reasonable trial, it does not develop sufficient revenue, either directly or as a feeder, to justify it.

It is agreed that the bus is a factor in transportation and as such must be viewed with an open mind, but its adaptation to territory either alone or in conjunction with rail lines is a matter for each individual property to judge for itself, because on no two properties will identical conditions be found and in no two sections will the same travel habit be found.

An important factor is the franchised auto carrier, which in some instances has acquired paralleling operative rights prior to commission control in semi-urban and interurban territory, operating at a lower fare than the rail lines, makes no commutation fares for workers, not attempting to carry peak loads—merely content to skim off the cream. This may or may not apply in communities elsewhere as it does in Pacific Electric territory.

It is evident, also, that a comparison of Pacific Electric urban conditions with that of Pennsylvania-Ohio properties could not be reasonably made because of the largely varying units of service operated in Pacific Electric territory, particularly in Los Angeles and its suburbs, where it varies from one to five car units, thereby taking it out of the single bus and single car comparative field. This diversity of units is necessary because of high morning and evening peaks of travel and variation of travel throughout the day.

So far as it relates to the Pacific Electric Railway, and we believe also to other properties of comparable size and traffic, with urban and interurban operations, mass transportation by buses is beyond possibility.

For our own purposes, the co-ordination of buses with rail lines as supplementary thereto and as feeders is the proper policy, with every effort bent toward expediting service over rail lines by the elimination of sources of delay, such as grade crossings, traffic congestion and unnecessary speed restrictions.

PAUL SHOUP.
President.

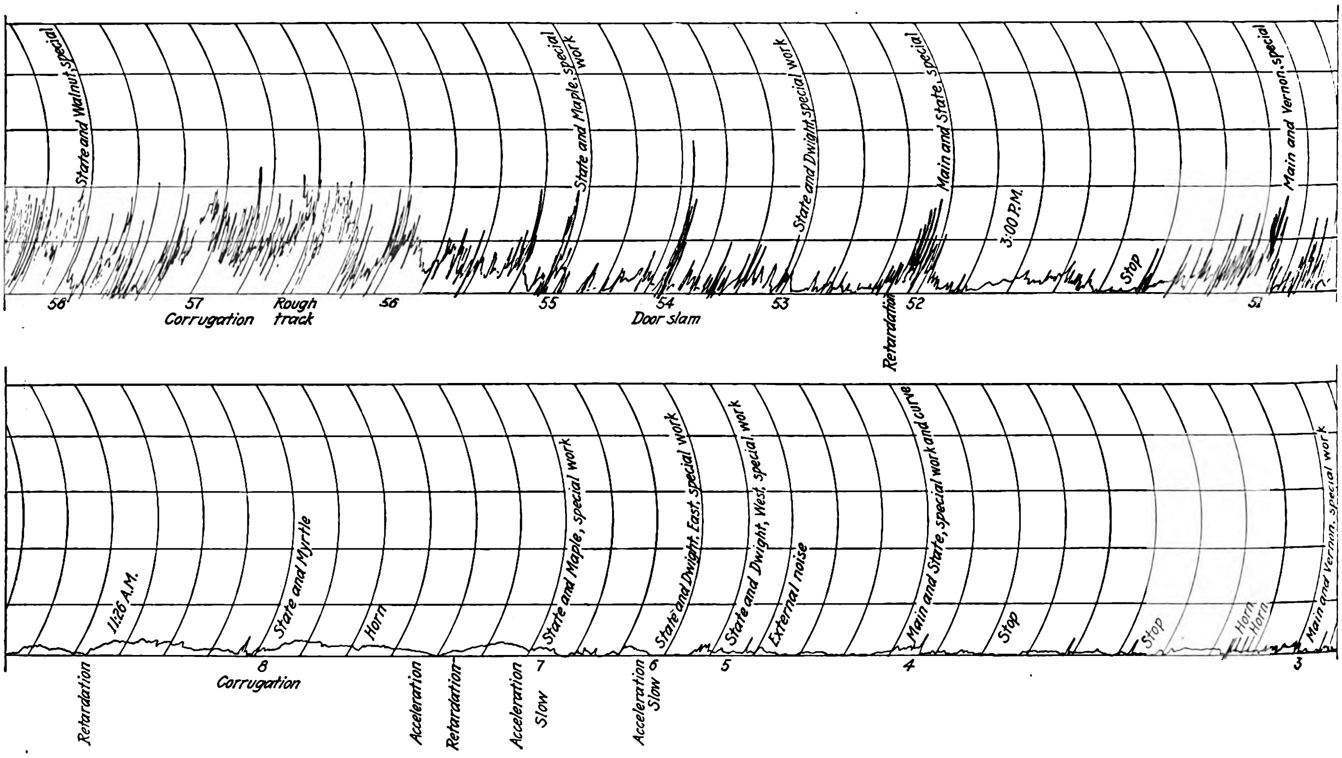
Test Shows Springfield Car to Be Quiet in Operation

SPRINGFIELD STREET RAILWAY
SPRINGFIELD, MASS., April 26, 1927.

To the Editor:

I have read with no little satisfaction your editorial of April 23 having to do with the noiseless street car. One part, however, I think is rather misleading. You say that "From the standpoint of noise reduction the car did not seem to live up entirely to what had been anticipated for this design. This was particularly true on the interior of the car." In this connection it should be understood that we did not expect to eliminate all noise, but were endeavoring merely to effect a reduction. That this has been accomplished in large measure is shown by the results of noise measurement tests made by Mr. Williams and his committee of the American Electric Railway Engineering Association. From the accompanying charts showing measurements made during a trip of one of our older cars and during a trip of the new car it will be seen that a substantial reduction has been made in the noise of operation.

C. V. WOOD,
President.



Noise measurements made on one of the older cars of the Springfield Street Railway, above, and on the new experimental car, below, show clearly that the latter is much more quiet in operation

Pacific Coast Company Leases Boats to Be Tied in with Railway

THE Key System Transit Company, Oakland, Cal., has been authorized by the Railroad Commission to lease to the Golden Gate Ferry Company, and the latter company has been authorized to hire and operate, the ferryboats *Fernwood* and *San Francisco* on the San Francisco-Sausalito line of the latter company, for a period of three years. The total rental will be $24,500 for each boat, to be paid at the rate of $700 a month per boat.

Maintenance Men

May 14

is the DEAD LINE for First Monthly Prize Material

Three Capital Prizes

First - - $200
Second - - $100
Third - - - $50

Twelve Monthly Prizes

$25 Each

Don't Miss This Opportunity to Win

ITEMS published in the maintenance data sheet section of ELECTRIC RAILWAY JOURNAL dated May 21, 1927, will have the first chance to win one of the $25 monthly prizes. It takes some time to prepare material after it is received at the New York office. In order to prepare proper illustrations and set the type for the first items to be used it is necessary that material be in New York not later than Saturday, May 14. Contestants will still have time to get their material in after reading this, if they act promptly. Some items have already been received. This material has been edited and is ready for publication.

ELECTRIC RAILWAY JOURNAL is offering the prizes in this Maintenance Data Contest to help maintenance men win recognition which they deserve in the industry. Enter the contest at once. Send in as many of your maintenance practices as you like. The JOURNAL will pay $5 for each item published whether or not it wins a prize. The more items you send in the more chances you have of winning a capital or monthly prize. Get started at once. Maintenance men, here is your opportunity!

FOR the benefit of new readers and those who may have missed the announcements in previous issues of ELECTRIC RAILWAY JOURNAL, the conditions for competing for the various prizes offered in the Maintenance Competition are restated in condensed form. Full information will be found in the April 16, 1927, issue, pages 700-701.

Three capital prizes will be awarded for the three best maintenance ideas submitted before Aug. 1, 1927. These are: First prize, $200; second, $100, and third, $50. In addition twelve monthly prizes of $25 each will be awarded, one each month beginning with the May 21, 1927, issue. Articles submitted will be published in the Maintenance Data Sheet Section of ELECTRIC RAILWAY JOURNAL, and a minimum of $5 will be paid for each article published.

Any employee or official of an operating electric railway or electric railway bus subsidiary may compete for the prizes.

Each contestant may submit any number of items he desires. Each will be judged separately.

The prizes will be awarded primarily on the value of the idea presented and its adaptability to maintenance work on electric railways. The form of presentation will be judged only as to the clearness with which the method or device is described and illustrated.

The author does not necessarily have to be the originator of the idea or device. An article may be submitted by several persons or by a department and need not be written by the person in whose name it is submitted.

Articles may describe any maintenance practice or device used by any department of an electric railway, such as the maintenance of rolling stock, buses, shop equipment, or methods and equipment for overhead line repairs, power distribution and power generation devices, signal work, track and way maintenance, etc.

Articles should be preferably 100 to 200 words in length and should be accompanied by one illustration. Brevity consistent with a proper presentation of information will be given weight in judging articles. In no event should they be longer than 400 words, with not more than two illustrations.

Manuscripts should be mailed to the editor of ELECTRIC RAILWAY JOURNAL, Tenth Avenue and 36th Street, New York, N. Y. To be eligible for the capital prizes the envelope must bear a postmark dated before Aug. 1, 1927. Photographs or sketches that accompany the manuscript may be in pencil, or blueprints will be accepted. Each item submitted should bear the name or names of the individual or individuals by whom it is submitted and to whom awards are to be made. Photographs, sketches and manuscripts should be marked so that should they become separated they can be identified readily.

Monthly prizes will be judged by the committee, to be announced later, after the articles are published in the Maintenance Data Sheet Section, the best item being selected each month from those appearing in the issue in the month devoted to Maintenance and Construction.

The announcement of the winner each month will be made in the issue devoted to Maintenance and Construction, the third issue each month, following the one containing the items.

The winners of the capital prizes will be announced in the Annual Convention Number of the ELECTRIC RAILWAY JOURNAL to be published in September, 1927.

Maintenance Notes

High-Powered Snow Plow Mounting

EARLY this year the mechanical department of the Kansas City Public Service Company completed two high-powered snow plow attachments designed to fight the heaviest snow storms and clear the tracks of drifts.

The attachments were applied to cars of the Differential dump type equipped with four 90-hp. motors with HLF control. The plow is constructed of a special reinforced steel, 16 ft. long and 3 ft. high, hinged to the main steel underframing of the car and set at an angle of 45 deg. with the track. A smaller wing plow is hinged to the left end of the main shear and is used for cleaning up the devil strip between the tracks. The wing can be raised to clear obstructions, such as poles and standards, where the overhead is carried on poles between tracks.

The plow is raised and lowered from the cab by compressed air, controlled by a standard type of brake valve. It can be raised to a height of 10 in. above the rail by a movement of the air valve, thus quickly clearing any unforeseen obstacles on the track, and it can be adjusted to any desired height for plowing snow.

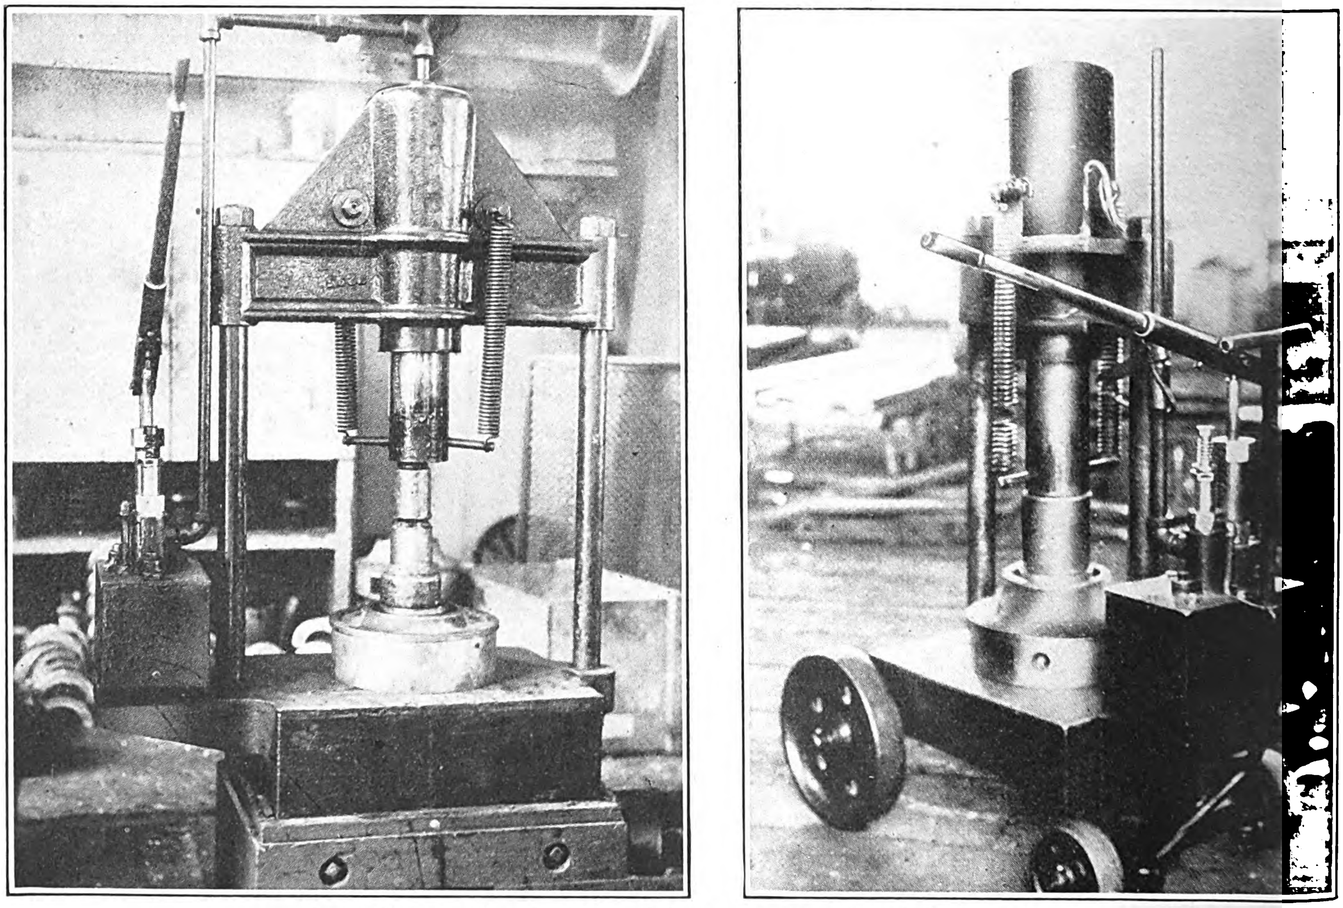
Provision is made so that the plow can be attached or removed on short notice so that cars can be used for regular construction work when not combating a heavy snowfall.

Hydraulic Presses Serve Many Purposes

HYDRAULIC presses are used for all fitting work around the shops of the Los Angeles Railway which does not require a pressure in excess of 15 tons. Seven of these presses are used on the property, five at the division inspection shops and two at the main overhaul shop. One of these latter is portable. All were made in the shops.

Construction of the press is relatively simple. The base is of cast iron, about 24 in. square and 6 in. deep, with tension rods and head support securely fastened in bosses on each side of the base plate. The head is carried approximately 20 in. above the base. The iron head casting contains the cylinder, which is lined with bronze. The ram, whose diameter is 4¼ in., has a stroke of 12 in. Return springs connected with cross arms near the end of the ram are secured to the head casting by drilled bolts.

The press is operated by a hand



Type of hydraulic presses used in the Los Angeles Railway shops

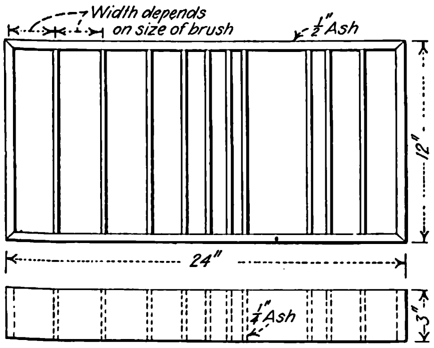
One of the stationary types is located at each division inspection shop. The view at the right shows one of the portable types which are in service at the main repair shop pump on top of an oil reservoir mounted on an extension of the base. The pump is of the single action type, the 24-in. handle having a leverage of approximately 6 to 1. Release of pressure is possible by depressing the handle to a point where it engages an extension of the relief valve. In the illustration the relief valve is shown directly in front of the pump cylinder.

Both the presses illustrated are being used to insert an armature bearing into its housing. On this particular work the pressing fit is between 0.004 and 0.006 in. A pressure of 3½ tons is required. A gage mounted on the top of the tee connection between the pump and the ram cylinder indicates this pressure. The illustrations do not show this gage.

Clean and fumigate your cars thoroughly on the inside so your patrons can't say "thanks for the buggy ride."

Receptacle for Storing Compressor Brushes

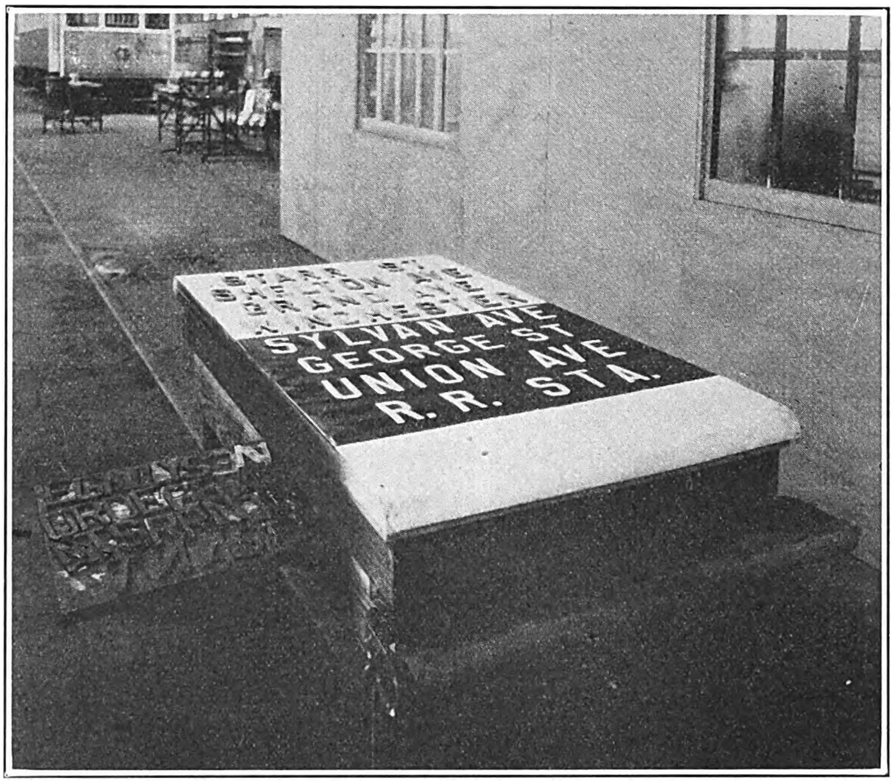
CHEAP but effective is a receptacle for the storing of air compressor carbon brushes designed and adopted by C. W. Wood, master mechanic of the Newport News & Hampton Railway, Gas & Electric Company, Hampton, Va. It consists of a box made from ½-in. ash, 24 in. long, 12 in. wide and 3 in. deep. This box is divided into sections of such a size as will accommodate a certain size of brush and each section is stenciled for the type and style of brushes it can hold. A special section is included in the receptacle for the storage of worn-out or defective brushes.



Wooden box used by the Newport News & Hampton Railway, Gas & Electric Company, Hampton, Va., for storing air compressor brushes

Prior to the adoption of this box brushes were strewn about the shop floor and the cost of brush replacement was exorbitant. This practice has now ceased, resulting in lower brush replacement cost.

Roll Signs Painted by Spray Method



Painting roll signs by the spray method in the Grand Avenue shops of the Connecticut Company

In this view the lower half of the sign has been painted and the metal letters have been removed to the near-by tray. On the upper half, which has not been sprayed, the letters remain in place.

MUCH time has been saved in the preparation of curtain destination signs by the use of spray painting at the Grand Avenue shops of the Connecticut Company, New Haven. Formerly new signs or sections of signs were made by outlining the letters and filling in the background by hand. A little more than a year ago J. E. Dooley, master mechanic, conceived the idea of painting metal dash signs by the spray method. Details of this process were given in the ELECTRIC RAILWAY JOURNAL for Aug. 8, 1925, page 211. It proved so satisfactory that recently it was adopted for roll signs.

A piece of sign cloth of the desired width and necessary length is laid on the top of a low table and secured by thumb tacks. One edge is then marked off in 6-in. lengths. A T-square is next lined up with the second mark from the top end of the cloth. Against the upper edge of the T-square are placed metallic letters 4 in. high. These are made of old babbitt metal by casting in forms made in the shop. The thickness of the letters is ⅜ in.

Watch your "P's" and "Q's"—pints and quarts of oil. And don't let your oiler be a lubricating bootlegger.

Spacing is done by eye. As soon as one line has been completed the T-square is moved down to the next 6-in. mark. After all letters have been placed, heavy pieces of paper are laid across the ends of the cloth to protect it from the paint. Black paint is then sprayed over the entire surface. The weight of the metal letters is great enough to prevent their accidental displacement during the spraying. After the painting has been completed the letters are lifted by means of wire handles and laid on a tray alongside the table.

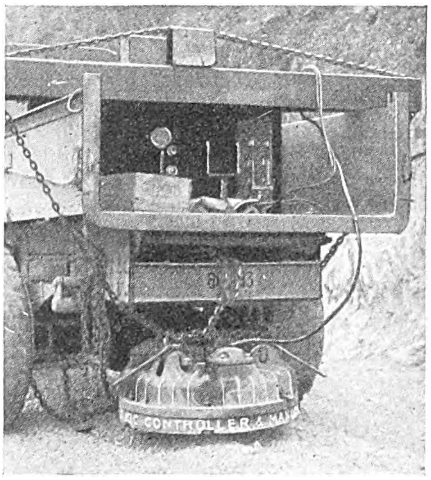
This method produces neat, clearly legible signs, quickly and at moderate cost. Since its adoption the company has been able to re-equip all cars when they are overhauled.

New Equipment Available

Magnets Clear Roads of Nails

OPERATORS of buses can profit by the experience gained from clearing roads of nails, tacks and other metal pieces to reduce tire troubles and damage. Lifting magnets of types manufactured by the Electric Controller & Manufacturing Company, Cleveland, Ohio, are used to accumulate the various metal pieces. This equipment can be attached to a truck or bus and should prove a valuable maintenance unit.

The accompanying illustration shows the equipment as used in Kellogg, Idaho. A No. 3 type SA lifting magnet was suspended from the rear of a 5-ton truck so that its lower face was about 4 in. above the road surface. Electric current was furnished to this magnet by 72 cells of regular locomotive type Edison storage battery. This outfit was operated back and forth along the road until it had covered the entire surface. Operating over 5 miles of roadway, this magnet picked up 150 lb. of nails, bolts, wire and scrap iron, all of which constituted a severe menace to tires.

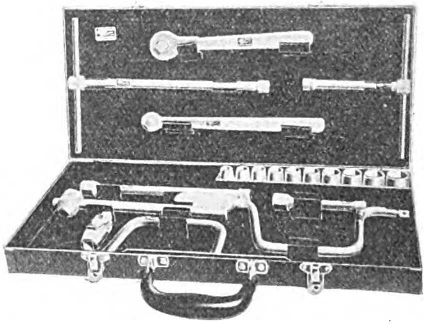


Lifting magnet applied to the rear of a 5-ton truck for picking up iron material from the roadway

At other places a different arrangement of magnets was tried. In Carson City, Nev., two lifting magnets, each of 22 in. diameter, were suspended between the front and rear wheels of a 5-ton truck with their faces raised 5 in. above the surface of the roadway. Magnetizing current was supplied to the magnets by a 5-kw. d.c. generator driven by a gasoline engine, mounted as a unit on the truck. In one round trip on a 100-mile section 1,370 lb. of nails, spikes and scrap iron were picked up. This equipment was also used to clean the streets in Carson City, where 4,850 lb. of iron material was picked up in two days.

Socket Wrenches in a Case

CHROME vanadium socket wrenches and handles packed in sets in an enameled metal carrying case with leather handle are being placed on the market by the Bonney Forge & Tool Works, Allentown, Pa. The set consists of ten chrome vanadium hexagon sockets from $\frac{7}{16}$ in. to $\frac{7}{8}$ in. inclusive and chrome vanadium handles. The handles included are solid offset, offset ratchet, sliding tee, solid tee 6 in. long, solid tee 12 in. long, two brace or speeder types 5 in. extension, 10 in. extension and universal joint.

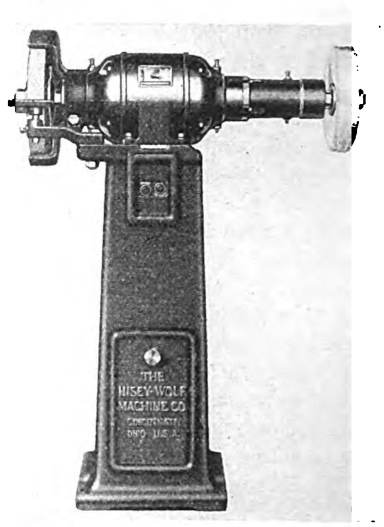


One of the sets of ten chrome vanadium socket wrenches and handles

Combination Grinding and Buffing Machines

EIGHT new models of combination grinding and buffing machines made in 1 hp. and 2 hp. sizes are being marketed by the Hisey-Wolf Machine Company, Cincinnati, Ohio. The accompanying illustration shows one of the machines which is equipped with incased type spindle extension and which because of its rigid double ball bearing construction is recommended for heavy-duty buffing, polishing and scratch brush work.

Some of the important details incorporated in the new line of machines include high grade over-sized ball bearings mounted in the heads in close proximity to the wheels. All bearings are inclosed completely and are protected from dust and grit. The oil chambers, with a capacity to last two or three months, have suitable flush or drain pot plugs to permit occasional cleaning. Grinding wheels have a diameter in proportion to the motor speed. This gives safe and efficient travel.

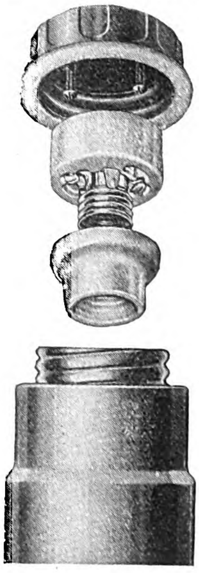


Pedestal type of combination grinding and buffing machine

Socket Installation Simplified

SOCKET bases fastened to the canopy by screws fitting into bayonet holes form a development in Durex sockets announced by the Wheeler Reflector Company, Boston, Mass.

This new principle in socket construction enables a twist of the wrist to remove or replace the socket in a moment. The porcelain socket shell screws on and off easily, exposing the contact screws for wiring.



New type socket

Association News & Discussions

Railway Section Shows Enthusiasm at New Orleans

ENTHUSIASTIC, active discussion of outstanding topics of the moment crowded the meetings of the railway section, Southwestern Public Service Association, at New Orleans on April 26-29. A preliminary telegraphic report of the convention was published in last week's issue of this paper.

The general subjects taken up by the railway men ranged from "Telling the Transportation Story" to "Modernization of Equipment." Traffic control occupied a large part of a full afternoon session. Discussion from the floor was active on each topic and Past-Chairman W. W. Holden, who presided in the absence of Chairman W. H. Burke, Southwestern district manager Stone & Webster, was several times forced to limit the discussion to keep within the allotted time.

Those who spoke or prepared papers for the meeting included President W. H. Sawyer and Managing Director Lucius S. Storrs of the American Electric Railway Association. A. J. Sarre, R. M. O'Brien, A. J. Naquin, Ben Commons, and Captain Casey of the Police Department, New Orleans; G. I. Plummer, B. R. Brown, C. J. Crampton, Dallas; R. C. Foreman, P. S. Duenweg, Carl Frazer and Public Service Commissioner C. J. Kirk, Houston; W. W. Holden, L. McInery, San Antonio; J. G. Holtzclaw, C. A. Brann, Beaumont; F. B. Scurlock, El Paso; C. L. Van Auken, Chicago; Charles Gordon, New York.

As reported last week, both President Sawyer and Mr. Storrs pointed to the changed conditions which face electric railway men to day. Their addresses before the general sessions of the association are abstracted elsewhere in this issue. Mr. Storrs commented on the active discussions which took place throughout the meeting and characterized it as an inspiration to railway men not only in the Southwest but in the entire industry as well.

Making Salesmen of Car Operators

Taking the topic of telling the railway story to the employee, Mr. Foreman outlined the work of coaching car operators to be salesmen. He held that the chief aim in coaching a group of employees is to train them so they will be responsible representatives of the company with initiative and judgment of their own. For this purpose he considered the academic and lecture method of instruction and training to be very weak. To win the active interest and co-operation of a group of employees, some point of common interest and ambition must be the foundation on which to build. Working on this idea in Houston, he found that the underlying ambition in every man's mind, to become able to speak on his feet and express his ideas, furnishes a basis by which employees are naturally attracted and by means of which their interest can be enlisted in self-improvement and in loyalty to the company's objectives in serving the public. A course of self-education has been successfully developed by the Houston Electric Company through the means of a class in public speaking. This class is composed of heads of departments and goes through the entire organization, taking the men in groups of fifteen to twenty. Through this course information is transmitted to each employee from the department heads and from the more articulate and intelligent of the employee group. More important than the information transmitted, Mr. Foreman pointed out, is the self-confidence which is built up and the interest in the work and in the company's problems that is enlisted. The ultimate objective is the development of each man as a salesman in the true sense of the term.

Practices of the New Orleans property in the training of employees were outlined in a paper by A. J. Sarre, which is abstracted elsewhere in this issue.

"Management is reflected as by a mirror in the action of the men on the cars," said acting Chairman Holden, speaking on this subject. He maintained that the management must be sincere in its thinking and actions and that unless that condition exists on a given property, the weakness will be reflected in the employees clear down the line. Even in the brief contacts which the railway manager has with his men, he explained, permanent impressions are made which affect the attitude toward the company and the public of every subordinate. "Men learn new things best by doing them." said Mr. Holden. In preparing a course of training, therefore, it was his opinion that this should be the guiding principle to be followed. He held that a proper training course should also give the man a real opportunity for doing his own thinking under proper direction. "If a man's heart is right and he is thinking. he may be expected to perform satisfactorily."

Practice in Advertising

Advertising as a means of telling the railway story to the public was the subject of a paper prepared by C. J. Crampton, and read in his absence by Mrs. C. C. Owen. Mr. Crampton found that railway practice favored daily newspapers as the best medium for addressing the public through advertising. Next to this he classed car cards and after that, billboards and moving picture films. He advised avoidance of specialized advertising such as one-time publications and programs. Money spent in these latter mediums should be classed as good-will contributions rather than as advertising.

Railway advertising in general he grouped in three classes as to the purpose: good will, merchandising the service and selling securities. The copy used for the first class is usually conceived from the viewpoint of keeping the public informed regarding the company and its activities. Sometimes copy in this class is devoted to talking about the employees of the company. This practice, according to Mr. Crampton, helps to inspire a desire on the part of the employees to live up to the standards set by the advertising.

In selling the service of a railway property through advertising, a number of copy appeals in use were listed. These include appeals built on the economy of electric railway transportation, dependability, safety, comfort, freedom from the petty annoyances of the automobile and opportunity for relaxation, reading, etc. The sale of service through advertising is only in its initial stages, is Mr. Crampton's opinion. He questioned the value of the "economy" appeal in copy, and felt that the public is more interested in "keeping up with the Jones's" than in "saving the difference." He expressed the opinion that comfort, dependability and freedom from traffic worries are more valuable selling appeals than that of economy.

Performance Must Live Up to Promise

The speaker cautioned against any attempt to exaggerate in advertising or to use advertising when the service does not measure up to the promise. Such a situation, he held, produces a reaction that is considerably worse than if no advertising at all were used. Mr. Crampton called attention to the increasing tendency to spend more money for art work and expert composition in the preparation of railway advertising. "Persistence," he said, "is the secret of advertising results with any particular kind of copy." Success in winning public approval, however, is dependent on providing a service which measures up to modern requirements.

The outline of a talk that is given to each new employee hired by his company was given by Mr. Brann. An abstract of his remarks is printed elsewhere in this issue. Mr. Duenweg testified to the value of the public speaking work in Houston as a means of interesting the men in their work and in improving their contact with the public. He held that when the men are really interested in their work and in pleasing the public, the company does not have to give much attention to telling its story to the public; that the men will do that most effectively. Commenting on this Mr. Holden said that not enough railway managers have sufficient faith themselves in the future of the electric railway business.

ENLISTING MECHANICAL MEN IN PUBLICITY WORK

Mr. Brown felt that not enough attention is given to the men in the various mechanical and maintenance departments. These men, he held, have frequent contacts with the public and become a powerful force for good or bad impressions. Mr. O'Brien called attention to the work done by the Association of Equipment Men, Southern Properties, and urged railway managers throughout the Southern territory to encourage their master mechanics to take part in the work of the mechanical men's organization. Mr. McInery felt that instruction in public speaking should be carried to the men in mechanical departments as well as to those in transportation work.

Speaking on the problems of improving traffic conditions, C. J. Kirk, Public Service Commissioner of Houston, criticised street railways for lack of frankness with the public on the matter of traffic control. This situation, he held, has developed beyond the crossing policeman and requires more scientific methods and study by experts. Street railway companies should take the initiative in bringing all the elements in a community into a united organization for the solution of an important and baffling community problem, as the representative of a large part of the people who make daily use of the streets. He felt that the average company is entirely too timid in demanding that consideration to which it is entitled in connection with this vital subject. American communities, he said, need help from the utilities in working out relief measures.

An interesting view of the traffic situation as seen by the man on the platform of a street car was given by Ben Cummings, a motorman of New Orleans Public Service, Inc. The first step in the relief of congestion, he held, is prohibition of obstacles to the free flow of traffic. Success of any ordinance or regulation which is put into effect for the relief of congestion is impossible, however, without co-operation of police, public officials and the railway.

A paper prepared by J. G. Holtzclaw on the subject of modernizing electric railway cars created considerable and lively discussion. An abstract of the paper is printed on another page. Charles Gordon, editor ELECTRIC RAILWAY JOURNAL, discussed the significance of the developments in cars that are being made in various cities and showed a number of photographs of the new worm-drive car which was recently completed in Springfield, Mass.

In acknowledging his election as chairman of the railway section for the ensuing year, Mr. Paterson pledged himself to continue the good work which has been done by his predecessors, and among other things pointed to the importance for electric railway success of obtaining an adequate rate of fare which will permit a program of improvement to be carried out.

Public Is Getting Better Understanding of Local Transportation*

BY LUCIUS S. STORRS
Managing Director American Electric Railway Association

IT HAS taken years for the urban transportation industry to obtain a general recognition by the public of the basis upon which operations can be successfully developed and maintained. Then, too, there are yet all too many places where these fundamental facts are still beclouded, either by a lack of full information or prejudices which frequently are the inheritances of old conditions that the public holds against the present operators, despite the injustice of it.

Briefly these fundamentals are: (1) The dependence of any community upon public transportation for its growth and the personal prosperity of its people. (2) An appreciation on the part of transportation executives that while an irreducible minimum of passengers will use the services because they must; to become entirely solvent the company must offer such service as will invite a vastly greater use of the cars or buses. (3) A complete willingness on the part of the people to make their transportation corporation a profitable business enterprise either through a large use of the cars or a somewhat lesser use at higher rates. There is nothing mysterious in our business and through no legerdemain can profits be established; it is just a plain business proposition. The public needs efficient service, nor does it care one iota who provides it.

REMARKABLE RECORD LAST YEAR

Local transportation service, with street cars as the backbone and buses being used supplementally, is making rapid strides in most parts of the United States. During the last year electric railway managements furnishing this joint service and embracing 78 per cent of the total carried some 14,600,000,000 passengers. Doubtless the entire industry carried many more than the previous high record of 16,000,000,000. Even this old record is about seventeen times as many riders as were carried by the steam railroads and many times the number carried by independent bus lines not run by street railway companies. It is three out of every four persons who ride in the streets in any kind of a vehicle. In other words, for every person who rides in a taxicab or an automobile or an independent bus in American cities three persons ride rail lines and buses run by electric railway companies.

This is a remarkable record, particuuarly when we recall that less than ten years ago, due to increased costs caused by the war, one-sixth of all the electric railway mileage in the United States was in bankruptcy or receivership. It was then generally predicted that electric railways were dead. Now they are growing stronger daily, primarily in metropolitan centers.

Improvement of local transportation in any given city invariably follows these steps: (1) The adoption of an operating agreement, contemplating high-class service, with modern equipment for the riding public and a fair return on the value of the property to the investor. (2) Elimination of competition by the placing of all local transportation, including rail and bus service, into the hands of single managements under the direct supervision of public authorities. (3) Elimination of downtown parking of automobiles. The fare issue, which once was the chief cause of controversy in almost every city, no longer is the dominating one in most communities. Public officials who put good service first generally have long since recognized the need for higher fares to meet increased costs and willingly grant them. As a result, the average fare for the United States today is 7¾ cents, and 10 cents in most large cities. Fares which permit just returns for owners of the properties are quickly reflected in improved service.

Service also is being improved in many communities through readjusting electric railway taxes, thus giving the companies more money to spend on general betterments. The most general tax adjustment being made at present concerns paving. In five states and some 50 communities companies have been relieved of paving costs in whole or in part. This is only simple justice. During this legislative session New Jersey has fallen into the line of progress, a bill for the relief from this tax having been enacted.

That competition destroys service and that the best results are obtained from permitting single companies to operate both street cars and buses in their respective communities is being proved repeatedly. The thought of a few years ago that the competing buses would drive street cars off the streets, or at least compel them to reduce fares, has been clearly shown to be unsound. Competition has damaged service and increased fares. Throughout the country there is a general movement toward the consolidation of street railway and bus lines under single managements. Three hundred and thirty-two electric railway lines now are operating nearly 8,000 buses and good results are being obtained from this co-ordinated program.

RAILWAY EXTENSIONS CONTINUE

Instead of replacing the electric car, the bus has added greatly to unified public transportation service. During the last ten years more electric railway track has been built than has been abandoned and the bus has driven very few lines out of business. They have added some 15,000 miles of extensions to electric railway properties, tapping new territory where the traffic was not dense enough to warrant the laying of rail lines.

The bus is finding its place in serving as a supplemental carrier to the electric and steam car. It has not replaced the street car widely because it cannot carry large numbers of persons as cheaply or quickly in congested centers. Where passengers are few and scattered the bus can give a service, even though unprofitable, that otherwise would not be possible. It is finding a much wider use in providing an auxiliary type of service to the rail lines which can only be given by a different kind of vehicle—one that more nearly approximates the private auto.

---

*Abstract of an address before the Southwestern Public Service Association, New Orleans, La., April 26-29, 1927.

There are almost 3,000 more electric cars in regular daily use today than there were in 1919. For instance, Los Angeles alone has 671 more cars in regular service than it had in 1919, Detroit 446, Chicago 425, Pittsburgh 175, St. Louis 155 and Milwaukee 114. The discontinuances of rail lines have been scattered through about 60 small towns. They occurred in such places as Albany, Ga.; Streator, Ill.; Iola, Kan.; Hattiesburg, Miss.; Nelsonville, Ohio; Lykens, Pa., and Waupaca, Wis. The average operation was seven street cars to a town. Generally speaking, street car service never should have been started in these small cities and would not have been if buses were available when the rails were originally laid. Many towns too small to support an electric rail line find the bus useful.

There is no indication that electric lines in urban centers are going to be seriously affected by the bus. There is every indication that the electric railways will continue to use the bus as a very helpful supplemental agency and through its use will find entirely new types of service that will attract the public. This growth is evident wherever local transportation company managements and the public, represented by city and state officials, have ceased bickering, quarreling and mud-slinging and sat down at round-table conferences to iron out their problems. The need for good transportation is mutual. Companies must give it or they cannot make fair earnings. Cities must have it or they cannot prosper. Recognition of this fact and an honest desire on the part of both public and management to play fair inevitably results in progress and profit for all.

PUBLIC OWNERSHIP UNDESIRABLE

There is more or less talk at present regarding the advantages of public ownership of public utilities. Sometimes there is talk of cities taking over electric railway properties, though not as often as of other utilities, it is conceded. A few cities have taken over the street railways and the results have not been particularly gratifying, to the public who furnished the money with which to purchase them, the riders who paid higher fares or the unfortunate managements who tried their best to render good service and carry out the orders of politicians at the same time.

A brief summary of the results of public ownership of electric railways gives such a convincing picture of inability to produce any remarkable achievement and the entire lack of claimed public betterment as a result from lower charges that the local transportation branch of the public utility business should be in little danger of having to undertake an active campaign against such attack. In fact, these spasmodic efforts of the public to provide service of this kind in a manner or at a cost that would receive public acclaim should be useful to the utilities as a whole in any discussion of the subject.

EXPERIENCE CITED

Detroit is a good example. Fares there have been raised under public ownership, but that is not the worst thing that has happened. Just as predicted, just as invariably happens in a case of public ownership of a public utility, local politicians soon got into the saddle. Detroit already has had three general managers of its municipal railways, and they alone know what a difficult job it has been for them to try to run the railway lines to suit the politicians. The fact is that the property is shot through with politics, that because of this the morale of the men on the lines is low, and that this condition is likely to continue just so long as the city, which means the politicians, operate the cars.

COMING MEETINGS
OF
Electric Railway and Allied Associations

May 11-12—**Central Electric Railway Master Mechanics' Association, meeting, Webster Hall Hotel, Pittsburgh, Pa., 9 a.m.**

May 12—**New England Street Railway Club, meeting, Copley Plaza Hotel, Boston, Mass., 3.30 p.m.**

May 18-19—**Central Electric Traffic Association, meeting, Tuller Hotel, Detroit, Mich., 9 a.m.**

May 31-June 1-2—**Canadian Electric Railway Association, annual convention, Winnipeg, Man.**

June 6-8—**American Association of Engineers, annual convention, Tulsa, Okla.**

June 9-11—**Midwest Electric Railway Association, annual meeting, St. Louis, Mo.**

San Francisco is having its troubles with a municipal line. Only part of San Francisco is served by the municipal property. It has been able to get along on a 5-cent fare by virtue of serving chiefly the territory of dense traffic and by a clever system of municipal bookkeeping which relieved the property of tax charges, depreciation costs, etc. Now extensions are needed, and within a month Adolph Uhl, manager of the San Francisco City Efficiency League, a prominent local body, has declared that proposed extensions and other costs would compel an 8-cent fare.

Seattle's experience is well known. The city took over the street car line because the politicians objected to an increase from a 5-cent fare. Under municipal operation a 10-cent fare soon was reached. Then, to prove that the way to make money was to have a 5-cent fare, it was restored. After the city had lost $750,000 experimenting with the nickel fare, the 10-cent cash or three tickets for a quarter fare was returned. Now the property is having trouble meeting its interest charges and the rolling stock is deteriorating.

These three outstanding examples of what municipal ownership of traction properties mean in the United States should be enough to warn any municipality against it.

Traffic congestion due to parked automobiles is one of the most serious problems of local transportation in every city. The 75 per cent of the people who use electric cars and buses as a means of transportation are being viciously delayed by the small minority who are permitted to park their automobiles in downtown streets. The common-carrier riders are the chief sufferers, but the majority of motor car owners, who cannot find places to park, also are being delayed by the select few who use the streets for garages.

DOWNTOWN PARKING MUST GO

A widespread protest against downtown parking is under way in this country and its result is as certain as tomorrow's sunrise. Downtown parking of automobiles must go. Nothing so unfair to a majority of the people can remain. The streets were built by all the people to be used as highways, and not as storehouses. Therefore, every vehicle which uses them, whether it be a street car, a bus or a private automobile, is entitled to reasonably free movement.

This fact has been recognized in Chicago, Los Angeles, Pittsburgh, Philadelphia, Cleveland and some parts of New York. Wherever parking has been wholly abolished, or restricted, street car and bus service carrying a vast majority of the people has been greatly improved.

Parking should be abolished particularly during the morning and evening rush hours. Generally, these hours are from 7 to 9 and 5 to 7. Most electric railways carry half of their total day's load during these four hours. Of the 43,000,000 daily passengers in the United States more than 20,000,000 are handled during these four hours. These 20,000,000 especially, most of whom are workers anxious to get to their places of employment or home to their evening meal after a hard day's work, are entitled to a clear path. There is no excuse for empty cars being parked along curbs so that moving traffic has to get over on the car tracks and obstruct workers. Think of the injustice of a parking regulation which permits one man to park his car at a curb and throw moving traffic over in front of a street car and thus delay 75 or 100 workers.

Good local transportation service makes prosperous cities and adds to the comfort of the people. It can be obtained by passengers insisting that they and the operating companies get a square deal. The people of this country want honest business to have a fair chance, and when shown that the utilities are being honestly conducted, the vaporings of the proponents of public ownership will fade rapidly.

However, it is important to bear in mind that the public must have the whole truth and nothing but the truth. It must be told to the public openly and aboveboard. No other method will insure justice to the utilities, nor should it.

Community Welfare Demands Transportation Improvement*

By W. H. Sawyer

President American Electric Railway Association

THERE was a time when one of the foremost ambitions of the electric railway executive was to induce people to ride the street cars instead of wasting the extra time by walking. Then there was a period when we first commenced to feel the effects of the privately owned automobile, it being first used by the more wealthy. Today one out of every five people has an automobile; a large number of people use their machines to go even a few blocks. Its use is confined not to pleasure riding; it is a necessity. There was a time when many questioned whether the number of automobiles could continue to increase. Today nobody questions but what there will be a continuing increase.

This means that every highway and every street that is to be of any real public use must be paved. It means that the traffic and parking problems are most complicated and pertinent civic problems. It means that there is not today the necessity for public transportation as previously existed, for as large a percentage of our population. It means that the street car riding habit is not maintaining its former rate of increase with the increase in population. This leads many to the erroneous conclusion that the day of the street car is past; that there is no longer the need for public transportation. The thinking man, however, cannot escape the fact that there is still an appreciable number of people who must depend upon public transportation all of the time, and it is also a fact that all of the people need public transportation some of the time. We are therefore confronted with the fact that public transportation still remains a necessity, and unquestionably will continue to remain a necessity. It is also apparent that with the changed conditions and with such acute competition many electric railway lines cannot survive if they are to continue to be operated with the same class of equipment and the same methods which were in vogue fifteen or more years ago. Many of these electric railway lines cannot survive if the communities served are to continue to treat their railways on the same basis as a generation ago.

I will talk later about what the electric railway companies are doing and should do to meet these changed conditions, but let me expand upon the situation which confronts you as citizens interested in the welfare and development of your community.

Noting the congestion of automobiles on the streets and on the highways, it is a natural thought that most people today are traveling by automobiles, but if you take an average important city street car corner you will find that the big bulk of the riders is in the street cars, not in the automobiles. This is due to the fact that practically all checks of automobile traffic show that on one important street there were more than five times as many pleasure vehicles as street cars but that the street cars carried more than twice as many people. Another check on an important thoroughfare showed fourteen pleasure vehicles to one street car, but even then the street cars carried 60 per cent of the total riders. Checks at large department stores and shopping centers show that more than 75 per cent come today by street car. These are typical illustrations, and yet there are those who say that the street car is obsolete and should be thrown into the discard. The important point I want to stress is the fact that the street car carries the bulk of the people and is the efficient transportation vehicle, and this should be taken definitely into account in all traffic regulations, including parking restrictions.

Unreasonable Burdens Restrict Service

There was a time when the electric railway was considered to be fair prey. The fare was fixed at 5 cents and any tax or obligation imposed upon the railway company was assumed to be beneficial to the community. There was a time when it was considered legitimate to force the railway companies to pave between the tracks and 1 ft. outside. Such a tax today imposed upon the car rider is not only unjust but is actually disadvantageous to the community. There must be a realization on the part of not only the public officials but the people generally of the fact that burdens put apparently upon their electric railway company are in reality burdens put upon the car riders, or are burdens which directly affect the ability of the company to furnish needed service.

I have no sympathy for the man who comes to my office and complains of the street car fare. I am all attention and am desirous of co-operating with the man who comes in seeking better service. Even in the case of the street car company which is today making a fair return on a fair value, the community would be the loser if the fare was to be decreased. What is needed from the community standpoint is more and better service. The average street car fare has not increased in proportion to the increase in cost of living, although admittedly the cost of labor, which is the most important item in street car expenses, has more than doubled and we are today operating more seat-miles per passenger than ever before.

Cash Fare Should Be Ten Cents

Also keep in mind that the automobile users are paying several times the cost of the street car ride for the privilege of riding in automobiles. It seems absurd that there should be even a quibble as to 1 or 2 cents difference in the cost of a street car ride when this charge is compared with the cost of operating an automobile, and when the charge is necessary for community progress. I doubt if there is a city in this country that from a community standpoint should not have a 10-cent cash street car fare, although where practicable there could be a lower ticket fare.

Our politicians have in the past too often felt that it would enhance their political fortunes if they could be the instrument through which the street car fare was lowered, or failing in that, if they could prevent any increased fare. There always will be politicians of this class, just as there always will be a certain class of people who are not broadminded enough to want to study a stiuation constructively, but there is undoubtedly a definite tendency toward a realization that transportation problems are technical and business problems to be solved on their merits for the benefit of the community. It is also becoming more generally recognized that the street car company, being a community asset and necessity, must be allowed to charge a fare commensurate with the cost of the service or eventually it will cease to function and the community will be the loser thereby.

There is unquestionably less political agitation against street car companies today than at any time within the last twenty years. We need only to have a thorough understanding of our community problem to arrive at a solution satisfactory to all concerned. There is no class of citizens which has a plainer duty along these lines than you operators of other public utilities. There is also a particular duty which devolves primarily upon you, and that is, to explain some of the fundamental differences between our operation and your operation.

No industry has any higher ideals as to public service than the electric railway industry. No industry is trying more faithfully to carry out those high ideals. You electric light and power operators have for years had money available so that you have been able to do many things for the advancement of community prosperity which the electric railway companies have been unable to do. We electric railway men have a more complicated and more complex problem with our customers than you electric light and power men do. We meet our customers twice a day mostly under disadvantageous conditions which cannot be avoided. It is impracticable to give every passenger a seat during the rush hour. The cost would be prohibitive. We not only meet our customers twice a day, but every time we meet them we must ask them for money. Try as we will it is impracticable for us to give as general satisfaction to our customers, except as there is an understanding of our problems and the limitations inherent to our particular industry.

---

*Abstract of an address before the Southwestern Public Service Association, New Orleans, La., April 26-29, 1927.

In many localities there are executives serving in a joint capacity in both industries. The intensity, complexity and the details of the railway problems demand that such executives give just as much time as practicable to the study and solving of these problems, while, comparatively, the electric light and power end is able to progress and go forward to the satisfaction of the community with appreciably less effort on its part. Let me say to you light and power people that our problem is your problem, but above all, it is a common community problem.

Permit me to say just a word about buses. There are few, if any, communities where the bus cannot be used to a greater or lesser extent to good advantage, but the electric car will remain as the foundation stone and backbone of our urban and interurban transportation. With both methods of transportation being used it devolves upon the electric railway operator to study and analyze his conditions so that each vehicle may be used in its proper place to the best advantage. The bus must not be used in direct competition with the electric car, where both are seeking the same class of business in the same territory.

CO-ORDINATION IS REAL PROBLEM

Many of us electric railway operators hesitated too long before we fairly attempted to utilize the bus advantageously. Many of us have made mistakes in attempting to utilize the bus. It is a real problem as to where the bus best fits in and where the electric car best fits in, and it is a real problem as to how the bus can best be co-ordinated with the electric car. Too many of us have operated buses unco-ordinated and that is an economic waste. It is also an economic waste to scrap existing transportation equipment and investment, except as it becomes absolutely necessary to do so. Such confiscation will ultimately react unfavorably on any future transportation investment.

There are still some electric railway men who are not meeting the changed conditions of today in the operation of their electric cars, but a great big bulk of electric railway operators are meeting these new conditions with changed equipment and changed methods, which entitles them to be at least in the category of having done their share toward meeting the changed community condition. It is interesting to note that those companies that have been the foremost leaders in progressive management and utilization of modernized methods and equipment are those companies that are making the best showing on the balance sheet.

No one is excusable for not having adopted progressive methods, but some of us are excusable for not having modernized all our equipment. We know that there are some electric railway lines which will eventually go out of business due to the changed conditions, but we are only part way through this reconstruction period. The dividing line is not yet in all instances clear. We know that those companies and those lines that are to survive must be modernized, and we also know that this will cost an appreciable amount of additional new money.

The number of companies in receivership has been very much decreased; the amount of scrapping has been really inappreciable and the number of companies that have modernized is constantly increasing. By modernizing I mean primarily that we are putting on equipment which has a very much greater appeal to our customers, equipment which is in keeping with the thought and trend of the day, equipment which is probably lighter and faster, and certainly is more attractive, more comfortable and more luxurious, and also more costly. Let me also add that until we have brought our railway equipment and methods up to date we are in no position to pass final judgment on the status of the bus or as to its proper functions when used in a comprehensive co-ordinated transportation system.

Today is a different day. We are living in an age of which the fast, luxurious, costly automobile is symbolical. The changed conditions have materially affected the electric railway industry, but it is still a most vital and essential industry. It must and will go forward. There has been definite, appreciable progress in the solving of its problems. The operators of the industry are striving, thinking, analyzing and constructively working as never before. They are capable, honest and sincere, and giving of the best of their skill and ability to solve these problems which are so vital to our civic prosperity. The industry asks not for sympathy, but it does need and must have constructive co-operation in solving this community problem.

Training Electric Railway Employees for Their Jobs*

By A. J. SARRE
New Orleans Public Service, Inc.

MANY factors contribute to the development and holding of the good will of the public served by a street railway, but the most important factor is a well trained employee.

If, however, we compare the amount of attention that has been given by management generally to the problem of increasing the efficiency of the rolling stock, the improvement of roadway, and power distribution and generating equipment with what has been given to increasing the efficiency of the man power, we will find that the human side has been woefully neglected. We spend time on the improvement of our machines and fail to realize how important it is to spend some time on the man who is going to be responsible for their successful operation. It is interesting to note how willingly any amount of time and study will be invested in the expenditure of a few dollars for a piece of equipment to be absolutely sure to have it just right, and how impatient we get when it is necessary to spend a few minutes explaining a problem to the man who has to handle that equipment.

The cost of training a man for a job has been variously estimated by engineers at from $35 to $600. It costs the New Orleans Public Service about $51.32 properly to train a new man to operate a street car. This is over and above the cost of hiring the man. The contrast between the extreme care given to the selection and installation of equipment and the general lack of consideration and total lack of system in handling the human element is certainly striking and marks us as being most inconsistent. If we consider the proposition entirely from the money side, wherein lies the difference between wasting money on inefficient or inadequate machinery or having it wasted by poorly trained inefficient workers?

INTELLIGENT INTEREST BY MEN NEEDED

Let us consider it now from another angle, that of public relations. The public knows the street railway organization in terms of motormen and conductors, and it is through the words and actions of these men that the public praises or condemns the company. Every act of an employee is interpreted by the public as a reflection of company policy. It does not differentiate between the individual and his employer. The company and its service is judged entirely by the actions of the men who operate the cars. If these men are properly trained in the mechanics of operation and in addition are trained to interpret every phase of operation in terms of effect on the public we can be sure that they will render the right kind of service. There is nothing that will contribute more to building up good will than the service rendered by a properly trained employee who by virtue of his knowledge of the job takes an intelligent interest in doing the job right.

The point that should now be considered is how to organize and carry out a satisfactory training program that will adequately meet the needs of the organization and the basic principles on which such a program must be built. The first basic principle is that the management must be entirely sold on the need and desirability of systematic training for its employees. It means that the management must be willing to pay for such training. The axiom that it takes money to make money holds just as surely in this proposition as it does in any other field of management. The recognition of the need and importance of the right kind of training as well as its value must go from the top down. The stimulus cannot and will not come from the bottom up. The management must be honestly interested in the proficiency of its employees. By an honest interest is meant one that is free of sentimentality. There is nothing as useless as an educational program based on the paternalistic theory that it is being done only to help the workers, that it is entirely philanthropic, that the management does not expect to profit through their improvement. If the results to be obtained are not mutually beneficial, then the program is not sound and is doomed to disaster.

---

*Abstract of paper delivered before the Southwestern Public Service Association, New Orleans, La., April 26-29, 1927.

EDUCATION TIED UP WITH OPERATION

The second principle is that the educational program must be definitely tied up with operation. It must not be set off as a side issue but must definitely function as an aid in increasing operating efficiency. Department heads, foremen, supervisors and other line executives must realize that they have a definite responsibility for aiding in providing the right kind of training both for new men entering their departments and for those who have been a long time on the job. The responsibility for having properly trained men on the job must always remain with department heads in charge of operation, but the machinery for providing this training will frequently be the responsibility of some separate department or division. There is one thing, however, that must be kept in mind and that is the fact that carrying out an efficient educational program for the employees of an organization is no inconsiderable task if it is done properly. It will require the same careful study and analysis of operation as is required of the engineer in designing equipment. When an educational program is started without an analysis of organization needs and the setting up of a plan to show what is desired and how it is to be accomplished, there is bound to be a loss of interest, time and money.

It also means an analysis of the individual job of motorman, conductor, supervisor, etc. It means finding out just what the elements are in each job. What are the various things a motorman must do to operate a street car successfully? He must stand in a certain position, otherwise he will work in an awkward manner. There is a certain speed at which a car must be fed, a certain way to apply the air. All of these things must be considered. They must not only be listed in a systematic way, but must be studied from two angles. First, successful operation of the equipment, and, second, from the standpoint of the passenger—each of the operations mentioned has a separate effect on the car as a piece of equipment and on the comfort and safety of the passengers.

The same thing is true of the supervisor or inspector. He must know whether or not an operator is rawhiding his car, because that damages the equipment. He must also understand the effect such operation has on the passenger. He must be able to deal successfully with the passenger whose frame of mind has been upset by some conductor blindly following rules and throwing reason to the winds. He must also know how to interpret company policy to the men on his lines and see that they carry on their work in accordance with that policy. He must know how to handle men to get the best work out of them, and that means a practical working knowledge of human nature. He must know how to maintain schedules—and keep the proper headway between the cars in order to provide adequate service.

If it is known just what operations and practices are to be followed on a certain job, it is an easy matter to check up on the way a new man is being trained by his supervisor or by an older employee. It is easy to determine whether or not he is being thoroughly instructed on all points, and nothing is being missed. It likewise serves as a check on the man who is doing the teaching. Does he really know his job or is he just getting by? Is there anything about it that he is unfamiliar with and where some special instruction might help him? Has he developed any bad operating habits since he was broken in? Is he working in full accord with the policy set up by the company? Putting a new man with one who has been a long time on the job is absolutely no assurance that the new man is being properly trained. The only way to be sure that he gets the training needed is by providing some definite system for supervising and checking the instruction as it is given.

DUPLICATE ACTUAL CONDITIONS

The actual instruction in operation and in dealing with the public should be given under conditions as near the real thing as it is possible to get them. It is much easier for the man to carry the instructions over to the job if he is trained under the same conditions and not on some artificial set-up that does not match with actual operating conditions. The training can be carried out by first having the men break in on special equipment set aside for this purpose under special instructors, or by actually going out on the road under the instruction of a regular line operator from the beginning. It is the practice generally when special equipment is set aside for new men to break in on to put them out afterward under experienced men designated as platform instructors. This is the general plan followed by the New Orleans Public Service, Inc., in training operators.

The training of supervisors must cover not only instruction in operation, but how to deal with the public and the simple principles of management. He must know how to handle men, how to get results at the least cost. It has been customary in the past to pick out some successful operator, promote him to a supervisory position and expect him to make good simply because he knows how to feed a car properly. It was expected that he would just naturally pick up whatever executive training he needed. In most cases he floundered around and after a long series of mistakes, sometimes very costly, managed to get by with some degree of success.

Here again it is necessary to provide a form of training, and one of the best methods that have been devised to date is the foreman conference. The general plan of the foreman conference consists in bringing the men together at regular intervals and having them discuss the different phases of their work under the direction of a competent leader. No books are used. The leader, through the discussion of a series of illustrations based on his experience and cases submitted from the experience of the members of the group, gets them to arrive at definite predetermined conclusions. When conclusions are arrived at in this way by a group of men, they rightfully believe that they are responsible for the decision and stand by it as being correct. A few of the subjects that have been discussed in this way at meetings of the transportation supervisors of the New Orleans Public Service, Inc., are "The Supervisor's Responsibility"; "Co-operation"; "Public Relations"; "Interest"; "Accident Prevention"; "Planning" and "Orders, Records and Reports."

PROPER ANALYSIS DESIRABLE

These meetings are held on company time and are considered just as much a part of the job as is keeping cars on schedule. The men appreciate the opportunity to discuss the important phases of their work with each other and the interchange of experience under the right kind of guidance is of considerable value. Here again the importance of analysis as a means of increasing efficiency is forcibly brought out. Each man is more or less forced to analyze his job in terms of the particular subject under discussion, because when he expresses his opinion on the subject he must be ready and able to defend it. The other members of the group are ready to check him up whenever he goes wrong. One of the most essential factors in the success of the foreman conference work is the confidence of the men in the management. If the management invites them to participate freely and to express their opinion, it must be ready to stand by and actually let the men talk. No man is going to talk freely if he feels that what he might say is going to be used against him in the future, that his suggestions are going to be taken as criticism and resented. If we ask our men to be honest and express their opinions freely in the interest of the organization, we must be honest and fair and not deal unjustly with the man whose opinions do not entirely coincide with ours.

There is still another type of work that is being carried on by a number of companies. This consists of special night courses designed to meet the needs of their employees from a general standpoint. There are at present fourteen different night classes in operation under the supervision and control of the New Orleans Public Service, Inc., for its employees. Eight of these are in practical electricity, four in accounting and two in shop arithmetic.

The instructors are all company men especially selected for their ability, training and experience. They are familiar with the property and can intelligently answer questions in their respective fields that are brought in by the men who are in daily contact with the work. It is very difficult for an outsider to get this information, consequently the company instructor can make the work much more valuable and interesting to those taking the course by the type of illustrations he can offer to explain the theories they are studying. The courses, being under company control, can be designed specially to meet the needs of its men. The average public night school has to take care of people from all types of industries and is forced to generalize in its instruction, leaving it up to the students to make the necessary application. Here again it is essential that such a program be looked upon as mutually beneficial. The employee gives his time and profits thereby, the company stands the expense and should also expect to profit by having a better trained group of men and women to carry on its work.

One of the unfortunate things about the problem of training employees is that we can accurately account for every dollar spent to pay for instructors, books, time away from the job, etc., but we cannot adequately measure the results obtained in dollars and cents. If the good accomplished could be measured in dollars and cents, the total amount would more than likely be staggering in its magnitude. It costs this nation a huge sum of money to provide the necessary facilities for teaching its people to read and write, but what would it cost us if our people did not have these facilities? Can the value of these facilities be determined in dollars and cents? Can the value of a well-trained employee, one who knows his job, is interested in it and knows the real meaning of co-operation, be measured in terms of dollars and cents? It would be extremely difficult to make such an appraisal.

How Far Should We Go in "Dressing Up" Street Cars?*

By J. G. Holtzclaw

Eastern Texas Electric Company, Beaumont, Tex.

BRIEFLY, the answer to this question might well be expressed in the form of another question, namely, "How far shouldn't we go in dressing up street cars?"

Every company is naturally limited by the amount of money that it can logically spend for this purpose, but if this limitation does not exist there is no other limitation except that of reasonableness. No one would be expected to provide facilities of comfort and luxury that are prohibitively expensive, either as to first cost or maintenance. Nor would they be expected to add frills and furbelows which simply make a street car look pretty but do not tend to improve either riding qualities or attractiveness.

There are two fundamental reasons why effort and money should be spent in making our street cars comfortable and good looking: First, for the drawing power of a good-looking piece of equipment. Second, the attitude that good equipment creates in the mind of our patrons as to our desire to give them the best possible ride for their money. Both of these reasons are sound. Some operator might say that the expenditure of money on painting, on seats, no noise-reducing devices, etc., is not a good investment, and that people will ride on a dilapidated piece of equipment just as readily as on a fine looking, up-to-date car. An operator who holds to this belief, however, is losing valuable time and probably a good many dollars.

This is a day of luxury, as undoubtedly all of you have heard a great many times during the past five years, and the working girl who is willing to spend a fourth of her weekly income for silk hose is certainly willing to spend 10 cents to ride in a first-class street car rather than 5 cents to ride in a dirty, rattle-trap piece of equipment on a rough track.

And right at this point enters the soundness of the second reason given, that is, the attitude it creates in the mind of our patrons as to our desire to give good service. The time is here, and has been for some time, when the street railways of the country must reach out for a new fare schedule. Many of them have already done so; others are in the making today. If our patrons feel that we have made an honest effort to give them satisfactory service with well-maintained equipment, they will be in a far more receptive mood to meet our requests for further increase in fare.

Improve Public Relations

One company in the Southwest has been successful, since the last meeting of this body, in obtaining a new schedule of fares through unanimous action of the city government and without the opposition of the people. The outcome of this company's request for increased compensation is one of the outstanding features for the past twelve months in railway circles, and should be a lesson to all of us as to how we should conduct our business if we are to expect the kind of treatment at the hands of governing bodies that we must have if we are to succeed.

This company, for several years past, has foreseen the necessity of increased rates, and its every effort has been toward keeping its equipment and track in excellent condition, properly maintaining its cars, dressing up to every reasonable degree—to the end that its patrons should realize that the proper portion of their money was going into the upkeep of equipment.

Another company in the Southwest has had a program of dressing up, which has extended through the past two years. It is difficult to estimate or even to state positively whether or not this program has resulted in more passengers, because the city in question has been quite prosperous. But in the face of declining railway revenue during the previous four years, this company, during the past two years, has experienced a constantly increasing revenue, and at this time its street car receipts are running approximately 10 per cent ahead of 1926, and 15 per cent ahead of 1925.

Improvements Made

The schedule of dressing up has not been extremely expensive, and every dollar that has been put into this work is being made effective either in appearance or comfort. All cars have been put through the paint shop, and have been painted, both inside and out, in attractive colors, vastly different from the old standardized yellow or green. Different seats have been provided, finished either in leather or some substitute far superior to the old wood slats. The floors have been covered with linoleum, substituting for the old unsightly wood floors, which could not be kept clean by any method. All fittings on the interior of the cars have been nickel plated. Inside frosted lamp globes have replaced the old glary clear globes.

Everything possible has been done to eliminate noise in operation, but right here it is realized that improvement in this respect can be carried still further to a very good advantage. The particular company in question has a program for 1927, involving only a few thousand dollars, but carrying on still further the work which has seemed to bring a noticeable element of success, and it is likely that it will be continued on and on in the fight which all of us are waging, with our backs against the wall, to keep all of our business from being swallowed up by the drastic competition of the privately-owned vehicle on rubber tires.

No one can answer with authority the question which is the subject of this paper, "How far should we go in dressing up street cars?" because no one yet has had sufficient experience to indicate a limitation. It is to be a matter of experiment. The famous Grand Rapids case has met with some degree of success. Whether the expenditure is justified I do not know, but Grand Rapids has made a name in the history of American street railway transportation, and in the mind of its patrons the Grand Rapids company very likely has a position that can hardly be duplicated anywhere.

To sum it up, we have two primary incentives for improvement: First, to get back some of the business which we have lost by giving our patrons a clean, comfortable, attractive vehicle to ride in. Second, building up in their minds the feeling that their street railway company is trying against great odds to provide the public with good facilities, the psychology of which being that when the time comes for you to ask the public to give you more revenue, you will meet with a ready response and a wholesome co-operation rather than the swift kick which has so often been the lot of the poor railway.

---

*Abstract of a paper delivered before the Southwestern Public Service Association, New Orleans, La., April 26-29, 1927.

When the American public feels that it is being treated fairly, it generally responds in a similar fashion; and if called upon to erect an idol for national worship, it would probably erect a gigantic figure which it would label, "A Good Sport."

Research Activities and Production Welding Discussed

NUMEROUS contributions were made to a symposium of the research activities in the welding field during the past three years by speakers at one session of a three-day meeting of the American Welding Society held at the Engineering Societies Building, New York, on April 27-29. At another session there was a symposium on production welding, including papers on thermit welding work, by J. H. Deppler, Metal & Thermit Corporation; a discussion on the field for replacing castings by welded structural parts, by J. F. Lincoln, Lincoln Electric Company; recent applications of arc welding to construction of houses and buildings, by C. J. Holslag, Electric Arc Cutting & Welding Company; oxyacetylene welding of furniture, by M. F. Bayer, Simmons Company, and applications of welding to automobile manufacture, by Robert Appleton, engineer of the Pierce-Arrow Manufacturing Company.

The first day was taken up by reports of various welding committees. H. M. Hobart analyzed and discussed the results of tests made by the Emergency Fleet Corporation in connection with arc welding. In the afternoon there was a meeting of the American Bureau of Welding, at which C. A. Adams, director, presided. Research work of the committee was reviewed, plans laid for future investigations, and officers elected.

Following the precedent of last year a dinner-dance was held at the Hotel Commodore on Thursday evening, April 28. At this the newly-elected officers were announced. These are F. M. Farmer, president; J. H. Edwards, senior, vice-president; R. L. Shepherd, Birmingham, Ala., and G. O. Wilson, San Francisco, divisional vice-presidents. J. J. Crowe, New York City; W. H. Gibb, Bay City, Mich.; H. S. Smith, New York City, and W. C. Swift, West Alexandria, Ohio, were elected to the board of directors.

Telling the Company's Story to a New Man*

By C. A. Brann

General Superintendent Eastern Texas Traction Company, Beaumont, Tex.

ABOUT eight months ago I was sent to Beaumont as superintendent of the railway system. I wanted to know, when they asked me to tell the transportation story to the public, "what is the transportation story?" I thought for quite a while about that particular thing, and it occurred to me that we in our industry were giving men jobs rather than seeking men for the industry. We have a superintendent of transportation who does all hiring and all firing. But in our little company we have another proposition which is quite different, and because it has worked out and because I believe in it, I am going to give you my idea of the transportation story as it should be given to employees.

You may agree with this story and then again you may not, but every green man who goes to work for our company—or rather, before he is regularly employed, before he goes to work there—is told this story; is given at least one-half to three-quarters of an hour's talk on the transportation industry. And these are practically the words that I use when I sit across the desk from him and talk to him about our business:

"The people of this community have granted us a franchise, and through this franchise we obtain the right to operate a transportation service in this city. We must carry the people where they want to go, when they want to go. It is our moral as well as our legal obligation to carry them safely on schedule time and courteously. We have a great many rules in this company. There must of necessity be many rules. There is a reason for every rule that we have. If there is no reason for the existence of any rule, we want you to tell us about it and we will get rid of it. But while we have many rules, they are all based on three fundamental principles; that is, that we must so operate our cars that we will carry the people safely, that we will take care of the people in the streets who do not take care of themselves, and that our patrons will want to ride with us again. The street car is not a has-been, it is a thing of today, a thing of tomorrow. The transportation of our city depends upon the good service that we must furnish.

Street Cars Best

"There is no facility that can take care of transportation as well as street cars. Buses are used, are necessary in some places, but will not and cannot displace the street cars. When a circus was in town, we carried 45,000 people on 45 street cars. Now imagine how many buses would be needed to carry that many persons to and from the places they were going to on that day.

"I want you to know this story because there are some people on the outside—I mean outside the company —that feel that the buses have come to displace street cars. They have not. What may happen 25 years from now, you and I cannot tell. But today there is a very definite need for street cars. In this business there is opportunity for you. It is not a thing of the past, but something for the future.

"No matter how many automobiles we get, we cannot conceive of every family having a sufficient number to take every member wherever he or she wants to go when they want to go. So you have an opportunity; you are starting into a business that is a good, clean, square American business. We want clean men with us, men who will treat other employees, the company and patrons with respect and courtesy. We expect and we are entitled to receive from people who expect us to give service a fair return upon the capital we have invested in order to supply the service.

There is no secret about this business. It is open and aboveboard, and I want you to tell this story to the people as we tell it to you. You may go as high as you can and are willing to go. The manager, the division manager, started as you start today. He did not get to the top by standing on the corner and wishing, but by being attentive to his business, by watching his job and knowing his job. We in this business would rather save character than cash, would rather build brains than brawn. The more you learn, the better we like you. The better you get along with the public, the better you get along with us."

We Have Service to Sell and It Must Be of the Best

That is about the story our men get. We tell it to the supervisors and all the transportation men. Or we tell them further that in this business we have something to sell—it is service. We must produce the proper kind of service before we can expect any one to sell it. Therefore if they will see that it is properly produced they will be able to sell it. Do they do it? During the month of March one of our supervisors, unsolicited, went out after his regular work and sold special car business to the amount of $84. During the month of April the same man sold to the amount of $110. He did not get any extra pay for it other than the satisfaction of knowing that he was doing his job well.

Now when it comes down to the discussion of telling the story to the public by advertising means, you can write ream after ream to the newspapers and magazines; but the most beneficial is the story you tell to the public through the service you give and the manner in which you give it.

---

*Abstract of remarks before the Southwestern Public Service Association, New Orleans, La., April 26-29, 1927.

New England Street Railway Club May Meeting

HON. LEWIS GOLDBERG, Commissioner of Public Utilities of Massachusetts, will address the New England Street Railway Club at its next meeting, on Thursday, May 12, at the Copley Plaza Hotel, Boston, Mass. "Radio Broadcasting" will be discussed in the afternoon session by C. W. Horn, superintendent of the radio operation of the Westinghouse Electric & Manufacturing Company. The session will convene at 3:30 p.m.

The News of the Industry

Peace Restored in Scranton by New Wage Agreement

The dark clouds that appeared for a time on the horizon of the Scranton Railway, Scranton, Pa., in the nature of a strike threatened by the Scranton Division of the Amalgamated Association have been dispelled and both parties are again bound by contract to provide service for the 100,000 people who use the street car and bus daily.

An agreement was reached on April 25 continuing the old working conditions and authorizing an increase of 1 cent an hour in all departments. The present wage scale, in cents per hour, is as follows: First three months, 57; next nine months, 62; after one year, 65, with an 8-cent differential for one-man operation.

The contract that bound the railway and the Amalgamated Association expired March 31. Negotiations were commenced on March 18 looking toward a renewal of the contract embodying an increase in wages and better working conditions. The demands of the men totaled an additional expenditure of $210,000 a year. Daily conferences were held until March 31, on which date it was agreed to continue negotiations with the view of arriving at some mutual agreement rather than strike. A precedent was established in the Lackawanna Valley when the union men continued daily operations after the expiration of their contract without any definite understanding of agreement or arbitration.

L. F. Harte, business agent of the local union organization, and H. H. Darte, vice-president and general manager of the railway, were the rival leaders in this campaign. J. D. Keator, managing editor of the Scranton *Times*, was responsible for calling several meetings with the idea of further arbitration.

Transportation Before United States Chamber of Commerce

With the new business era as its main topic the fifteenth annual meeting of the Chamber of Commerce of the United States, held in Washington, D. C., May 3-5, went on record as unalterably opposed to governmental interference with business. In his opening address John W. O'Leary, president of the chamber, declared that by self-regulation American business is bringing about a condition which will result in fewer restrictions being imposed upon private enterprise and initiative through governmental regulation.

The outstanding feature of the manufacturers section was the declaration by Arthur T. Morey, general manager of the Commonwealth Steel Company, that America would sell itself to the world by recognizing that every worker was entitled to life, liberty and the pursuit of happiness in its broadest adaptation.

At the meeting of the transportation and communication group the consensus of opinion was that the merchant marine should be sold to private interests as soon as practicable, and that the chambers of commerce throughout the country should in every way assist in exploiting the air mail service. A. J. Brosseau, president of Mack Trucks, Inc., discussed the relation of the bus and truck to city transportation and the railroads. In discussing the matter of competition with the railways from the bus and inland water carriers, George D. Ogden, traffic manager of the Pennsylvania Railroad, said there was a growing demand for all forms of transportation and that it was his belief that what is good for the community is good for the railroads; what is not good for the community is not good for business.

Among other topics discussed were the regulation on the height of skyscrapers, conservation of natural resources and the Mississippi flood situation. In this latter particular the chamber issued a challenge to the engineering skill of America to see that there were no repetition of the present disaster.

The meeting will be reported at length in the ELECTRIC RAILWAY JOURNAL for May 14.

Chicago Men Hear President Sawyer

Stimulating Address Made by Association Head at Annual Gathering of Surface Lines Employees—First Duty Is to Carry Citizens of Community

INSPIRATION for electric railway employees everywhere was contained in an address made recently by W. H. Sawyer, president American Electric Railway Association, before the Chicago Surface Lines Club in annual session. Mr. Sawyer said in part:

Generally I have spoken as president of the American Electric Railway Association from a national viewpoint of our industry rather than from any particular local viewpoint. You are, of course, all interested in the industry nationally, but your particular interest is primarily local to your own company and your own community, and I can confine my remarks primarily to your local situation.

I believe that I am normally an optimist and I like to think and talk optimistically, and, frankly, I have every right to be more optimistic about the Chicago Surface Lines than I have about the average electric railway. Others may be trying as hard as you are trying, but, due to local conditions, are not able to accomplish the results which you are accomplishing. The results nationally are, however, encouraging, especially on those properties which are meeting the changed conditions of today with modernized equipment and modernized methods.

Why is it that Chicago made such a splendid record in 1926? There were many contributing factors. Your management has a distinct realization of the responsibility which rests upon it. It fully appreciates to what extent this community needs transportation. More than that, it appreciates to what extent this community needs electric railway transportation. It has not dodged its responsibility to its community, but has gone forward with a determination to carry on and be the asset to this community that it should be.

I believe that our duty to our community requires that, first of all, we be transportation men to transport the citizens of the community in the most efficient manner at the lowest practicable cost. I say that we should, first of all, be transportation men—not electric railway men—now, that is definite, but too many of us have used buses where we had no business to use them for the best interests of the community, and it is indeed reassuring to note the results where practically no buses have been used.

While the number of passengers on the Chicago Surface Lines increased, the number of passengers carried by the Chicago Motor Coach Lines decreased in 1926. I think that gives a picture worthy of careful thought. This brings me face to face with the disheartening phases of the Chicago situation from the community standpoint. There should have been more buses in operation in Chicago in 1926 than were operated. These buses should have been operated in co-ordination with the electric railway cars, both surface and elevated. I believe in the bus as an efficient transportation tool which makes possible far better transportation facilities than would ever be possible with the electric car alone, but, on the other hand, it is absurd and ridiculous in the extreme to give serious thought to buses attempting to supplant the electric surface cars of Chicago. The electric street car must remain as the backbone and foundation of your transportation system. The electric car is a necessity; the bus is a most helpful adjunct.

There are, however, other situations where under today's conditions the bus can take care of all of the traffic better than can the electric car. This is true in Belleville, Ill., a city of about 25,000 people, where we have discarded street cars and are using buses entirely on the local city lines and are covering with the buses more territory than was previously covered by the street car lines. The electric cars which we discarded never paid their way and it is doubtful whether the buses will pay their way. There are other small communities akin to the Belleville situation, where there is an obligation to continue service, and where the losses with bus operation will be less than with railway operation.

Your street railway situation is a community problem, which should be solved for the benefit of the community. I have a host of friends who are politicians. I find no fault with a man for being a politician, but I say to them and I say to you that this is not a political question. This is a business man's problem, which must be solved for the benefit of your community. I say that every day's postponement in solving this problem is detrimental to your community.

What do the electric railways of Chicago ask in the settlement of this problem? They ask that the problem be so solved that they can secure the money necessary to do those things which are needed for the benefit of the community. That covers all and everything that they are asking. They are not seeking to make an abnormal profit.

It is true that they, in effect, ask an indeterminate or revocable franchise. The underlying theory of the revocable permit is tenure during good behavior. It affords protection to the public and the community served. It permits a permanent financing program. It would prevent receivership of a going concern. Everybody would be benefited. Nobody would be harmed. The railways could, undoubtedly, accept a franchise that was fixed as to time and limitations, but the people of Chicago should not be asked to pay the cost under such a franchise. It would be an economic waste.

Analyze every suggestion which the railways have made in connection with the solving of this situation and you will find that what they are doing is to point out the efficient way by which they can furnish needed, essential transportation to the community, and when the railways object to provisions which politicians desire to inflict upon them, they rightfully object because the community cannot carry that handicap.

Knowing the situation as they do, your railway executives and bankers would not be true to their trust if they accepted these handicaps which would prevent them from furnishing efficient, comprehensive transportation such as this community desires and must have. I have no doubt but that terms could have been arrived at a long time ago if, as has at times been insinuated, the financial interests behind these properties were simply looking for personal financial gain. These men are honest, responsible business men seeking as community builders for a firm foundation to enhance the community welfare.

I review these local conditions because, knowing them as I do, I feel the obligation to point out to you that you have a duty which you should not and cannot escape. You know the facts. You know that the people you are working for are honest; you know that they know what to do and how to do for this community; you know that they are willing to do and you are their representatives, each and every one of you. You are the salesmen who must go out and give the facts and tell the truth to your friends, to your neighbors and to the people of this community.

Your executives, in spite of all they have done and the high opinion you have of them, have certain limitations. They cannot achieve the impossible; they cannot force men who have money to put that money into the transportation needs of Chicago, unless those men having money are assured that their property will not be confiscated and that they are making a wise investment. Every time there is any objection raised to any provision asked for by the railway, analyze it from that standpoint. It is all right to discuss rapid transit extensions and subways. It is perfectly proper to estimate, study and analyze, but before anything real is done toward appreciable extension of rapid transit facilities existing transportation facilities must be co-ordinated and the first step is the placing of the electric surface transportation on a healthy, solid foundation.

Your problems are interesting. There never was a time when there were more interesting problems to be solved in city transportation; there never was a time when there was more need of the maximum of skill and ability in our industry. Today is a different day, and we must have not only different cars, car equipment and different methods, but we must be up on our toes and doing as never before. If we are to meet today's conditions we certainly must think in conformity with the age in which we are living. If there is one excuse more than another that I personally object to—on our own property—it is to be told that they are doing something today because that is the way we always have done it. We most do things today in the best way to meet today's conditions, after analyzing and studying the conditions. Street car riders—actual and potential—are our customers. We must give them not only good service but we must treat them politely and courteously, just the way any good salesman treats a customer or a potential customer. Please do not think that I am assuming that you are not doing these things. All of us need all the inspiration we can get to do the kind of a job that needs to be done. Your company is going forward today because of the co-operation, skill and ability of this group assembled here. You have every right to be proud of what has already been accomplished, and you are particularly fortunate in that you can look ahead to even greater accomplishments. The day must come when the clouds will roll away and the Chicago traction problem will be settled on a basis helpful to your community, helpful to your company and helpful to you personally. The day will come when community welfare will rise above politics.

New Parlor Car Trains for Summer Service Out of Chicago

Increased summer service on the Chicago, South Shore & South Bend Railroad has been provided in a new schedule which became effective April 24. Seventy-two fast trains are now operated between Chicago, Ill., and Gary, Ind., providing half-hour service throughout the day, and 40 limited trains daily between Chicago and South Bend, Ind. The new schedule shows three additional trains between midnight and 6 a.m. Two new parlor-observation car trains were also added, giving patrons parlor or dining car service on twelve limited trains daily.

Wages Increased 5 Per Cent in Brooklyn

Directors of the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., have approved the recommendation of W. S. Menden, president, that he be authorized to modify existing agreements with various groups of employees so as to provide for approximately 5 per cent increase in wages and a two-year extension of the period in which the present agreements are effective. This approval was with the understanding that the increase be made effective as of the first day of the payroll week in which the new agreements are signed.

As a result, agreements making increases in pay effective as of April 15 are made with following groups:

Motormen and conductors of the surface lines.

Ticket agents, conductors and trainmen, and porters on the rapid transit lines.

Shop, power house, substation, line department, track division and building division employees.

The modification of the wage schedules at this time, in advance of their expiration, is due to an understanding that if there were changes in wages by other transit companies in New York City during the year the representatives of the employees would have the right to seek a modification of the agreements as to wages in advance of their termination date. After the recent announcement of the increase in wages for employees of the Manhattan transit companies, the representatives of various groups of B.-M.T. employees requested conferences with the company officials and asked for an increase in the hourly rates of pay.

Agreements providing for an increase in wages of approximately 5 per cent for employees of the Brooklyn City Railroad have also been completed between representatives of the employees and Clinton E. Morgan, vice-president and general manager of that company. This wage increase is effective as of April 15. The new agreements provide that the new scale of wages shall remain in effect until August, 1929.

Surface motormen and conductors of the B.-M.T. now receive 52 cents the first year, 54 cents the second year, 57 the third year, 60 cents the fourth year and 65 cents the fifth year and thereafter. Elevated trainmen receive 52 cents the first year, 53 cents the second year, 55 cents the third and fourth years, 56 cents the fifth year and thereafter. Elevated conductors receive 59 cents the first two years and 60 cents the third year and thereafter. The differential for one-man car operators is 5 cents. The conditions under which the rapid transit motormen work are contained in a separate agreement which has not been altered.

Adjournment of Legislature Menaces Chicago Settlement

If the present Illinois Legislature fails to pass legislation permitting the consolidation of the surface and the elevated lines of Chicago, together with subways and feeder buses, and authorizing the granting of an indeterminate type of franchise and other fundamentals of ordinances now pending before the City Council and tentatively agreed upon by the city and companies, a delay of nearly two years in the settlement of Chicago's troublesome local transportation problem appears inevitable. Even should the expired surface lines franchises be extended again on July 31, needed extensions and new construction would be indefinitely postponed and not even a beginning could be made toward the much-desired subway construction. That is the concensus of opinion now existing both among city officials and traction experts.

With the present session of the Legislature set for adjournment early in June, immediate presentation of the enabling bills must be made. Such action has been forestalled by the failure of the local transportation committee to meet in nearly three months, by the intervention of the mayoralty election last month and by the subsequent refusal of Mayor Thompson to discuss officially any proposal he may have for a solution of the problem. Rumors that the Mayor had reached an understanding with Samuel Insull, president of the Chicago elevated lines, for the consolidation of elevated, surface and bus lines into a unified transit system under the latter's management have been vigorously denied by both men. The purpose of a later meeting between Mr. Insull and Samuel Ettelson, newly appointed corporation counsel, has been kept a secret.

The only expression it has been possible to obtain from Mayor Thompson since his return from his election "victory" tour of the South is that he desires immediate action in the matter and that while he is still inclined to favor his original idea, providing for a transportation district to acquire and operate the surface lines, which was defeated in the state Senate some years ago by a narrow margin, he will consider other plans with an open mind. He has declared that, in any event, the final decision will rest with the people of Chicago, since he would insist on a referendum on any traction ordinance passed by the City Council. He is said to be no longer committed to the municipal ownership theories he once favored.

Seeks to Discontinue Weekly Pass in Terre Haute

In a petition just filed by the Terre Haute, Indianapolis & Eastern Traction Company permission is asked of the Indiana Public Service Commission to discontinue the $1 weekly passes at Terre Haute. The petition says the people of the city abuse the pass by using it to get on the car and then by handing it out the windows to other persons. Besides, confusion resulted from the necessity of making the passes a different color each week.

Arbitration of I.T.S. Wages

William Atkins, United States Commissioner in St. Louis, Mo., has been selected as the third member and chairman of the arbitration board which will consider the matter of a new wage scale for the Illinois Traction System. Hearings will begin on April 5 and will be held in St. Louis, Mo., and Springfield, Ill.

The old contract of the trainmen with the Illinois Traction System expired on Dec. 1, 1926. Prior to that time a committee representing the workers had asked for increases in the wage scale. The company has contended that conditions warranted a decrease.

Failing to agree among themselves, both sides decided to submit to arbitration, as provided in their previous contract. W. L. Perry, St. Louis, was appointed to represent the men and E. E. Soules, Peoria, Ill., was named as the company's representative. They selected Mr. Atkins as the third man.

Pending final settlement the men have continued at work under the old agreement, but any change in wages is to be retroactive to Dec. 1, 1926.

Wage Issue in New York State

Negotiations are still under way between representatives of the New York State Railways and of the employees of the lines in Rochester, Syracuse and Utica, N. Y., looking to a new wage and working agreement for the year starting May 1. No announcement has been forthcoming as to progress save that an agreement had been reached on the working conditions.

The real issue, the wage question, is still being threshed out in conferences. The union is demanding a straight 9 cents an hour increase for all employees in the three cities. Motormen and conductors on city lines now receive 55 cents an hour; one-man car operators, 60 cents, and interurban operators, 58 cents.

The railway has contended that despite increased fares in the three cities, the demands for improvements have increased in proportion and mounting cost of operation prohibits a wage increase at this time.

In the event no agreement is reached by May 1, any settlement made after that date will be retroactive.

Buffalo & Erie Wage Issue to Be Arbitrated

The proposed 10 per cent wage reduction in the pay of platform and other employees of the Buffalo & Erie Railway, which operates an interurban line between Buffalo, N. Y., and Erie, Pa., will be submitted to a board of arbitration as the result of an agreement made by the company and its employees at a conference in Fredonia between Manager MacLeod of the company and a committee of the employees. The men named Harry Solomon, Erie, as their representative on the board, the company choosing H. L. Mack, former vice-president in charge of transportation of the International Railway, Buffalo, as its representative. These two will select the third arbiter. The men will continue at work pending the outcome of the conferences by the board. It was stated in the ELECTRIC RAILWAY JOURNAL, issue of April 30, page 789, that the company had ordered the wage cut effective May 1.

Fares Changed in Tacoma—Weekly Ticket 30 Cents

As the final experiment pending the digestion of the lengthy analysis and report on the affairs of the Tacoma Railway & Power Company, Tacoma, Wash., about to be submitted to the City Council another change in fares was instituted on May 1.

The outstanding feature of the new fare basis will be a new type of weekly ticket costing only 30 cents, which will entitle the holder to as many rides as he desires at 5 cents additional each, with full transfer privileges. The object of this new fare is to encourage added or convenience riding, and thus increase total revenues by selling more service. In addition to the weekly ticket fare, a single cash fare will be 10 cents and tokens will be sold on the cars at three for 25 cents. It is expected that the new fare basis will not mean an increase in the average fare paid by Tacomans. The 5-cent fare zone is eliminated entirely under the new fare plan. Tokens will not be sold at agencies. Cards good for six rides and selling for 50 cents will be discontinued. School fares have been left undisturbed through all experiments.

Agreement between the City Council and the company was reached after the most amicable negotiations. Richard T. Sullivan, manager of the company, first suggested a 40-cent ticket, but finally, upon suggestion of the city officials, amended it to 30 cents. Under the proposed 40-cent price, Commissioner Davisson pointed out, the man who needs twelve rides a week at the lowest fare possible would pay 8⅓ cents per ride under the pass fare.

Manager Sullivan is quoted as saying that the revenues of the last two months have been so low that the company would have to increase the token fare from fifteen to thirteen for $1 if the ticket experiment were not approved. The present fare tariff expires April 30 and it would be necessary under any circumstances for the company to file a new schedule with the state by that date. Under the agreement between city and company for the experimental period, the company would have the right to raise fares because revenues have failed to reach the agreed minimum.

W. Kesley Schoepf Dead

W. Kesley Schoepf, president of the Cincinnati Traction Company, Cincinnati, Ohio, which was succeeded by the Cincinnati Street Railway, identified with the Cincinnati Car Company and other local enterprises for many years, died on the morning of May 6. Mr. Schoepf terminated a period of service of 25 years with the traction company in the fall of 1925. He was always very much in the public eye, but none denied the power of the man as a constructive force that had done much to enrich the local community.

Phoenix Voters Approve Bond Issue

The proposed $750,000 bond issue for the complete rehabilitation of the Phoenix Street Railway, Phoenix, Ariz., was carried at the special election on April 30 by a 95 majority vote. An ordinance calling for the special election and approved by the City Commission calls for the purchase of new cars, rails, ties and other necessities for bringing the present municipal railway up to date. It means the rehabilitation of the entire system. Under the plan the system will be operated for a period of five years before the sinking fund provided to amortize the payment of the principal of the bonds begins to function.

The city of Phoenix acquired the properties of the railway by purchase on June 4, 1925, for $20,000 and assumed direct operation on Nov. 1, 1925.

Lincoln Interurban Authorized to Charge Ten Cents

The Omaha, Lincoln & Beatrice Railway, Lincoln, Neb., has been authorized by the State Railway Commission to increase its car fares to the level charged by its competitor, the Lincoln Traction Company. That rate is 10 cents for cash fares and four tokens for 30 cents, with 2 cents added for rides beyond the 45th Street zone. It has been charging 6 cents cash, with 1 cent additional for zone rides. Its revenues in 1926 from carrying 489,976 6-cent passengers and 308,130 1-cent riders was $32,479. The company was also authorized to make its bus rates the same as its competitior, 10 cents cash, with 2 cents additional for first zone and four tokens for 30 cents.

The commission finds that operation resulted in a deficit in 1926 of $3,206, which is larger than any year since 1923 and $2,500 more than 1925. While revenues have increased nearly $2,000 expenses have gone up $5,500. The company has never paid expenses. The present value of the property is $300,000, not including $89,000 spent for grading a roadway upon which tracks were never laid.

Seattle and Aberdeen Perfect Car Designation Signs

Mayor Bertha K. Landes of Seattle, Wash., has promised that a system of numbering and lettering street cars, so that each car will show more plainly the designation of its route, will be put into effect as soon as possible. The principal complaint now is against the position of the numbers ahead and from one side of the cars. It is proposed to broaden the narrow scope of visibility by placing boxes on top of the cars, with the numbers displayed in large type on all four sides. The cost of putting the boxes on the cars would be $10 a car, it is estimated.

The Grays Harbor Railway & Light Company of Aberdeen, Wash., is also completing a system of designating the cars by colored lights, so that persons wishing to board a car can identify it easily. As soon as the work is finished, each car will carry two colored lights showing the destination.

Seniority Rule Demanded in Seattle

Unless the seniority rule be made effective on the lines of the Seattle Municipal Railway, Seattle, Wash., a tie-up of the railway system is threatened by the local branch of the Amalgamated. If the Civil Service Commission does not accede to the demands of the union a strike vote will be taken. The issue was raised the first of the year, when twenty employees of the municipal lines were laid off, under the combined efficiency and seniority rules in vogue in all city departments. The union head demands that the last man employed be the first to go. Protest was made to the commission, which has finally voted in favor of its present system, with the resultant threat of strike. Tom S. Patterson, chairman of the Civil Service Commission, characterizes the issue as "a tempest in a teapot." He declares the men laid off were slated for the layoff under the system by which an average of an employee's last two efficiency ratings is taken, then a half point added for each year of service up to ten years. He states that nearly all the men laid off from steady employment have had part-time jobs, and will undoubtedly be restored to full time eventually.

News Notes

St. Louis Argument on May 17.—The Missouri Public Service Commission will hear arguments on May 17 on the intervening petitions of the city of St. Louis and University City against the latest application of Receiver Rolla Wells of the United Railways for an 8-cent fare. It is probable that when the case does come up the entire valuation controversy will be gone over again. Special Master William Igoe has advertised the sale of the United Railways properties under foreclosure proceedings for May 25.

A Public Relations "Get Together."—A "Fellowship Dinner" at the Pleasant Valley Country Club, Connellsville, Pa., on March 11 knitted even more closely the relationship between the West Penn Railways and the community life of that section, known as the heart of the West Penn System. The speakers at the dinner told of the beginnings of the corporation's business. It was revealed that the West Penn believed in the future of Connellsville and has testified to this faith by locating more of its staff and operations in that center. The latest contribution is a new terminal station and office building for the West Penn Railways, on which construction is now under way.

Seeks Namesake's Records.—Leningrad, formerly St. Petersburg, Russia, through its city engineer, has sought the records of the city of St. Petersburg, Fla., to be deposited in the town museum. R. E. Ludwig, director of utilities of St. Petersburg, has been asked to send complete data on the municipal railways of St. Petersburg, the number of passengers carried yearly, "tramways and other urban and suburban railway, cargo, wagons, kilometers and casualties." J. Clark, engineer of Leningrad, said that the material on St. Petersburg, borrowed from periodicals and special literature, was insufficient for their needs. Director Ludwig said the data would be prepared and sent by registered letter to Leningrad.

Boston Takes Up Question Fad.—"What do you know about the El?" is a new department of the *Co-operator*, published by the Boston Elevated Railway, Boston, Mass. It consists of 25 questions covering the history and operation of the Massachusetts property. In the April issue 25 more questions supplementing those asked in the previous issue are published, together with the answers to the March queries.

Strike Formally Ended.—The strike of 29 employees of the Danbury Power & Transportation Company, Danbury, Conn., was declared ended on April 26 by the employees. The employees left their places on Nov. 23, 1926, when they were denied a new agreement. Buses have been operated over the company's lines since that time. Practically all the strikers have secured new positions. The vote was merely a formality.

Wages of Trenton Men Increased.—The Trenton & Mercer County Traction Corporation, Trenton, N. J., has granted an increase of 5 cents an hour to its employees. The agreement, retroactive to April 1, gives the men a 1 cent an hour wage increase in 1927, an additional 2 cents an hour increase in 1928 and another 2 cent advance in 1929. Previously wage agreements were made for a period of one year only. The three-year progressive increase contract was reached at a conference between General Superintendent Edward J. Peartree and railway employees.

Reorganizing Railway Departments.—The $3\frac{3}{10}$ per cent increase in net earnings of the city of Detroit, Department of Street Railways in March, 1927, over 1926 is explained by Del A. Smith, general manager of the Michigan line, by the fact that approximately 100 employees have been dropped from the payroll during the past 30 days. These dismissals have been in the line, track, mechanical and office departments, and in several instances high ranking jobs have been absorbed by other departments. Among the positions that have been abolished and the work absorbed by other departments are the employment manager, superintendent of traffic and assistant electrical engineer.

New Routes Recommended.—Abandonment of three one-man railway routes of the Washington Railway & Electric Company, Washington, D. C., and the substitution of three other routes were recommended on April 14 by R. G. Klotz, engineer for the Public Utilities Commission. The company has agreed to the proposal and a hearing will be held shortly. In the meantime the commission is planning to obtain opinions from patrons on the proposed changes. Trackage on practically all the lines will remain unchanged. Mr. Klotz said that the present routes never had been considered entirely satisfactory, but had been allowed to continue for several years in order to observe the development of each and so determine what changes finally would prove desirable.

Electrification of Lines Proposed in Maritimes.—Addressing employees at Moncton, N. B., recently, Sir Henry Thornton intimated that the Canadian National Railways would investigate the possibilities of power development in New Brunswick, with particular relation to the Petitcodiac project, in an endeavor to discover the prospects of electrification of lines in the Maritimes.

Newly Painted Cars in Parade.—Ladies in their new Easter raiment this year did not have everything their own way in Baltimore, Md. The United Railways & Electric Company came in for a share of the applause. Several newly painted cars had an important place in the Easter parade that took place on Charles Street, attracting the attention of the thousands who celebrated on Easter. The United is experimenting with color combinations for its cars and the public will decide which it likes best. The cars are being tried out on various lines which operate through the center of the city.

Bargains and Free Rides in Nashville.—Free rides were granted to visitors to the Lebeck Store in Nashville, Tenn., on May 2, when Lebeck Brothers celebrated their 53d anniversary. Special anniversary street cars were run on all lines on a regular schedule. Thousands filled the four spacious floors of the big Lebeck building for the big sale, carried thither by the Nashville Railway & Light Company without discomfort. In addition, any Lebeck customer who desired to drive into town in his car was permitted to park it in the big fireproof Northern garage and leave the vehicle there during the day on as many of the sale days as desired, free of charge the only requirement of this privilege being that the owners are customers at the sale, which comes to a close May 14. Large cash prizes were offered and opportunity was afforded of adding coupons to some worthy charity.

Settlement in Kingston.—Railway lines operated by the Kingston, Portsmouth & Cataraqui Electric Railway in Kingston, Ont., will continue to operate despite the announcement that that would cease on April 30. Through the Board of Trade a conference was held between the Public Utilities Commission and the railway officials and a settlement was reached whereby the commission will pay the railway $15,000 besides crediting as paid all power accounts up to May 1, 1927. Awaiting the settlement the railway has paid no accounts for fifteen months. The $15,000 will be invested and used if necessary in meeting annual deficits in operating expenses or interest on debentures. The company will improve its roadbed and will operate, if the money just paid will allow, until July 1, 1934, when a new agreement and a new franchise will be negotiated. The matter was brought to a head by a demand of the Ontario Utilities Commission for a rate for power of 6.5 cents per kilowatt-hour. The railway refused to consider any such demand.

Recent Bus Developments

Awaiting the Good Old Summer Time in Atlanta

Although the Georgia Power Company, Atlanta, Ga., does not guarantee to make the sandwiches, open the olives or keep the ants out of the pie, it nevertheless has put in operation a plan which is at once a boon to picnickers and a profit maker for itself. That plan is to supply fifteen double-deck coaches, each with a capacity of 60 persons, to picnic parties on afternoons and evenings during the summer at moderate prices. As the company effectively says in advertising its new picnic coach service to the public:

> The big, comfortable coaches mean that your entire party can journey to the picnic grounds together. There's no worry about whether there will be room for Susie in Uncle John's car, or whether she will have to sit on the cake in the tonneau of brother Joe's machine. When you are ready to return, there's nothing to do but load up the coach and start. An automobile large enough for every one makes the party much more congenial and adds just about 50 per cent to the pleasure of the trip.

All that the company asks is that it be notified when the coach is wanted and where the party wants to go, and it will do the rest. Special efforts are being made to rent out coaches for Sunday school picnics and straw rides.

Indianapolis Coach Deal Up on May 9

Formal hearing before the Indiana Public Service Commission on the application of the Indianapolis Street Railway to buy all the assets and franchise rights of the People's Motor Coach Company for approximately $650,000 will begin May 9. Because of the importance of the case, Frank T. Singleton, commissioner in charge, said the entire commission will be present and the hearing will be held in one of the legislative chambers. In the transaction the railway seeks authority to issue ten-year notes amounting to $500,000. These notes are to be sold to raise money with which to buy an equal total of the stock of the coach company. In addition the railway will assume the present outstanding indebtedness of the coach company.

Opposition Expressed to Southern Pacific Bus Plans

Organized bus carriers of California will oppose bus operation plans of the Southern Pacific Company. Arthur H. Samish, secretary manager of the Motor Carriers' Association of California, so stated in Sacramento following announcement by the railroad that it plans to enter the bus field. As announced in the ELECTRIC RAILWAY JOURNAL, issue of April 30, page 790, incorporation papers were filed in Sacramento April 19 for the Southern Pacific Motor Transport Company. The new company has a capital stock of 1,000 shares of no par value. Its headquarters will be in San Francisco. The officers of the corporation have not as yet been announced. The directors are E. J. Murphy, R. R. Cheever, Theodore Wright and T. B. Wilson, San Francisco, and E. H. Gubbins, San Rafael. Southern Pacific bus lines, it is announced, will replace unprofitable branch lines and will act as feeders for main lines.

It is expected that the bus carriers of the state will oppose the granting of certificates of public convenience by the California Railroad Commission at the time application is made if the route in question is in territory already served by bus lines.

Preliminaries of Bus Regulation in Missouri

Preparations to put into effect rules for the regulation of all bus lines operating in Missouri are being made by the Public Service Commission at Jefferson City. Under a law passed by the last Legislature and signed by Governor Baker the commission assumes jurisdiction over the bus lines on July 3. The commission will first adopt a tentative set of rules and regulations and will then hold a series of hearings for bus company officials before the law becomes effective. Hearings on the issuance of certificates of convenience and necessity and on rates, service schedules, routes and equipment will not be held until the law goes into effect.

Seeing Ottawa

The Ottawa Electric Railway, Ottawa, Ont., has announced that its Gray Line is ready to take care of this season's sightseeing business. Twelve de luxe motor coaches provided with especially comfortable seats will be available for this purpose. The Ottawa-Hull, Connaught Rifle Ranges and Gatineau Valley tours will be operated and will be in charge of chauffeurs carefully selected and trained by the Ottawa Electric Railway. The regular sightseeing tour operated daily last summer through the Ottawa-Hull district will commence early in the month and the other tours will be operated by request or on special days.

Hearing Postponed.—The hearing scheduled before the Public Service Commission on May 2 on the petition of the Capitol District Transportation Company, Inc., for permission to increase its fare from 7 to 10 cents has been adjourned to May 11. This is the bus subsidiary of the United Traction Company, Albany, N. Y.

Petition Denied.—The California Railroad Commission has dismissed the application of the Key System Transit Company for a certificate to operate bus service between Oakland and Hayward and intermediate points. The commission held that the proposed operation over the Foothill Boulevard route would mean a loss which the company could not suffer while business was being developed.

Votes for Buses.—The City Council of Eugene, Ore., voted favorably on the substitution of buses for street cars of the Oregon Electric Railway at a meeting held April 18. The franchise is to be advertised for three weeks before the final ordinance is passed.

New Service Given.—Milton Ellis, owner and general manager of the Rockford Public Service Company, recently instituted a bus-interurban schedule which gave Rockford-Chicago passengers a two-hour-and-35-minute service direct to the loop. The buses left Rockford with direct run to Elgin, stopping only at Belvidere, and connecting with the Chicago, Aurora & Elgin third-rail system. As soon as storm damage to the interurban lines is repaired the Rockford Public Service will furnish hourly service to Chicago.

New Use for Bus. — A twelve-passenger de luxe bus to be equipped with parlor car chairs and to be used in carrying passengers between downtown Detroit hotels and the Ford Airport will be bought from Dodge Brothers, Inc., for the Department of Street Railways, under authorization by the Council on April 25. The coach, according to Del A. Smith, general manager of the Department of Street Railways, will be placed in service within 30 days. It will cost $3,800. It will not be run on schedule, but will be used to meet aircraft arriving at the port. Besides its practical use, it would be of value as an advertising medium for the city's interest in aviation.

Employees Paid for Securing Contracts.—The United Railways & Electric Company, Baltimore, Md., has decided to pay a commission to employees who aid in the leasing of chartered buses and de luxe coaches. It is believed that many employees can help measurably in developing this business. Where employees are members of lodges, church organizations, socials, clubs and athletic teams, which take trips at various periods of the year, a word or a bit of effort on the part of an employee may influence that organization to use the company's buses or coaches. These conveyances may be used for visits to Annapolis, Frederick, Belair or any other point. It will not be necessary for an employee to obtain a definite order to secure commission. When inquiries that have been turned in to the Gray Line develop into orders the employee will be given credit for the commission.

No Action on the Substitution by Buses.—Contrary to expectations, the village board of Elmsford did not follow the Tarrytown officials in refusing to grant the petition of the Third Avenue Railway for the substitution of buses for trolleys on the Tarrytown Road between Elmsford and Tarrytown, N. Y. At the last meeting of the board, when the trolley situation was brought up following the joint meeting of the Tarrytown, Elmsford and town of Greenburgh boards, the sentiment seemed to be decidedly in favor of the continuation of railway service, as the cost of sending some 100 children to the Tarrytown school would prove too great a hardship for the parents without the benefit of commutation tickets and school fares.

Financial and Corporate

3 Per Cent Increase in Chicago "L" Traffic

For the first quarter of 1927 the Chicago Rapid Transit Company, operating the "L" lines, carried a total of 58,881,450 revenue passengers. This was an increase of 1,695,616 over the corresponding three months of last year, or 3 per cent. One of the reasons ascribed for the steadily increasing business of the Rapid Transit Lines is the growing congestion on the city streets. The private automobile is becoming less and less a serviceable method of transportation in the city because of the traffic congestion on the streets and boulevards. This is becoming more apparent in a study of traffic on the elevated lines. On the opening of the baseball season on April 12, for instance, the Rapid Transit Lines collected approximately 11,000 fares on the return trip from the ball grounds. This was twice the number registered on the opening day a year ago. The "L" lands its passengers at the gates of the Cubs park and only a short distance from the entrance to the Sox park.

Morristown Property to Be Sold at Foreclosure

Sale at foreclosure of the Morris County Traction Company, Morristown, N. J., in receivership for several years, was decided upon at a hearing before Federal Judge Runyon. An order authorizing the sale will be presented to Judge Runyon for his signature May 20 by Elmer King of Morristown, counsel for the receivers, Joseph P. Tumulty and Joseph K. Choate. At that time the court will appoint a special master to conduct the sale.

Representatives of Chatham, Madison and Dover and a number of judgment creditors attended the hearing. The attorneys for the three municipalities asked whether taxes owed by the company would be given priority, and received an answer in the affirmative. The trolley tracks will be removed. There will be two different sales. The company's real estate in Morris County will be sold at the Morris County Court House, while the real estate in Union County will be sold at Elizabeth. It is intimated that a committee of security holders of the company will make the purchase. Under a plan now in contemplation buses would be substituted for the railway.

Dividend Omitted by Brooklyn City Railroad

The directors of the Brooklyn City Railroad omitted the usual quarterly dividend of 10 cents a share on its capital stock at their meeting on May 3, after having reduced it from 20 cents last January. They believe the earnings should be put back into property, constantly increasing its value. Frank Bailey was elected a director.

H. Hobart Porter, president, in a letter mailed to the stockholders says considerable delay in any proposed financing must result from the Transit Commission's denial of an application to issue $2,500,000 of 6 per cent general and refunding mortgage bonds. Mr. Porter said in part:

"Your directors determined that it was to the best interests of the company that no dividend should be paid at this time. They feel this suspension of dividends will be a hardship to many, but the earnings are being put back into the property, constantly increasing its value, and this will accrue to the benefit of the stockholders."

Receiver for Empire State Railroad

T. C. Cherry has been appointed receiver for the Empire State Railroad Corporation, Syracuse, N. Y. Announcement is made of the appointment of a bondholders' protective committee, of which A. B. Merrill, vice-president of the First Trust & Deposit Company, Syracuse, is chairman. The Empire State Railroad was unable to provide for payment of interest due May 1 on the Syracuse, Lake Shore & Northern 5 per cent bonds secured by first mortgage on the railway property.

Interurban in Ohio Does Well

Cincinnati, Hamilton & Dayton Reports Balance Remaining After Fixed Charges and Depreciation 55 Per Cent in Excess of Estimates Made by Reorganization Committee

RESULTS of operation of the Cincinnati, Hamilton & Dayton Corporation, Hamilton, Ohio, the holding company for the Cincinnati, Hamilton & Dayton Railway, in 1926 were more favorable than had been predicted. Gross revenues from operation were 1½ per cent less than were estimated, but this was more than offset by economies in operation, which brought the operating expenses to a figure 2 per cent less than was estimated. Net revenues from operation available for fixed charges, depreciation and surplus were 3.07 per cent in excess of predictions. Interest chargeable to operation was materially less than had been thought probable, in consequence of which the balance remaining after charges was more than 30 per cent in excess of that estimated. The accrual for depreciation was about 13 per cent in excess of the amount tentatively fixed at first. After deducting this accrual and giving credit for non-operating income the balance remaining over and above fixed charges and depreciation was 55 per cent in excess of the estimate.

INCOME ACCOUNT, CINCINNATI, HAMILTON & DAYTON CORPORATION

March 9, 1926, to Dec. 31, 1926

Operating revenue		
Passenger and special car revenue	$653,014	
Freight and express revenue	170,689	
Miscellaneous revenue	8,759	
		$832,463
Operating Expense:		
Way and structures	$98,270	
Equipment	61,335	
Power	149,562	
Conducting transportation	264,577	
Traffic	4,381	
General and miscellaneous	148,827	
		$726,954
Net revenue from railway operation		$105,509
Taxes assignable to railway operations		29,322
Operating income		$76,187
Non-operating income		2,394
		$78,581
Deductions from gross income		32,152
Net income before Federal income taxes		$46,428
Federal income tax (estimated)		2,500
		$43,928

The Cincinnati, Hamilton & Dayton Railway took over the 86.2 miles of railway on March 8, 1926, following reorganization.

For the purpose of comparing the results of operation in the year 1926 (including the operations of the receiver from Jan. 1 to March 8, 1926, and for the balance of the year) with the estimate prepared by the management and set forth in letters to the bondholders under date of Jan. 20, 1926, the following comparison has been made:

	Actual Results of Operation —1926*	Estimated Results of Operation for 1926 as Set Forth in Said Committee Letters
Gross revenues from operation	$1,015,325	$1,030,000
Operating expenses including maintenance, rentals and taxes (exclusive of Federal income tax)	885,041	903,606
Balance	$130,284	$126,394
Interest on bonds of operating company chargeable to operation	†30,781	50,000
Balance	$99,502	$76,394
Depreciation accrual	45,468	40,000
	2,394	
Non-operating income	$54,034	$36,394
Balance available for holding company surplus and Federal income tax	$56,428	$36,394

* Adjustments were made in the operating expenses of the property from Jan. 1 to March 8, 1926, to exclude therefrom fees of the receiver and his attorneys, capital expenditures improperly charged to operating expenses and certain small non-recurring charges.

† Includes interest on $350,000 first and refunding Cincinnati, Hamilton & Dayton Railway 6s, 1941; $250,000 Dayton Traction 6s, 1931, and $200,000 Hamilton City 6s, 1931, from March 9, 1926, to Dec. 31, 1926, less interest during construction of $8,151.86 charged to capital.

The balance sheet does not reflect the issue and sale, at par and accrued interest, to the reorganization managers of $500,000 par value of the railway first and refunding mortgage 6 per cent gold bonds. The proceeds from the sale of these securities are now held by the reorganization managers and will shortly be made available to the railway. When this transaction is consummated the railway will have nearly

$500,000 in its treasury. The value of "Road and Equipment," shown as $4,675,890, was based upon an engineering appraisal and is believed to represent the minimum sound value for the property.

Additions and betterments aggregating $397,594 were made during 1926. The more important items in this program were as follows:

ADDITIONS AND BETTERMENTS

Pleasant Avenue track reconstruction	$89,581
Freight facilities at Cumminsville	13,294
Freight and passenger conncetions to Delco Light plant	26,273
Purchase of Miamisburg station property	10,000
Initial payment on account of purchase of 60-cycle automatic substation equipment	95,455
Payments to reorganization managers on account of six new cars for Hamilton city lines and fifteen freight box cars and future liability thereon as per balance sheet	89,922
Expenditures by company in connection with ten interurban cars, ten Dayton-Miamisburg cars, one freight motor and 25 freight box cars	25,014
Paving improvements	13,626
Miscellaneous items	26,273
Interest during construction	8,151
Total	$397,594

"Car trust certificates" represent the balance outstanding as of Dec. 31, 1926, on car trust obligations created by the receiver while operating the Cincinnati & Dayton Traction Company and covering certain rolling stock used on the Hamilton city lines.

The "Depreciation Reserve" item in the balance sheet, amounting to $203,097, is made up of reserves turned over by the reorganization managers to the railway in accordance with the decree of the Court of Appeals of Butler County, Ohio, and accruals for depreciation through charges to operating expenses from and after March 9, 1926.

Immediately upon acquiring title the Cincinnati, Hamilton & Dayton Railway launched a comprehensive plan of rehabilitation, additions and betterments. On Aug. 30, 1926, the reorganization managers let contracts for the construction of six safety-type passenger cars for use on the Hamilton city lines and fifteen freight trail box cars, all of which were delivered during 1926. In addition thereto the managers on Nov. 9, 1926; Nov. 12, 1926, and Dec. 18, 1926, placed contracts for ten one-man, two-men passenger cars for use on the Dayton city lines and in the local service between Miamisburg and Dayton, ten passenger cars for use on the interurban line, an electric freight locomotive and 25 additional freight trail box cars. Plans have been formulated for financing a large part of the cost of this rolling stock by the creation of a car trust.

That the company is fully alive to the freight possibilities is shown by the fact that it has enlarged its Cumminsville freight station at Cincinnati and has installed additional steam and less-than-carload tracks.

So much for the results. Now for a little history. The Cincinnati, Hamilton & Dayton Corporation came into existence by virtue of a certain plan and agreement of reorganization for the railway property of the Cincinnati & Dayton Traction Company, dated Oct. 1, 1925, which was declared effective and binding by the reorganization managers on March 4, 1926. Pursuant to the terms of that plan two corporations were organized by the reorganization managers, viz: Cincinnati, Hamilton & Dayton Railway and Cincinnati, Hamilton & Dayton Corporation.

The Cincinnati, Hamilton & Dayton Railway was chartered in Ohio on March 24, 1926, and acquired title to the railway property formerly owned by the Cincinnati & Dayton Traction company, consisting of (a) an interurban line 53½ miles in length, a large part of which is of double track construction, located largely upon private right-of-way, running from the center of Dayton to the outskirts of Cincinnati, passing en route through Hamilton, Middletown, Trenton, Franklin, Miamisburg, West Carrollton, Mount Healthy and College Hill; (b) a branch line from College Hill to Mount Healthy, 3 miles in length, over which only freight service is now rendered; (c) local railway lines serving the city of Hamilton, and (d) two local railway lines (operating in large part over the above-described interurban trackage) furnishing service to a rapidly growing section of Dayton, Ohio. The interurban line traverses the populous and prosperous Miami Valley. The total population of the territory served, including the cities of Dayton and Cincinnati, was 733,030 in 1920. The various cities and towns served by the property are showing a consistent and substantial growth.

The Cincinnati, Hamilton & Dayton Railway had outstanding as of Dec. 31, 1926, the following securities:

Dayton Traction Company first mortgage 6 per cent gold bonds (extended to Jan. 1, 1931)	$250,000
Hamilton City Division first (closed) mortgage five-year 6 per cent gold bonds, due 1931	200,000
Cincinnati, Hamilton & Dayton Railway first and refunding mortgage 6 per cent series "A" gold bonds, due 1941	350,000
60,000 shares of common stock (without par value) constituting all of the stock issued and outstanding.	

In addition the reorganization managers have subscribed at par and interest for a block of $500,000 par value of first and refunding mortgage series "A" 6 per cent bonds and authority for the issue thereof has been secured by the railway from the Ohio Commission.

The Cincinnati, Hamilton & Dayton Corporation was chartered under the laws of Delaware on May 6, 1926, and acquired all of the common stock, without par value (except directors' qualifying shares), of the Cincinnati, Hamilton & Dayton Railway. The Cincinnati, Hamilton & Dayton Corporation has issued the following securities:

$2,125,000	par value prior debenture 6 per cent gold bonds, due Jan. 1, 1976.
875,000	par value adjustment income gold bonds, due Jan. 1, 1976.
20,500	shares of common stock (without par value.)

The reorganization managers were unable to complete their work during the year 1926, hence no balance sheet was included in the report for the Cincinnati, Hamilton & Dayton Corporation pending a final settlement between the reorganization managers and the corporation upon the completion of the reorganization.

Traffic Fare and Wage Figures

Electric railway passenger traffic increased slightly in March, 1927, compared with March, 1926. The month of March, 1926, however, was a very good month for electric railway passenger traffic and showed a substantial increase over the corresponding month in 1925. It is not surprising, therefore, that March, 1927, has not increase very much over the 1926 figure.

The number of revenue passengers, including bus passengers, reported to the American Electric Railway Association by 217 companies is as follows:

March, 1927	868,973,115
March, 1926	866,604,853
Increase, per cent	0.27

Average cash fare in cities of 25,000 population and over:

	Cents
April 1, 1927	7.8194
March 1, 1927	7.8194
April 1, 1926	7.6653

Average maximum hourly rates paid motormen and conductors in two-man service by companies operating 100 or more miles of single track:

	Average Hourly Rate, Cents	Index Number 1913 = 100 Per Cent
April 1, 1927	56.97	209.06
March 1, 1927	56.97	209.06
April 1, 1926	56.66	207.93

Fredonia Stub Line to Be Abandoned

Upon evidence that the Buffalo & Erie Railway has not taken in sufficient revenue in eighteen months on its East Main Street stub line in Fredonia, N. Y., to pay wages of its car operators, the Public Service Commission approved on April 22 a declaration of abandonment by the company of that part of the Fredonia line running from Temple Street east along Main Street to the Pomfret town line. The abandonment, according to the order, is not to become effective until July 1, 1927, so that provision can be made by local authorities for the transportation of school children.

New York City Road in Receivership

The Eighth & Ninth Avenues Railway, which split from the New York Railways system when the latter went into bankruptcy in 1919, went into a receivership on May 5. Loss of revenue-paying passengers, increasing taxes and the effort of the federal government to reopen income tax proceedings against the company were given as the causes.

The application for the receivership was made by the American Brake Shoe & Foundry Company. Federal Judge Henry W. Goddard named Nathaniel A. Elsberg and Michel Kirtland as receivers. Joseph Tate, president of the company, said that it had been run at a loss for the last eight years and had been using up its available assets in the hope of relief from an inadequate fare and a crushing burden of taxes.

The Eighth Avenue Railway was formed in 1855 and the Ninth Avenue Railway in 1859. Both companies were leased to the old Metropolitan Street Railway for 99 years, but reverted to their owners when the New York Railways, which had assumed the Metropolitan Company's lease, went into bankruptcy in 1919. The two companies were merged last year. The combined company has more than 26 miles of track and about 200 cars.

Earnings and Traffic on the Increase in Tampa

Earnings in the railway department of the Tampa Electric Company, Tampa, Fla., for the year ended Dec. 31, 1926, increased 19.1 per cent. That this increase had a salutary effect upon the combined departments' gross and net earnings was mentioned by Peter O. Knight, president, in his annual statement to the stockholders.

During 1926 an issue of $1,000,000 of series "A" preferred stock was authorized and offered for sale on Aug. 1. At the end of the year $333,100 of this stock had been sold for cash and an additional $93,700 had been subscribed for payments in installments.

In the early part of the year the $100 par value common stock was split five no par for one.

In 1926 the company expended for maintenance, which is included in operating expenses, 12.2 per cent of the entire earnings of the year, and in addition during this period a total of 17.7 per cent of these gross earnings was set aside for reserves or retained as surplus. The amount retained in retirement reserve at the end of the year and invested in plant was $1,037,710.

The earnings and expense statement for the year was cast in new form with explanations of important items. In the statement on railway operation items are shown as follows:

Transportation earnings $1,279,941

23,920,188 passengers paid $1,270,479 for transportation; the balance of $9,462 came from miscellaneous sources such as special concessions, special cars, and rent of equipment.

Operation—Transportation $687,314

Wages, conducting transportation and miscellaneous items due primarily to operating 4,726,719 car and bus miles.

Maintenance—Transportation $332,202

Wages and materials used in keeping cars, buses, track and other transportation equipment and buildings in efficient operating condition. This item also includes $96,651 accrued for depreciation on street cars and buses.

OPERATING STATISTICS OF THE TAMPA ELECTRIC COMPANY

	1926	1925
Number of street cars owned	158	165
Miles of equivalent single track owned	55.87	55.13
Number of buses owned.....	31	22
Miles of bus routes.........	16.2	16.2

The growth in the number of passengers carried since 1916 is noted in the following table. This list excludes transfer passengers:

1916	10,872,102
1917	11,107,645
1918	11,958,831
1919	14,247,180
1920	15,260,820
1921	17,224,084
1922	17,032,058
1923	16,451,400
1924	16,123,569
1925	21,641,839
1926	23,920,188

Partial Discontinuance in California Authorized

Permission has been granted by the California Railroad Commission to the San Jose Railroad to discontinue railway service and to remove its tracks on its Hanchett Park line. The Peninsular Railway, San Jose, Cal., has been authorized by the Railroad Commission to abandon its franchise and to remove its tracks from portions of Saratoga Avenue, Bellamy Street and Franklin Street in the town of Santa Clara. Both companies are controlled by the Southern Pacific Company.

Sacramento Report Issued.—The Sacramento Northern Railway, Sacramento, Cal., reports to the Railroad Commission its 1926 operating revenue at $1,569,482. The operating expenses, excluding taxes for 1926, are reported at $1,181,297, leaving net operating revenue of $388,185. Taxes charged to operation amounted to $81,824. Deducting the taxes leaves operating income of $306,361 for 1926. Adding to the operating income the non-operating income of the company and deducting non-collectible revenue and rents, results in a gross corporate income, which represents the amount available for interest, amortization of debt discount, other fixed charges, non-operating expenses, dividends and surplus, of $352,104.

Fordson Franchise May Go to City.—Negotiations have been started which, if successful, will result in the city of Detroit, Department of Street Railways, taking over the Detroit United Railway franchise in Fordson, Mich., which will expire on Nov. 9, 1927. The Detroit United Railway property involved includes 2.65 miles of track on Michigan Avenue. It is understood that the Department of Street Railways has submitted an offer to Fordson, with a promise to build a double track through the city, if it is granted and a satisfactory settlement can be made with the Detroit United. The estimated cost to the Department of Street Railways, including payment to the Detroit United, laying double tracks, paving between tracks and other improvements contemplated, is approximately $138,000. In the event the negotiations are successful the present fare of 11 cents from Detroit to Fordson will probably be reduced.

Abandonment Petition Filed.—The New York & Stamford Railway filed a petition on May 3 with the New York Public Service Commission for approval of a declaration of abandonment of portions of its route in Rye and the town of Mamaroneck, Westchester County. Public hearing will be held on this application.

Would Discontinue Line.—The Berkshire Street Railway, North Adams, Mass., has applied to the Vermont Public Service Commission for authority to discontinue railway service between North Bennington, Vt., and the New York State line. The company has also applied to the New York Public Service Commission for permission to abandon its line between the Vermont State line and Hoosick Falls, N. Y. If the petitions are allowed the Hoosick Falls-Bennington line will be closed to railway service except from Bennington to North Bennington in Vermont. The road was constructed in 1898 and of recent years has developed into a non-paying proposition.

New Director of Cities Service.—M. H. Aylesworth was elected a director of the Cities Service Company, New York, N. Y., at the annual meeting of stockholders. Last fall Mr. Aylesworth was made president of the National Broadcasting Company, Inc. Before that he was managing director of the National Electric Light Association.

Service in Peterborough Ceases.—Negotiations between the city of Peterborough, Ont., and the Hydro-Electric Power Commission looking toward the sale of the Peterboro Radial Railway System failed and service has ceased. It is claimed by the Hydro-Electric that the railway is operated at a loss of $50,000 a year. The city offered $150,000 for both railway and gas works. The price set by the Hydro-Electric is $575,000 for the two. It is believed an offer will be made to a private bus company. If the Hydro-Electric fails to operate cars for 90 days the franchise lapses.

Small Road Bought.—Announcement was made on April 12 of the purchase of the Maysville Street Railroad & Transfer Company, Maysville Gas & Electric Company and all other holdings of the Maysville Public Service Company, with the exception of the water plant, by J. P. Mathews, general manager of the Kentucky Power Company, Augusta, Ky., a few miles east of Maysville, Ky. The railway covers 4 miles of line. The Maysville properties had been controlled by the Cochran family of Maysville for 50 years or more. It was reported that the deal, which included the Maysville & Flemingsburg Light & Power Company and Maysville Ice & Cold Storage Company, involved about $2,000,000.

California Company Makes Report.—The Petaluma & Santa Rosa Railroad, operating from Santa Rosa to Petaluma and Sebastopol, reports to the California Railroad Commission its 1926 operating revenue at $611,280, compared with $571,330 for 1925. The operating expenses, excluding taxes, are $454,531 for 1926 and $432,602 for 1925, leaving net operating revenue of $156,749 for 1926 and $138,728 for 1925. During 1926 taxes charged to operation were $34,394 and $26,799 for 1925. Deducting the taxes leaves operating income of $122,355 for 1926 and $111,929 for 1925. Adding to the operating income the non-operating income of the company and deducting non-collectable revenue and rents. The gross corporate income, which represents the amount available for interest, amortization of debt discount, other fixed charges, non-operating expenses, dividends and surplus, is $125,607 for 1926 and $116,024 for 1925.

Traffic Shows Decrease.—The United Railways, St. Louis, Mo., carried 1,314,556 fewer passengers during the first quarter of 1927 than in the similar period of 1926, the figures being 63,371,709 and 64,686,265 respectively.

Legal Notes

FLORIDA.—*Proof of Fraud in Releases Must Be Convincing.*

It is the policy of the law to encourage and favor the compromise and settlement of controversies, when such settlement is entered into fairly and in good faith between competent parties, and is not procured by fraud or overreaching. In order to accomplish the impeachment as for fraud, of a release so executed, proof of the fraud should be clear, cogent, substantial and convincing. [Florida East Coast Ry. vs. Thompson, 111 So., 525.]

KANSAS.—*Conductor Should Protect Passengers from Assault.*

Plaintiff on entering street car stood alongside of a seat which was occupied. As one part of the seat became vacated, she attempted to sit down. Passenger occupying other part of the seat told her she could not sit there. She sat down and passenger struck her, knocking her across the aisle. She got up, went back and sat down again. The man again struck her with his fist. She got up, went to sit down again and the man struck her for the third time. The conductor stood facing her, only 8 ft. away. After being struck the third time the conductor took hold of her and threatened to call a policeman. Nothing was said to the passenger who had struck her. The conductor took the plaintiff away and the passenger who had struck her left the car. The court, in censuring the conduct of the conductor, held that the law required him to exercise diligence to protect passengers from unprovoked assault and battery by fellow passengers, and when another passenger used force to prevent the plaintiff from exercising her privilege to occupy a vacant seat it was the conductor's duty to protect her. [Holmes vs. Fleming, 253 Pac., 224.]

MAINE.—*Truck Driver Must Listen and Look Also.*

A driver of a motor truck colliding with a trolley car must establish not merely negligence of defendant but his own freedom of contributory negligence. While motor trucks and trolley cars have co-extensive rights and reciprocal duties at street crossings, close watch is required on the part of the motorman. Likewise it is the duty of the driver of a truck also to look, and where he did not do so, but only listened, his failure so to look when his truck was proceeding at a slow rate of speed and could have been stopped in a short distance was contributory negligence barring recovery. [Blanchette vs. Waterville, F. & O. Ry., 136 Atl., 116.]

MARYLAND.—*Proximate Cause of Accident Was Intervention of Automobile.*

Plaintiff was waiting for a street car. As it approached him it failed to stop and he was struck by an automobile going in the same direction, which knocked him into the car. It was held that the failure of the motorman to slacken his speed was not negligence and that the intervention of action of the automobile driver, rather than the motorman's failure to stop the car, was the proximate cause of the injury. [United Rys. & Elec. Co. of Baltimore vs. Perkins, 136 Atl., 50.]

MASSACHUSETTS.—*Rules on Interstate and Intrastate Transportation.*

Appellant was the owner of a number of omnibuses engaged in passenger transportation, both interstate and intrastate, the same buses being used on the entire route. The intrastate carriage constitutes a substantial part of its business. Under the state law operation is prohibited where transportation is similar to that afforded by a railway along the route on which the vehicle is operated or as a business between fixed and regular termini, without first obtaining a license from the city or town, and operation under such license is prohibited until the owner has obtained from the department of public utilities a certificate of public convenience and necessity. No license or certificate is necessary if such carriage be entirely interstate. Power to restrain such operation is vested in the Supreme Court and Superior Court jurisdiction in equity, on petition. Appellant has no such license in the cities where its route parallels that of the street railway and such operation has resulted in financial loss to the latter, who has caused appellant's drivers to be arrested and prosecuted and intends to prosecute them for operating without obtaining the licenses and certificates required by statute. Appellant attempts to restrain the enforcement of the statute on the ground that it conflicts with the commerce clause of the U. S. Constitution and the Fourteenth Amendment. The record contained no information as to the number of passengers carried in the same vehicles and what part of the total number was interstate or intrastate, nor that the two classes of business are so commingled that the separation of one from the other is not reasonably practical. It was held that appellant may not evade the act by the mere linking of its intrastate transportation to its interstate or by the transportation of passengers by the same instrumentalities and employees; that there is no support for the contention that the act deprives it of its property without due process of law and that the state has the right and power to regulate the use of its highways so long as it does not directly burden or interfere with interstate commerce; plaintiff has no standing to attack the statute as a violation of the due process clause. [Interstate Buses Corp. vs. Holyoke St. Ry. Co., et al., 47 Superior Court Rep., 298.]

NEW JERSEY.—*Damages for Injuries to Children Held Not Excessive.*

The sum of $15,000 for weak-minded three-year-old boy losing one leg, with injury to the other, and $7,000 to father, held to be not excessive. [Ketterer vs. P. S. Ry. Co., 135 A., 679.]

NEW JERSEY.—*Attempt by Town to Regulate Rate of Fare Declared a Nullity.*

Under an ordinance passed in 1921 a fare of 10 cents was allowed to be charged for the carrying of passengers by omnibuses on Sundays. Under an amendment to the ordinance passed in 1926, an attempt was made to fix all fares at 5 cents. Prior to the amendment and in 1924 the Legislature had passed an act vesting buses under the control of the Board of Public Utility Commissioners, and this control included the fixing and regulation of fares to be charged. The prosecutors, all of whom were in the employ of a company operating buses, had been fined for collecting the 10-cent fare. The court, in setting aside the convictions, held that the act of the legislature divested the town of its power to fix and regulate fares and that its attempt to adopt the amendment was a nullity. [Morrison, et al., vs. Town of West New York, 136 A., 175.]

OHIO—*Time Allowed to Provide Convenient and Necessary Service.*

Where the Public Utility Commission finds that a motor transportation company does not give convenient and necessary service upon a certain route, it should give to the company a reasonable time, not less than 60 days, to provide such service, before it grants permission to a competing motor transportation company to extend and increase its service upon the route in question. [Central Ohio Transit Co. vs. Public Utilities Commission of Ohio, 154 Northeast. Rep., 323. (See also Scioto Valley R. & P. Co. vs. Public Utilities Commission of Ohio, 154 Northeast. Rep., 320.]

RHODE ISLAND.—*Employees Not Guilty of Negligence Because Man Is Struck While Lying Prone on Ground at Night.*

Defendant's trolley, proceeding between 20 and 25 miles an hour, between streets on a rainy night, struck and killed the plaintiff. There was testimony to the effect that the headlights of the car could be seen for a distance of 600 ft. and it was making considerable noise; that as the car was proceeding, the motorman, and another employee who was also in the front part of the car, saw something on the ground close to the track; that at first neither could see what the object was, but within a second or two they saw a man with his back toward the trolley car, prone on the ground on his hands and knees. The car immediately slowed down and the operator did all that he could do to make a quick stop, but before a full stop could be made the man was struck, receiving injuries resulting in his death. The car was 40 ft. long and stopped in less than its length. At the conclusion of the evidence a verdict was directed in favor of the defendant, which was affirmed on appeal on the ground that there was no negligence on the part of the motorman, as the evidence clearly disclosed that he did all that he could have done to avoid the accident as soon as he saw there was any danger. [Caporicci vs. United Elec. Rys., 136 A., 11.]

Personal Items

A. B. Paterson Heads Southwestern Section

Vice-President of the New Orleans Public Service Company in Association Post

A. B. Paterson, newly elected chairman of the railway section of the Southwestern Public Service Association, is of the younger type of utility executives rapidly forging to the front and taking the lead in the readjustment of electric railway operations to meet present-day conditions. As vice-president of the New Orleans Public Service Company, "Pat," as he is best known among his associates and friends, is in direct charge of operations not only of the railway property in the South's "Queen City" but of gas and electric services as well.

A. B. Paterson

The new railway section head is an engineer. His fingers are on the pulse of each department's activities. His ability and knowledge are recognized by all with whom he comes in contact. But there is no engraved diploma over his desk. If he has one he has never let it be discovered. One senses that he is largely "self-made." There is about him something which gives the impression of years of study after working hours, of the determination which wrests technical knowledge out of books and the hard knocks of experience while the world is busy with recreation and sleep.

Mr. Paterson was born just outside of Toronto, in Canada, 43 years ago. He is an adopted rather than a native son of the South, but nearly twenty years of his experience has been gained below the Mason and Dixon line. He first attracted attention in the utility field while doing special field work for Henry L. Doherty & Company. He became vice-president and general manager at Meridian, Miss., but continued to do special field work for Mr. Doherty. Later he joined the forces of Newman & Company, acting as representative on various Southern properties.

It was during this period that "Pat" gave considerable attention to the New Orleans utilities and became intimately acquainted with these properties. In 1920 he was appointed general superintendent and held that position until the death of A. L. Kempster, when he was put in charge of all operations as vice-president and general manager. Under the leadership of H. B. Flowers, president, Mr. Paterson has welded the New Orleans organization into a loyal, enthusiastic team.

"Pat" is not much in the limelight. He shuns publicity and shrinks from a camera. He is a silent worker and is known for his accomplishments rather than his exploits on the platform. But he is intensely human—and he has a hobby. Pat is an inveterate fisherman. During the season when the finny tribe tempt line and net he sometimes omits his Sunday morning conferences with department heads and lays down slide rule and operating report to try his hand with the sportsman's rod.

His election as chairman of the railway section was accompanied by little demonstration, but there was a feeling of confidence as he took the helm—a feeling that the new pilot knows his job; that the affairs of the railway section are in the hands of a capable leader.

L. M. Zapp Succeeds E. J. Burdick

L. M. Zapp has been appointed vice-president and general manager of the Detroit United Railway, Detroit, Mich. He succeeds E. J. Burdick.

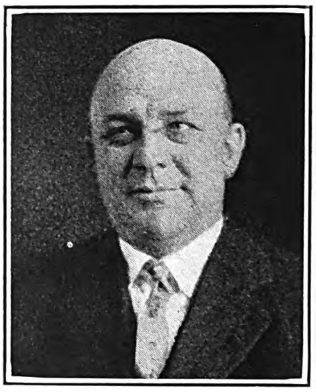
Messrs. Sloan, Gadsden and Brosseau C. of C. Directors

Matthew S. Sloan, president of the Brooklyn Edison Company, has been nominated a member of the board of directors of the Chamber of Commerce of the United States. He will be unopposed, so the election is a perfunctory matter. In addition to Mr. Sloan, new directors elected were: William Pfaff, New Orleans; Robert P. Lamont, Chicago, and Edward Peck, Omaha.

In addition thirteen members who have been serving as directors were re-elected for new terms. They are: Stanley H. Bullard, vice-president of the Bullard Machine Tool Works; Philip H. Gadsden, United Gas Improvement Company; William Candler, vice-president Atlanta-Biltmore Company; J. G. Leigh, L. B. Leigh & Company; E. T. Meredith, Meredith Publications; Dwight B. Heard, Dwight B. Heard Investment Company; Everett G. Griggs, president St. Paul & Tacoma Lumber Company; Charles W. Lonsdale, president Simonds-Shields-Lonsdale Grain Corporation; John G. Lonsdale, president National Bank of Commerce; Walter M. Daniel, Havana; H. A. Smith, president National Fire Insurance Company; A. J. Brosseau, president Mack Trucks, Inc., and A. L. Humphrey, president Westinghouse Air Brake Company.

New Supervisor of Accident Prevention in Chicago

William Pasche has been appointed supervisor of accident prevention of the Chicago Surface Lines. He succeeds Victor T. Noonan, resigned. Mr. Pasche has been with the company since 1904. He began as a conductor working out of the Division carhouse. In 1918 he was made supervisor and his work in that capacity attracted so much attention that he was promoted to the position of assistant division superintendent five years later and stationed at North Avenue. In 1925 he succeeded to the position of division superintendent at North Avenue, which is the largest carhouse on the system. He has won frequent commendation from the management by the efficient way in which he has operated the 600 runs and managed the 1,400 trainmen and 414 cars under his supervision. Last year his station won the trophy in the accident prevention contest, which extended over a period of twelve months. The initiative and resourcefulness he exercised in this campaign proved to the management that he was capable of taking charge of all the accident prevention work on the system and when, through the resignation of Mr. Noonan, the opportunity arose Mr. Pasche was immediately selected.



William Pasche

Frank W. Shappert and L. E. Butler Recent Appointees

Frank W. Shappert, formerly general traffic manager of the Chicago, North Shore & Milwaukee and the Chicago, South Shore & South Bend railroads, was appointed recently to the position of assistant to Bernard J. Fallon, vice-president in charge of operation of the two lines. Mr. Shappert is especially charged with the development of plans for increasing traffic.

Another important change in the North Shore organization is the appointment of L. E. Butler as assistant to C. E. Thompson, vice-president. He will be responsible for rates, divisions and tariffs, and relations with individuals and other transit companies.

W. S. Finlay, Jr., Heads West Penn Electric

Former Vice-President of American Water Works Made President of Large Utility—H. L. Mitchell President of West Penn Railways

W. S. Finlay, Jr., for the last seven years a vice-president of the American Water Works & Electric Company, Inc., has been elected president of the West Penn Electric Company and chairman of the board of its major operating subsidiaries, the West Penn Power Company and the West Penn Railways. G. M. Gadsby, for many years identified with the West Penn Electric properties and lately a vice-president of the West Penn Power Company, has been elected president of the latter corporation, while H. L. Mitchell, the present vice-president of the West Penn Railways, has been elected president of that company.

R. B. Keating has been elected vice-president in charge of finances of the West Penn Electric Company and will supervise the finances of all of its operating properties. Mr. Keating has, for the past thirteen years been prominently associated in various financial capacities with the West Penn Electric properties, prior to which time he had had a wide public utility experience.

Mr. Finlay has long been identified with public utility properties. For some years before his association with American Water Works & Electric Company, Inc., he was superintendent of motive power of the Interborough Rapid Transit Company, New York City. He is a member of the American Engineering Council, United Engineering Society and Engineering Foundation, past vice-president of the American Society of Mechanical Engineers and a fellow of the American Institute of Electrical Engineers. Mr. Finlay will move from New York City to Pittsburgh, the central office of the West Penn Electric System. He was graduated from Cornell University in 1904.

G. M. Gadsby, the new president of the West Penn Power Company, was graduated from Marietta College, Marietta, Ohio, in 1906, and from the Massachusetts Institute of Technology in 1909. Immediately thereafter he started work with the properties now controlled by the American Water Works & Electric Company, Inc. In 1918 he became vice-president of the West Penn Power Company and has since served in that capacity. Mr. Gadsby is a past-president of the Pennsylvania Electric Association and as its head was active in stimulating better relations between utilities and the public. He is also a member of the Engineering Society of Western Pennsylvania and the Association of Iron and Steel Electrical Engineers; he is well known throughout the territory served by the West Penn Electric System.

H. L. Mitchell, who has been elected president of the West Penn Railways, has devoted his entire working life to the railway properties of the West Penn Electric system. He received his schooling in Warren, Pa., and entered the employ of the West Penn Railways in 1902. He was elected vice-president of the West Penn Railways in 1920. Mr. Mitchell is vice-president of the Pennsylvania Street Railway Association and an associate member of the American Electric Railway Association.

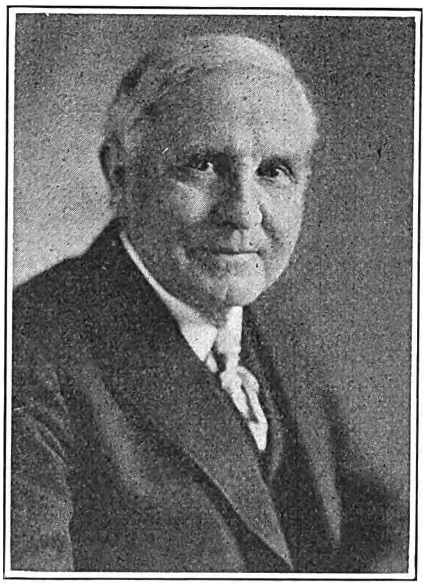
The executive changes outlined previously are a final step in the co-relation and co-ordination of the subsidiary electric and transportation properties of the West Penn Electric Company. The major companies of the West Penn Electric system are: West Penn Power Company, West Penn Railways, Monongahela West Penn Public Service Company and the Potomac Edison Company.

The population served totals more than 1,600,000 in western Pennsylvania, northern West Virginia, western Maryland and northern Virginia, as well as a small portion of the southeastern section of Ohio.

Father of Interurban Dead

Charles L. Henry, Pioneer Operator, Active Until Almost the Last—Man of Charming Mien Who Won for Himself the Appellation of "Engineer of Good Will"

THE passing of a man like Charles L. Henry, who died at his home in Indianapolis, Ind., on May 2, invests with reality Carlyle's complaint that more good lives are lived than written.



Charles L. Henry

Mr. Henry was making history in this industry when most of those of the present generation were in swaddling clothes, and he continued to make history almost until his dying day. This he did unobtrusively, never seeking the limelight. He worked effectively and fearlessly, but always fairly. Unchanged by his successes, Mr. Henry was equally unchanged by his defeats. And he tasted bitter defeat. Twice was his fortune swept away. That made no difference in the outward demeanor of the man. These observations are merely specimen bricks that show the hardihood of the man who was the father of the interurban railway and held at one time the most important office within the power of the industry to bestow, that of president of the American Electric Railway Association.

To this office, filled by him in 1915-1916, Mr. Henry brought a great store of experience, for he had a record of success in the practice of law, had owned the Indianapolis *Journal*, served usefully as a member of the Indiana State Senate and as a member of Congress and was nationally recognized as one of the notable pioneers of interurban electric railway development. It was he who gave the word "interurban" to the language. For more than 35 years he was foremost among the keen-visioned in community building by amplifying rapid transit facilities. He was a pioneer not only in the building of railways, but in the application and use of new methods. The road of which he was long president, the Indianapolis & Cincinnati Traction Company, was one of the earliest successful single-phase systems in the country. His service at Washington in the interests of the electric railway industry during the war-time period was notable. General George H. Harries said of him at Chicago in 1922 at the past-president's day at the meeting of the association that Mr. Henry had kept the industry straight federally and tried to keep the federal authorities straight—with gratifying success. On that memorable occasion General Harries concluded his remarks about Mr. Henry with these words: "His personal charm and our gratitude bind us to him, and always will."

For 37 years Charles L. Henry was a factor in the railway world. He was graduated from the law school of the Indiana University in 1872. He was then 23 years of age and he practiced in Pendleton, Ind., and Anderson, Ind., until he began his connection with the railway industry, nineteen years later. He entered the industry by purchasing the local line at Anderson and made it the nucleus of the far-flung system of the Indiana Union Traction Company. That was a long time ago. Only to the so-called old-timers does the recital of these facts stimulate memories of that now imaginary aroma of the stables and barns that were really barns, and of reeking harness which was as frankincense and myrrh precious to the nostrils of the railway presidents of the distant days in which pine tables served for presidential desks and drivers were paid $1 for a fourteen-hour day; in which the books of accounts were kept by bright lads who labored after school hours for $2 a week and deemed themselves to be well on the way to great riches. It is fascinating to reminisce, particularly fascinating in the case of a man like Mr. Henry, but his life was replete with so many activities that the story of the man would quickly get out of bounds if the attempt were made to elaborate the facts. This is unfortunate, but it is true. The history of a man active in affairs for more than 35 years cannot be covered even cursorily within the limitations which are laid down by the laws of journalism.

Mr. Henry coined and applied the name interurban to the new lines in Indiana. As indicated before, his venture at Anderson was the beginning of the now famous Union Traction Company, formed in 1899 to combine electric railways that had sprung into existence following the success of Mr. Henry's pioneer line from Anderson to Alexandria. Subsequently, as general manager of the company, Mr. Henry constructed the line from Muncie to Indianapolis, forming the backbone of the system as it exists at the present time. Later he disposed of his interest in the company to form the Indianapolis & Cincinnati Traction Company.

All of his activities during his long and successful career centered in or about Indiana, his native state, but his every instinct was that of the pioneer who avoided the beaten trail. It may appear strange to say so, but it does seem that the best characterization of his personality was that contained in a testimonial presented to him about ten years ago by a committee of engineers. It said: "Charles Louis Henry, loved by us all for his unfailing delightful personality, consummate tact, nice discernments and ready power of appreciating and doing that which is required, is hereby elected to the degree of engineer of good will." That was the encomium bestowed upon a man educated in the law, who had become a financier and had acquired an uncanny grasp of the essentials of engineering, in which he had become a pioneer through the backing which he gave to the men with whom he was associated.

In somewhat similar vein is the memorial on the death of Mr. Henry, adopted at a meeting of electric railway men convened during the session of the Chamber of Commerce of the United States at Washington May 3, 1927, attended by President Storrs. That memorial said:

> With profound sorrow and deep regret, representatives of the electric railway industry, assembled at Washington, learn of the death of Charles L. Henry. A pioneer of electric railways, a past-president of the American Electric Railway Association, for years the chairman of the association's committee on national relations and its able counsel. Mr. Henry had been a powerful factor in the development of the industry. He brought to his work a wide experience gained as a lawyer, a member of Congress, a newspaper publisher and a citizen.
>
> A man of intense loyalty, of unusual intelligence, of cool judgment and of understanding, he laid the industry under a deep debt of gratitude for services performed. His genial, lovable nature, his innate kindness and his genius for friendship endeared him to his host of friends.
>
> By this memorial, we record our sense of the loss that we have sustained in the death of one who has been a friend and mentor to us as individuals and a tower of strength to the industry which we represent.

No amount of vigorous phrasing would add materially to this record. Suffice it to say, in conclusion, that the quiet power and the unrevealed glory of this man, to whom the law was not anything that's boldly asserted and ingeniously maintained, are not within the comprehension of fatuous Philistines of the present day.

Manufactures and the Markets

News of and for Manufacturers—Market and Trade Conditions
A Department Open to Railways and Manufacturers
for Discussion of Manufacturing and Sales Matters

Substation Equipment Ordered by Milwaukee Railway

A contract for substation equipment has just been closed by the Milwaukee Electric Railway & Light Company, Milwaukee, Wis., with the Westinghouse Electric & Manufacturing Company. This contract calls for two 1,500-kw. and two 500-kw., 60-cycle railway converters, transformers and automatic switching. The equipment will be used to supply 600-volt direct current to the street railway system, which is to be changed over from the present 1,200-volt operation.

This last move completes the changeover of the entire system to 600-volt operation. The equipment included in this order is to be used on what is known as the East Troy and Burlington branches of the system. Due to the length of these branches, it was necessary to build five new substations in order that sufficient power could be supplied at the reduced voltage. The equipment included in the above order will be used in these stations, together with some that was in possession of the customer at the time the changeover was made.

The automatic switching supplied on this order includes equipment for the full automatic control (undervoltage starting and light load stopping) of the five new 500-kw. substations on the East Troy and Burlington branches.

The two 1,500-kw. railway converters included in this order are to be installed at the Thirty-sixth Street station and the Oakland Avenue station, each one of which will be full automatic controlled. In addition these two stations are to be equipped with Westinghouse audible type supervisory control equipment. Control and supervision of seven feeder circuit breakers, two lockout relays and two signal circuits at the Thirty-sixth Street station and six circuit breakers, two lockout relays and two signal circuits at the Oakland Avenue substation will be accomplished with this equipment.

On completion of this installation the Milwaukee Electric Railway & Light Company will have seven substations under full automatic control using Westinghouse switching throughout.

In this connection it is interesting to note that the Lisbon Avenue substation of the Milwaukee company recently placed in operation an automatic, nonattended, alternating-current substation controlling two incoming lines, two transformer banks and five three-phase feeders, operating as fifteen single-phase feeders. All switching of lines, transformers and feeders is completely automatic and functions according to operating requirements. The switching equipment, standard relays on which the automatic features depend, and the reclosing relays for controlling each of the feeders were furnished by the Westinghouse company.

The Grandville substation of this company, which steps down line voltage from 132 kv. to 26 kv., has been recently changed over to a non-attended substation with Westinghouse synchronous visual supervisory control equipment. The switching equipment for this station is also of Westinghouse manufacture.

$500,000 for Gas-Electric Cars for St. Paul

Expenditures of more than $425,000 by receivers for the Chicago, Milwaukee & St. Paul Railroad for the most modern type of gas-electric cars were approved April 16 by Judge James H. Wilkerson of the federal district court of Chicago. Orders for the new equipment have not yet been placed, but it is understood it will be used to replace steam service on branch lines in the Western states.

Work Commenced on New Repair Shop for Cincinnati Company

Work on a new repair shop for the Cincinnati Street Railway began April 25. The new shop, estimated to cost more than $500,000, will have a floor area of 147,920 sq.ft., with a separate building for housing the stores department of 23,250 sq.ft. It will be located on property already owned by this company on Mitchell Avenue and the Baltimore & Ohio Railroad, the site being easily accessible from all sections of the system. Preliminary plans were prepared by E. J. Jonas, superintendent of equipment, and architectural details were completed by Col. Harry Hake. The contracts were placed with the Fisher-DeVore Construction company of Cincinnati. Brick and steel will be used for construction, while the roof will be the flat monitor type. The shop is to have a capacity for handling work on 60 cars at one time, which is 10 per cent of the cars in regular operation. It will also be possible to paint all cars as frequently as necessary as a spraying system will be used.

All departments and facilities for making major repairs to rolling stock and for overhauling and painting this equipment will be installed in this shop. The stores building will receive and disburse supplies and material for all departments of the company.

Although the company does not plan to build cars, it will be in a position to handle its own heavy repairs and reconstruction. One department of the shop will be fitted to take care of body repairs for the motor coach division.

Since the Cincinnati Street Railway Company resumed the operation of its property Nov. 1, 1925, it has been using a section of the Cincinnati Car Company shops for major repair work.

A. K. Brumbaugh Joins White

A. K. Brumbaugh, formerly in charge of the experimental and test engineering departments of the Autocar Company, has joined the commercial engineering department of the White Motor Company. He is associated with G. W. Smith, Jr., technical assistant to Thomas H. White, vice-president and general manager, and will have charge of the division whose function is the establishment and maintenance of White standards. Previous to twelve years service with the Autocar Company, Mr. Brumbaugh was superintendent of transportation for the Consolidated Gas & Electric Company of Baltimore, engineer for the Maryland Casualty Company, with the railway engineering division of the Westinghouse company and the electrical department of the Baltimore & Ohio Railroad. He was graduated from Lehigh University in 1909 as an electrical engineer.

Sales of Mack Buses to Public Utilities High

Sales of Mack buses to electric railways and steam railroads during the first quarter of 1927 were higher than for any like period since buses became an important factor in transportation. During the first quarter this year, 82 per cent of bus sales were to public utility companies. Thirty-two per cent of buses sold were gas-electric drive and 30 per cent were the new Mack six-cylinder type. Bus sales in March to utility companies amounted to 73 per cent of the month's total business. Among the sales reported were the following:

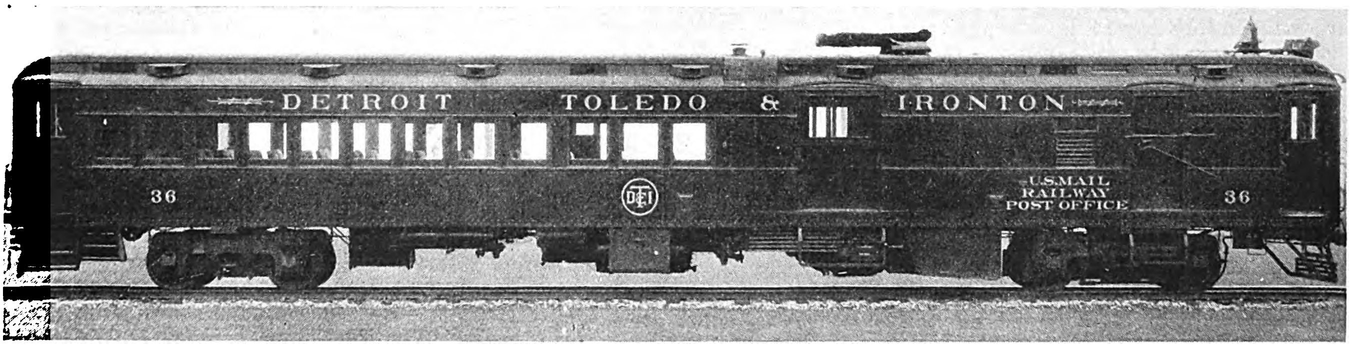
Oklahoma Union Railway, Tulsa, Okla., six 25-passenger city type buses, four-cylinder;
Lehigh Traction Company, Bloomsburg, Pa., one 25-passenger city type bus, four-cylinder;
New York, Westchester & Boston Railway, New York, 25 29-passenger city type Macks, four-cylinder;
East St. Louis & Suburban Railway, East St. Louis, Ill., one 29-passenger city type, four-cylinder;
New York, New Haven & Hartford Railroad, Boston, Mass., twelve 230-in. wheelbase Mack bus chassis, four-cylinder;
Twin City Rapid Transit Company, St. Paul, Minn., seven 230-in. wheelbase Mack bus chassis, four-cylinder;
Iowa Southern Utilities Company, Des Moines, Iowa, four 25-passenger city type buses, four-cylinder.

Report of a sale of twelve city type Macks, ten 25-passenger and two 29-passenger, to the United Railways & Electric Company, Baltimore, Md., in January was also received in March.

Officials of the International Motor Company's bus department in close contact with the situation in the electric railway field are optimistic concerning the outlook for the balance of the year.

New Cars for Henry Ford's Road

The gasoline-electric cars recently placed in service by the Detroit, Toledo & Ironton Railroad were built by the Pullman Company, which co-operated with the Hall-Scott Motor Company and Westinghouse Electric & Manufacturing Company. The cars are of all steel aluminum construction, 72 ft. 6 in. over all, 14 ft. high and 10 ft. 4 in. wide. Each car weighs approximately 66 tons.



Henry Ford is using gas-electric cars on his D., T. & I. line

R. L. McLellan in New Westinghouse Post

Ross L. McLellan, formerly managing director of the Compañia Westinghouse Electric Internacional, S. A., has been appointed general manager of the Westinghouse International Company with headquarters in New York. He was graduated from Purdue University with a degree in electrical engineering in 1907 and joined the Westinghouse forces in 1915 in Chicago as a salesman in the railway field. In 1920 Mr. McLellan became a member of the staff of F. H. Shepard, director of heavy traction, and in 1921 went to Santiago, Chile, where he contracted on behalf of the Westinghouse company for the electrification of the Chilean State Railways. In 1922 he represented the company in important negotiations with the government-owned railways of Brazil, and in 1923 was sent to Europe, also in connection with railway electrification. In 1924 he was made managing director of the Compañia Westinghouse Electric Internacional, S. A. Mr. McLellan is president of the Chamber of Commerce of the United States in Argentina and a member of the A.I.E.E.

Copper Dips Below 13 Cents—Lead Prices Cut

Dullness continues to be the outstanding characteristic of the non-ferrous metals in the domestic market. In spite of this prices have remained comparatively firm. This applies to each of the metals except lead, in which business has been done in moderate volume, apparently stimulated by lower prices. In general buyers are confident that their current needs can be met without difficulty and that there is no occasion for buying ahead. Though the principal copper producers have held firmly at 13 cents, some sales have been made at concessions all week, and the market cannot be quoted at the even 13 cents delivery in the East. On May 4 lead in New York was obtainable at a slight concession under the Smelting company's price of 6.75 cents, the prevailing quotation in the St. Louis market being 6.40 cents. Zinc has been fairly steady at 6.125 cents, or a trifle under, all week. Tin has been quiet, with prices fluctuating within narrow limits.

With one or two exceptions the past week has seen the dullest copper market in two or three years. Producers generally are in a fairly comfortable position, and they are apparently confident that the April statistics will show a marked reduction both in mine production and in stocks of refined metal.

Except for a few sales of moderate tonnage by first-hands and one or two by second-hands, the business of the week was placed at 13 cents in Connecticut and 13.125 cents at Middle West points. The bargain prices are reflected

METAL, COAL AND MATERIAL PRICES F. O. B. REFINING

Metals—New York	May 3, 1927
Copper, electrolytic, cents per lb.	12.750
Copper wire, cents per lb.	15.125
Lead, cents per lb.	6.73
Zinc, cents per lb.	6.46
Tin, Straits, cents per lb.	66 875
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.425
Somerset mine run, Boston, net tons	1.90
Pittsburgh mine run, Pittsburgh, net tons	2.25
Franklin, Ill., screenings, Chicago, net tons	†
Central, Ill., screenings, Chicago, net tons.	†
Kansas screenings, Kansas City, net tons	2.50
† Quotations withdrawn because of strike.	
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	$5.15–20
Weatherproof wire base, N. Y., cents per lb.	16.75
Cement, Chicago net prices, without bags	2.05
Linseed oil (5-bbl. lots), N. Y., cents per lb.	11.60
White lead in oil (100-lb. keg), N. Y., cents per lb.	14.50
Turpentine (bbl. lots), N. Y., per gal	$0.63

in the quotations only because of the extremely light sales by the producers who maintained the 13-cent price. Foreign business has been fair, the export price being 13.35 cents, c.i.f. all week. Some f.a.s. orders were placed at 13.05 cents and 13.10 cents.

On April 28 the American Smelting & Refining Company reduced its New York contract price from 7 to 6.85 cents, and on Monday, May 2, a further reduction to 6.75 cents was announced. The London market has shown a little more strength than in the past, spot lead in that market declining only 2s. 6d. following each decline in New York.

Corroding grades of lead command the usual premium of $2 to $3 per ton.

Statistics of production and consumption for April are not expected to bull the market.

Prime Western zinc has been sold in limited quantities during the week at prices ranging from 6.10 cents to 6.15 cents, East St. Louis. Zinc ore in the Joplin market has declined to $40 per ton, at which price current sales are around 12,000 tons per week against a production only slightly under 15,000 tons. The Far Western zinc districts are contributing increasing amounts to domestic production, so that Joplin does not dominate the situation as decisively as it once did. High-grade is quiet, with 8 cents asked for delivered metal in the New York district.

Tin Holds Fairly Well

There has been a moderate business on some days in tin for early delivery. Demand for futures has not amounted to much, though the more distant deliveries have been obtainable for from 1¾ to 2¾ cents less than prompt.

Nugey Process Sold to Swan & Finch

The soapless lubricating grease process developed by A. L. Nugey has been taken over exclusively by the Swan & Finch Oil Company, New York City, with plants at Elizabeth, N. J.; Buffalo, N. Y., and Chicago, Ill. In addition to these plants, branches are located in Syracuse, Boston, Pittsburgh and Detroit. Mr. Nugey is a mechanical and petroleum engineer, well known as the author of the volume "Oil Refinery Specifications."

New Bailey Meter Company Formed

Babcock & Wilcox Company and General Electric Company announce the formation on April 1 of a new company to be known as the Bailey Meter Company, which acquired the flow meter business of the General Electric Company and the fluid meter and combustion control business of the old Bailey Meter Company. Payment for the flow meter business and patent will be made to the General Electric Company in stock of the new company, of which the other principal holder will be the Babcock & Wilcox Company.

E. G. Bailey, president of the present Bailey Meter Company, will be president of the new company. R. S. Coffin, vice-president of the present company, will be vice-president in charge of administration and finances. R. E. Wooley, now connected with the General Electric Company, will be vice-president in charge of engineering and sales.

Messrs. Morrow and Cutter Added to International G.E. Board

Dwight W. Morrow, of J. P. Morgan & Company, and Victor M. Cutter, president of the United Fruit Company, were elected directors of the International General Electric Company on April 29.

Gerard Swope, president of the General Electric Company, was elected chairman of the board, succeeding the late Anson W. Burchard; Clark H. Minor was re-elected president; Walter J. Edmonds, comptroller, was elected a new vice-president in charge of financial relations, and E. F. Colyer was named comptroller.

Track and Line

Milwaukee Northern Railway, Cedarburg, Wis., has announced that it will separate its tracks from grade for 13,800 ft. between Fiebrantz Avenue and the Silver Spring Road crossing in Milwaukee. The tracks will be depressed under Olive Street, the proposed Roosevelt Drive, Silver Spring Road and the extension of 27th Street and are to be elevated over Hampton Road and across the lowlands adjacent to Mud Creek. According to R. H. Pinkley, vice-president, the work is being done to avoid the congestion of surface operation and the hazard on busy crossings in this rapidly growing residence section. The work will cost $270,000.

Municipal Street Railway, Seattle, Wash., is meeting with opposition in its proposed plan to tear up the single track on Fourteenth Avenue Northwest and to double track the line on Fifteenth Avenue Northwest from Fifteenth Avenue bridge to 67th Street and construct a single track from that point to the city limits. The chief opponents of the change are merchants on Fourteenth Avenue Northwest. Property owners in the district involved have been invited to bring their street railway problems to the City Council at an early date. The proposed work will cost $42,000.

Shops and Buildings

Milwaukee Electric Railway & Light Company, Milwaukee, Wis., is remodeling one of its oldest carhouses at National and 22d Avenues, at a cost of about $50,000. A new front and a new roof, pits and tracks will be installed. In addition new tracks will be laid on National Avenue between 22d and 24th Avenues.

Worcester Consolidated Street Railway, Worcester, Mass., has awarded a contract to the Henry R. Kent Company, Rutherford, N. J., for the construction of a one-story brick and concrete carhouse on Grove Street, Worcester.

Trade Notes

Consolidated Car-Heating Company, Albany, N. Y., has announced that its electric car heaters have been installed on some of the buses in New York City. They are plugged into the city lighting circuit at stop-over points to keep the interior warm, when the motor, which supplies heat from the exhaust on runs, is idle. Another innovation is the use of immersion-type heating units in the water-jackets and crankcases of the engines, to keep the water and oil heated when the motor is not running, thereby facilitating starting. These units are also furnished with current from the city circuit.

Lincoln Electric Company, Cleveland, Ohio, announces the appointment of Royal D. Malm as western district sales manager, with headquarters at Chicago. Mr. Malm is an engineering graduate from Case School of Applied Science, Cleveland, Ohio, class of 1912. For four years after leaving school he was engaged in construction engineering and then became identified with the Elyria Iron & Steel Company. Later he went with the Standard Welding Division of the Standard Parts Corporation as general superintendent. For the past year he has had charge of Lincoln sales in the automotive industries with office in Detroit.

International Register Company, Chicago, Ill., has received an order for electrically operated double registers to equip all of the cars of the Shreveport Railways, Shreveport, La.

Prest-O-Lite Company, New York City, announces the sale of the storage battery branch of its business to a new company, Prest-O-Lite Storage Battery Corporation. The entire capital stock of the purchasing company is owned by the Automotive Battery Corporation of New York. That portion of the Indianapolis plant of the Prest-O-Lite Company, Inc., used for the manufacture of storage batteries has been leased to the new company. The Prest-O-Lite Company, Inc., will continue the manufacture and sale of acetylene gas for use in the oxyacetylene process of welding and cutting metals. The company will continue operation of that portion of its Indianapolis plant devoted to the manufacture of gas cylinders, acetylene generators and other apparatus.

New Advertising Literature

Fitzjohn Manufacturing Company, Muskegon, Mich., is issuing a new catalog descriptive of its motor coach bodies especially designed for Studebaker dealers.

Interflash Signal Corporation, New York City, is distributing to state, county, and municipal officials throughout the nation a handsome circular describing its signals. Colored diagrammatic sketches with explanatory text matter present the various traffic situations where the signals are useful.

Alpha Electric Company, Inc., New York City, has just distributed a new folder presenting the uses of its "Van Dorn" electric drills.

Fire Protection of Bus Garages Demands Serious Attention

REGULATIONS for the construction and operation of bus garages have been under consideration for some time by the National Fire Protection Association. A committee of this organization has made a study and recently presented a progress report, which in substance is the third draft of a set of regulations. Since electric railways have become large operators of buses the subject has become of increased importance to the industry, and the American Electric Railway Association has been given representation on the committee.

G. C. Hecker, the association's representative, in the May issue of *Aera* indicated that the tentative regulations do not meet with the full approval of many bus operators, and that there is a wide difference of opinion as to the methods of protection against fire that should be adopted. He felt it is desirable to get as comprehensive a discussion as possible.

In this issue of ELECTRIC RAILWAY JOURNAL is a communication by Howard H. George, chairman of the committee on ways and structures of the Engineering Association, under which comes the subject of garages. Mr. George mentions some of the objectionable clauses in these specifications. For instance, great stress is laid on so designing the garage that buses can be run out quickly in the event of a fire. With the explosive gasoline that is always present in large quantity, it is questionable whether in any garage fire it will be possible to start the engines and move out any considerable number of buses before the fire gains such headway that it is dangerous to life to attempt to move the vehicles. Then, too, many such fires occur at night and in cold weather. With the engines cold considerable time will be needed to run out even one bus, and with the small number of men who are available at night, when practically all are off duty, there is little chance that property can be saved in this manner.

Another instance of a clause that does not meet with the approval of operators is that which limits the height of any story for a garage to 20 ft. for single-deck buses and 25 ft. for double-deck buses. It is not evident that there is any need for this distinction, and still less likelihood that any operator of both types of buses will be able to restrict entire floors to one or the other. Similar questions apply to several other sections of the report, particularly those on type of fireproof construction for roofing, area of windows with respect to floor space, and methods of ventilation.

It is only by careful analysis of the report that the specifications can be written so as to be of the greatest good to the greatest number. Mr. George in his comment does not advocate practices which would increase the fire risk, but on the contrary he feels that certain modifications would result in a decrease in risk, while at the same time the ease of operation would be enhanced. Every bus operator and every garage designer should lend his assistance by making such suggestions as he considers will be constructive. In that manner only will it be possible to secure minimum fire risk with greatest facility in movement and ease of operation.

Electric Railway Business Flourishing in Canada

HIGHLY encouraging to the whole electric railway industry are the reports recently submitted by member companies to the president of the Canadian Electric Railway Association. From the Maritime Provinces on the east to British Columbia on the west railways record more passengers and greater revenue in 1926 than they had in 1925. In the entire Dominion only two railways report a decrease in business. Summaries of the statements of operating officials in practically all the important cities in Canada are given in an article elsewhere in this issue.

Reasons are numerous for the flourishing condition of the Canadian electric railways. The territory served by these systems has increased rapidly in population since the war. This is particularly true of the Western Provinces. In the east general business conditions have been good, especially that of the paper pulp mills. While the use of private automobiles has grown considerably, the increase has been less marked than in the United States. The comparative scarcity of well-paved roads has acted as a check on automobile popularity. So, also, have the severe winter weather conditions habitually encountered in many parts of the dominion.

Factors which have tended to discourage the use of the private automobile have hampered bus development, too. This has been both a drawback and an advantage. Despite conditions somewhat unfavorable to motor vehicle operation, extensive bus systems have been developed by the railways in Toronto, Montreal, Winnipeg and Vancouver. Others have gone into the bus business on a smaller scale. A number of railways are planning to expand their bus service in the near future.

From the viewpoint of limiting bus competition the difficult conditions have been fortunate, because the Canadians look more favorably upon competition in transportation than do the majority of people in the United States today. Duplication of service is permitted in many localities. The future of several small interurban railways is seriously threatened. That this situation should exist is surprising, because many of the Canadian railways are municipally owned. For the most part, however, the rail systems are furnishing a service for which no acceptable substitute has been found, and it is the general belief that they will continue to play the primary rôle in local transportation.

Plans are being made to extend and improve the service. Figures for passengers carried and revenue received during the first few months of 1927 show a continuation of the upward trend in evidence last year. Except in two or three of the smaller towns, prospects for the future are thought by the managements to be extremely bright.

A Determined Effort for Practical Patriotism

IT WAS indeed gratifying to an observer at the recent meeting of the United States Chamber of Commerce to hear repeated opposition to government control and interference with business. Likewise it is gratifying to note the stand taken by that body on the subject of federal, state and local taxation. The average American citizen has been busy so long making money that he has failed to grasp the seriousness of the situation in the city by the Potomac. The gradual aggression of federal government upon those inalienable rights guaranteed to the citizens is making the Constitution a scrap of paper. The repeated efforts by the government to operate business enterprises have resulted in a laughable exhibition of inefficiency and mismanagement. No matter how practical may be politicians, they are theorists when it comes to transacting business for a legitimate profit or for the good of the majority. For any arguments to the contrary, we offer the powerful rebuttal as revealed in the government's handling of the railorads; or, again, the building of cantonments during the war. Like the Alamo, they should be remembered.

There is a narrow, almost indefinable line between autocracy and democracy. In the history of the world the rise of any one person or party to power has been preceded by the overthrow of economic balance. The patriotism of a democracy then demands that business be divorced from the sphere of government. The safety of a republic lies in the right of every citizen for individual expression. Mathematically, a government is the sum of its citizens. No theoretical political structure has ever or will ever take raw material and convert it into useful and necessary products.

It is, therefore, a gratifying sight to see a body representing a cross-section of our citizenry demanding the right to conduct the nation's business along the lines of sanity, economics and individual liberty. For years we have put too much confidence in our new-hatched, unfledged spellbinders that yearly congregate under the dome on Capitol Hill. The chamber's action is a determined effort at practical patriotism.

A Human Engineer Proves His Case

MANY speeches made today may be described as wind pudding with rainwater sauce. The speaker with a real message is a *rara avis.* When one is encountered we always find a personality fired with the spirit of service and conviction; a personality thrice armed because its quarrel is just. Such a personality is found in Arthur T. Morey, whose speech on industrial relations before the recent meeting of the Chamber of Commerce of the United States is abstracted elsewhere in this issue.

A lawyer by education, general manager of the Commonwealth Steel Company by occupation, and a human engineer by conviction, Mr. Morey has found his greatest reward in the latter capacity by assisting a worker to find himself. Those who were privileged to hear his address came away with the feeling that he has brought practical Christianity into business. After Mr. Morey had outlined the work of his company in promoting a new era of industrial relations, one was convinced that he has proved that sentiment, citizenship, the aspirations and individualism of the work will loom large upon the horizon of greater business in the future.

Perhaps the most significant thing about the campaign of Mr. Morey and his associates lies in the fact that they have placed the development of the individual above what it cost to develop him. With the fetish of the almighty dollar eliminated, the program has gone forward with marked success, and, as usual, in the forgetting of self, the directors of the Commonwealth Steel Company, in the end, have reaped financial benefits.

In this particular it was a source of some amusement and keen gratification to an observer for the JOURNAL to hear the remarks of two industrialists who sat near him: "Aw, you can carry that thing too far," commented the gentleman who typified the age of "catch 'em young and treat 'em rough." His companion agreed with him, and the conversation was centered upon the question of how much it would cost. As if reading the minds of the two gentlemen, Chairman Brosseau arose when the speaker had finished and informed the gathering that he had asked Mr. Morey what was the financial result of the program, and Mr. Morey had replied, "Higher production and lower unit cost." In other words, the scoffers had been confounded, and a human engineer had proved his case.

What a Difference the White Caps Made!

VISITING a relative in another city where a new trolley manager had been functioning only a few weeks, a railway executive could not help casting a professional eye on the local scene. What impressed him most was the apparently insignificant fact that the trainmen were wearing white yachting caps! Indeed, he hardly had a chance to notice and approve this novelty before his relative and various townsmen began to brag about the sartorial initiative of the new manager. The white caps had no necessary connection with anticipated improvements in equipment and service, but were symbolic of better things to come.

Here is an example worth pondering. The new man wanted to create a favorable impression as quickly as possible. Rerouting, new schedules and new rolling stock would be a matter of months and put a strain on the public's expectancy, but the innovation of white yachting caps for summer wear could be put through almost overnight. The way the citizens greeted this change was beyond all hope.

It is a mistake to suppose that the people appreciate only big and splashy effects in public relations. The manager who bathtub-enameled his old cars pending receipt of new ones and the operator who first set out sidewalk benches to soften the annoyance of waiting for a car also spent relatively trifling amounts to strikingly good purpose. It is true that all three of these executives possessed the Heaven-sent gift of imagination, but with such and many other examples of like nature in the records of our technical societies and journals there is no reason why even the most unimaginative cannot pick some of them for his own use. Imitation of such examples is not only the sincerest flattery, but also good business for everybody concerned.

An Ohio Interurban Being Put Back on the Map

RESULTS achieved since the reorganization of the Cincinnati, Hamilton & Dayton Traction Company more than a year ago are fully up to expectations. It is true that the reorganization was a drastic one, but that is not the answer to the accomplishments. Other reorganizations have been quite as drastic. The story of success of the new management lies more in its militancy than in anything else. It is convinced that this 86-mile road can be put back on the transportation map, and the digest of the report of earnings published in the JOURNAL for May 7 makes it appear that its ardour for the task is ample.

The story has been so presented that he who runs may read. The need now is to emphasize only certain points. One of these is the part that new cars have played in the program of rehabilitation. Another is the realization of the value of freight as a revenue producer and the extent to which the management is prepared to go to cater to this business. Still another is the development of a public relations policy that contemplates the use of daily newspaper advertising and the publication of a house organ to keep the riders and others informed and interested.

There is nothing new in any of these things. They are all instruments to the end, panaceas only when properly used. And they have been properly used in the past by the very management that is now in charge of this property. That is what invests the recital of this story with value. Much more important than the sum would seem to imply is the figure of the final balance of $43,928 for the operation of the property from March 9, 1926, the date the reorganization became effective, to Dec. 31, 1926. Even sums of money are relative. Sizable sums are not to be judged entirely by the number of the digits they contain. Certainly any pride that may be felt by the management of the Cincinnati, Hamilton & Dayton Corporation on its accomplishments of the past year is pardonable.

One Out of Three Gets Across

JAY-WALKING will be discouraged in Chicago by the imposition of suitable penalties on the offenders, if the recommendations in a report recently made by the Albert Russel Erskine Bureau for Traffic Research are followed. Any pedestrian who crosses other than at a street intersection when the signal is given will be considered a jay-walker. Such a person not only endangers his own life but also creates a serious obstruction to vehicular traffic.

One often wonders just what the jay-walker intends to do with the few seconds he tries so hard to save. As a matter of fact, the investigation demonstrated that time seldom is gained by this kind of infraction of traffic rules. Checks made at typical intersections showed that more than half of the pedestrians held up by movement of cross traffic try to break through the stream against the signal lights, but that only one-third of those who make the attempt are successful. The rest are caught in a huddled mass in the center of the roadway between ines of moving vehicles.

The occasional success of the jay-walker who breaks hrough is more than offset by the continuous reduction n street capacity caused by pedestrians edging out into he roadway. Miller McClintock, director of the Erskine Bureau, states that studies made in the Chicago Loop district reveal a reduction in capacity from two lanes of traffic moving at 15 m.p.h. to one lane moving at 10 m.p.h.

Heretofore, objection to jay-walking has been based on the idea of preventing accidents, but the survey shows that the matter has another aspect of equally great importance. If the motive of safety has not been enough to discourage jay-walking, the evidence that little time is gained may be more convincing. For the remaining unbelievers, the penalties recommended may drive the lesson home.

Municipalization Recommended at Los Angeles

UNLESS things are not what they seem Dr. Delos F. Wilcox favors municipalization of the lines of the Pacific Electric Railway Corporation, Los Angeles, Cal. He thinks that the purchase price would be less than $30,000,000. He deems the purchase advisable on the ground that, among other things, the city would be freed from the jurisdiction of the Railroad Commission; that the cost of new capital would be limited to the rates paid on city bonds instead of the rate of return allowed by the Railroad Commission on private investments; that gross receipt and income taxes would no longer have to be paid. These are merely some of the things he cites in favor of the plan he advocates.

His is, of course, a counsel of affirmation, but even he, as a proponent of the measure, tacitly if not outwardly warned the city that Mr. Huntington, owner of the system, would insist on the fulfillment of certain stipulations intended to protect him against the uncertainties of the municipal ownership policies. Dr. Wilcox himself says that the good features of the present management ought by all means to be preserved in case the city should decide to take over the railway. This is, indeed, a timely warning.

The Los Angeles *Times* characterizes the Wilcox report as "vague in its conclusions and recommending no definite plan." It is true no definite plan is outlined, but that was hardly to be expected in a preliminary report. The author's warning about preserving the good features of the present management was made without reservation, and however imperfect the conclusions of the expert may be, he did not stub his toe over this factor. Dr. Wilcox may not see the same as others with respect to all the virtues of private operation and ownership, but his long service in consulting work and his contact with politics in his various studies of public life have impressed him with the need of caution in a direction in which caution is seldom exercised.

It is said that advice is given in bushels and taken in grains, but the very warning of the city's expert confirms the significance of the statements made by Managing Director Storrs with respect to the results with municipalization of its railways by the cities of Detroit, Seattle and San Francisco. As Mr. Storrs said at New Orleans, these three outstanding examples of what municipal ownership of electric railways means in the United States should be enough to warn any municipality against it. Los Angeles is still apparently a long way from municipal ownership. If the danger signal means anything, it should stop, look and listen a long while. And if it does that, it may save itself from itself.

Plaza in front of Union Station, Ottawa. Last year the Ottawa Electric Railway carried 1,500,000 more passengers than in 1925

Railway Revenue Increasing

Survey of conditions on 25 important electric railway properties in Canada shows marked improvement over those prevailing a year ago. Bus operation developing slowly

SUBSTANTIAL increase in gross revenue during the past year is reported by nearly every electric railway replying to inquiries made by W. R. Robertson, president Canadian Electric Railway Association. Included in this survey are twenty-five important railways in the provinces of Nova Scotia, New Brunswick, Quebec, Ontario, Manitoba, Saskatchewan, Alberta and British Columbia. In all, these companies own more than 1,600 miles of track and operate approximately 3,500 cars.

Inquiry was made at the same time concerning the bus situation in the territory served by each of these railways. Answers indicate that development is proceeding slowly. Besides the thirteen Canadian railways operating buses at the first of the present year, however, a number of other companies have under consideration plans to establish bus service in the near future.

Receipts of the Nova Scotia Tramways & Power Company, Halifax, were 5.66 per cent greater in 1926 than in 1925, according to W. H. Munro, manager. He expressed confidence in the future of the industry and plans to spend money on new cars and track improvement year by year. Although this railway is not paying dividends at present it is gradually improving its earnings. It is hoped eventually to make it a profitable undertaking and indications are that this will be done in the near future if the general business activity of the district keeps on improving.

Another railway in eastern Canada, the New Brunswick Power Company, at St. John, reports that gross revenue for 1926 increased about $77,000 over the preceding year and revenue passengers about 140,000 in the same period. Mileage operated in 1926 was approximately the same as in 1925, namely, 1,200,000 car-miles.

According to M. A. Pooler, general manager, the increase in revenue occurred principally in the early months of 1926 and in December of that year. St. John is a city of walking distances and it is only with extremely bad conditions under foot that there is any large increase in railway traffic. This has been especially noticeable during the early months of 1927. The winter has been open and revenues have shown a downward trend. Favorable weather conditions have enabled automobiles to operate more easily and a greater number of licenses have been isued by the Department of Public Works thus far this year than for some time past. As a rule the majority of passenger car owners do not use their cars to a great extent until the early spring.

In view of these circumstances it is difficult, Mr. Pooler says, to make any prediction as to the outlook for the entire year of 1927. The railway's prosperity is dependent upon the prosperity of the community. If business improves the management hopes that it will be reflected in revenue. If the recommendations now before Parliament regarding the Maritimes are put through by the government it is expected that conditions will improve to a marked extent.

PROSPECTS BRIGHT IN THE PROVINCE OF QUEBEC

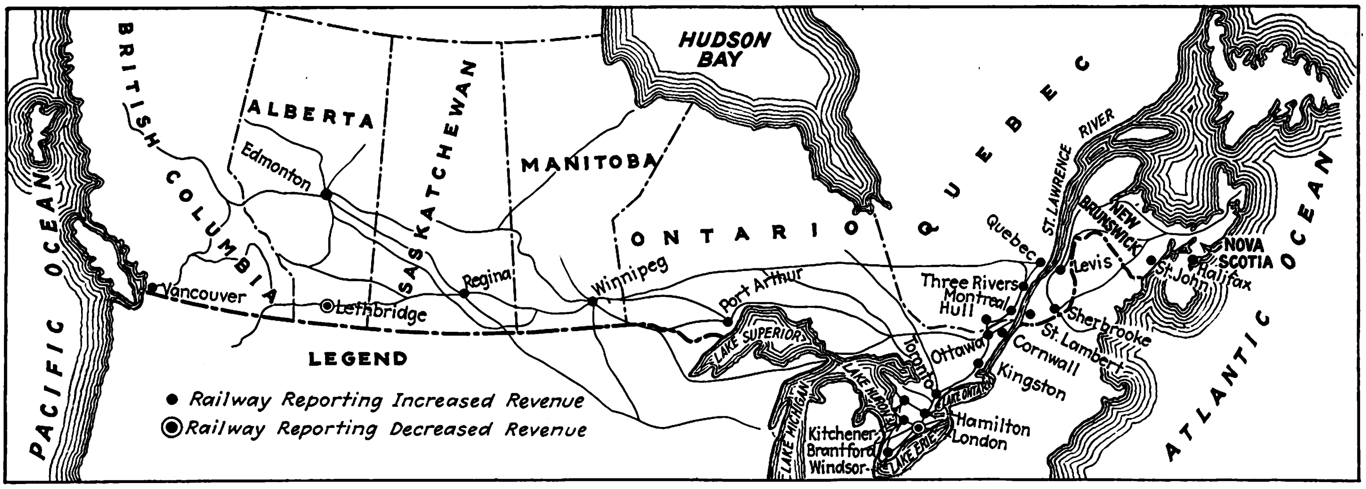
All signs point to much better conditions in and around Quebec than at any time since the close of the World War, in the opinion of J. E. Tanguay, general manager Quebec Railway, Light, Heat & Power Company. The past year has seen definite progress toward business improvement. Industrial activity has increased in many lines, with consequent increased employment in the building trades and greater spending power.

During 1926 the revenue of the railway increased 5 per cent over that for 1925, with a corresponding increase in the number of passengers carried. The early part of 1927 shows no change in this trend and the indications are that it will be a banner year. Prospects are good for heavy tourist traffic to Quebec during the coming summer. This is expected to result in increased patronage on the local railway lines as well as on the interurban line to St. Anne de Beaupré. It is hoped that new records may be made this summer in the number of passengers carried.

Across the St. Lawrence River, H. E. Weyman, manager Levis Tramways, says that electric railway conditions improved last year and the outlook appears favorable for the future, because there is much more activity generally in the Quebec and Levis districts than there has been since 1920. The earning power of the people has improved and electric railways are feeling this improvement. On the other hand, the private automobile competition was felt more last year than ever before. In spite of this the Levis Tramways was able to increase its revenue by publicity, maintenance of friendly relations with the public and a campaign to sell transportation.

Down near the American border the Sherbrooke Railway & Power Company states that for the year ended February, 1927, its gross earnings showed an increase of 10 per cent over the gross earnings for the year ended February, 1926. At Three Rivers the traction company has had a good year and the revenue has shown a marked increase. That district has been prosperous, due principally to the newsprint situation and the extensive construction program carried out by various paper mills. The population has been increasing steadily and indications are that 1927 will be another good year for the railway.

The outlook appears to be extremely favorable in the territory served by the Montreal & Southern Counties Railway, according to W. B. Powell, general manager. The number of passengers carried during the year 1926 was the largest of any year in the history of the company. So far this year traffic has shown an increase over the figures for the same period last year. In 1926 the operating ratio was 80.9 per cent, as against 81.8 per cent in 1925. General business in this territory is active and the population is increasing. Future prospects for the railways are encouraging.



From the Maritime Provinces on the east to British Columbia on the west Canadian electric railways report increased earnings

During the twelve months ended Dec. 31, 1926, gross passenger revenue of the Montreal Tramways increased 2.92 per cent over the same period of the previous year. For January, 1927, the increase was 3.86 per cent, for February 3.70 per cent and for March 3.67 per cent. The average from Jan. 1 to March 31, 1927, was 3.75 per cent over the same period of the previous year.

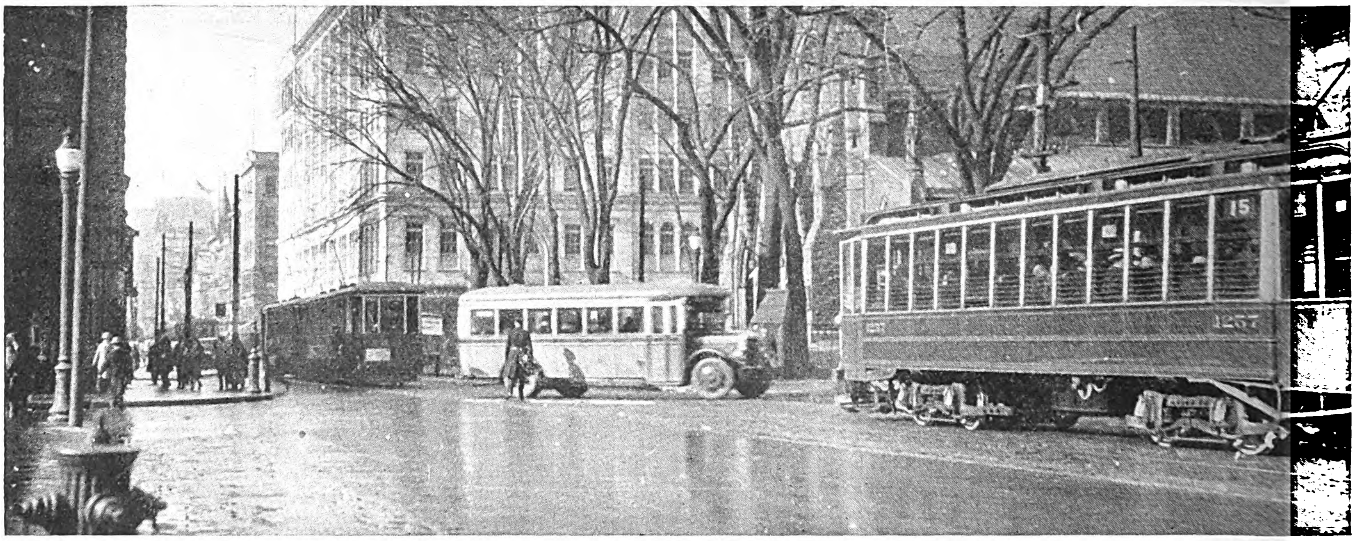
With regard to bus earnings, it is difficult to make comparisons, according to J. E. Hutcheson, vice-president and general manager. For the six-months period ended Dec. 31, 1925, the gross revenue per bus-mile was 24.63 cents, while for the year ended Dec. 31, 1926, it was 26.46 cents per mile, an increase of 1.83 cents, or 7.42 per cent. The number of buses in operation in 1925 was 26, and in 1927 it was 54. Earnings per revenue passenger in 1925 were 6.90 cents and last year 7.61 cents. Revenue bus-miles operated in 1925 were 287,694, in 1926 they were 1,543,632.

After the experience of two winters of operation it is the opinion of the management that the normal future expansion of the tramway system in outlying territory can be satisfactorily affected by motor buses. Use of motor buses co-ordinating with the tramways furnishes more economical expansion and aids the growth of the city without involving large expenditures for construction of new tram lines.

At Hull, across the Ottawa River from the capital of the Dominion, A. V. Gale, manager of the Hull Electric Company, reports a slight improvement in traffic conditions on the railway. This has been due in part, at least, to the failure of a bus line which had been competing with the railway. A moderate increase is expected in the company's business this year.

RAILWAY BUSINESS GOOD IN PROVINCE OF ONTARIO

The year 1926 showed an increase in passengers carried by the Ottawa Electric Railway amounting to nearly 1,500,000 over those carried in 1925. Thus far during the present year there has been an increase of about 5,000 passengers per day over last year. According to Major F. D. Burpee, vice-president and general manager, after the peak year of 1925 the company experienced a steady decline up to and including the month of February, 1926. Since that date railway traffic has shown a steady upward tendency. General business in Ottawa is good. Retail merchants seem prosperous and the future outlook is favorable. The growth of railway patronage, despite the increase in the number of automobile licenses issued, is most encouraging.



Despite weather conditions that hamper motor vehicle operation, the Montreal Tramways has developed an extensive system of co-ordinated car and bus service

In the small town of Cornwall the street railway reports an increase of $15,780 for 1926 over the 1925 revenue. According to W. L. MacFarlane, manager of the Cornwall Street Railway, Light & Power Company, the largest part of the revenue comes from the movement of freight. This was substantially larger in 1926 than the year before. Other traffic also has increased as shown in the following table:

COMPARATIVE STATEMENT OF EARNINGS

	1925	1926	Increase
Cash fares	$28,162	$31,484	$3,322
Ticket sales	8,888	13,992	5,104
Mail service	1,400	1,600	200
Freight and express	30,905	38,663	7,757
Other revenue	2,753	2,150	603*
Total operating revenue	$72,108	$87,889	$15,780

*Decrease.

For the week ended March 12, 1927, the total earnings were $2,630, as compared with $1,421 for the corresponding week in 1926, an increase of $1,209. Passengers carried numbered 26,070, as compared with 15,931 for the corresponding week a year ago. The figures for this period are considered to be typical of conditions this year.

The directors of the company feel optimistic over railway conditions in Cornwall. Last year a capital expenditure of $20,000 was authorized for various improvements, including the purchase of two additional passenger cars. This year an expenditure of $38,000 has been authorized for three more passenger cars and an addition to the carhouses.

Revenue of the Kingston, Portsmouth & Cataraqui Railway is not so large as it was in 1921, according to H. C. Nichol, general superintendent, but was larger in 1926 than the year before. Passenger revenue for the twelve months ended Dec. 31 last was $51,570, as compared with $51,293 for the preceding twelve months. In his opinion, the large number of privately owned automobiles in the city is responsible for passenger revenue being smaller than it was some years ago.

D. W. Harvey, general manager Toronto Transportation Commission, reports a substantial increase in traffic in the city lines during the past year, and indications are that 1927 will show an improvement over 1926. Operating economies have reduced expenses notwithstanding the increase in the volume of traffic handled. Because the management has had experience with the suburban lines for only a limited time it is difficult to forecast their future accurately. It is the feeling, however, that the position of the recently acquired 97 miles of radial lines will be improved as the result of linking and co-ordinating them with the city system.

At Windsor the railway has had a continued increase in revenue since it was taken over in 1920 by the Hydro-Electric Power Commission. In 1919 the gross revenue of the lines serving Windsor and the other border cities was $355,000. For the year 1926 the gross revenue was $1,031,443. This was an increase of 203.9 per cent compared with the first year of Hydro-Electric operation. During this period operating expenses increased only 177.1 per cent, resulting in a gain of 148 per cent in net revenue. The number of passengers carried has increased from 9,150,000 in 1920 to 18,410,000 in 1926. Revenue for the first four months of the present fiscal year, which began Nov. 1, shows an increase of more than $43,000 over the corresponding period the year before.

At Guelph the railway in 1926 had the largest revenue in its history. The Toronto & York Radial lines showed some decrease in revenue, due partly to the transfer of certain portions of the interurban lines to the jurisdiction of the Toronto Transportation Commission and partly to bus competition. It is expected that the bus competition will be eliminated in the near future.

City lines of the Brantford Municipal Railway in the year 1926 showed considerable improvement over 1925. Passengers carried numbered 2,543,176, as against 2,344,842 the preceding year, an increase of 198,334. Passenger revenue was $129,293, as compared with $119,904, an increase of $9,389. On the interurban lines to Paris there was a slight decrease. Passengers carried were only 104,495 in 1926, as against 109,696 the year before. The loss in revenue amounted to $319.

Increase in the city business is attributed by A. H. Foster, manager, to the fact that the industries in Brantford have been busy of late and there has been little unemployment. While this condition continues the railway may expect good business. The prospects for the interurban line are not particularly bright, in his opinion. Competing buses are to some extent responsible for this, but the widespread ownership of private automobiles is the fundamental difficulty.

At Hamilton the Dominion Power & Transmission Company shows a marked improvement in its street railway business. George E. Waller, manager of railways, is optimistic concerning the future of the city lines, but expresses doubt about interurban lines serving outlying communities.

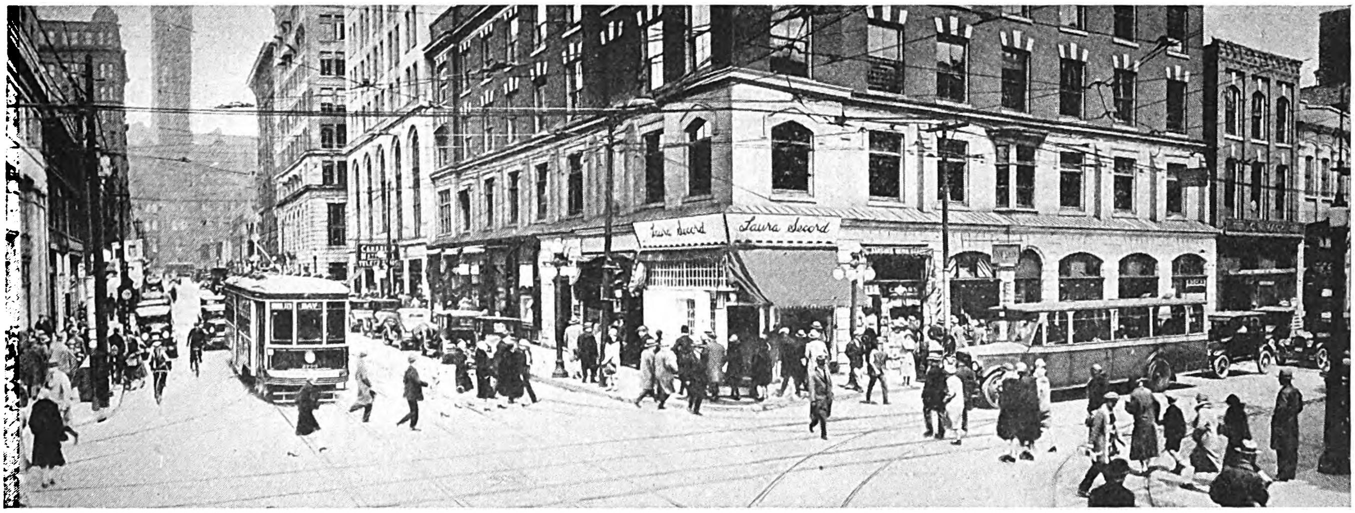
While there was an increase in railway traffic at Kitchener during 1926 over the previous year, the present outlook is not thought by V. S. McIntyre, manager, to be particularly favorable. To date during 1927 the traffic has been somewhat less than during the corresponding months of 1926.

Although the London Street Railway operated approximately 120,000 more car-miles and bus-miles during the year 1926 than during 1925 the revenue showed a decrease of about $2,000. The same general tendency has continued during the early months of 1927. In the opinion of Leonard Tait, manager, this is largely due to the open winter, the streets in the city of London having been free of snow practically all the time.

Last fall this company began the conversion of two-man cars into one-man, treadle-exit cars. Four cars have already been changed over and the fifth is now under way. It is expected that the reduction in operating expense will to some extent balance the decrease in revenue.

At the Head of the Lakes, electric railway conditions in Port Arthur have shown substantial improvement recently, according to T. W. Brackinreid, manager. Whereas the Port Arthur City Railway had a deficit of $1,160 in 1925, it had a surplus of $5,642 last year. For January and February, 1927, earnings were approximately $4,000 per month above the corresponding period of 1926. March, 1927, was about $3,000 above March, 1926. This increase in revenue is due partly to the heavy snowfall during the past winter, necessitating the storage of private automobiles. The major portion of the increase, however, is due to improvement in industrial conditions. Last summer the railway built an extension to serve the Thunder Bay Pulp Mill. This has been profitable from the day when operations began.

Success or failure of the street railway at the Head of the Lakes depends entirely upon industrial conditions, Mr. Brackinreid states. In past years revenue sometimes has increased due to the construction of grain elevators, but after the construction was completed the revenue dropped off again. With the growth of the pulp mill business, however, conditions have improved because practically the same number of men are employed in the operation of the mill as were employed during its construction.



Traffic on the lines of the Toronto Transportation Commission showed a substantial increase last year. At the same time operating expenses were reduced

ENCOURAGING CONDITIONS IN WESTERN PROVINCES

Since August, 1925, the railway department of the Winnipeg Electric Company has shown steady improvement in gross earnings and the number of passengers carried, according to A. W. McLimont, president. Last year showed an increase of 2,289,000 revenue passengers over those carried in 1925. This was a gain of approximately 5 per cent. Traffic has not yet got back to the peak year of 1925, but will soon reach this figure if the present improvement continues. Figures of passengers carried by years are given in the following table:

Year	Passengers Carried
1921	61,515,000
1922	60,399,000
1923	58,253,000
1924	55,978,000
1925	55,096,000
1926	57,985,000

Railway conditions at Regina, Sask., are very encouraging, according to D. W. Houston, superintendent. Since 1924 the revenue has been increasing steadily. Up to the end of last year it had not quite got back to the high level prior to 1924, but revenue for the first quarter of 1927 was the highest in the history of the railway. The city of Regina is growing and its growth is being reflected in increased street railway traffic.

At Lethbridge, Alberta, railway operation still presents a rather puzzling problem, according to M. Freeman, commissioner of public utilities. On account of the small population of the city and the short distances it is difficult to make street railway operation profitable. In 1926 revenue decreased 2 per cent as compared with the preceding year, but a reduction in operating expenses of 12½ per cent was made, so that the net revenue was substantially increased.

Electric railway conditions at Edmonton are good, according to W. J. Cunningham, superintendent street railway department. The number of privately owned automobiles has increased enormously during recent years, but in spite of this, and the fact that the population of the city has not greatly increased, the number of passengers carried annually remains nearly the same as it was in 1922, the maximum year, as shown below:

1917	10,086,213	1920	12,371,091	1924	12,365,889
1918	9,909,529	1921	12,790,738	1925	12,588,475
1919	11,779,466	1922	12,914,896	1926	12,388,636
		1923	12,339,465		

The year 1927 has started out well. For the first four months traffic was well ahead of last year with an increase of more than 300,000 passengers.

For twelve months ended Dec. 31, 1926, the British Columbia Electric Railway carried 61,311,703 city passengers and 6,706,509 interurban passengers. When compared with similar figures for the year ended Dec. 31, 1925, an increase of approximately 4.18 per cent is shown in city travel and 3.41 per cent in interurban.

W. G. Murrin, vice-president, reports that revenue in 1926 from city line operations increased 4.15 per cent over the previous year, while interurban operations showed a decrease of approximately 0.21 per cent.

Car-miles operated in 1925 and 1926 were respectively 11,257,177 and 11,845,149 on the city lines and 1,933,050 and 2,008,872 on the interurban lines. This was an increase of 5.22 per cent on the city lines and 3.92 per cent on the interurban.

Bus Development Proceeding Slowly

Operation of buses by electric railways in Canada has not progressed as rapidly as in the United States. This is due in large measure to adverse weather conditions. At St. John, N. B., the railway has not undertaken to render bus service. Careful study has been made of this question, but it is felt that it would be impossible to make money with buses under existing conditions.

The Three Rivers Traction Company is considering the establishment of a bus line and expects to have it in operation within a year. The Montreal & Southern Counties Railway and the Hull Electric Company are both considering the operation of buses. Elsewhere in the Province of Quebec no plans to extend bus operation are reported. Mr. Weyman of Levis says that there is a field for bus transportation to outlying districts during the summer time, but it is impossible to operate buses in this district from November to May. Under the circumstances it is impracticable to undertake the service. The territory served by the Sherbrooke Railway is considered too small to be a promising field for bus operation.

At Montreal there are two classes of bus service, "tram auxiliary bus service" and "convenient bus service." The former, in lieu of tram service, is operated on standard tram fare. On the convenient bus service the fare is 10 cents cash or three tickets for 25 cents. In the first instance the service is given at a loss, but is justified by the fact that the losses are less than on tram operation of the same service. The convenient bus service is given to offer more convenient, direct and comfortable transportation and has been well patronized.

Both the above-mentioned services were inaugurated to retain public good will, and it is thought that its establishment has done more than anything else to convince the public that motor buses will never replace trams for mass transportation. The prospects for the future, for all transportation services, are promising.

In Ontario the bus service of the Ottawa Electric Railway thus far has been conducted at a slight loss. Operations consist of one regular suburban route feeding the city railway, sightseeing routes operated during the months of May to September inclusive and chartered trips throughout the year. It is the belief of the management that the bus can render useful service when co-ordinated with the street railway. On account of the limited experience which the company has had with buses no definite conclusions concerning their future possibilities have yet been reached.

At Cornwall the railway has no intention of undertaking bus service. The distances that people ride in the city are comparatively short and much of the railway revenue is derived from the transportation of factory employees. For this kind of patronage the street cars, with their larger capacity, are thought to meet the requirements better than buses.

The Toronto Transportation Commission now operates a fleet of 80 buses and coaches. Service was first established in 1921, principally to feed the street railway. Six feeder routes are now in operation and two more will be established in the near future. The feeder bus routes serve districts that could otherwise be served by street cars, but where the traffic is so light that the car service would not pay. Losses with bus operation are less than they would be if cars were operated.

In June, 1925, the commission began the operation of motor coaches painted a distinctive color and operated independently of the railway. A special fare is charged. These vehicles are used on interurban routes, for chartered trips, in sightseeing service, on school contracts and for other similar purposes. The gross revenue in 1925 was $132,000; in 1926 it was $300,000, and it is expected that in 1927 it will be well over $500,000. This represents business which could not have been obtained by railway operation and is an important addition to revenue.

At Kitchener the Public Utilities Commission feels that certain sections of the city may deserve better transportation facilities, but that bus service would not pay in those districts. For that reason no plans have been made to establish it. Similarly at Port Arthur bus operation is not favored by the Public Utilities Commission except for long-distance runs to such places as Duluth or other remote points.

Conditions for bus operation at Winnipeg are quite different from those prevailing in the eastern part of Canada. Population is less dense and there are comparatively few outlying towns of any size. Moreover, highway construction has not yet reached the same stage of development as in the East. The management of the Winnipeg Electric Company therefore believes that the field for bus operation there is comparatively small and the company has not gone into interurban bus operation to any large extent. One route is in operation from Winnipeg to Transcona, a round-trip distance of 15 miles. Some extension of this type of service is contemplated for the near future. Buses have been used in local service as feeders to the street railway since April, 1918. Eight such routes are now in operation and it is planned to add to their number in the near future.

Real demand exists today in the territory served by the British Columbia Electric Company for de luxe bus service, particularly for intercity service of this type. It is thought that undeveloped city and suburban districts constitute a good field for experiment with feeder buses connecting existing lines, but the experience of this company indicates that this kind of service is unremunerative on account of the low fares charged. Success or failure of such feeder buses, according to Mr. Murrin, depends entirely upon the density of travel and the rate of fare. This company was one of the pioneers in bus operation and plans to extend this service in the future.

Portage Avenue, Winnipeg, Manitoba. Railway traffic in this city has shown a steady increase since August, 1925

First Aid School Has 335 Graduates

GREATER public safety and a better knowledge of "what to do until the doctor arrives" are purposes of the First Aid training school conducted by the Chicago Rapid Transit Company under the direction of Dr. Hart E. Fisher, head of the medical department, and which graduated nearly 300 student-employees during 1926. The Chicago, North Shore & Milwaukee Railroad simultaneously graduated 35 employee-students. Regularly constituted members of the board of examining physicians of the American Red Cross are in charge of the rigid final tests to which each employee is submitted before he becomes eligible for a First Aid certificate.

In a recent annual interdepartmental First Aid competition held by the employees of the Chicago Rapid Transit Company, which operates the elevated lines in the city and its suburbs, nine teams, composed entirely of employees, entered. Keen rivalry marked the contest and its success is seen in that the winning team averaged 96.5 per cent in two practical problems. Further proof of the proficiency of the employees is shown by the many citations awarded them for meeting emergencies both on and off company properties.

Not only have First Aid educational activities been centered on employees of the Rapid Transit Lines but considerable effort has been expended toward education of the public. During the past year a First Aid team of picked experts gave 184 demonstrations before public gatherings aggregating 87,000 persons. The Rapid Transit Lines also has the distinction of having won the Chicago city championship in First Aid for two of the last three years.

A first aid team to represent the Rapid Transit Company in the annual Chicago city first aid championship contest is chosen from those recently graduated from the school.

St. Louis Building & Loan Association Thrives

THE net earnings from operations of the United Railways Savings & Loan Association, St. Louis, Mo., for the year ended Feb. 28, 1927, were $229,608. As of that date 5,871 members have $3,903,938 to their credit in the association upon the 52,377 shares, or an average of $665 per member. This incorporated building and loan association, with an authorized capital stock of $1,000,000, was organized in January, 1915, to promote home owning and to encourage thrift among the employees of the United Railways. Response to the share offering has been so active that the authorized capital stock has been increased from time to time until it has reached $11,000,000, divided into 55,000 shares, of which 52,377 are outstanding, of a par value of $10,475,400. The association has financed the building or purchase of 2,147 homes since its organization, aggregating loans in the amount of $6,006,096. The number of loans outstanding as of Feb. 28, 1927, was 1,386, aggregating $4,062,586.

A Short Life and a Sorry One for Melbourne's Jitney Buses

Australian Tramway Manager Gives Information on Relative Advantages of Privately Owned and Railway Owned Service

MOTOR BUS legislation in the Province of Victoria, Australia, was summarized in ELECTRIC RAILWAY JOURNAL for Oct. 30, 1926, under the title "Bus Legislation in Victoria, Australia, Proves Effective." The Melbourne & Metropolitan Tramways Board had secured the right to run buses in December, 1923, but success against the forays of wildcat operators did not come until the acts of Dec. 30, 1924, and Dec. 31, 1925, which demanded responsible service and a reasonable amount of taxation from any kind of motor bus operator, whether co-ordinating or independent.

The careers of various independent operators were succinctly stated Dec. 15, 1926, by W. O. Strangward, secretary of the board, before an inquiry of the Parliamentary Accounts Committee. The question was: "Can you give any information concerning the operation of privately owned buses? Can you say whether they are carrying on at a profit after making adequate provision for depreciation?" In reply, he said:

> The Melbourne General Omnibus Company ran for one year, whereupon its buses were seized by creditors who had expectations of possibly 2s. 4d. in the pound sterling, or 11 to 12 cents on the dollar.
>
> The Commonwealth Motors Company's five buses were seized by the creditors after nine months operation, but were already in deplorable condition. Creditors received 3s. 2d. in the pound, or about 16 cents on the dollar.
>
> The Trak Motors Company had 30 buses, of which fourteen were of London General Omnibus design and manufacture. These went back to London when the company failed, while the rest were sold around scrap prices. All the capital investment was lost, aside from losses by unsecured creditors.
>
> The Kintrak Company with nineteen buses lost them all for non-payment of installments. The company lost the whole of its capital. Two sightseeing buses of another company suffered the same fate.
>
> The Grey Motors, after a year's operation, had to quit when the makers seized their seven buses. The whole of the capital was lost. The Blue Line Motor Company, with eight buses, had a like end. The Press Motors lost its equipment to creditors, while the Royal Motors and Forrester Company gave up the business as non-paying.

Mr. Strangward estimated that Melbourne bus-selling concerns had lost at least £100,000 between 1924 and 1926 through selling on installments to unsuccessful operators. He figured that at least 80 per cent of the privately owned buses of Melbourne had been bought that way.

In his testimony Mr. Strangward drew up the following deadly parallel between the operations of independents and the board:

Private Enterprise	The Board
Buses usually poor and cheap-starved in maintenance.	Buses up to date and substantially built.
Interest on capital, small.	
No provision for depreciation or renewal.	Twenty per cent allowance for depreciation.
Frequently purchased on time payment.	Heavy interest and sinking fund on cost of bus.
Inadequate garage accommodation.	Adequate upkeep and maintenance.
No attempt to provide an adequate "all day" service.	An adequate, dependable and regular "all day" service is provided.
Owner-drivers "lay off" for meals and at slack hours, spreading their work over two widely separated peaks. They are thus able to pick up the cream of the traffic.	Meal reliefs are provided by additional drivers. Excessive spreads are met by the employment of additional crews.
Cases have been reported of owner-drivers spreading their work over fifteen or sixteen hours a day.	Each man is paid for at least 48 hours per week, although in many cases only 42 hours work can be found for them.
Seeks payable routes only.	The board's buses are run on two "developmental" routes, viz., at Williamstown and from Victoria Bridge to Balwyn Road. A portion of the latter route was exploited by privately owned buses, found unpayable and abandoned. The balance of the board's buses are used to provide a "stop-gap" service while cable tramways are being converted to electric traction. The sides of these "conversion" streets are congested and the surfaces are unfit for bus operation. This causes excessive maintenance and extra fuel consumption and slows down and disorganizes the service.
No concession fares or free traveling.	The board allows school children and others to travel at concession fares and also allows certain free traveling.
Very few restrictions as to working conditions.	Practically in line with tramway operation. For example: Drivers are paid 1½d. (3 cents) per hour extra for driving one-man buses. Time and a quarter on Sundays. Time and a quarter for "spreads." Employees are supplied with uniforms free. Two weeks annual holiday is granted on full pay, also sick pay allowance, etc.
In some cases female conductors are employed at wages much lower than those paid to male conductors.	No female conductors are employed.
Owner-drivers effect their own running repairs.	Board is compelled to employ mechanics to effect all repairs. For example: At Williamstown three shifts of mechanics are maintained to effect repairs to the three buses in operation.
No inspectors or supervisors.	Board requires supervisors.

It is apparent that evolution toward unified service has gone the same course in Australia as in America, but the process has been faster because the officials of the board kept a keen eye on the development of jitney-bus operation in America and Great Britain and therefore were better prepared. It will be recalled that during the summer of 1925 Mr. Strangward visited the United States and Canada to get a first-hand view of transport progress in America.

Tests of Worm-Drive Car Show Reduced Noise

Mayor Parker of Springfield, Mass., and President C. V. Wood of the Springfield Street Railway just before boarding experimental worm-drive car for demonstration run

Initial tests with apparatus developed by noise reduction committee of American Electric Railway Engineering Association show worm-drive car considerably quieter than conventional car. Additional features of brake, safety and door control equipment are outlined

FURTHER data concerning the experimental worm-drive street car built for the Springfield Street Railway, Springfield, Mass., have recently become available. These include the results of noise tests conducted by H. S. Williams, chairman of the noise reduction committee of the American Electric Railway Engineering Association, together with details of the novel control and brake equipment on the car. A general article on the body and truck design was published in the March 26, 1927, issue of ELECTRIC RAILWAY JOURNAL. The noise tests were referred to briefly in a communication from C. V. Wood, president of the railway, published in this paper last week, page 822.

The noise tests were made with measuring apparatus which is in process of being developed by Mr. Williams' committee. Although the measuring apparatus itself is still in rather rough form and does not give quantitative results which permit the effects of various sounds on the human ear to be evaluated, it afforded an approximate means of making a comparison between the sounds set up in the new car and those encountered in one of the conventional type cars in service on the Springfield property. The measuring device makes use of radio tubes for converting the sounds produced into electrical impulses which actuate the pen of a sensitive recording meter.

A reproduction of the charts produced on the new car and on one of the standard spur-gear-driven cars on the property, is shown in an accompanying illustration. Although the tests are of only a preliminary nature, the striking contrast obtained is considered by those who conducted the tests to give an indication of what can be expected from further attention in car design to the matter of noise reduction.

In interpreting the results of the tests, Mr. Williams calls attention to several factors which should be taken into consideration. The new car weighed only 25,300 lb., while the conventional car with which it was compared weighed 48,390 lb. Since the noise resulting from impact between wheel and rail was considered to be related to the car weight, it was felt that the new car had an inherent advantage in this respect. In so far as the weight reduction is the result of reduced motor weights made possible by the worm-drive design with complete spring support of the motors, however, the new car is entitled to credit for the improvement.

One other factor to be taken into consideration in interpreting the curves is that the experimental car was entirely new, with no wear on the various running gear parts, whereas the conventional car had been in service for a number of years and was not specially prepared for the tests. It was, however, considered to be in first-class operating condition. During the tests the new car was run at slightly lower operating speed than the conventional car.

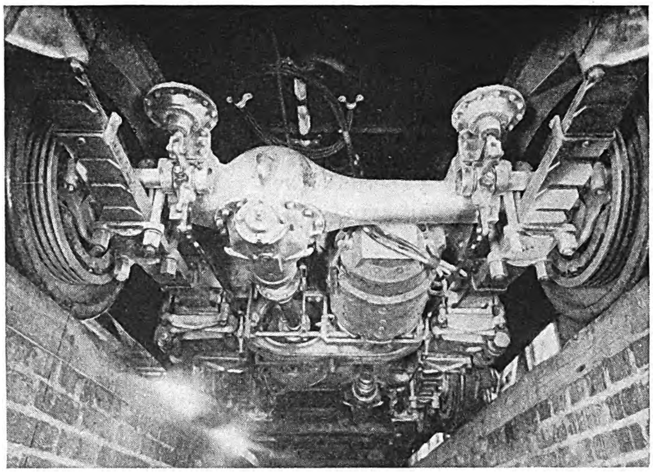
The comparative noise made by the two cars is shown

by the charts. They read from right to left, the upper chart being for the old car and the lower chart the results on the new car. Both cars were run over the same track and the various locations and track conditions are shown, so that comparisons of noise can be made for the same track locations. The effects of special work and rail corrugation are strikingly shown. Comparison of the noise values on identical pieces of track may be made by means of the street locations indicated on the charts. The variations in car speeds over these sections for the two tests represent the only definite variable introduced. In the section of track between Maple and Hancock Streets on State Street the effect of the new design in reducing the noise over corrugated track is clearly indicated.

NOVEL FEATURES IN CONTROL AND BRAKES

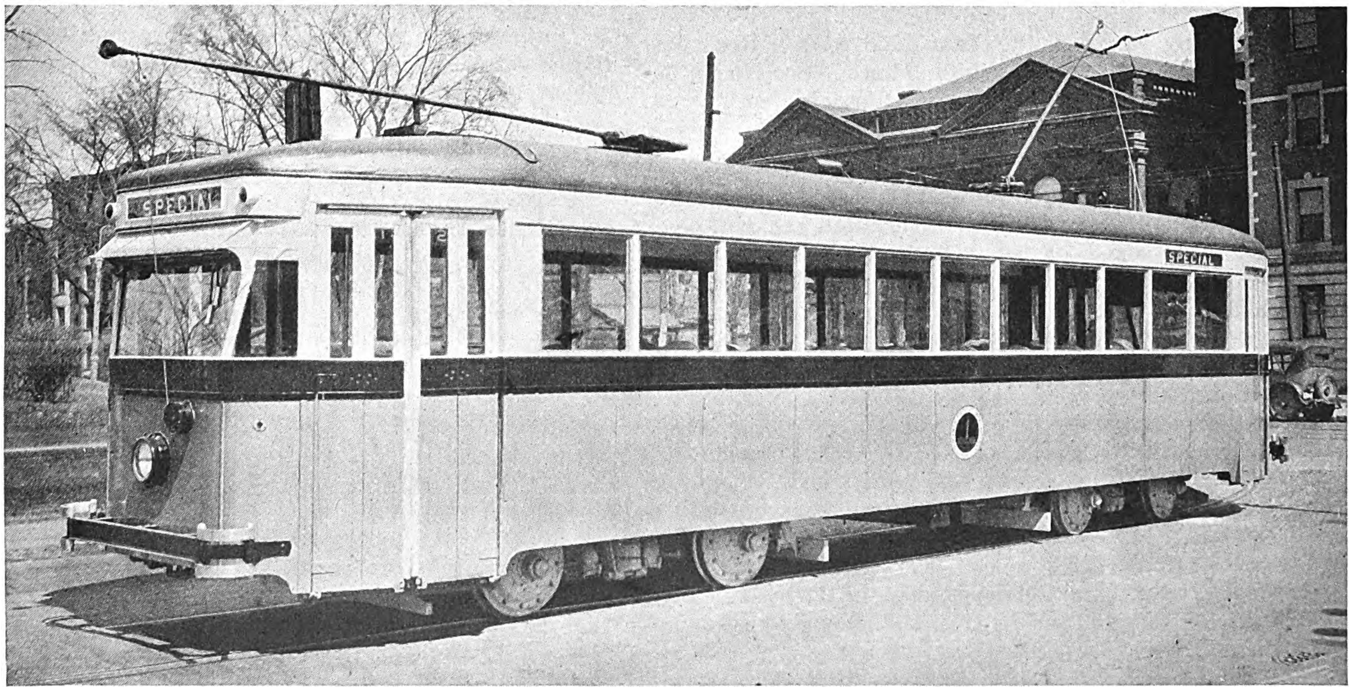
As described in the previous article on this car in the March 26, 1927, issue of ELECTRIC RAILWAY JOURNAL the brakes are automotive type with Westinghouse brake diaphragms mounted directly on the axle housings and with internal expanding shoes inside brake drums bolted to each wheel. Use of a vehicle type master controller with 24-volt battery current control of the contactors mounted under the car is another novel feature of the equipment that was described in the previous article. But even more radical departures from general practice are represented in the brake control, safety features and door control arrangement. All of this is full electro-pneumatic so that no air pipes except that to the air gage are brought above the car floor in the vestibules. One reason given for the adoption of this arrangement was elimination of the air pipes leading to the brake valve at the operator's location.

A piping and wiring diagram for the various air devices, which include full safety car devices and treadle-operated exit doors, is shown in an accompanying illustration. The motorman's brake handle functions merely as a device for completing electrical contacts to the various remotely located electro-pneumatic valves. To apply the brakes in service application, or to release them, the electrically controlled service or release valves, as the case may be, are actuated when contact is made by moving the brake handle to service application or release positions. Operation of the service valve admits air from the reservoir line to the brake diaphragms, while the release valve, when its contact is made, exhausts brake pipe air to atmosphere just as is done in a conventional brake installation. These electrically controlled valves merely perform the functions of the service application and release ports in the customary brake valve.



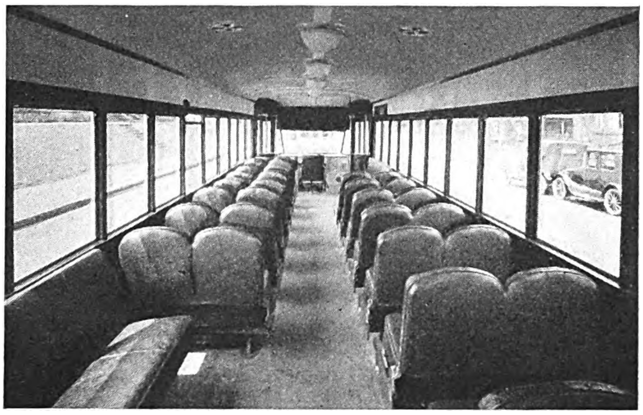
A view looking up under the Springfield car. The motor and driving gear arrangement are clearly shown together with the mounting of springs and brake rigging

A K-1 type emergency valve is included in the equipment. It functions to dump reservoir air directly into the brake diaphragms to give emergency application of brakes, balance door engines, sand rail and trip off power, when the electrically controlled valve *A* in the diaphragm is opened to atmosphere. This emergency action is caused by moving the brake valve control to



Three-quarter view of worm-drive car showing clear vision obtained for operator by automotive type windshield. Sloping glass relieves him from glare of interior lights at night. Streamline appearance is obtained in this design the extreme right-hand position, as is done on the standard safety devices equipment, by release of the motorman's foot switch without having the air brakes set, or by pulling a passenger's emergency switch in the center of the car.

Service application of sand is also electrically controlled through magnetic valves indicated on the diagram. Doors are operated through an electrical contact on the brake handle in a position similar to that on the standard safety devices equipment. The operation is through magnetic valves in the door equipment. Selector switches are arranged conveniently for the operator so that he may open either front or rear door or both, by moving the brake handle to door open position. While the treadle-operated door at the rear of the car remains open to discharge passengers, the brakes cannot be released, nor can power be applied to start the car.



Interior of Springfield car looking forward. Note the absence of top sash, the flat roof and clear view from operator's position

Nashville Railway Betters Accident Record

The Company Finished the Year 1926 with a Record of 73 "Zero Days" on Which There Were No Accidents—Eighty Trainmen Participate in Bonus for Going Through Entire Year Without an Accident

WHEN the Nashville Railway & Light Company operated its cars 66 days without an accident in 1925 it was looked on as something of an accomplishment. Working to better this record, Superintendent H. A. Davis continued the campaign during the past year without relaxation. As a result the transportation department went through the year 1926 with a record of 73 no-accident days.

The 400 trainmen averaged 16,905 car-miles per chargeable accident, against 15,487 in 1925. Considering all accidents, they went 6,852 car-miles for each accident, chargeable or non-chargeable, compared with 6,600 in 1925. The record has been improving year after year ever since 1922, when 1,779 accidents were recorded. In 1923 the number fell to 1,418, in 1924 to 1,205, in 1925 to 840 and in 1926 the record was down to 829.

COMPARATIVE ACCIDENT RECORD OF NASHVILLE RAILWAY & LIGHT COMPANY FOR 1926 BY CAR LINES AND BY DIVISIONS

Car Lines	Total Accidents	Car-Miles per Total Accidents	Chargeable Accidents	Car-Miles per Chargeable Accidents
Belmont	62	6,310	24	16,300
Radnor	50	10,882	17	32,005
Cedar St.	22	4,965	6	18,207
St. Cecilia	10	9,986	7	14,266
West Nash	77	9,323	30	23,928
Woodland	62	8,578	19	27,990
Wharf Ave.	15	5,509	6	13,772

Divisions				
South	125	7,584	56	16,929
West	98	8,439	36	22,974
East	156	7,793	53	22,938
So. West	324	6,042	140	13,982
North	125	5,507	51	13,498

A striking feature of the year was that there was a decrease in the number of automobiles struck by street cars from 252 in 1925 to 190 in 1926. As an indication that this was not due to safer driving of the automobiles, the accidents in which the latter struck the sides and rear of street cars went up from 272 in 1925 to 286 in 1926.

Of the 400 men, 80 motormen and operators went through the entire year without a chargeable accident. For this record they will share in a bonus of $1,000 donated by the company.

The spirit of competition which has been a feature of past years in Nashville was continued, and this was probably the primary cause of the excellent record. Two types of comparison are made, one for the various car lines, the other for the five operating divisions. Each month the computation is made of the total number of accidents, car-miles operated and car-miles per accident. The same is done for chargeable accidents. The accompanying table shows the final record for the year for each of the car lines and for the divisions. The best record for all accidents was that of the Shelby line, which ran 12,038 car-miles per accident. Counting only the chargeable accidents, the Radnor line went 32,005 miles for each one reported. It is interesting to note that the owl cars ran the entire year without having a single accident of any character.

Details of the methods used for accident prevention were published in this paper Oct. 31, 1925, page 784.

Market Street Railway Advertises City and Railway Growth

THE Market Street Railway is a believer in consistent advertising in San Francisco, where it furnishes three-fourths of the electric railway service. The March issue of *Byllesby Monthly News* states that in one of its recent advertisements, under the heading "It's Interesting to Know," many pertinent facts were recorded. Among these were the following:

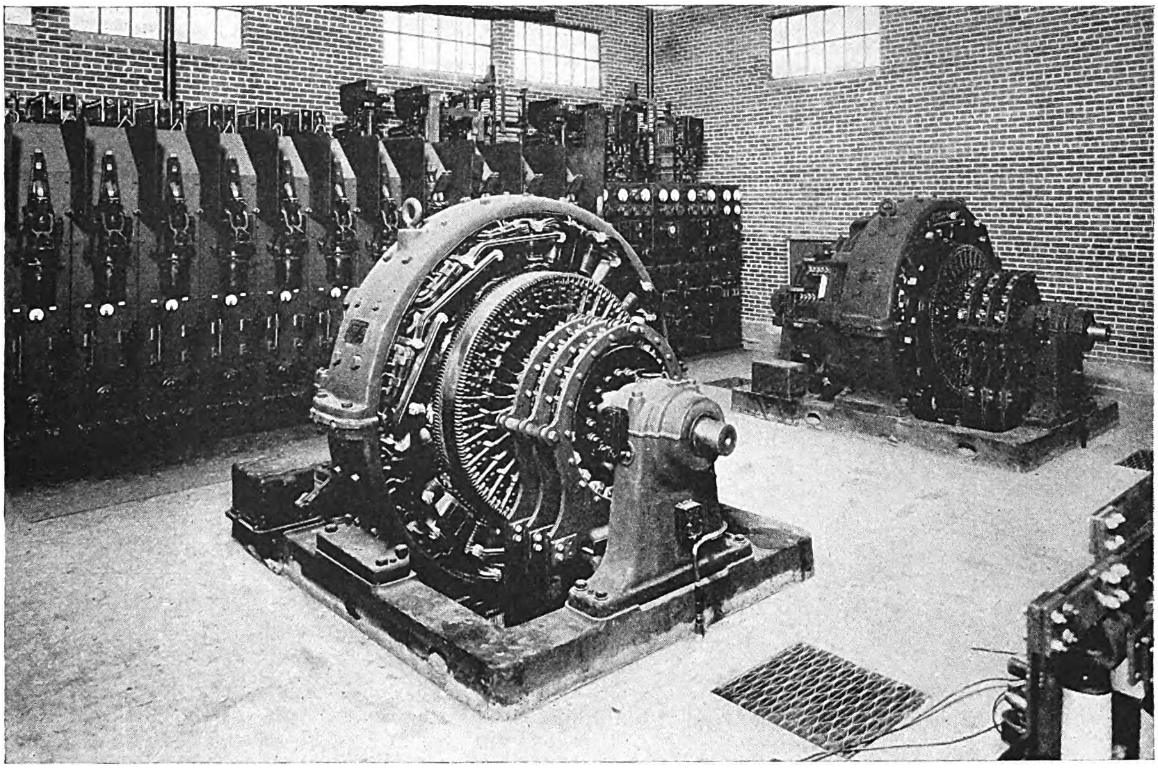
That San Francisco has consistently increased in population at the rate of about 30,000 annually for the past ten years.

That in this city there are 2,198 industries.

That there are 1,600 hotels here.

That San Francisco has 44 public parks and 27 playgrounds for children.

That this company built 28 new street cars in San Francisco shops in 1926 and manufactured in those same shops almost all the vast amount of maintenance material required for its 700 cars and 295 miles of street car lines.



All automatic control panels in the Grimm Avenue substation are located on the right end of the switchboard

New Automatic Substation

for the Chicago Surface Lines

Supervisory control has important part in scheme of operation. No load shifting resistors are used. Comprehensive system of natural ventilation

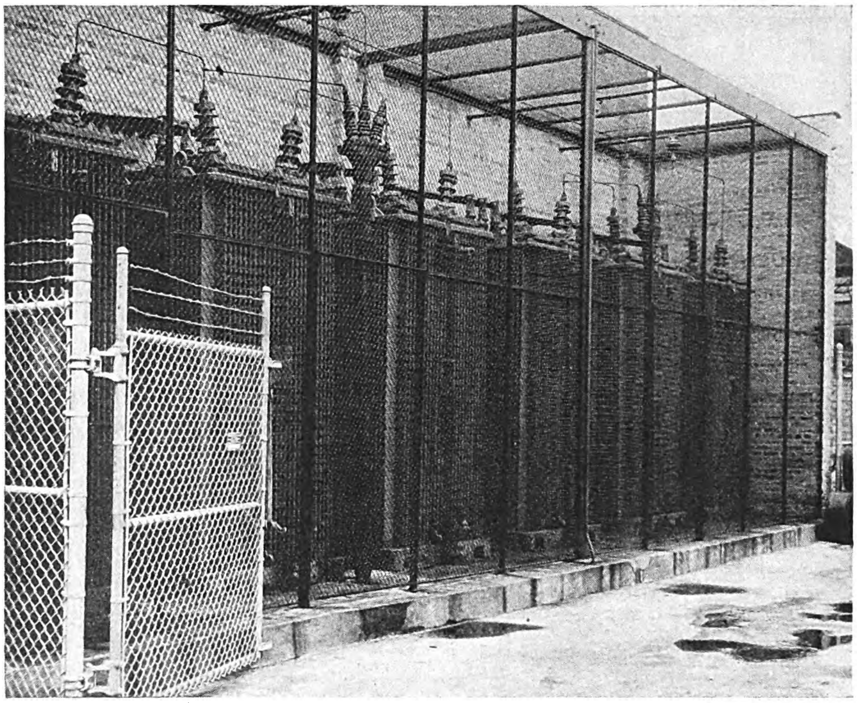
By B. G. Noah

Engineer of Tests Chicago Surface Lines, Chicago, Ill.

RECENTLY the first automatic railway substation to be used in Chicago was put in operation by the Chicago Surface Lines. It is designated the Grimm Avenue substation and is located near the intersection of Milwaukee and Lawrence Avenues in the northwest section of the city. It contains two 2,000-kw., 600-volt, 60-cycle synchronous converters, which provide sufficient capacity to take care of the present load with some reserve for future extensions. At present six sections are fed from this substation, three being ties with the Crawford Avenue substation and three stub-end feeders.

Grimm Avenue substation is supplied by two 12,000-volt, 60-cycle underground lines. These lines terminate in a high-tension switching compartment located inside the building and are connected to a common bus through line oil circuit breakers. The primaries of each bank of transformers are connected to this bus through an oil circuit breaker and a short section of underground cable. This cable terminates in the transformer compartment at the rear of the building. The transformers are of the single-phase, oil-insulated, self-cooled, outdoor type. Their secondaries are connected to the respective converters through starting and running oil switches. The interconnections between transformers, secondary switches and converters are made with 1,500,000-circ.mil lead-covered cable which is run in fiber conduit.

The synchronous converters are six-phase, compound-wound, commutating-pole machines. They have 100 per cent shunt field windings and are operated with the series field winding short circuited. The direct-current

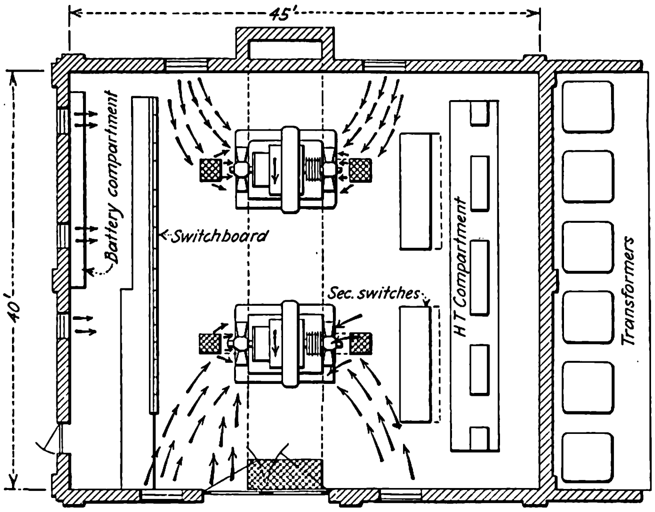


Transformer compartment at rear of building

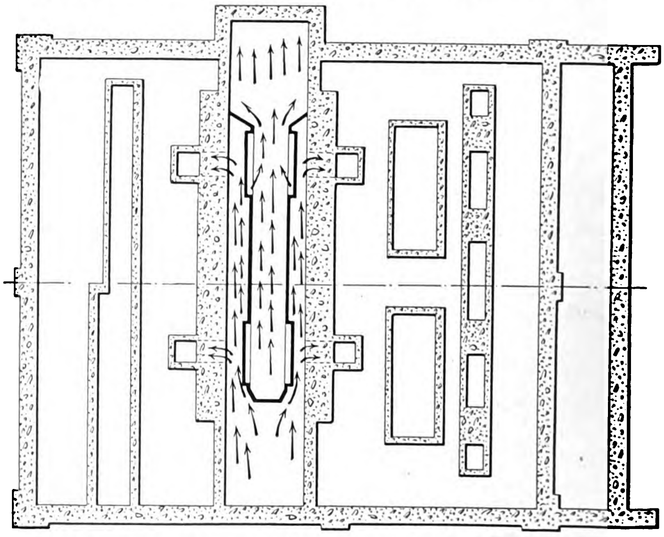
voltage of the machines drops 5 per cent between no load and full load when operated in this way. The necessary equalizer contactors and connections are installed so that the machines may be operated as compound units in the event that a constant or rising d.c. bus voltage is desired.

As is common practice the leading machine is started automatically with a sustained low direct-current bus voltage, and the second machine is in turn started on sustained overload on the first. The machines are shut down in the reverse order due to sustained underload. Either can function as the leading machine, the order being governed by the position of a manually operated sequence switch. All of the protective features of the modern automatic substation are included. Each machine is protected from severe short circuits on the direct-current side by two parallel-connected high-speed circuit breakers in its positive lead. These breakers are paralleled by grid resistors. When a short circuit occurs these breakers will open and introduce the grid resistors into the circuit, limiting the load on the machine to its commutating capacity. Opening of the high-speed breakers is followed immediately by the opening of a 6,000-amp. carbon circuit breaker which is also connected in the machine positive lead. This entirely disconnects the machine from the direct-current bus. The circuit breaker on the grounded feeder will also open, after which the high-speed breakers will reclose. The carbon circuit breaker will then reclose under the supervision of a voltage balance relay. The circuit breaker on the grounded feeder will not reclose, however, until the ground is removed. These feeder circuit breakers are of the short-circuit detector, service restoring type and have a rating of 3,000 amp. An auxiliary direct-current bus is connected to the main bus through an auxiliary feeder breaker. With this arrangement any section may be fed through the auxiliary circuit breaker when it is desired to make tests or repairs on any one of the regular feeder equipments. The scheme of operation differs from that of the usual automatic substation in one respect, i.e., no load shifting resistors are used. Two factors are involved in making this method of operation possible: First, the low effective resistance between this and the Crawford Avenue substation to which it is tied, and second, the inherent voltage characteristics of the machines in this substation and those in Crawford Avenue. As mentioned before, the machines at Grimm Avenue have a drooping voltage characteristic, whereas the two 4,000-kw., 25-cycle synchronous converters in the manually operated Crawford Avenue substation have a 1 per cent rise in direct-current voltage between no load and full load. In times of abnormal load demand, due to resumption of service after a street blockade, etc., the voltage on the Grimm Avenue substation will be reduced automatically and a portion of the overload will be shifted to the Crawford Avenue substation through the low resistance tie sections.

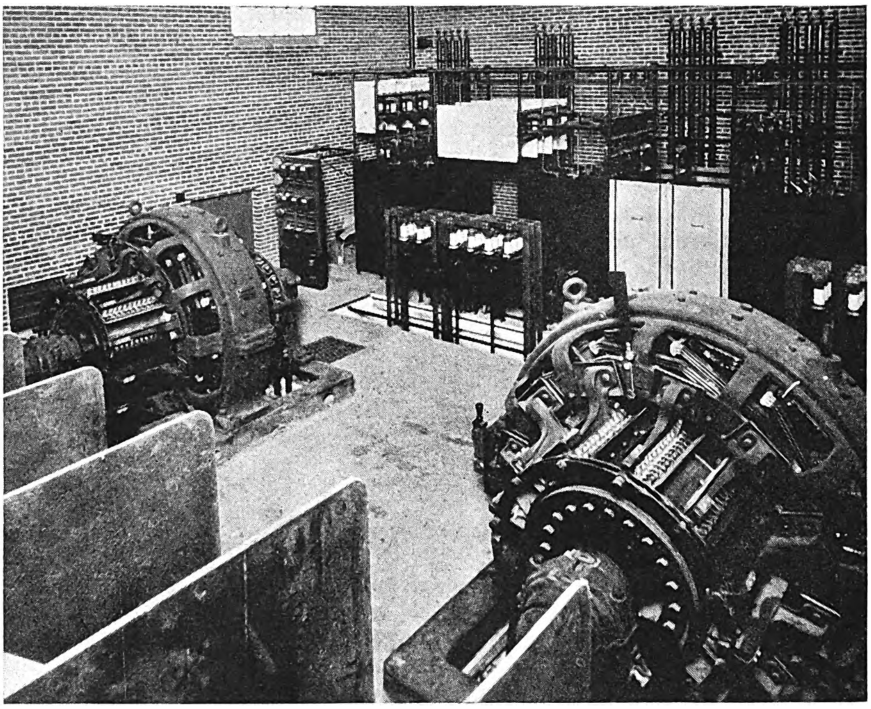
In addition to the above described automatic features



Floor plan of substation. Air is drawn in through four louvers in the side walls



The pit under machines is separated into two compartments by a steel partition



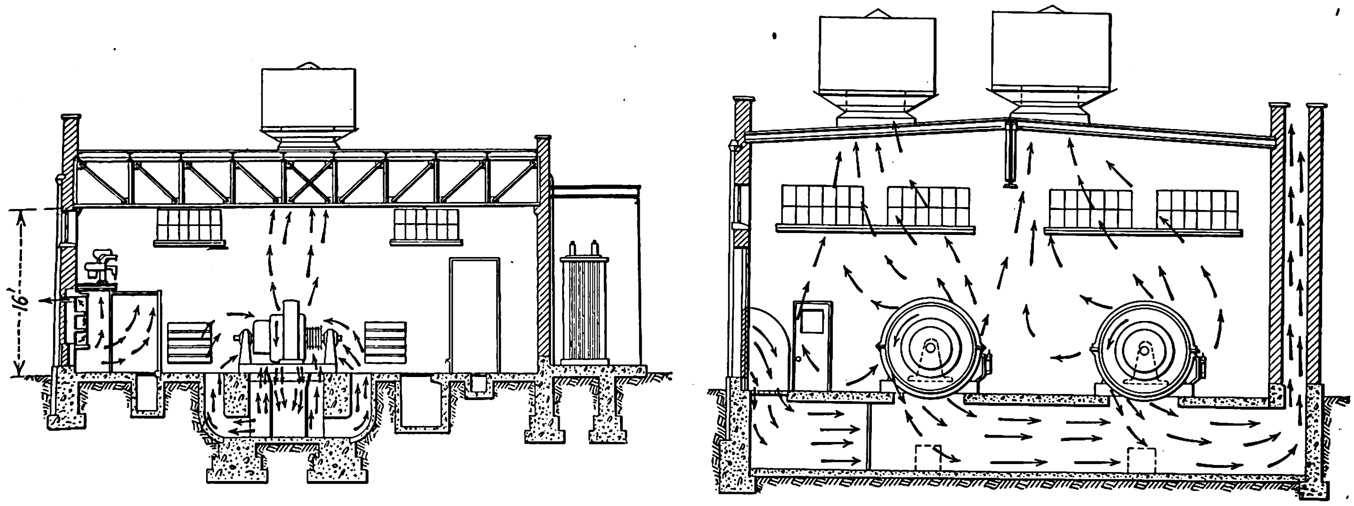
High-tension switching compartment of the Grimm Avenue substation

this substation is equipped with a synchronous visual supervisory control system. The office or control end of this system is located in the Crawford Avenue substation, the operator of which has complete control of the equipment at Grimm Avenue. He can start up, shut down or lock out either or both machines and at all times has a visual indication of the load on each. He has indication when a machine is operating but not connected to the line due to extremely low direct-current bus voltage. He is able to open and close all feeder circuit breakers, has visual indication of the position of the oil circuit breakers on the alternating-current incoming lines, and of the conditions of the operating battery.

In effect, the supervisory control system makes Grimm Avenue substation a part of the Crawford Avenue substation. The major portion of the Grimm Avenue load is common to both and the equipment in both is under the control of one man. This arrangement is of particular value in case of an outage at Crawford Avenue or a general outage of the entire system. In such an event the load on Grimm Avenue can be held to the capacity of the machines by switching on the feeder section at either Grimm Avenue or Crawford Avenue substations. For example, if Crawford Avenue has an outage the operator will open the Grimm Avenue tie feeder at Crawford Avenue. This operation makes all Grimm Avenue section stub-end feeders. If this overloads the machines at Grimm Avenue, he can disconnect the least important feeders from that substation bus until Crawford Avenue is again in service or the load on Grimm Avenue is reduced enough to allow the closing of the feeders.

If the outage at the Crawford Avenue substation occurs while Grimm Avenue is out of service due to low load demand the bus voltage at Grimm Avenue will be excessively reduced. The leading machine will then start. The action of the voltage balance relay, however, will prevent its direct-current circuit breaker from closing if the bus voltage is so reduced that the machine would pick up sufficient load to trip it out again. This condition is indicated at Crawford Avenue through the supervisory control. The operator will then reduce the value of the connected load at Grimm Avenue by opening the three tie feeder breakers at that substation.

It is obvious that this operation will reduce the Grimm Avenue bus voltage to zero. However, the three tie feeder circuit breakers are interlocked with the voltage balance relay through the supervisory interposing relays and will allow the leading machine circuit breaker to close and carry the load on the remaining three stub-end feeders. The operator can then increase the load on the station by closing one of the tie feeders. This increase in load will bring the second machine into service and the remaining tie feeders can then be closed. These tie feeders must be opened at the Crawford Avenue end during this switching operation if that substation is still out of service. In this way the machines at Grimm Avenue can be used to their full capacity during abnormal times without reducing the voltage on the sections it is feeding.



These cross-sectional views indicate the methods used in the natural ventilation system

The supervisory control also becomes invaluable in the event of fire or other accidents when the hazard of live trolley wires must be removed as quickly as possible. This emergency arises quite frequently on a metropolitan system and it is merely necessary to call the Crawford Avenue operator by telephone and he in turn can open the feeder in question at the Grimm Avenue substation through the supervisory control.

The substation building is 40 ft. wide, 45 ft. long and 21 ft. high. Its volume per installed kilowatt is 9.835 cu.ft. The accompanying illustrations show the arrangement of the equipment.

NATURAL VENTILATION IS USED

The scheme of natural ventilation is illustrated in the four accompanying sketches. The arrows on one sketch indicate the direction of air as it is drawn into the building through the four louvers in the side walls. These louvers are 4 ft. square. The direction of the warm air as it is exhausted from the periphery of the armatures is also indicated. The upper portion of this air is discharged from the building through two 54-in. roof ventilators, and that exhausted below is conducted out of the building through the stack shown on the right side of the sketch. Other sketches show the arrangement of the pit under the machines. This pit is separated into two compartments by a steel partition. The sides of this partition are in the neutral air zone between the pressure and vacuum areas. The warm air is discharged from the lower part of the machines into the center compartment, from which it is exhausted through the stack. The cool air, which enters the outer section of the pit through the louvers and floor grating, is drawn into the machines parallel to the axis of the shafts through the floor ventilators. A portion of this air is also drawn into the machines through the upper openings of these outer sections. This arrangement provides free circulation for the incoming air and reduces recirculation of the warm air discharged from the machines to a minimum.

Evansville Company Names Cars After First Settlers

TWO of the four new cars which were ordered recently for use on the Evansville and Princeton, Ind., traction lines have recently been put in service by the Southern Indiana Gas & Electric Company, Evansville, Ind. The cars, of the one-man type, are named after prominent men who figured in the history of Gibson County, in which the city of Princeton is located. The "John Stevens" is named for the first settler of Gibson County, who settled there early in 1789, after serving a period of service in the Revolutionary War. The "William Prince" bears the name of the man for whom the city of Princeton was named. Still another car, styled "Aaron Le Grange," is in honor of the first settler in the town of Fort Branch, which formerly was called Le Grange, and the fourth car, "Henry Haub," is in remembrance of the first man who settled in the town of Haubstadt, which is one of the important stops on the Evansville and Princeton traction line. The new cars are to replace the oldest in service, used on the line since its opening in 1903. The company also has purchased several new one-man cars for operation on the Bellemeade line in the city. According to recent announcements, the purchase of several new buses during the coming year is planned.

California Motor Transport Shows Declining Profits

Railroad Commission Reports Reveal Low and Decreasing Profits—Similarity to History of Electric Railway Industry Shown by Comparison

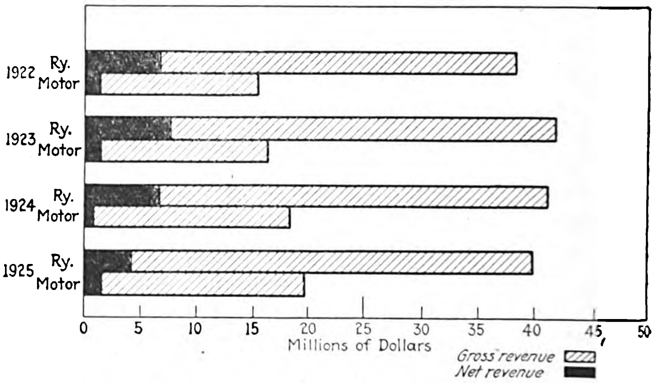
BY GEORGE K. MCCABE

Department of Economics, Sociology and Government,
Yale University, New Haven, Conn.

IS MOTOR bus and truck operation profitable? This question is uppermost in the minds of all students of transportation today, and in an attempt to analyze this question a study was made of the common carrier motor bus industry in California. This state was selected as being the most favorable to this class of transportation.

Six conclusions are drawn from a perusal of figures supplied by the California Railroad Commission. First, the motor transport industry in that state considered as a whole has a very high operating ratio with a consequent low net income. Second, the increase in volume of business has been slow, especially that resulting from passenger traffic. A third conclusion is that the loss of passenger business of the electric railways cannot be attributed to motor bus competition.

If the rate of depreciation and maintenance charged in 1922 had been maintained in 1925, the rate of return on the bus and truck industry of California would have been less than 1 per cent. This would have been even less than the 2⅛ per cent return for the principal electric railways of that state in 1925, based on the investment in plant and equipment. Other findings indicated that the declining profits in motor bus operation may be due to the partial payment plan of purchasing new equipment and unreal profits which may actually be accrued depreciation.

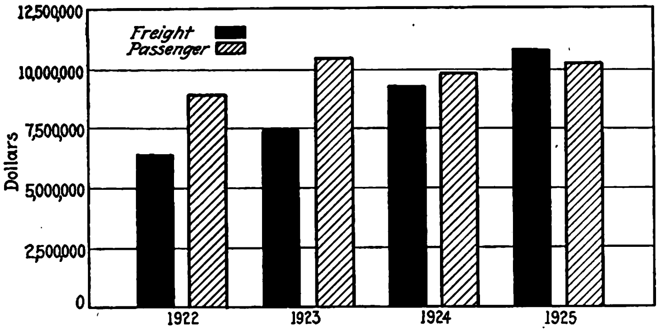


Comparative electric railway and motor transport earnings in California, 1922-1925

Electric railway revenues for 1925, on the other hand, were higher than in 1922 although lower than in 1923-1924. This points to the inability of electric carriers to increase freight and express business as the motor carriers have done.

The study of the motor transport revenues from 1922 to 1925 inclusive shows that the combined receipts from passengers, freight, express and mail net the owners a return of about 7½ per cent on the $19,000,000 of investment in the industry. This return is after deducting a depreciation charge of 12½ per cent, which assumes a vehicle life of eight years. For a new and flourishing industry 7½ per cent would seem to be a low return. This rate of return on the investment is especially ominous in that it has fallen from 10½ per cent in 1922 to 7⅓ per cent in 1925. This is not due to increases in the allowance for depreciation. On the contrary, this has been reduced from 13½ per cent of the investment in the early years to 12¼ per cent since 1922. So, too, have the maintenance and repairs fallen from 23 per cent of the investment to 16½ per cent. Had the operators kept these charges as high as they were in 1922 the profits would have returned less than one-half of 1 per cent on the investment in 1926.

It should be remembered that the gloomy conclusion that the industry may be living on its capital is true only of the industry taken as a whole for the state. Individual operators favorably situated may be earning a high rate of return on their investment after deducting adequate allowances for depreciation and maintenance.



Passenger and freight receipts of motor transport industry in California, 1922-1925

Data supplied by Railroad Commission of California. Revenue includes freight, express, mail, baggage and other goods traffic.

Turning to the first chart, it is apparent that the 50 per cent increase in gross revenue since 1922 has been more than offset by increased expenses. The operating ratio, based on the expenses, including depreciation, maintenance and taxes, has fluctuated between 92 per cent and 96 per cent. In 1925 the operating ratio was 93½ per cent. The only expenses that have risen out of proportion to the increase in receipts have been "taxes and licenses" and "salaries and office expenses." Taxes were twice as high as in 1922 and office expenses five times the 1922 figure.

The high operating ratio given above is probably due more to the slow increase in receipts rather than to the increased operating expense. The passenger business has risen only 14 per cent in four years, although the freight has increased 72 per cent. The second chart shows the yearly changes in these figures. A comparison of these two rates of increase seems to point to the freight business as the more profitable part of the traffic.

The comparison of the gross receipts of the eight principal electric railways with the gross receipts of the motor industry shows that these railways carry twice as much business as the highway transport industry. The railways considered are: Key System Transit Company; Market Street Railway; Pacific Electric Railway; San Diego Electric Railway; San Francisco, Napa & Calistoga Railway; San Francisco-Sacramento Railroad Company; San Jose Railways; Santa Barbara & Suburban Railways. The data on earnings of these companies are taken from Moody's Rating Book for Public Utilities, 1926. The amount of net income after taxes and depreciation, estimated at 5 per cent of gross receipts (more than company accounts allow), is more than five times the net income of the gasoline competitors. This favorable showing is neutralized by the fact that the electric plant and equipment represent about ten times the investment in the motor transport equipment. Consequently the rate of return on the investment in the electric railways averages about 3½ per cent, as compared with 7½ per cent in the motor transport industry.

ELECTRIC RAILWAY AND MOTOR TRANSPORT EARNINGS IN CALIFORNIA, 1922-1925

Data Compiled by Railroad Commission of California

	Electric Railway Lines		Motor Transport Lines	
Year	Gross Revenue	Net Revenue	Gross Revenue	Net Revenue
1922	$38,318,000	$6,613,000	$15,547,000	$1,226,000
1923	41,960,000	7,595,000	16,237,000	1,318,000
1924	41,169,000	6,774,000	18,232,000	810,000
1925	40,056,000	4,394,000	19,673,000	1,383,000

Net revenue is residue after payment of operating expenses, taxes and depreciation, but before interest.

Plan Schedule Adjustments Now for Reduced Summer Riding

By L. M. TRAISER

Special Traffic Engineer Chicago Surface Lines

On most urban transportation systems summer car riding falls materially below the average of fall and winter months. Greater use of automobiles is a factor in this reduction, but loss in school riding and the growing inclination to spend the summer vacation period in the country are the principal considerations.

In many cities the leading stores and business houses close at noon on Saturdays during July and August, the principal vacation months. This not only reduces the riding in the business district during the afternoon, but it gives the people an opportunity to go out of town and much evening riding is lost. This reduction starts soon after the shops close and is felt the remainder of the day.

On lines serving parks and other centers of recreation Sunday schedule adjustment will mean increased service, but it is necessary that the growing tendency away from Sunday street car riding in summer time be recognized and that schedules be trimmed accordingly, or that the increases for park lines necessary to handle the riding be made on an efficient basis. On park or beach lines summer service may be built in the form of a supplementary schedule to be used in full or in part, when and as needed. This permits service to be operated according to riding demands and the flexibility allows reduced operating costs during bad weather, when special attractions elsewhere reduce riding on these lines, and in the fall when the popularity of parks and beaches is waning.

Adjustments of weekday, Saturday and Sunday schedules to reflect the changed conditions of riding during the vacation months should be made early so that saving in crews and cars may extend over the entire period of reduced riding. To provide a basis for these adjustments the schedule man should be informed on the following features:

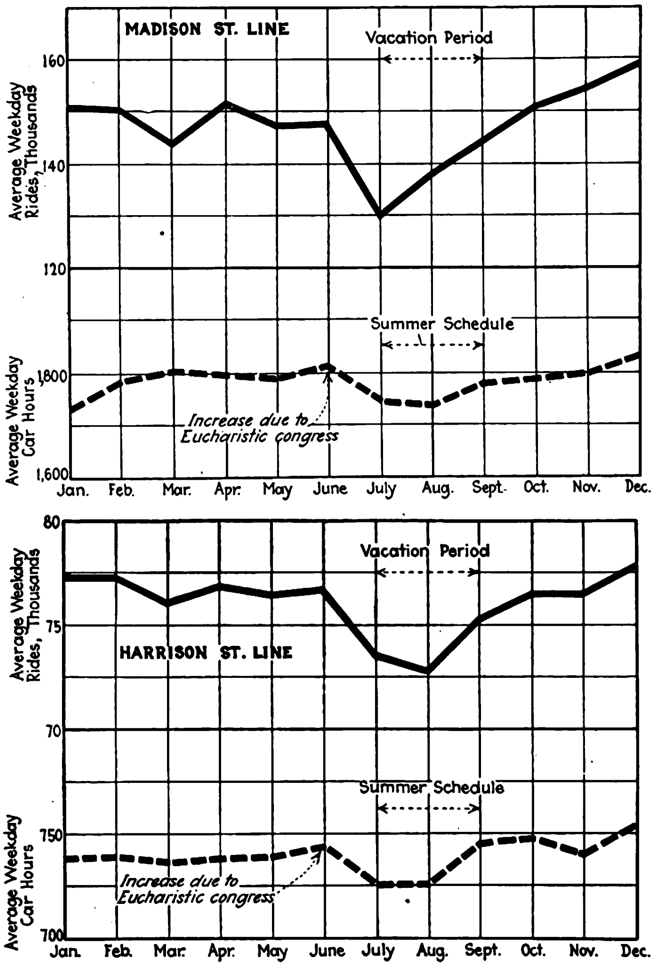
1. The lines on which school riding is important, the approximate number of pupils handled and the time at which this riding occurs.
2. The lines carrying during the rush-hour periods a

large proportion of office workers to and from the business district.

3. The probable effect of the vacation period, early closing hours and other factors on Saturday afternoon and Saturday evening riding.

4. The lines on which Sunday riding is materially different during the latter part of June and in July and August.

With this information at hand the schedule man will determine on which lines reduced riding can be translated into schedule changes and then at what periods of the day and on which sections of the line wider headway will function satisfactorily. He will make cuts where it is evident that service will not be needed.



Graphs showing decrease in summer riding and corresponding car-hour reduction in summer schedule on Madison Street and Harrison Street lines in Chicago

The management of the Chicago Surface Lines has met this summer reduction in riding during the past few years with careful adjustments on many of the lines. In 1925 plans were laid for week-day schedule adjustment on fifteen lines involving a reduction of between 35 and 40 runs and a reduction on ten lines after 2 p.m. on Saturdays.

The net result of summer schedule adjustments in 1926 on this property was as follows:

	Change	Cars	Man Runs
Weekday schedules	Decreased	49	61
Saturday schedules	Decreased	18	18
Sunday schedules	Increased	1	6

This represents a considerable saving in labor cost. In addition the reduction in car maintenance, power consumption and the release of cars for overhauling and painting represents a direct economy.

The Readers' Forum

Proposed Fire Protection Regulations Undesirable

NEWARK, N. J., May 6, 1927.

To the Editor:

In the May issue of *Aera* there appears in full the progress report of the National Fire Protection Association committee on garages, together with a review of the considerations which led up to the development of the present draft of proposed regulations. The attention of the street railways is specifically called to certain objectionable clauses which have been retained in the tentative draft now being submitted to the N.F.P.A. In this review particular attention has been drawn to the section on heating and ventilating and to that covering maximum floor areas and size and number of door openings in partition walls between sections.

As the A.E.R.A. representative on the N.F.P.A. committee Mr. Hecker has made a strong effort to secure an acceptable modification of obviously objectionable clauses in these proposed regulations, in some instances with success. In other important instances which vitally affect the railways, however, he has as yet been unable to secure modifications which, so far as opinion expressed to date by a number of railway men indicates, are highly desirable. It has been a case of one representative not having been able to present sufficiently convincing arguments to the balance of the committee to sway them to see these matters in the same light as he sees them, he having been supplied with views of only relatively few of the total number of properties affected.

Mr. Hecker has appealed to the railway engineers and others of the industry interested in the subject to study this report carefully and to see that any comments or criticisms are sent to him promptly so that he may be in a position to present them to the committee. This is a matter the importance of which cannot be emphasized too strongly. It is one that will affect every company building garages through its pocketbook, either in largely increased construction costs or through higher insurance rates, and may also have a serious effect on annual operating costs by reason of reducing the flexibility of use of a given total floor area.

The writer, as chairman of the way and structures committee, has been closely in touch with Mr. Hecker since this subject first came up for consideration and, realizing that only by prompt concerted action on the part of the railway interests can the desired modifications be secured, is taking advantage of the opportunity presented through your columns of emphasizing the importance of the matter to all street railway and bus operators, and in the hope that the appeal may in this way reach some who might not be reached through the other channels.

It is, of course, not expected that a 100 per cent acceptance of our views will be secured in the finally adopted draft of these regulations, as such regulations as these are always a matter of compromise, but no stone should be left unturned in the effort to secure the most acceptable compromise possible under the circumstances. It therefore behooves every street railway operator of buses to see that these regulations are given the most thorough study.

HOWARD H. GEORGE,
Chairman Committee on Way and Structures.

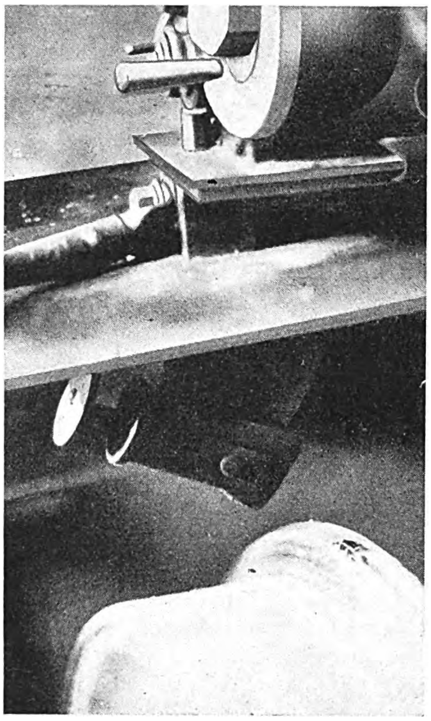
Maintenance Notes

Wheel Flanges Built Up by Welding

EXTENSIVE use is made by the Los Angeles Railway of automatic electric welding for building up the flanges of steel wheels. The machine used, with the exception of the head, which is a General Electric product, was designed and built in the railway shop. Many features of the machine make it especially suitable for handling this type of work efficiently and economically.

The main frame is built of 2½x3x¼-in. steel angles. The carriage way is about 5 ft. above the floor. Its length is approximately 6 ft. It is braced and gusseted to give it needed strength. The carriage also is built up of the same size angles and supports on top the reel of welding rod and below on a suspended rack the automatic welding head. A switch on top of the carriage is used for turning on and off the welding current.

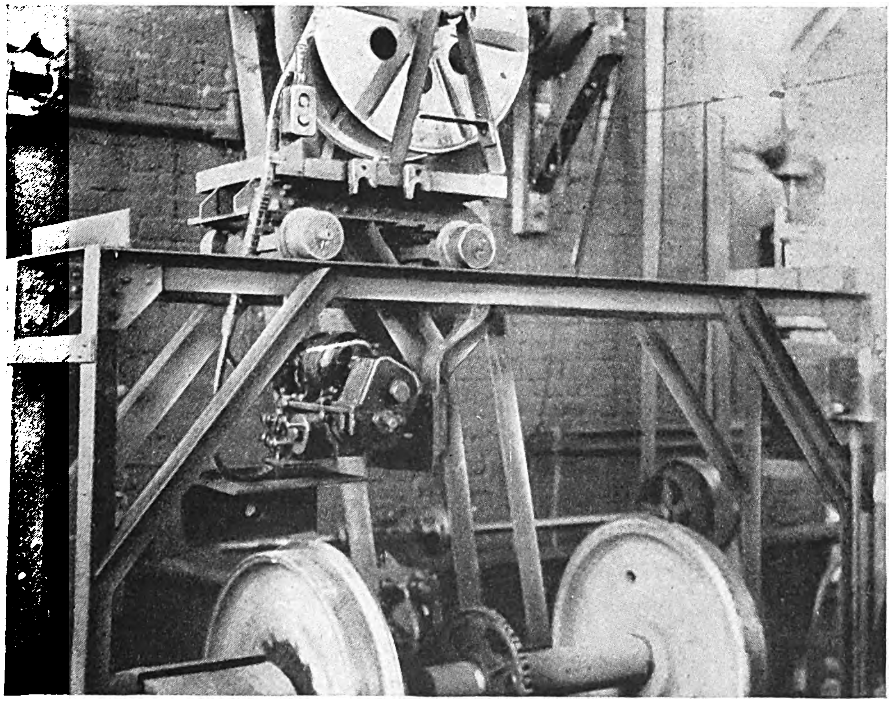
The wheels and axles are rolled in to the machine over a piece of track. When in the proper position mechanically operated jacks placed under the journal bearings raise the unit off of the floor. These jacks have brass bearings which permit the wheels and axle to turn freely. A split sprocket is clamped on the center of the axle. This serves to revolve the work. The drive to the sprocket is through a quadruple worm reduction from a countershaft at the rear of the machine. A motor is belted to this countershaft. The wheels and axle turn over once in every 7½ minutes, which gives the proper peripheral speed for welding a 30½-in. diameter wheel.



Close-up showing the head and welding point and the wheel set for building up of its flange

At the rear of the apparatus is another countershaft on which is mounted a wire brush so placed as to clean the wheel being welded. It is driven by the same motor which turns the wheel-driving mechanism.

With the wheels in position, the welding head is lined up with the point on the flange or wheel where welding is to be done, the proper adjustment of the point made, the welding rod feed motor and the wheel driving motor started. Then the device takes care of itself for the complete revolution of the wheel. It takes approximately one hour to build up a wheel flange sufficiently for turning to give the proper contour. The head and spool being mounted on a base which is capable of transverse movement, easy adjustment is possible to cover that portion of the wheel needing building up.

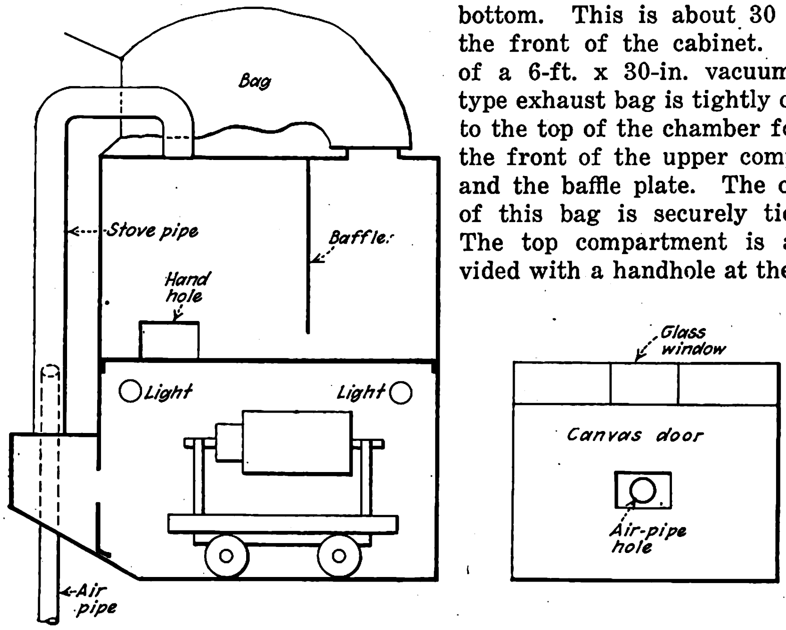


Apparatus used in the Los Angeles Railway shop for automatically building up by electric arc welding wheel contour and flanges. The carriage supports the rod supply spool and welding head

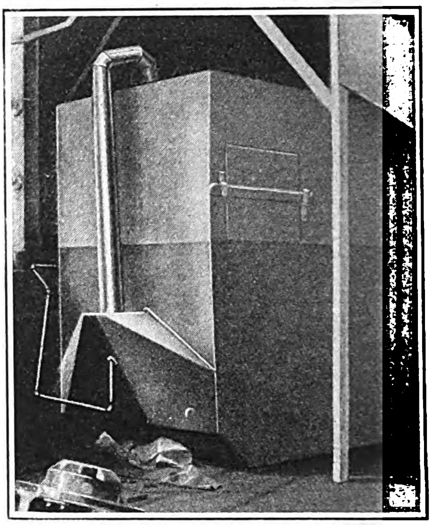
Dust-Absorbing Cabinet for Blowing Out Armatures

WHERE men work under healthy, sanitary conditions, maximum production is assured, since loss of time due to sickness is minimized. With this thought in mind the Interborough Rapid Transit Company of New York developed a cabinet for blowing out armatures and field frames which not only protects the operator from the inhalation of dust but absorbs all dust within itself.

This cabinet is made of $\frac{1}{16}$-in. sheet iron and is 6½ ft. long, 5½ ft. wide and 7½ ft. high. A horizontal steel partition divides it into a 3-ft. upper and 4½-ft. lower section. The front of the lower section is fitted with a canvas door containing a glass observation window and a hole for the entrance of the compressed air pipe. In the top of the upper section near the back and in the rear of the lower



A large vacuum cleaner bag above keeps the shop atmosphere clear



A specially designed cabinet in the Interborough shops absorbs the dust during the process of blowing out armatures and field coils

section near the bottom there are exhaust holes, to each of which is attached a 6-in. galvanized stove pipe. A 1-in. air pipe protrudes up into the stove pipe about a foot above the opening of the lower compartment. A vertical steel baffle plate extends down from the top of the upper section, full width, to within 8 in. of the bottom. This is about 30 in. from the front of the cabinet. One end of a 6-ft. x 30-in. vacuum cleaner type exhaust bag is tightly connected to the top of the chamber formed by the front of the upper compartment and the baffle plate. The other end of this bag is securely tied down. The top compartment is also provided with a handhole at the side for the removal of accumulated dust. The lower section is illuminated by four 100-watt lamps.

The armature or field frame is put into the lower section and the canvas door closed. Then the air in the stove pipe is turned on. The part to be cleaned is thoroughly blown out by means of an air pipe inserted through the hole in the door, the results obtained being observed through the glass window.

The direct air stream in the stove pipe, expanding into the upper section of the cabinet, creates sufficient suction effect to draw all of the dust from the lower section up through the stove pipe, depositing it in the upper section. Small particles remaining in the air as it makes its

Attention, Maintenance Men!

THREE CAPITAL PRIZES

***First,* $200 *Second,* $100 *Third,* $50**

TWELVE MONTHLY PRIZES OF $25 EACH

SHORT maintenance articles for ELECTRIC RAILWAY JOURNAL's maintenance competition are being received. Those published in the Maintenance and Construction issue for May will have the first chance to win one of the prizes. Maintenance men, here is your opportunity! The more items you send in, the more chances you have of winning a capital or monthly prize. Start at once. The JOURNAL will pay $5 for each item published, whether it wins a prize or not.

Any employee of an operating electric railway or electric railway bus subsidiary may compete for the prizes to be given by ELECTRIC RAILWAY JOURNAL for short maintenance items. Full information is given in the April 16, 1927, issue, pages 700-701.

The author does not necessarily have to be the originator of the idea or device. An article may be submitted by several persons or by a department and need not be written by the person in whose name it is submitted.

Articles may treat of any maintenance practice or device used by any department of an electric railway and should be preferably 100 to 200 words in length and accompanied by one illustration. Brevity consistent with a proper presentation of information will be given weight in judging articles. In no event should they be longer than 400 words with more than two illustrations.

Manuscripts should be mailed to the editor of ELECTRIC RAILWAY JOURNAL, Tenth Avenue at 36th Street, New York, N. Y. To be eligible for the capital prizes, the envelope must bear a postmark dated before Aug. 1, 1927.

In addition, a prize of $25 each will be awarded each month, beginning with the May 21, 1927, issue. Articles submitted will be published in the Maintenance Data Section of ELECTRIC RAILWAY JOURNAL.

If sketches accompany the manuscripts they may be in pencil, or blueprints will be accepted. Each item submitted should bear the name or names of the individual or individuals by whom it is submitted and to whom awards are to be made.

The announcement of the winner of each monthly contest will be made in the issue devoted to maintenance and construction, the third issue of the month, following the one containing the item.

The winners of the capital prizes will be announced in the Annual Convention Number of ELECTRIC RAILWAY JOURNAL, to be published in September, 1927.

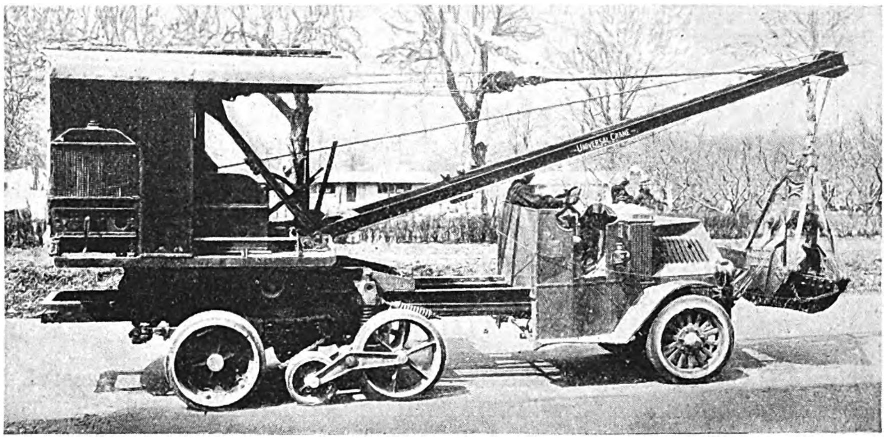
exit through the bag are deflected by the baffle and caught in the bag.

To clean the cabinet, the tied end of the bag is loosened and raised vertically so that the contents will be deposited in the upper chamber. By removal of the handhole cover in the side of the upper section the accumulated deposit can be removed.

New Orleans Leads in Mileage Per Pull-In

IN A SHORT article in the April 23 issue of ELECTRIC RAILWAY JOURNAL, page 745, a statement was made that Atlanta is leading the "Southern League" of Street Railway Companies in mileage per pull-in with an average of 26,041. The mileage given per pull-in was substantially correct, but Atlanta is in fourth place instead of in the leading position. In the last report of the Association of Equipment Men, Southern Properties, New Orleans headed the list with 100,833 miles per pull-in, Nashville was second with 45,000, Knoxville third with 32,524 and Atlanta fourth.

New Equipment Available



Crane equipped as an eight-wheel truck. Its speed is 16 m.p.h.

Removable Crawler Tread for Crane

CONVERTING a rubber-tired truck into one with full crawler rear wheels is the duty of an attachment recently announced by the Universal Crane Company, Cleveland, Ohio. For several years this company has been trying to effect better weight distribution on motor truck cranes, both on pavements and on soft ground. As a result, the eight-wheeled truck was developed, as shown in an accompanying illustration. Even the small wheel shown is a rubber-tired load carrier. Eighty per cent of the load is carried on the rear end and this is distributed equally to the six rear wheels. The box form arrangement of the six rear wheels gives a substantial ground bearing and increases the facility of the unit, which permits handling heavier loads. The unit is capable of a speed of 16 m.p.h.

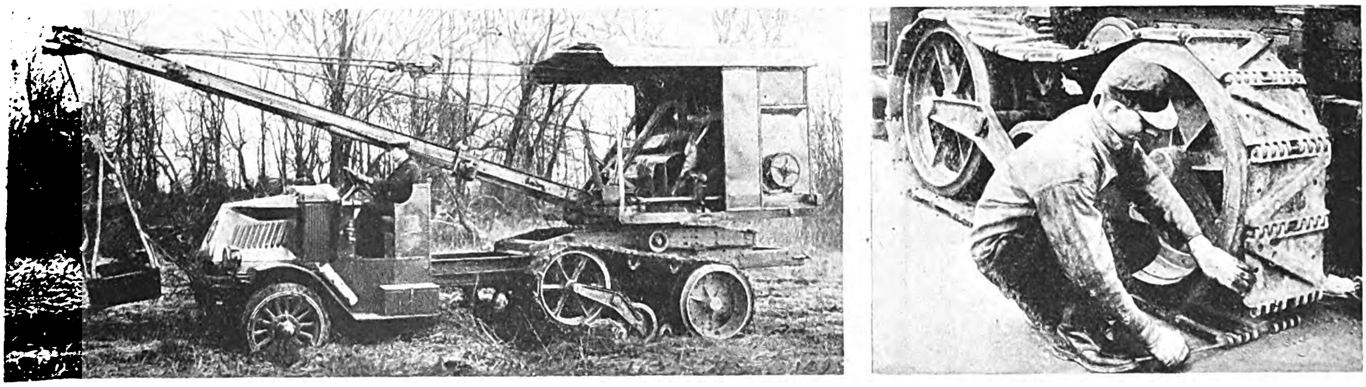
The crawler tread is carried just above the rear wheels, much in the same manner as fenders on an ordinary car. This crawler tread can be attached quickly and can be handled by one man at no extra cost. With the crawler tread in use, the unit has numerous advantages. It eliminates all danger on soft ground work and the necessity for planking. It provides for going directly to the job over banks and depressions. The speed of the unit as a crawler is 6 to 8 m.p.h. over soft ground.

In addition to the soft ground traveling ability of the unit greater over-all width and better distribution of weight are provided. The crawler tread travel is by means of lugs located on each alternate tread which fits between two spacer rollers on the rear driving wheels.

Heavy-Duty Ignition Unit

BUILT to withstand the severe service encountered in bus and truck operation, a new battery ignition unit is being placed on the market by the North East Electric Company, Rochester, N. Y. It is of the closed magnetic circuit type employing the jump spark. Mechanically the unit has been built to provide economical operation under adverse conditions. To this end all parts are made particularly strong and ball bearings are used to eliminate shaft wear.

The ignition coil is ironclad with closed magnetic circuit. It is waterproof, easily accessible and demountable. At high speed the high-tension impulses furnished by the battery ignition unit are reduced slightly in intensity, thus eliminating the rapid burning away of contact points. Contacts are made of tungsten and are protected from burning and arcing by high capacity condensers. Efficient engine performance is attained by automatic regulation at the spark. A supplementary manual control makes it possible to set the spark at the most desirable point under varying speeds and load conditions.



The motor truck crawler will travel from 6 to 8 m.p.h. on soft ground. One man can put the crawler tread on in five minutes

Association News & Discussions

U. S. Chamber of Commerce Frowns on Government Running Business

Private Ownership and Initiative Seen as Key to New and Successful Business Era—There Will Be Need for All Forms of Transportation

IN THE general sessions, committee meetings and section gatherings the keynote of the fifteenth annual meeting of the Chamber of Commerce of the United States at Washington, on May 3-5, was that a new and successful business era was dependent on the government withdrawing from all participation in business. It was the consensus of opinion that private ownership was fully able to operate an American merchant marine, inland waterways and the coal industry, and that by self-regulation American business is bringing about a condition which will result in fewer restrictions being imposed upon private enterprise and initiative through government regulations. Curbing the Mississippi also was given consideration.

TRADE BODIES PROMOTE UNDERSTANDING

Aside from the annual address of John W. O'Leary, president of the chamber, in which he traced the tremendous problems and territory that the chamber covered, also his belief in the slow but sure method of the chamber's referendum as a means of judging future business, the outstanding feature of the first general session, held on May 3, was the address of Haley Fiske, president of the Metropolitan Life Insurance Company, New York. Mr. Fiske's subject was "New Responsibilities of Business," which he divided into the relation of business men to each other, to employees, and to the public. In the first particular the speaker brought out very forcibly what some 60 trade associations were doing to bring about better understanding between business men. Some of the activities, he stated, were as follows: To solve the difficult problem of bringing about improvement in conditions to enable members, especially the weaker ones, to stay in business is what is characterized as "a deplorable competitive situation." To help small manufacturers by giving information they cannot afford to get. To obtain for common use legal opinion on trade difficulties. To put a stop to unfair competition involving graft in obtaining orders. To improve standards in order to meet and overcome cut-throat competition by a series of substitutes. To improve standards and qualities to comply with building ordinances and to strengthen and improve the laws. To establish ethical codes in competition. To send out inspectors to factories to make tests to improve qualities and raise standards. In the Coal Association to promote safety in mining. Co-operating with the Federal Board of Vocational Training to give training courses in localities and by literature to enable merchants to survive competition of chain stores. Co-operation with the Department of Commerce in standardization and eliminating duplication. In regard to the effect of standardization, the speaker said that in one industry $70,000 was saved on one item of the manufacturers, and that another industry had surveyed establishments covering $50,000,000 of business to fix proper ratios of assets, liabilities, income and expenses and had brought about vocational training and furnished help to the small concerns.

COMING MEETINGS

OF

Electric Railway and Allied Associations

May 18-19—Central Electric Traffic Association, meeting, Tuller Hotel, Detroit, Mich., 9 a.m.

May 31-June 1-2—Canadian Electric Railway Association, annual convention, Winnipeg, Man.

June 6-8—American Association of Engineers, annual convention, Tulsa, Okla.

June 9-11—Midwest Electric Railway Association, annual meeting, St. Louis, Mo.

June 19-23—International Street and Interurban Railway Association, annual conference, Copenhagen, Denmark.

June 20-24—American Society for Testing Materials, 30th annual meeting, French Lick Springs Hotel, French Lick, Ind.

June 20-24 — American Institute Electrical Engineers, convention, Book-Cadillac Hotel, Detroit, Mich.

June 24-25—New York Electric Railway Association, annual meeting, Hotel Champlain, Bluff Point, N. Y.

June 29-July 1 — Central Electric Railway Association, summer meeting, Book-Cadillac Hotel, Detroit, Mich.

June 30-July 1 — Tramways and Light Railways Association, annual meeting, Bath, England.

July 27-29—Association of Equipment Men, Southern Properties, 12th semi-annual meeting, Atlanta, Ga.

Oct. 3-7—American Electric Railway Association, annual convention, and exhibit, Public Auditorium, Cleveland, Ohio. Exhibits open at noon of Oct. 1.

As an example of how business is improving its relations with the public, Mr. Fiske pointed out that constituent associations are working for the protection of the buying public; that one industry educates the employees to produce good output and has actually got 70,000 of them to sign pledges to give the right kind of work and to replace inferior; many of these are foreign born who are thus trained in American ways. Several of the associations are fighting against misbranding and misstamping; in other words, against deception of the public as to material and quality. Some of them as associations guarantee the quality and evidence it by standard labels. One association certifies an important product where deception would be easy and non-compliance with legal requirement might be concealed. Another association standardizes grades and correctly marks them upon the product. Another enforces standards recognized throughout the world for measurement and inspection. Another association is engaged in eliminating trade abuses and unfair methods of competition. The speaker saw in advertisement also a trend toward better public relations.

EMPLOYEE RELATIONS IMPROVING

In regard to the relations toward employees, Mr. Fiske sees increasing signs of better understanding between employer and employees. "There is much evidence that business men are regarding the human element in labor relationship," continued the speaker. On the other hand, it was pointed out that encouraging signs had their origin in the fact that trade unions are recognizing that peace and prosperity can be promoted by understanding, by co-operation, by recognition of common interests in the industry. The other encouraging signs were personnel administration; co-operation in shop management; suggestion systems with prize awards, not in wages but in promotion of efficiency; improvement of apparatus and conditions under which it is used; medical and surgical attention; dental work; nursing; cafeteria service; milk supply; profit sharing; stock purchased by employees, helped by contributions of employers, mutual benefit associations with corporate assistance, etc. The speaker also gave his opinion of group life insurance, with all its ramifications, which he characterized as "one way to bring home to the employer his responsibility for the welfare of his employees as human beings and the economic quality involved in the brotherhood of man." In this particular Mr. Fiske took occasion to compliment the work of the American Federation of Labor in its recent step of forming a Union Life Insurance Company.

For the new business era, according to Mr. Fiske, both sides are calling for mutual understanding and both are expressing the duty of public service. The true ideal of the business man is to be of service to his country, to his associates in occupation, to the public, to those dependent on him.

Business Forecasts from Various Sections

THE general session on May 4 was given over to forecasts from the East, South, Midwest and West. Speaking for the East, John F. Lawrence of Boston, Mass., stated that pessimism is disappearing in New England. "Many of us feel," he said, "that the problems that New England faces today arise from the fact that New England, to a greater degree than any other section of the country, has reached the stage of industrial majority." Mr. Lawrence then traced the operation of what he described as the business clinic conducted by the New England Council. In his opinion, public knowledge is the best means for a cure. He also stated that the council, in addition to securing the help of educational institutions in the matter of research, was conducting exhaustive surveys through its own research committee. The council, it was stated, has made it popular for New England towns to look within themselves for the means of their advancement and improvement of their economic situation. We are newly awakened to the fresh opportunities before us and to the reward which will likely be ours, the speaker said in conclusion.

Speakers Are Optimistic

George H. Baldwin of Jacksonville, Fla., speaking for the South, predicted a bright future for that section of the country because of the availability for the first time of adequate capital and because of the departure from dependency on one product, and of the rapid establishment of new industries. He also saw great encouragement in the fact that there had been practically no labor troubles in that section of the country, attributable to the pure Anglo-Saxon blood of the white population. As far as Florida was concerned, he stated that the rapid deflation of real estate values is being met successfully by the many large and sound banks of the state and by other agencies. The development of the resources of the South, in the opinion of the speaker, is just as dependent as that of other sections of the country on the encouragement which the government gives capital to invest in business enterprise. A curtailment of the demands of those with large incomes for tax-free bonds must be brought about to see these funds again invested in productive enterprise rather than in tax-free bonds.

The agricultural situation in the Midwest was characterized by Silas Strawn, chairman of the board of Montgomery, Ward & Company, as being of unusual gravity, but he described the prosperity prevailing in industrial centers to be unprecedented. As a whole, Mr. Strawn considered the situation as favorable.

Harry Chandler of the Times-Mirror Company, Los Angeles, gave a glowing account of the progress of business in the West. "Forces beyond our power to control or to direct," said Mr. Chandler, "are setting the stage on the shores of the Pacific of a new theater of world events. The century westward march of Aryan achievement has ushered in, what for want of a better term, may be called the Pacific Era. The front door of America will ultimately be on the Pacific, whose eastern and western shores are formed by lands just coming into the world's spotlight in its upward sweep from East to West. In all, while the progress and development of the West has not been without its disappointments and reverses, it has been generally one of steady, consistent fulfillment. We have suffered from few of the spasms of speculative hysteria known as booms, and in consequence we have not had to recover from feeling the resulting sloughs of depression. We have perhaps learned little that the East did not already know and have done nothing that it had not already done. If we have shown any virtue, it is that we have not wasted our time and opportunity in reckless experiments. Our problems line up not so much in what we have done but in what we shall do. We have learned to walk with considerable assurance, but we have no deep-worn paths of tradition to determine the direction we should take. We are dealing with the future, not the past." Mr. Chandler then pointed out that the southern portion of the Pacific seaboard, like every section which experiences an unusually rapid growth of population, has been hard put to balance its census figures with its commensurate rate of industrial growth. Parts of this area, he pointed out, have established new world records for numerical increase and population has been obtained which would be economically impossible of maintenance save for an exceptionally favorable background of natural resources and industrial potentialities.

Group Sections Centers of Interest

VYING in interest with the speakers at the general sessions were those who addressed the group section and who later interpreted the group opinions at the general session on May 5, their topic being "What's Ahead for Business."

"There should be teamwork between agriculture and business," said White B. Heard of Phoenix, Ariz., speaking for the agricultural section. "It is the plain duty of organized business to give assistance in stabilizing agriculture. Farmers are not asking for dough, but equal opportunities and self-interest demand that business men see to this."

"There are 925,000,000 acres devoted to farms," the speaker said, "and 24 per cent of our population derives its living from agriculture." This, it was pointed out, represented an investment of $64,000,000,000. On the other hand, Mr. Heard stated that in 1925-1926 outside capital invested in agriculture represented only 3½ per cent, and that for the same period the average return to the farmer was $648 per annum. Reduction in production is not practical, as the climatic conditions make this impossible; agriculture has not recovered from the depopulation which occurred after the war; the farmer's dollar buys less today, were some of the speaker's observations. On the other hand, he saw an encouraging outlook in the fact that the pure seed movement was growing, that crop rotation was being practised and that several products of the farm had increased in value.

Skyscrapers Defended and Condemned

In the meeting of the civic development group Harvey Wiley Corbett of New York declared that the skyscraper is not a disease but a solution of business perplexities. He pointed out that it may relieve street congestion and enable business men to conduct operations in limited area. The business day is growing shorter and the volume of business done larger; the skyscrapers now are as essential to efficiency as is the telephone or the automobile. Reduced building heights, he said, to seven or eight stories in the 42d Street area of New York City would require 1½ square miles of new territory and would so lengthen the lines of communication as to promote rather than decrease congestion. It was his opinion that vertical transportation is easier to handle than horizontal transportation. In opposition to Mr. Corbett were the views of Major Henry H. Curran, also of New York, who held that the skyscraper makes for congestion, particularly during rush hours, and that failure to control height spoils the appearance of cities. Because of skyscrapers, Major Curran said, New York is faced with the necessity of putting all of its funds into new subway transportation facilities instead of building sewers, parks and playgrounds.

Reporting to the general session of May 5 on this subject Charles W. Lonsdale, president of the Simonds-Shields-Lonsdale Grain Company, Kansas City, Mo., after reviewing the general discussion pointed out that urban population is steadily growing and that in 60 years, out of a probable population of 150,000,000 people, 67 per cent would live in cities and small urban communities. He thought it encouraging that in recent years the city populations had shown a lower death rate than that of the country. He reminded the chamber of the $1,000 prize which has been offered by the National Real Estate Association for the best opinion on what is the economic height of buildings.

Forecasting what was ahead in the way of problems for those interested in domestic distribution, Robert I. Ellis stated that 60 per cent of the chambers of commerce in the United States were interested in this most vital subject. Distribution, he said, was more intricate in this country than in any other country of the world due to our enormous territory and the high standards of living. He said that business men are primarily interested in what is the status of the chain store and independent store and as to the probability of the manufacturer dealing directly with the retailer and ignoring the wholesaler. Business must have better relations, it was pointed out. Cancellation of orders after the discount had expired is to be frowned upon. Business, Mr. Ellis continued, is facing a relaxation on the part of the consumer and speculative buying was not justified. In his opinion all signs pointed to normal conditions, however. At the group session on domestic distribution on May 4 it was revealed that the Department of Commerce would take a census of distribution in eleven cities; this census is to follow the lines of that recently taken in Baltimore. The gathering of distribution figures, it was explained, is an experiment. If final results are as valuable as they now seem a national survey will be undertaken.

FEAR OF SHERMAN ACT REMOVED

When leading the discussion in the group meeting Judge Edwin B. Parker, umpire of the Mixed Claims Commission, United States and Germany, predicted that now the fear of the Sherman act had been removed from fact-finding there would be little place for government regulations, as business could regulate itself. While business may not act in concert to fix prices or to limit competition unreasonably or to restrict production, Judge Parker declared that it is lawful to assemble facts and distribute them stripped of opinion.

A discussion in the meeting of the finance group, Felix M. McWhirter of Indianapolis, reported, placed emphasis on sound management and upon the necessity for self-regulation of banks. In some sections of the country, said Mr. McWhirter, there was a general impression that there were too many banks and too few bankers. He pointed out that the country could expect only one more reduction in federal taxes, and that these taxes should balance governmental expenses and not show any surplus. He thought it of the utmost importance that a broad study be made of the financial conditions and operation of the Federal Reserve System and that sound conclusions be arrived at in regard to the system. He also pointed out that it is necessary for the financial interests of the country to determine what was of value in an emergency and what was necessary in normal conditions of activity. As far as foreign finance is concerned, the speaker voiced the opinion that Europe must pay and that the money derived from this source should not be used for tax reduction or for governmental expenses.

Speaking for the foreign commerce group, Henry Sharpe, president Brown & Sharpe Manufacturing Company, Providence, R. I., was most enthusiastic as to the outlook of our foreign commerce, particularly so as, coincident with the meeting of the chamber, the Third Pan-American Commercial Conference was being held in Washington. Resorting to figures, Mr. Sharpe revealed that $4,500,000,000 of the United States capital was invested in Latin America; that the trade in 1926 was $835,000,000 in exports and that purchases from the countries south of us amounted to $1,000,000,000, this combined business representing one-fifth of our total foreign commerce. The speaker saw in the Hoch act, recently passed by Congress, which put the Department of Commerce on a par with that of the Department of State, a tremendous factor in improving foreign commerce. He also considered the erection of consular buildings in various countries as having been a great aid in this particular. The American people must show an increasing interest in foreign commerce, and at all times they must maintain an international mind, Mr. Sharpe cautioned. New foreign competition had arisen, he admitted, due to the discovery of metallic producing sections in Europe.

Substituting for H. A. Smith, president of the National Fire Insurance Company of Hartford, Conn., and chairman of the insurance group, James F. Kemble, vice-president of the chamber's insurance advisory committee, reported the insurance group as approaching the coming year with confidence and that life insurance protection now totaled $85,000,000 with fire insurance coverage amounting to $200,000,000. He also reported that nine years extension of longevity was the result of the educational campaigns carried on by insurance companies.

HIGH WAGES RESULT FROM PROSPERITY

Led by A. J. Brosseau, president of Mack Trucks, Inc., of New York, the manufacturing section heard several interesting speakers, the first H. R. Rice, assistant to the president of General Motors Company. In developing his subject, "Wages in relation to Cost," Mr. Rice said: "Our own people have been writing and talking as to the reasons for increased business in the face of declining prices and also without declining wages, either money or real. Many reasons have been given, among them: Small individual profit and quick returns; rapid turnover; plant rejuvenation and the scrapping of good machinery worth many dollars when there was offered better machinery of greater efficiency; absence of trade jealousies or trade secrets; avoidance of waste and attention to time saving; general interest in welfare; prevalence of research; incentive to group and individual exertion; cooperation of labor; absence of geographical barriers; mass production; prohibition, installment selling; lack of class distinction, and every man being a capitalist through stock ownership, etc.

"High wages are more a result of prosperity than prosperity is a result of high wages," continued Mr. Rice. "Prosperity is a result of high average production per man. However, that high production may be achieved, so that the order is, first, high production; second, prosperity and high wages." In the speaker's opinion "the low wage earner from abroad cannot increase his own ability merely by a trip across the ocean. His strength is not multiplied by the short sea voyage. We are not as hard muscled as our grandparents, but the difference in our economic status is that we are able to produce more, not by an increase of muscle, but by brain power, evidenced in equipment, wages and organization. That is the chief asset to our prosperity and our high wages. High wages are a result of high production with low unit cost and cannot themselves be the cause of prosperity. It is for us to make sure," Mr. Rice said in conclusion, "that at this time, when we have been enjoying the period of greatest prosperity in our history, we shall not lose sight of the fact that this prosperity has been caused by and is dependent upon the great production of this nation; in which worker, foreman, manager, organizer and every kind of interest may alike take pride."

Intense enthusiasm was aroused by the next speaker, Arthur T. Morey, general manager of the Commonwealth Steel Company, whose speech is carried elsewhere in this issue of the JOURNAL. Basing his remarks upon the premise that industrial relations have much to do with human happiness, Mr. Morey gave a thorough and absorbing description of the welfare work and general industrial relations program carried out by the Commonwealth Steel Company.

In summing up to the last general session of the chamber the work of the manufacturers' section, Chairman Brosseau said that it was the consensus of opinion of the group that the short week and shorter wages would cause no controversy provided the unit cost did not increase. He next touched upon the increase in the wages of rail workers, pointing out that it was problematical to what extent this would affect industry, the outcome being largely dependent upon whether the rail worker, in consideration of a higher wage, was willing to do more work. Mr. Brosseau announced that his group had prepared a comprehensive plan for 1927 which would include the study of trends, overproduction, mass production, cost accounting, foreign relations, foreman training and industrial production in prisons.

CONGRESS' DISREGARD OF WATER-POWER ACT DEPLORED

At the general session on May 5 Milton Marcus, chairman of the national resources production group, made a notable talk in which he deplored the disposition on the part of Congress to disregard the water power act in dealing with large projects such as those at Muscle Shoals and at Boulder Canyon, also the tendency to interest the government in the production and distribution of hydro-electric power. He pointed out that private initiative and energy have brought us to our present high state in the development of that important industry. Referring to the coal industry, he declared that the experience of recent years has shown the public that, if let alone, it can be depended upon to furnish coal in ample quantity at fair prices. He held that the industry has justified the confidence voted it by the chamber last year when it reiterated its opposition to government regulation or control. Mr. Marcus also urged the enactment of legislation which will make possible the business of growing crops of trees. He stated that three states have already enacted constitutional amendments looking toward the conservation of the forests and that 36 states are giving study to the situation. It was gratifying, he pointed out, that of all the constitutional amendments offered at the last meeting of the Legislature of Wisconsin only the tree conservation amendment was finally passed.

Needs for All Forms of Transportation Predicted

"NEW Trends in Transportation," a scheduled address by R. E. M. Cowie, president of the American Railway Express Company, was, owing to his illness, divided among W. L. Claus, who gave a résumé of the recent developments of waterways; A. J. Brosseau, who discussed the trend of bus and truck transportation, and George D. Ogden, traffic manager of the Pennsylvania Railroad, who presented the rail situation.

Prior to the speeches by these gentlemen several resolutions were introduced. Prominent among them was one dealing with commercial aeronautics, in which it was pointed out that charted airways had progressed and that the American Railway Express Company had contracted for the handling of express through the air. It was urged that the chambers of commerce throughout the country help sell the commercial air routes to the public and that wide patronage was the ultimate solution.

Speaking on the waterways situation, W. L. Claus gave a graphic description of the progress of water transportation made along the Ohio River during the past few years. He stated that the last dam was expected to be completed in 1929, which would afford transportation from Pittsburgh to New Orleans, and that definite recommendations for improving navigation on the Mississippi above St. Louis have been made. In regard to work on the Allegheny River the speaker revealed that locks and dams 4 and 5 are expected to be completed by the summer; lock 6 is scheduled for service next year. He also reported that 45 miles of the Warrior River Canal was now navigable. To add impetus to water transportation Mr. Claus urged that the government relinquish its operations as soon as practical. In substantiation of his contention that the use of inland waterways was on the increase, he gave some astounding figures on the ton-miles of freight handled by the Monongahela River at Pittsburgh.

BUS AND TRUCK USEFUL FOR SHORT HAULS

A. J. Brosseau, who followed Mr. Claus, held that the field of the railroad is the long haul. Trucks, he declared, are being confined more and more to the short haul, while the bus, successor to the lowly jitney, and over-exploited in relation to railroad and civic transportation competition, was held to occupy a definite but not thoroughly understood place in the transportation system. Confronted by a challenge made by the two previous speakers as to the railroad's position toward the truck, bus and inland waterways, Mr. Ogden laid down the very broad principle that what is good for the community is good for the railroad and what is not good for the railroad is not good for business. He also voiced the opinion that as the years went on there would be a demand for all sorts of transportation; he predicted that it would be a long time before transportation facilities would be entirely adequate.

One of the outstanding features of the transportation group session was the fearless attack on a government-owned merchant marine, made by Philip H. Gadsden of the United Gas Improvement Company of Philadelphia. Mr. Gadsden stated that he was against ship subsidy, but expressed the opinion that private business will find a way to support an American merchant marine. Chairman O'Connor of the Shipping Board, in reply, stated that the board favored a privately owned merchant marine if that be possible, but that it is first for a merchant marine. He said that the board is willing to sell any route that operates if a guarantee of five years of operation is given. The prices which will be asked for the ships will not be allowed to be an obstacle to such a deal, he declared. In view of the disclaimer of Chairman O'Connor that the board contemplates investing public funds in new construction and in view of the policy of disposing of all ships and trade rights to private enterprises at any sacrifice, if reasonable assurance of continued service is given, the transportation group decided to take no action in the matter other than to impress the board to use all energy in its power to place shipping in private operation.

Reporting in general for the deliberations of the transportation and communication sections, Mr. Brosseau predicted a better era of relations between the railroads and the public. More than $850,000,000 will be needed by the railroads annually, he stated. The future of railroad expansion calls for sound financing of railroad securities and returns should allow financing through stock issue.

RESOLUTIONS ADOPTED

Of the many resolutions adopted at the chamber's final session, those of particular interest to the electric railway field were on the subjects of taxation, federal, state and local; tax administration; trade relations; revision of postal rates; street and highway safety, and highway bridges. On federal taxation the following statement is pertinent:

> Both sound fiscal policy and equity to taxpayers require a reduction in the tax upon corporations. It is unsound for the federal government to rely upon one source for so large a part of its revenue as it is now obtaining from the corporation income tax. The result is that the government's revenues are necessarily affected by changes in business conditions. The present rates of federal tax upon corporate income are so high that they are inequitable in comparison with the rates upon individuals, unfair as an excessive indirect levy upon the great body of stockholders, and essentially unjust to business transacted in the corporate form, because of the weight of total taxes now accepted by federal, state and local governments.

In the matter of trade relations, the chamber urged "the elimination of all wasteful practices and trade abuses by the formation in each trade of a joint trade relations committee composed of representatives of every branch of trade. Such committees should seek out and define trade abuses and co-operate with the Federal Trade Commission in their elimination."

Regarding postal rates, very definite recommendation were made that they be reduced to a reasonable basis. The resolution reads in part:

> There has been a more or less generally accepted idea that the receipts from the postal service should fully cover all of the costs of that service. This is contrary to accepted business principles and overlooks the fact that efficiency and adequacy of the service should be the first consideration. It also overlooks the fact that Congress, in its wisdom, has seen fit to use the postal service for carrying out governmental policies by the granting and extending of "free" or "less-than-cost" services.

The chamber was equally positive in its position with respect to street and highway safety, declaring that "unceasing vigor should be applied to remedy the situation." The resolution indorsed the principles set forth by the National Conference on Street and Highway Safety and urged active support of its program.

The construction of highway bridges, in the opinion of the chamber, causes financial problems, upon which the following test of a resolution has bearing:

> Whenever after careful survey it is found to be necessary to meet these problems by permitting the erection of toll bridges, authority to build and operate such bridges should be granted only upon definite conditions. These conditions should include a requirement that construction and operation will be under the control of appropriate public agencies with a duty to see that the public interest is in all ways safeguarded and a provision that the right to collect tolls shall cease after there has been opportunity to obtain a reasonable return.

At a meeting of the board of directors today Lewis E. Pierson of New York City was elected president of the Chamber of Commerce of the United States and Edwin B. Parker of Houston, Tex., and Washington, D. C., was named to fill a newly created position of chairman of the board of directors.

Eastern Division—A. J. Brosseau, New York, to succeed Mr. Pierson.

Southern Division—Robert R. Ellis, Memphis, re-elected.

Northern Central Division—William M. Butterworth, Moline, Ill., re-elected.

Western Division—Paul Shoup, San Francisco, re-elected.

Human Treatment of Worker Will Solve Problems of New Business Era

PLACING the whole success of the new business era upon an appreciation of the worker's right to life, liberty and the pursuit of happiness, Arthur T. Morey, general manager Commonwealth Steel Company, St. Louis, made the keynote address at the manufacturing luncheon session of the Chamber of Commerce in Washington on May 3. As far as his company was concerned, declared the speaker, granting workers such constitutional rights had resulted in higher production and lower unit cost.

"Industrial relations have much to do with human happiness," Mr. Morey said. "When the workers of the world receive justice and a due measure of worldly comforts and opportunities one of the greatest causes of human friction and unhappiness is removed. Life, liberty and the pursuit of happiness is interpreted by most people as the right to make, and the blessings of having, a good living. By industrial relations, I presume we mean the relation between labor and management, using the word management in preference to capital which it represents, management being more direct contact. Of old, industrial relations have been dictated by supposed necessity, by economic force, or even by fear and perhaps sometimes by greed, but the better latter-day concept of industrial relations is a condition between labor and management based on equity and good will, American management having come to see that the nearer it can treat men as men, as Americans by Christian standards, can it gain that co-operation, respect and good will of employees that is essential to obtain the best productive effort. It is simply the operation of the law of cause and effect. It seems strange that men ever thought that good results could be got without having set in motion good causes.

WELL-PAID WORKERS CREATE MARKETS

"That sort of good will is Americanizing America to the workers and the workers are extremely important—in fact, the most important part of any community. It is extremely desirable for every reason that our great class of wage earners be self-respecting, well clothed, well housed, well educated and well informed so that they may be intelligent citizens and voters and also gain a greater measure of culture. Well-paid workers create a fine market, and steady work and steady pay we may find will mend a part of our broken prosperity circle and aid in giving us steady good business all the time instead of its ups and downs. By well paid I do not mean paid an existing wage, but a living, saving, cultural wage that makes of a man an upstanding, self-respecting, self-reliant American. Nor is it just money enough. A workman spends a good part of his waking hours in the shop. His job is a big thing to him. His company contacts should be upbuilding and exemplary in evidencing to him justice, fair and open character and friendliness. His job and his environment should be character building."

In developing his subject from this premise, Mr. Morey cited the industrial relations program now operating in the plant of the Commonwealth Steel Company. Among other things he told of how his company has instituted high school courses for the apprentice workmen, with the result that the students were able to take the regular high school diplomas in the public schools of his city. Next he sketched the employee-managed service department and commissary, and explained the insurance plan which was set up several years ago when the company hired an insurance expert to work out with the men a sliding scale of protection that gave each employee insurance policies from $500 to $2,000 and upward.

He next told of the Americanization plan by which "Hungry Hollow," one of the toughest sections of the city, was developed into a civic center with a splendid community building, built by the workers upon land donated by the Commonwealth Steel Company. This work, he said, included new sewers, schools, sewing circles for women, boy and girl scout activities, etc. He also sketched briefly the work of the two fellowship clubs, one for each race; the Home Building fund, which loaned money at 5 per cent without commission, and the fellowship fund, employed in emergencies. In the case of the former the speaker stated that his company had never had a loss, and that two-tenths of 1 per cent loss was the record in the fellowship fund, which had reached over $56,000 in loans. Next the bonus distribution system was explained; it being the attitude of the president, said Mr. Morey, to determine how much and not how little the company's profits should be shared with its employees.

In the realm of safety, the speaker was convinced that the movement as a whole was the opening wedge for better industrial relations in this country. As an example of what safety had done in his plant, he cited the case of the steam pipe gang that had installed 42 miles of piping in four years without a time-loss accident, and of a new pattern shop which had gone two years without a time-loss accident. Continuing, Mr. Morey said:

"It has been our policy to figure about so much per ton on our costs to support our program of safety and fellowship activities. We believe that instead of these being a cost to us, these expenditures have been an efficiency measure and that our costs are lower than they would otherwise be. The cost is not as great as one might think—it is often a matter of willingness to serve and is not a cost at all. Our home loans, fellowship loans, safety work are not costs, for they support themselves. Some of the other activities are practically no cost. I think the better question would be, 'Can we afford not to do these things?' I do not believe we could accomplish the fine product of our company without the good will and hearty co-operation of our men.

"Some concern has been expressed as to whether or not inventions and mechanical improvements will disturb the balance and will cause an excess of labor and unemployment.

"We speak of Newton's law, of the law of supply and demand, etc. I believe we can announce another law. That the consuming power of the world is equal to its creative power. It is proved so already here in America. The sewing machine at first caused riots through great fear that honest women would be thrown out of needlework; it is now recognized as perhaps the greatest single blessing for practical human needs. The early harvester machine was received with attempted destruction; without it today the people could not be fed at any reasonable price. And, too, the trend of modern inventions has been to raise the mentality of the people. The intelligence required under changed conditions is higher and higher and this calls for more and more in our markets. It takes more intelligence and a higher environment to be a motorman or chauffeur than it did to drive a horse car or old-time hack. I do not think we need be disturbed by the displacing of men by inventions and improvements, for I take it on faith that it is a law that no two truthful conditions can conflict.

"I think the thing that need concern us the most is the fellow who tediously and monotonously drives bolt No. 57 all day long instead of being a craftsman with love and interest in his work. Here there must somehow come compensation and adjustments. The eight-hour day helps this situation by giving leisure to turn the mind and interest to constructive things. We may develop conditions further so as to devise a machine to drive bolt No. 57 and do it so as to require intelligent supervision instead of drudgery.

"H. G. Wells says that the common people are happier than ever before in the history of mankind. There seems to be an eternal law of justice and adjustment that assimilates progress.

GOLDEN RULE APPLICABLE IN INDUSTRY

"The world is in flux. The old traditions are slipping. Old reverences are loosening. Long dormant races of overwhelming numbers are awakening. The world, particularly the East, is doubting and sometimes despising the "Western Devils" civilization because of some unfortunate things they have witnessed or experienced. What is going to happen as the world gets smaller and smaller and these great foreign masses of people get aroused and in motion? What is going to happen unless a common principle of conduct for all men is found that is easily explained and easily understood and can influence and govern all peoples?

"We are finding in industrial relations the principle of the Golden Rule is the only rule in human affairs that seems to work. We are going to find that the principle in industrial relations is the only thing that will interpret America to the world. The unrest of the world is among the workers and the peasants. If in America we have a contented and constructive wage earning class—*that* will sell America to the world quicker than any other thing.

The News of the Industry

Expert Suggests M. O.

City of Los Angeles Recommended to Buy Local Lines by Expert Delos F. Wilcox

Dr. Delos F. Wilcox, traction expert, in a preliminary report on local transportation policy filed with City Attorney Jess E. Stephens and the City Council, recommends that the city buy the Los Angeles Railway, Los Angeles, Cal. Doctor Wilcox was recently employed to aid the city in opposing increased street car fares.

The city's consultant emphasizes that he feels no hesitation in recommending that the City Council "take the necessary steps to authorize official inquiries and the preparation of a form of contract to effectuate the plan above outlined for the acquisition of the yellow lines."

With respect to the city's financial ability to take over the car lines Doctor Wilcox is advised that there is plenty of margin within the legal debt limit for this purpose, but that the city deems it necessary to conserve its available credit for still greater enterprises in the field of water supply and light and power development.

He further says that he is advised that Mr. Huntington, having sole ownership and control of the lines, has long entertained the hope that he would be able to sell them to the city at a conservative price and take his pay from the earnings. According to him Mr. Huntington would be willing to take in payment for the system city bonds bearing a low interest rate.

Doctor Wilcox said:

> In street railway operation, where the great masses of the citizens come in daily contact with the service and pay for it as they ride, the public has a better chance than in any other utility to insist upon good service and efficient operation.
>
> The good features of the present management ought by all means to be preserved, in case the city should decide to take over the car lines, and the plans adopted should be such as to insure better things instead of worse under public management.

Doctor Wilcox expresses the opinion that the purchase price of the Los Angeles Railway, including its bus lines, would be less than $30,000,000 at the present time.

Discussing the pending rate case, the preliminary report expresses the opinion that a valuation of $40,000,000 or more would be much higher than the "just and true value of the property for rate making purposes."

On the advantages of public ownership, Doctor Wilcox in part says:

> (a) The city would be free from the jurisdiction of the Railroad Commission and could adopt such policies with respect to service and rates as it saw fit, with the unquestioned right to pay for the property out of earnings if it was financially able to do so.
>
> (b) The city would have unrestricted control of extension and betterments, including the expansion of bus service.
>
> (c) The capital investments as a basis for rate making would be stabilized at the actual cost of the property of the Los Angeles Railway Corporation to the city, free from the burden of increasing land values and reproduction costs.
>
> (d) The cost of new capital would be limited to the rates of interest paid on city bonds instead of the rate of return allowed by the Railroad Commission on private investments.
>
> (e) The city would be free, under the present law, from the payment of gross receipts and income taxes on street railway operations.
>
> (f) The city would be able to co-ordinate the service now rendered by different agencies, and establish uniform and non-discriminatory rates. If the city acquired only the lines of the Los Angeles Railway Corporation it would be in a position to extend its lines and service so as practically to compel the co-operation of the Pacific Electric Railway and thus secure most of the benefits of unification, even if it did not own the red lines.

New Chicago Official Acts

Mayor's Advocacy of Unified Chicago Transit Results in Preparation of Bills for Enabling Legislation—Rush Subway Construction Bills—Opinions Differ on City's Right

A LONG-ANTICIPATED move on the part of Mayor William Hale Thompson and the new city administration in Chicago for the settlement of the traction problem was made on May 6, when work was begun on the drafting of bills by the city's legal department. Detailed contents of the bills have not been officially disclosed. It is expected, however, that the measures will be presented to the Legislature at Springfield some time within the next week or ten days in an effort to obtain legislation which will permit the consolidation of the different local transportation agencies, the granting of a terminable permit, the adoption of home rule and the construction of subways by means of special assessments, before adjournment time six weeks hence. The home rule feature, if granted, will be a concession by the companies, which have been seeking terminable permit legislation.

Mayor and Utility Representatives in Private Conference

Both Mayor Thompson and traction officials have agreed that such terms should form the basis of any new contract between the city and the companies. This decision resulted in the bills now being drafted. It was reached after a succession of private consultations in the last ten days between the Mayor and Samuel Insull, president of the Chicago Rapid Transit Company; Albert J. Harris, chairman of one of the Surface Lines bondholders' protective committees; John Hertz, chairman of the Chicago Motor Coach Company, and other local transportation officials and bankers. Alderman J. B. McDonough, chairman of the local transportation committee, has assured the Mayor that his committee will be ready to pass upon the measures within 24 hours after they are presented to the City Council for approval.

If the needed legislation is obtained, expert observers have pointed out, the twenty-year Surface Lines franchise plan of the Frederick J. Lisman interests and the exclusive city-wide bus service proposal of the Chicago Motor Coach Company, both of which are now pending before the local transportation committee, will probably be dropped from consideration.

One of the effects of the introduction of these bills into the Legislature will be to hasten the presentation of the terminable permit bill sponsored by Senator Richard J. Barr of Joliet. This measure, known as the "Barr" bill, has been the cause of an exhaustive investigation in recent months of the terminable permit in practice by a legislative sub-committee.

Discussion of subway construction as a problem independent of the railway franchise difficulties has been renewed by the city officials. Although it is agreed that both should be dealt with concurrently, members of the City Council now favor the speeding up of plans for a subway system to be built by special assessment regardless of the outcome of negotiations for general settlement of the traction problem.

In order to insure construction of subways adequate to the city's needs, Corporation Counsel Samuel Ettelson is now preparing, together with the general traction measures, a bill which would grant the city broad powers in this matter and would cover all contingencies that might arise in connection with subway construction.

Because opinion as to whether the city has the right under present statutes to build subways by means of special assessments differs among lawyers, Mayor Thompson believes it advisable to seek additional legislation to cover the points raised. Lawyers for the city contend that the present laws spreading special assessments for public improvements are adequate to permit the building of subways, while other attorneys hold that enabling legislation is required. The bill now being prepared by the corporation counsel would grant the city the right to build subways by this method, to use the accumulated traction fund of $50,000,000, would give the city the power of condemnation for the building of stations and switchyards and would also grant authority to the city to lease the subways when completed to whatever uses and whatever tenants may be selected.

No Change in Capital Traction Wages

A decision was rendered on May 11 in the wage issue affecting the employees of the Capital Traction Company, Washington, D. C. The arbitration board denied the application of the employees for an increase in wages and the company's application for a decrease in trainmen's wages. Arbitration sessions began on April 9 and after several interruptions were concluded on May 2.

The principal reason advanced by the board for refusing the men's request was the financial inability of the company to give it. Recommendations were made for relief for the company in the form of one-man car operation. The report was signed by Frederick A. Delano, the third arbitrator, and by Stanton Peelle, the company's representative on the board. Arthur E. Holder, representing the men, dissented.

In accordance with the terms of the three-year contract with the organized employees executed in March, 1926, transportation men of the Capital Traction Company prior to Feb. 28 requested a flat rate of 65 cents an hour for conductors, motormen and bus operators, which was 7 cents above the maximum rate, and an increase of 7 cents an hour for all other employees. Following this the company requested a decrease of 2 cents an hour for conductors, motormen and bus operators, with no change in rate for other employees.

Handling of Tacoma's Transportation Problem Criticised

In a report to the City Council of Tacoma, Wash., Kenneth G. Harlan, city statistical engineer, charges that only the inclusion of improper operating charges and computation of returns upon unwarranted valuations prevented the Tacoma Railway & Power Company and its allied company, the Pacific Traction Company, from showing a reasonable rate of return under any of the railway fare schedules which have been in effect during the life of the company. The report is voluminous. Criticism is directed "against improper methods that have been employed to obtain unjust rates and exorbitant valuations."

Approval of the report, and decision to stand squarely behind Engineer Harlan in negotiations for a permanent settlement of the Tacoma transportation problem, was voted unanimously by the City Council in its first session. The fact that the report is almost revolutionary in its character from the standpoint of corporate finance and that it will strongly be attacked was realized by the commissioners.

R. T. Sullivan, manager of the property, said in a letter to all employees:

> 1. Mr. Harlan is obviously strongly influenced by the socialistic doctrine of municipal ownership.
>
> 2. If the newspaper accounts are accurate, one of two conclusions is inevitable. Either Mr. Harlan's interpretation of the financial facts of the company is right, and all the many state officials who have examined our records, the entire committee of 25 appointed during Mayor Riddell's régime and our own men, such as Mr. Wilmot, Mr. Rounds, etc., are wrong, or the many state officials, the committee of 25 and our own men are right, and Mr. Harlan is wrong.
>
> Mr. Harlan was hired as an expert by the city and we have not yet checked his qualifications, having assumed that he is qualified as an expert. We do not know what his previous record has been or is.
>
> It may be necessary to ask the city to call in an expert of recognized standing to interpret Mr. Harlan's report.

Hearing on Houston Fare Awaited

The question of increased fares on the lines of the Houston Electric Company, Houston, Tex., is expected to come up before the City Council in a short time. Members of the city administration have been working on the company's petition, investigating rates in other cities, estimating incomes under various rates and gathering data since the Houston Company submitted its appeal for higher fares early this year. As outlined in the ELECTRIC RAILWAY JOURNAL, issue of March 12, 1927, page 464, the company proposes a fare adjustment based on a sliding scale which will permit regular patrons the same fare as heretofore or probably less and the occasional rider to pay a fare of 10 cents. The company claims improvements which will cost $1,000,000 will be necessary in 1927.

Free Rides in Portland

The Lipman-Wolfe department store, Portland, Ore., on May 2 chartered all the cars of the Portland Electric Power Company between 9 and 10 o'clock in the morning to carry passengers into the city, in celebration of its 77th anniversary in business. Conductors announced to passengers who proffered fare that this was the private car of the Lipman-Wolfe Company. This department store has a contract with the Portland Company to carry its ads on the front of the street cars announcing sales and has used this privilege exclusively for many months.

Jaywalker Scored in Chicago

The pedestrian who ignores traffic signals and rushes across street intersections without their protection has less than one chance in three of reaching the other curb without wasting more time than he saves. This conclusion is contained in the survey report submitted by the Albert Russel Erskine Bureau for Street Traffic Research, Chicago. Beside an investigation into walking habits, other studies made in Chicago's "loop" business district developed that the jaywalker seriously retards the speed and volume of traffic movement. To reduce the congestion and waste of time occasioned by this one phase of the traffic problem the report of the survey recommends that jaywalking be prohibited, with suitable penalties for violation. In order to reduce the inconvenience to a minimum and to introduce a degree of flexibility into the rule, the report also proposes that crossings be placed near the middle of blocks in districts where the distance between intersections exceeds 400 ft., and that in such places pedestrians be permitted to cross with a right-of-way over vehicular traffic.

Public Inquiry Next Step in New York

Negotiations between the New York Transit Commission and the traction corporations for amicable readjustment of the dual subway contracts and unification through agreement have failed. Announcement to this effect was made on May 11 by Samuel Untermyer, special counsel for the Transit Commission. As a result hearings designed to bring all the facts of the situation before the public and to enable the Transit Commission to devise a plan based substantially on the recapture by the city of some important trunk subway lines are to begin very soon.

Mr. Untermyer's statement declared that the Interborough wanted the city to take over the Manhattan elevated lines, which it holds on a lease, but which do not pay, and that the B.-M. T. expressed its willingness to dispose of its surface lines to the municipality but wanted a guarantee of its earnings in perpetuity.

Mr. Untermyer intimated that the companies were unreasonable in their demands. Recapture seemed to be the only answer, he said, if the companies remained in their present mood. He indicated a firm belief that the problem could be solved without increasing the 5-cent fare.

Mitten Bank and Brotherhood Bank Merged in Philadelphia

Mitten Men & Management Bank & Trust Company has merged with the Brotherhood of Locomotive Engineers Title & Trust Company. The two banks will continue to occupy their respective quarters at Market and West City Hall Square and the Lincoln Building in Philadelphia, Pa. Approval of stockholders of Mitten Bank will be asked for an increase in the capital stock of the bank from $3,000,000 to $3,500,000, to care for the present merger.

The letter to stockholders, which included a call to a special meeting for final action on May 28, reads in part as follows:

> In accordance with the terms of the agreement, each stockholder of the Brotherhood of Locomotive Engineers Title & Trust Company will at his option have the right to exchange his stock for stock of the Mitten Men & Management Bank & Trust Company on the basis of two shares of stock of the Brotherhood of Locomotive Engineers Title & Trust Company for one share of stock of the Mitten Men & Management Bank & Trust Company (the last sale of which was at $150 a share), or to receive for each share of his stock $45 in cash. This option must be exercised by writing delivered to Mitten Men & Management Bank & Trust Company, within 30 days after approval of the said consolidation agreement by the stockholders of the Brotherhood Company.
>
> In accepting this proposal, the board of directors has taken into consideration the attitude of helpfulness and co-operation shown by the Mitten Bank toward the working people of this city. The bank has more than kept its promises to the stockholders and depositors of the defunct Producers & Consumers labor bank whom it saved from loss. In the services it has provided, it has made special provision for people of moderate means, and has proved its desire to advance the cause of labor becoming capital. In all of these policies and features, Mitten Bank closely parallels the Brotherhood Bank and the proposed merger will therefore not only maintain for our stockholders and depositors the same advantages which they have heretofore enjoyed but will provide greater resources on which to build for the future.

Legislation for Boston "L" Fails —Valuation Ordered

The House of Representatives adopted on April 26 an order for a valuation of the Boston Elevated Railway, Boston, by the Department of Public Utilities. This becomes effective without action by the Senate. The order follows:

> Ordered, That, as an aid in determining the disposition to be made of the Boston Elevated Railway and its property, including the question of extending or terminating public control of said company, the Department of Public Utilities is hereby directed to investigate the value for transportation purposes of the property of said company, and whether this value is more or less than the option price provided for in Sec. 16 of Chapter 159 of the special acts of 1918, and also whether the value of said property for transportation purposes has been increased during the period of public control through expenditures from carfares and other revenue for maintenance, depreciation reserves or otherwise, and if so, how much.
>
> The department is also directed to investigate as to the reproduction value of the property of said company and to report its opinion as to the amount thereof, less a proper deduction for depreciation and obsolescence. It shall also state its opinion as to the value of the surface lines abandoned by said company. The public trustees charged with the management and operation of said company under said Chapter 159 are hereby directed to furnish said department, on its request, with all facts, figures and other data in their possession that may be of assistance to the department in making such investigations. Said department shall report to the House of Representatives its findings, together with such data as it deems pertinent, by filing the same with the clerk not later than Dec. 1 in the current year.

In commenting on the failure of the Legislature to enact laws to help Boston solve its transportation problem, Governor Fuller said:

> I am tremendously disappointed after urging upon the Legislature in January that the most important matter to come before it had to do with the Boston Elevated; that it should be satisfied in the closing days of the session to promulgate a few questions and then adjourn without doing anything to settle the transportation question for the Metropolitan District of Boston which has to do with the comfort, convenience and accommodation of the working people of this great metropolitan district, and all this without a record vote. This subject has been debated for three years, going on four years.
>
> I should think the members of the Massachusetts Legislature would insist on staying in session if it took all summer to settle this question and settle it right.

Monorail Proposal for Detroit Under Advisement

The City Council of Detroit, Mich., has taken under advisement the question of acting on the proposal of the Rapid Transit Corporation of America to install a monorail line in that city. This course was decided upon following a hearing at which statements made by Del A. Smith, general manager of the department of street railways, about the monorail proposal were characterized by the monorail company's spokesman as "all wet."

The Rapid Transit Corporation proposes to install the system without cost and in return for a share of the fares to let the city operate it for 50 years. Service at 60 miles or more an hour is promised, and it is proposed to operate the line from Miller and Eight-Mile Roads to Jefferson Avenue and thence east across the city, doubling back by way of Chalmers Avenue and Eight-Mile Road.

Utilizing railway to assist refugees

Flood Not Serious for Electric Railways

All factors taken into consideration, the past few weeks have been very difficult ones for the public utilities in the flooded section of the Mississippi Valley states, and next to the work by the Red Cross, these companies have done more than any other one agency to relieve the terrible conditions in the various communities served. The value of their service cannot be estimated.

Contrary to the many reports about conditions in New Orleans, the city is secure and in no danger of being flooded by the waters of the Mississippi River. The New Orleans Public Service, Inc., which controls the important utilities of this section, reports business as usual and independent companies are serving power to adjoining parishes, including St. Bernard and Plaquemines below the city, where an artificial crevasse was created as a further protection to this city.

Outside of New Orleans only three other cities in the lower flood region enjoy electric railway transportation. They are Baton Rouge, Shreveport and Lake Charles. The former, while on the river, is high and dry and the latter two are out of the flood area. According to reports transportation has not been interrupted at Vicksburg, Miss., where the crest of the big flood passed recently.

At the mention of many other cities there flashes in kaleidoscopic view transmission lines patrolled with airplanes and motor boats and fleets of trucks and launches escorting people to safer regions. A fitting tribute was paid the public service companies by Secretary Hoover, following his arrival at New Orleans after studying conditions on the Mississippi. On this point he said: "Had it not been for the transmission lines interconnecting the towns and cities in Arkansas and Mississippi conditions would have been much worse, for no matter where people were forced to go by the floods, there they would find electric service and all of the comforts it implies."

Rebuilt Cars Dedicated at East St. Louis

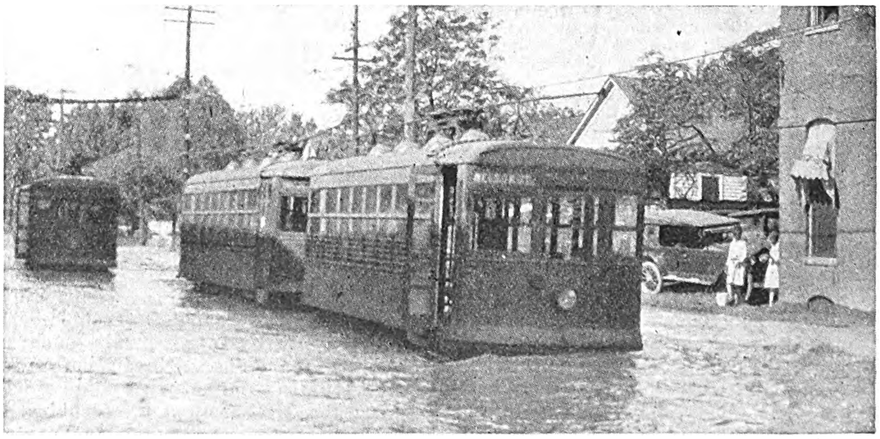
Very unusual dedication ceremonies were held at Jones Park in East St. Louis, Ill., at 2 p.m. on Tuesday, May 10, when prominent matrons of the city christened six "new type" cars for use on the lines of the East St. Louis Railway's Lansdowne division.

It was not generally known that the cars had been rebuilt for the company by the St. Louis Car Company, St. Louis, Mo., as the work was so complete and well done even experts found it difficult to believe that the equipment they were inspecting was rebuilt.

As one of the features of the dedication of the new cars the company, through W. H. Sawyer, president, extended special courtesy passes good during non-rush hours on the city lines to all women of the Lansdowne district who registered at the inspection of the cars. Many took advantage of this offer.

The passes permitted each woman and party to ride between 9 a.m. and 3:30 p.m. and between 6:30 p.m. and 12 midnight on May 10, 11 and 12. The passes were not valid for any part of an interstate fare because of the limitations placed on such service.

The address of welcome was by President Sawyer on behalf of the East St. Louis Railway. This was followed by the unveiling and dedication of the cars. Then came the inspection of the cars by the general public, registration by the ladies of Lansdowne and the parade of the cars with Boy Scout buglers as an escort.



Relentless floods submerged cars at Greenville, Miss.

Safety Crusade in Milwaukee

A street car and a bus crusading in the interest of safety have been placed in operation by the Milwaukee Electric Railway & Light Company, Milwaukee, Wis., for a month's visual accident campaign, to impress the public with the need of special caution as the seasonal increase in the use of motor vehicles gets under way. Both the car and bus are painted ivory, with safety slogans standing out in vivid green. The car will be operated for two days on each one of the fifteen lines and the bus will be run over the regular bus routes during May. Both vehicles, which transport passengers, carry large front signs "Bound for Safety." They will also be taken to schools, where the driver will tell the children of the increasing traffic hazards.

Gage Change of Radials Opposed

The Council of New Toronto, Ont., has instructed its solicitor to oppose the request of the Toronto Transportation Commission before the Ontario Railway and Municipal Board, for permission to change the gage of the Lake Shore radial line until such time as the board has considered the application New Toronto has before it of what proportion the owners of the street railway are to pay towards the widening of the highway.

Gage-changing is regarded as the crucial step toward linking up the radials with the city system and with each other, enabling the Toronto Transportation Commission to put the resources of each at the disposal of all and effect economies which would at least reduce the annual losses. As one commentator said, it is discouraging to find that neighbor municipalities which now receive electric railway service at Toronto's cost are objecting to the one procedure which can reduce the drain upon Toronto's treasury. It is pointed out that the linking up of radial and city lines will mean better passenger service to the center of the city and quicker express service to downtown points for the people of the territory which the radials serve. A statement said:

> Without the improvement in finances which gage-change would make possible, there can certainly be no improvement in service. Toronto might even be forced to abandon the radials altogether. It is in the interests of all radial municipalities that the York interurbans should be put on a more sound financial basis than that which at present exists. It cannot be done unless the gage is altered.

Providence After Metcalf Trophy

The United Electric Railways, Providence, R. I., has been entered in the 1927 contest for the Metcalf trophy. For the past two years the public utilities of Providence, except the railway, have competed for this trophy. The contest is handled by the Providence Safety Council. *All Aboard*, the official publication of the company, states that the good work now being accomplished by the company should continue. The company hopes that when January, 1928, rolls around it will be found that the record made by it in connection with the factors of the award will be sufficient to bring the trophy to the company. The principal factor for the award is the time lost during the given period, using the number of man-hours worked as the basis.

New Fare Schedule on Northampton Lines

The Northampton Street Railway, Northampton, Mass., has notified the Public Utilities Commission it intends to increase the fares on its lines, effective May 30. The increase in rates is from 1 to 2 cents over the present fare of 7 and 8 cents. Under the new régime a 6-cent fare territory has been established. Under the new plan tickets can be purchased in strips of five for 40 cents, each good for an 8-cent fare; five for 50 cents, each good for a 10-cent fare, and five for 30 cents, each good for a 6-cent fare. Special tickets will be available for one continuous passage between points in section J (Hadley to Amherst) and the railroad station at five for 60 cents. Special tickets at two for 30 cents can be had for a continuous passage from the Academy of Music to any point in the Mount Tom Junction section. School tickets can be purchased in strips of ten at half rates.

Winners Announced in Foshay Advertising Contest

Miss Gertrude Percival, New York, won the first prize of $2,500 in an advertising contest conducted by the W. F. Foshay Company, public utility operators. Second prize went to E. H. Steinmetz, Minneapolis, and to G. S. Ryan, Minneapolis, who made a joint entry. Their manuscript and illustrations won $1,000. Miss Marchette Chute, a first-year student at the University of Minnesota, received third prize, $500. Ten additional prizes of $100 each were awarded.

Coming to Philadelphia: Little Nellie Kelly

Three evenings a week out at the Luzerne carhouse men and women of the Philadelphia Rapid Transit Company are taking fancy steps and repeating smart lines under the direction of a professional dancing and dramatic coach. They have been doing it now for several weeks and the progress so far made augurs well for "Little Nellie Kelly," to be produced at the Academy of Music on May 16, 17 and 18, the proceeds to go to the helping hand fund.

There is talent galore among the employees, and it is not the first time they have put on a show, but no other show has ever provoked so much comment in anticipation of its presentation. This isn't blah. It's a fact. Even the *P. R. T. Co-operator*, Vol. 1, No. 3, for April 28, 1927, was out in new dress in honor of the event. Never before, so far as can be remembered, did the little paper contain such uproarious cartoons. Never before did it scintillate so much with stage stories. Even Mr. Mitten must have rubbed his eyes when he gazed upon the cartoon of Joe Holland and Dorothy Snyder as "Jerry Conroy" and "Nellie Kelly."

News Notes

Seeks Ten-Cent Rate.—Right to collect a 10-cent fare on its Sandusky, Ohio, city lines is sought in a franchise proposal presented to the City Commission recently by the Lake Shore Electric Railway. The franchise under which the company is operating there expired a year ago. Commissioner Schade said that although the present 5-cent fare was likely too low, prevailing conditions considered, he would never vote to permit a 10-cent charge.

Railway Carries Morning Mail. — Early morning mail from Milwaukee will hereafter be carried by the interurban cars of the Milwaukee Electric Railway & Light Company, Milwaukee, Wis. The United States postal authorities have granted the request of the citizens for this service, which will be started at once. The Waukesha newspaper commends the railway for its speedy co-operation in serving the city with morning mail.

Modern Methods in Sacramento.—Cars of the Pacific Gas & Electric Company operating in Sacramento, Cal., will hereafter be designated by numbers rather than by street names, as in the past. The numbers will be carried in a conspicuous place on the cars and for the convenience of the public the street name of the line will be carried on the dash of all cars for the time being. This announcement was made by E. W. Florence, division manager, who also said that hereafter in the issuance of transfers it will no longer be necessary for the passenger to inform the conductor or motorman where he was going. Under the new system he need only request the transfer.

Close-Ups in Boston.—The Boston Elevated Railway, Boston, Mass., is running on the cover of *Co-Operation*, its pamphlet, close-ups of its employees in various departments. The subject may handle plant or equipment with a view to maintaining it. The April issue shows the car operator handling his equipment by giving direct service to the patrons of the railway. After a glance at the close-up the reader is directed to another page which explains the illustration and the duties of the operators.

Extend Service Over South Side Route.—Direct and more frequent service to downtown Chicago was made available on April 10 to a heavily populated district in the extreme southeast portion of the city when the route of the through Cottage-Grove-South Chicago Avenue cars, heretofore turned back at 93d Street, was extended nearly 5 miles to Ewing Avenue and 180th Street. Under the new plan no transfers will be necessary to reach the downtown district, the headway over this line will be slightly increased and considerable duplication of local, crosstown service will be eliminated. Use was made for the greater part of the distance of tracks over which the Hammond, Whiting & East Chicago interurban cars operate.

Recent Bus Developments

Gary Railways Supplements System with Coach Lines

Two new motor coach lines in Gary, Ind., have recently been added to the co-ordinated railway and motor coach system of the Gary Railways. The new routes serve a section of the city heretofore without public transportation of any kind. They provide in one instance a special luxurious type of express service and in the other a local service during rush hours to and from the steel mills.

Coaches of the former line, known as the Broadway-52d Avenue service, operate on an hourly headway over a route 5¾ miles long between a high class residential district on the south side of the city and the downtown station of the Chicago, South Shore & South Bend, where connection is made with fast electric trains for Chicago.

The route is paralleled three-quarters of the way between terminals by street car tracks, on which a fifteen-minute headway is maintained. The motor coaches operate as expresses for about one-half the distance through the downtown sections, the running time for the same distance being from eight to ten minutes less than that of the street cars, which make all stops. The fare charged is 15 cents, compared with the 8-cent street car rate. Transfers are issued to other car and bus lines.

One of the coach routes just added, and known as the Harrison Street line, is approximately 6¼ miles long. It serves a newly developed residential area in the southwest portion of Gary as well as a densely settled section of foreign population lying close to the downtown business district. Service is maintained with 21-passenger city type motor coaches during the morning and evening rush hours only. The fare is 10 cents with universal transfers. Both lines have been established for an experimental period of 90 days by agreement with the city administration.

Hearings on Albany Bus Fare Concluded

Commissioner Lunn concluded the earings on May 11 on the petition of he Capitol District Transportation ompany, Inc., for a change in its passenger rates of fare in Albany, Troy, ohoes, Rensselaer and in the town of uilderland, in New York, and for per-nission to file new tariffs. The bus com-any seeks to have the fare the same as hat charged by the United Traction ompany, the bus company being a subsidiary of the traction company and upplementing its operation. The ap-lication of the traction company for hange in fares has been heard by the ommission and decision is pending.

At the beginning of the hearing on ay 11, Michael D. Reilly, counsel for e city of Albany, asked for the dis-issal of the petition on three grounds: irst, that the question of segregation f the various lines of the company was still before the commission for decision; second, that the city questioned the right of the company to use as a basis for calculation for rate-fixing purposes the value of property which the traction company or the bus company leased or rented from other companies, and third, the right of either company to use as a rate base the reproduction value of its property, without allowance for depreciation. In connection with the question of segregation, Mr. Reilly called attention to the franchise granted by the city of Albany to the bus company in which it was provided that fares and transfer privileges applicable to the United Traction Company would be the same as for the bus company.

Commissioner Lunn stated that inasmuch as the two cases were so closely related, he would receive the evidence and refer the questions to the commission. Briefs are to be in May 25.

Duplication Not the Answer in Buffalo

The New York State Public Service Commission has issued an order denying the application of the Buffalo Motor Coach Corporation, Buffalo, for a certificate of public convenience and necessity to operate four bus lines in Buffalo in competition with the International Bus Corporation, a subsidiary of the International Railway. In a memorandum on the application, Chairman William R. Pooley called attention to the fact that the International Railway covered 23 miles of the proposed routes of the Buffalo Motor Coach Corporation and the International Bus Corporation operates three lines which serve practically all sections of the city. In its order the commission says that duplication of transportation is not the solution of Buffalo's transit problems. The report was unanimous.

The Buffalo Motor Coach Corporation is sponsored by Ernest M. Howe, Detroit. The company was granted franchises by the Buffalo City Council for the operation of four bus lines in the city on an 8-cent fare with free transfers to connecting lines. The International Bus Corporation charges a 10-cent fare.

Pennsylvania 3-Cent Gas Bill Signed

The 3-cent gasoline tax bill in Pennsylvania was signed by Governor Fisher on April 13. It is estimated that this will produce $22,000,000 of revenue for the next biennium. The bill makes the current 2-cent tax a permanent impost, with the extra cent an emergency levy for the next two years. Provision was made that the entire amount collected from the extra cent—or temporary tax —will be placed to the credit of the motor fund for use by the Department of Highways. The counties will receive one-fourth of the permanent tax of 2 cents a gallon.

Bus Bill Gives Wisconsin Commission Control

After prolonged efforts, street railway interests, independent bus operators, the league of municipalities and the brotherhood of railroad engineers finally agreed on a proposed bus bill and appeared before an assembly committee in Madison, Wis., in support of its passage. Truck owners were the only objectors. The committee recommended the bill for passage immediately after the hearing.

The bill places buses under the regulation of the Wisconsin Railroad Commission, provides for the issuance of a permit to operate, regulate routes and fares and calls for a fee of $25 for a certificate, with an additional charge of $40 for each bus. A special tax is placed on the basis of weight and miles traveled. Cities are given the right to designate routes and to charge a special fee.

Seeks Bus Permit.—The Milwaukee Electric Railway & Light Company has requested the Common Council for a permit to operate a new bus line between North Milwaukee and the A. O. Smith Corporation plant, with transfer privileges to the Milwaukee cars. The request was referred to a committee.

No Stage Line Needed.—Finding that the service maintained by the Petaluma & Santa Rosa Electric lines is adequate and efficient, and that its connections with the Northwestern Pacific Railroad and the Sausalito, Petaluma & Santa Rosa Stage line are adequate and convenient, the Railroad Commission recently denied the application of C. A. Johnson for a certificate to operate a stage line connecting Sausalito and Sebastopol.

Field of Toronto Commission's Activity Extended.—Power has finally been given to the Toronto Transportation Commission, Toronto, Ont., to operate bus lines outside the city. The commission made a strong bid to have the board of control of Hamilton withdraw its opposition to the private bill, which would enable the commission to operate such service. During the week of May 1 the Toronto-Niagara Falls buses ran to Niagara Falls, N. Y., for the first time. Many local manufacturing interests supported the claims of the commission for legalizing operation of the route to Niagara Falls and operation for chartered bus parties.

Buses Substituted.—The Public Service Commission has granted the petition of the New York & Stamford Railway and approved the declaration of abandonment of the line in Port Chester on North Main Street from Mill Street to the state line between New York and Connecticut. In December, 1926, on petition of the company, the commission granted a petition for the abandonment of the Westchester Avenue line and the North and South Regent Street lines. Permission is granted by this order to abandon the remaining portion of the route on North Main Street, which the company alleges should have been included in the previous application. Buses have been substituted for street cars, operated by the County Transportation Company.

Financial and Corporate

Dividend Policy Explained

Circumstances Connected With Passing of Brooklyn City Dividend Reviewed —$11,000,000 for Improvements

The directors of the Brooklyn City Railroad, Brooklyn, N. Y., at a meeting held on May 3 determined that it was to the best interests of the company that no dividend should be paid at this time. The directors felt this suspension of dividends would be a hardship to many, but the earnings are being put back into the property, constantly increasing its value. This will, of course, accrue to the benefit of the stockholders.

The facts thus set forth were made plain in the ELECTRIC RAILWAY JOURNAL for May 7. They tell only part of the story. The company is earning in excess of $1,000,000 a year over and above all operating expenses, reserves for renewals and replacements and a sinking fund sufficient to purchase new rolling stock at the expiration of the life of the rolling stock bought in recent years, and interest on its outstanding bonds and car trust certificates. This does not include the annual installment on the principal of the car trust certificates, amounting to $375,000 a year. The officers of the company have been advised that these cars are capital improvements and they expect that securities will ultimately be issued to reimburse the treasury of the company for these expenditures.

As a matter of fact a plan presented by the directors for a general and refunding mortgage and the sale of $2,500,000 of 6 per cent bonds to be issued thereunder was approved by the stockholders on Dec. 7, 1926, and again at the annual meeting of the stockholders, held on Jan. 10, 1927. Application was then made to the Transit Commission for its approval. Hearings terminated on Jan. 24, but on March 10 the commission denied the application, with leave to the company to renew. The commission, in its decision, raised a number of questions which involve the lease dated Feb. 14, 1893, to the Brooklyn Heights Railroad and the so-called construction account, now in litigation.

Since the separation of the property from the Brooklyn Rapid Transit in October, 1919, the Brooklyn City Railroad has expended for the purpose of extending and improving its service approximately $11,000,000 for capital additions, betterments and improvements. Of this amount approximately $1,000,000 was derived from the sale of capital assets. Additional securities have been issued and are now outstanding in respect of such expenditures as follows: $4,000,000 of stock issued in September, 1924, as a stock dividend and $3,000,000 of equipment trust certificates, of which $750,000 have been retired. The balance of such capital expenditures, something more than $3,000,000, the railroad's officers believe could be capitalized under the law. In the belief that the commission would approve the proposed general and refunding mortgage and the issuance of securities thereunder, which the company had arranged to sell, it borrowed some $800,000. The action of the commission denying the application must result in a considerable delay in any proposed financing. H. H. Porter, president of the company, points out that under decisions of the Supreme Court of the United States in valuation cases concerning other utility companies the property of the Brooklyn City Railroad has a value largely in excess of the par value of its stocks, bonds and all other securities.

Texas Line Surrenders Railway Charter

Economic necessity is given by the Paris Transit Company, Paris, Tex., as the reason for the surrender of its charter to the Secretary of State. The company has owned and operated the railway system of Paris 37 years. It began with old-time mule cars, but in 1894 it converted the system to electric operation. Notwithstanding the fact that Paris has grown to a city of more than 15,000 population, the company finds itself unable to compete with the private automobile and the "For Hire" car and has decided to abandon its lines. W. G. Moore, manager, said that in authorizing fare increases and preventing bus competition the city officials had undoubtedly prolonged the life of the company, but the competition from privately owned automobiles reduced the revenues of the company to a point where hope had disappeared that the line could ever again be made profitable. The company operates 5.5 miles of line.

Philadelphians Purchase Washington-Virginia Road

The Washington-Virginia Railway, which operates a railway line connecting Mount Vernon, Alexandria, Washington, D. C., Falls Church and Fairfax Courthouse, has been sold under the hammer, including equipment, and brought $575,000. The purchasers represented bondholders and noteholders and were all Philadelphians. It is understood they will operate the road just as soon as the sale is confirmed by the court.

The property was sold in parcels. Lewis H. Parsons bought the Mount Vernon division, extending from Washington to Mount Vernon, for $300,000; the Falls Church division went to John McMullin of Philadelphia for $150,000; the equipment to John Wayne of Philadelphia for $125,000.

The road has 60 miles of track and there were outstanding bonds totaling $3,500,000. It has been in the hands of receivers since November, 1923.

Approval of $20,000,000 Brooklyn Refunding Issue Sought

The New York Rapid Transit Corporation, the subway operating subsidiary of the Brooklyn-Manhattan Transit Corporation, applied to the Transit Commission on May 7 for permission to issue $20,000,000 in additional refunding mortgage 5 per cent sinking fund gold bonds. The proceeds will be used to cover $3,375,000 spent for equipment from July 1, 1923, to April 1, 1927, and $12,625,000 for the purchase of equipment for subway and elevated lines.

William S. Menden, president of both the B.-M. T. and the Rapid Transit Corporation, told the commission that the B.-M. T. proposed to take over the $20,000,000 in bonds at 80 per cent of par, or to pay $16,000,000 for them. He said this was all that could be obtained for the bonds in open market. Duncan A. Holmes, vice-president Chase Securities Company, confirmed this assertion, and added that 80 per cent was all the bonds would fetch.

Of the $12,675,000 to be spent, $9,700,000 will be for operating equipment, mostly for 363 new steel cars which the company has been directed by the commission to buy, and $2,700,000 will be for the Fourteenth Street-Eastern line shops and yards. Transit Commissioner Leon G. Godley reserved decision on the application.

Stockholders of Grand Rapids Company to Meet May 25

Stockholders of the Grand Rapids Railway, Grand Rapids, Mich., at a special meeting on May 25 in Grand Rapids, Mich., will act upon the proposed readjustment of the finances of the company in accordance with the plan outlined in the ELECTRIC RAILWAY JOURNAL for April 16, page 718. This plan of readjustment contemplates the organization of a new company to take over the assets of the present company and the cancellation of all of its common stock, and extinguishment of $600,000 of its indebtedness through the issue of common stock of the new company, and the exchange of preferred stock on the basis of two shares of new company common stock for one share of present preferred stock, the depositors of which are also offered subscription rights. The plan also provides for the authorization of additional preferred stock by the new company to provide funds further to reduce existing indebtedness and for other corporate purposes.

Question of P.R.T. Underlying Companies Again

Governor Fisher of Pennsylvania on May 3 signed the Daix bill enabling the city of Philadelphia to institute proceedings for the condemnation of the underlying companies of the Philadelphia Rapid Transit Company and the Philadelphia Rapid Transit Company itself. Under the Daix act the city need not take the entire system, but may condemn the underliers only, if it so desires. Mayor Kendrick expressed satisfaction when he heard about the Governor's act. He said he thought it was a step in the right direction and would aid materially in the solution of the transit problem in Philadelphia at some future date. Under the Daix act the city could condemn and acquire not only all surface, underground and elevated transit facilities but also buses, taxicabs and trackless trolleys within the city, and leases for such operation and all plant and equipment connected with these facilities.

Seattle Financial Status Improves

The Seattle Municipal Railway system, Seattle, Wash., is recovering from the strain of a $1,100,000 bond interest and principal payment which followed refusal of the local banks to assist the utility over a financial emergency. By June 10, it became known recently, the railway will have paid off, out of its current earnings, $735,000 loaned from other city funds to tide it over the recent crisis and will have no indebtedness outstanding except bonds and warrants representing capital investment.

In order to have ready the money due on March 1, 1927, to Stone & Webster as interest and principal on the railway purchase bonds, the city treasurer started on Dec. 19, 1926, to turn all the railway's daily receipts into the special bond interest and redemption fund. At the same time the railway's current fund, known as the city railway fund, was placed on a warrant basis. When the banks refused to cash the payroll warrants, two loans totaling $735,000 were made from the city light department. So rapidly have these loans been repaid that now only $250,000 remains unpaid. It is expected this sum will be wiped out within the next five weeks. On Aug. 1, 1927, it will be necessary to have on hand $255,050 to meet the semi-annual interest payment on the purchase bonds due on Sept. 1, but the city officials believe this can be handled without the need of putting the railway fund on a warrant basis.

Figures Show Trend in Sioux City Since Fare Increase

In March, 1927, the first month the rate of fare on the cars of the Sioux City Service Company, Sioux City, Iowa, was advanced to 8 cents and two tickets for 15 cents, passenger revenue showed an increase of only 2.20 per cent, while the revenue passengers showed a decrease of 13.8. That month happened to be a poor riding month due to nice weather and also to the agitation over the fare increase. During April, a good riding month due to rainy and cold weather, the passenger revenue increased 11.09 per cent, while the number of revenue passengers decreased 6.43 per cent. This is in line with the previous decrease in the company's revenue passengers.

Company officials are said to believe this condition to be difficult to correct as it is due to the preponderance of automobiles. During 1926 the company suffered a decrease of 7.60 per cent in the number of revenue passengers carried and 7.70 per cent in passenger revenue. The old rate of fare was 7 cents with four tokens for 25 cents.

Passenger Receipts Slightly Lower in Allentown

The operating results of the Lehigh Valley Transit Company, Allentown, Pa., for 1926 do not compare favorably with those of former years. This was the initial statement of P. B. Sawyer, president, in his report to the stockholders. Passenger receipts are still on the decline, although the loss has been offset in a measure during the latter part of the period by the establishment of bus service operated where that form of transportation appears to be practical and more economical than railway service. Owing to increased expenditures for maintenance, the current operating expenses have increased approximately 2 per cent.

CONSOLIDATED INCOME ACCOUNT OF THE LEHIGH VALLEY TRANSIT COMPANY AND SUBSIDIARIES FOR THE YEARS ENDED DEC. 31.

	1926	1925
Total gross earnings	$4,950,443	$5,047,104
Total operating expenses including taxes	3,710,217	3,603,062
Net earnings from operation	$1,240,226	$1,444,041
Income from interest on bonds	977	906
Income from interest on notes and deposits	28,025	3,618
Income from dividends on stocks	110,075	110,075
Total net earnings	$1,379,303	$1,558,642
Depreciation allowance	$277,712	$377,798
Interest—funded debt	599,585	599,802
Amortization of discount and expenses	21,593	21,705
	$898,890	$999,306
Net income	$480,413	$559,335

The physical property of the company has been adequately maintained and the transportation service supplied to the public has been kept up to the past standard.

With the approval of the Public Service Commission, the company has abandoned 11.9 miles of line between Wales Junction and Chestnut Hill and the service is now being supplied by buses, operated by the new subsidiary, the Lehigh Valley Transportation Company. In addition to this service, the company has entered new territory with a bus line operating on Turner Street, Allentown. These additions bring the total buses operated by the bus company to sixteen, covering four routes.

The company is now operating, in addition to the bus service 312 passenger, freight and work cars, over 203 miles of track. The accompanying table shows the income account for 1926 compared with 1925.

Depreciation Case Goes Over

Postponement has been secured by the electric railways of the hearing by the Interstate Commerce Commission on the depreciation case. This deferment will hold until further order of the commission.

Lucius S. Storrs, managing director of the American Electric Railway Association, said that the electric railways were fortunate in having additional time to prepare carefully the case of the electric carriers and must be able to present to the commission the complete economic and statistical aspects of the theory of depreciation as applied to the electric railroads and as called for by the forms previously sent out. For the purpose of having this complete presentation it will be necessary actively to continue collecting and collating the statistics of the industry. The committee now at work desires the hearty support and co-operation of all in the industry. All those who have not already filed their answers to the association's depreciation questionnaire are requested to do so as promptly as possible.

Net Earnings Show Improvement.—For the year ended Dec. 31, 1926, the gross revenues of the railway department of the Northern States Power Company and subsidiaries were $268,705, against $277,578 for the year previous. Net earnings showed a loss in 1926 of $30,654, against a loss in 1925 of $61,858. The Northern States Power Company is operated by the Byllesby Engineering & Management Corporation and runs railway lines in Fargo, N. D.; Eau Claire and Chippewa Falls and a line connecting Eau Claire, Chippewa Falls and Altoona.

Defaults on Bond Payment.—Talmadge G. Cherry, vice-president of the Rochester & Syracuse Railroad, Inc., Syracuse, N. Y., announced on May 2 that the company was obliged to default the payment of $62,500 interest on the $2,500,000 of 5 per cent gold bonds of the company. Mr. Cherry declared that the road would continue to function as in the past.

Net Income Increases.—For the first quarter of 1927 the gross revenues of the Twin City Rapid Transit Company and subsidiaries, Minneapolis, Minn., were $3,665,898, against $3,839,102 for a similar quarter of the year previous. Operating expenses fell off from $2,794,755 to $2,608,388 for the 1927 quarter. After the consideration of fixed charges and taxes the net income for the 1927 quarter was $481,402, against $448,360 for the first quarter of 1926.

Deficit in Buffalo.—For the three months period ended March 31, 1927, the operating revenue of the International Railway, Buffalo, N. Y., was $2,515,944, against $2,709,594 for a similar period in the year previous. Expenses and taxes increased from $2,283,271 in the 1926 period to $2,290,797 in the 1927 period. After the consideration of income deduction, the three months operation of 1927 ended with a deficit of $124,888, against a net income of $64,298 for the period from January to March, 1926.

Settlement of Affairs of Indianapolis Property Awaited.—A step nearer settlement of the affairs of the Indianapolis & Cincinnati Traction Company, Indianapolis, Ind., was taken recently with attorneys filing additional special findings in the foreclosure of the $2,000,000 mortgage. Resumption of the case follows a recess due to the death of Charles L. Henry, founder of the line and its president and receiver. It is expected that Judge Will M. Sparks of the Circuit Court at Rushville, Ind., will name another receiver. More than fifteen attorneys, representing many clients, are interested in the case.

Book Reviews

Mathematical Principles of Finance—Second Edition

By Frederick C. Kent. New York, N. Y.: McGraw-Hill Book Company. Price, text alone, $2; text with tables, $4; table alone, $4.

Frederick C. Kent, associate professor of mathematics Oregon State Agricultural College, has revised this textbook on the mathematics of investment and insurance. In the new edition special attention has been given to interpolation methods. The original problems have been simplified and many additional practical problems have been added. The book covers the fundamental principles of the theory of interest and annuities and gives application to valuation, depreciation, amortization and other financial elements.

What Price Progress?

By Hugh Farrell. New York: G. P. Putnam's Sons. 323 pages. Price, $2.50.

Here is a book akin in some of its aspects to "Anticipations," by H. G. Wells. The subject of the author is the stake of the investor in the discoveries of science appraised in the light of the question: Is America keeping step with the rest of the world in the application of science to industry? The publisher of "What Price Progress?" is correct in his statement that this book answers that question. It boldly sets forth that which is and that which is not being done toward holding the country's place in the economic world. And the author does so in simple, non-technical language, in a style that has been likened to that of Matthew Arnold.

Not many of us have thought about it in that light, but the chemist is making a new world. Mr. Farrell makes plain how this is being done. He also makes plain how many other things are being done. He has a positive genius for uncanny presentation of facts. What, for instance, could be more engrossing in a discussion such as that of Mr. Farrell's than to couple under one head paint, silk stockings and dynamite and at another point phonographs, photographs and philanthropy. There is alliteration in the one and the idea of catastrophe in the other.

It is hardly an exaggeration to say that the book should appeal to everybody everywhere with an intelligent interest in the progress of industry. Of special interest to railway men is the chapter "Science and the Railroads." Here much that is controversial is touched upon by the author, but whether or not one agrees with all that Mr. Farrell says, there can be no question about the stimulating effects upon the reader of what he has set down. The author sees the railroads in the grip and under the domination of the rate makers. He says their only hope of adequate returns on their capital appears to lie in the direction of increased efficiency and lower costs of operation. Least of all, can they afford to look with complacency upon the drying up of the sources of new knowledge.

While he does not minimize the good work along scientific research lines that has been done in the United States, Mr. Farrell feels that there is not in this country the interest in and the understanding of the immense importance to every sort of scientific research, both pure and applied, there should be, and that unless industrial leaders and investors change their methods and bring American industry to the front by full utilization of scientific help it is likely to be outstripped in the keen competition of these modern, scientific times. He says:

> Every application of science which results in lower production costs through either a saving in labor or in raw materials, or which gives a new, useful product or increases the use of old products is directly beneficial to every man, woman and child living in the areas served by the industries making the improvement. The benefits extend even beyond that, they go to generations yet to come and to remote corners of the earth.

At the risk of repetition, be it said again of Mr. Farrell that there is nothing of Dryasdust about him.

Making Transportation Pay

A digest of presentations made by electric railways to the Charles A. Coffin Foundation; edited by Henry H. Norris, with an introduction by Frank R. Coates. American Electric Railway Association, New York. 227 pages, exclusive of appendix and index. Price, $2.

Important changes have been made in this, the fourth in the series of "Electric Railway Practices." Most significant, of course, is the change in name of the volume to "Making Transportation Pay." Sprinkled through the book at the bottom of some fifty pages are principles which start with "Better Service Is the Answer to the Problem of Competition," and finish with "A Fair Valuation Includes Going Value." It may appear that emphasis of the last-mentioned innovation just at this point is out of proportion to its significance. While the change is, of course, one of typography, it is noteworthy because it has resulted in emphasizing principles that need constantly to be reiterated. This list of principles, for that is what it really is, distributed throughout the chapters epitomizes many of the outstanding characteristics of good electric railway service in a form calculated to attract attention. The principles should prove useful in advertising, in educational work and in other directions. They are in line with the general tendency to formulate codes and creeds based on experience and conviction. The principles are based on the text of the book, but the editor has had the co-operation of the managers of the companies represented in the volume in formulating them and in estimating the relative importance of the different achievements of the companies.

If ever a book were the bible of an industry, "Making Transportation Pay" is that book. This does not mean that the practices set forth therein are the only ones to be followed in a given case. No one would be so foolish as to make any such claim, but the practices of the contestants as set forth represent the application of principles that have been tried and not found to be wanting. The topics were selected and the material classified to show, first, the present status of the electric railway as a revenue producer, as a public service agent and as a part of the community. Then the ways in which this status has been improved are described. Finally, the means for operating a property more economically and smoothly are taken up and illustrated.

As H. H. Norris, the editor, points out, a comparison of this volume with its predecessors will disclose the particulars in which progress is being made most rapidly at present. Most noteworthy is the place being given to the bus. Co-ordination of rail and bus is already taken as a matter of course, but numerous details are still in the problem stage. Progress is being made in the accounting aspect of co-ordination. It is essential to know just what bus operation is costing in order that service may be rendered with full knowledge even if it cannot be directly profitable.

Attractiveness of all equipment is another element now recognized as essential to good service. Cars and buses are being designed with due reference to comfort, brightness, noiselessness and safety, all features which appeal to the public. This does not imply that the operating and maintenance features, like durability, general reliability and low power consumption, are being overlooked. The reverse is true. But the aim is to make service salable, as well as efficient; hence the present stress on items of strong public appeal. This leads directly to salesmanship, which now is taken to include a wide range of activities, such as public relations, advertising and ride-selling fare plans, as well as direct selling.

From the beginning of the series the "Practices" have been segregated somewhat in order to make them readily accessible for reference. In the present volume the segregation has been carried farther, bringing together, for example, in one chapter the items of greatest interest to the master mechanic, in another those of interest to the way engineer, and so on. Thus construction and maintenance in a given department are brought together, which will render easier than before the finding of any one class of articles.

But to return to the physical make-up of the volume. In the early part the electric railway is considered largely from the standpoint of the public; in the latter part from that of the management. In other words, the quality of the service is first set forth and then the ways in which the quality is maintained are taken up in detail.

In his foreword to the volume Frank R. Coates, president of the American Electric Railway Association 1925-1926, is correct in the statement of his belief that it will profit every electric railway looking for ways to make public transportation pay to study carefully the many methods employed by all of the contestants for the 1926 Charles A. Coffin award. In fact, the main title, "Making Transportation Pay," was selected for the volume because it epitomizes the present trend of managerial thinking. The book shows that transportation is being made to pay, and therefore can be made to pay even more generally. Still more important than this, the volume tells how to do it.

Benjamin Garver Lamme

Late chief engineer of the Westinghouse Electric & Manufacturing Company. An autobiography, New York, N. Y.: G. P. Putnam's Sons. 1926. 271 pages. Price $3.

B. G. Lamme was a great engineer, and his autobiography is more than an account of the personal accomplishments of the man. Beneath the record of events which is set down the reader will quickly discern the reasons for the author's success. It is true that the book is primarily an engineering history, but as much as Mr. Lamme might seek to mitigate his own part in the record of engineering accomplishments the record of his interest in people and his sympathy for the problems arising from human causes shines through the formal record. This was inevitable. And the human characteristics weave themselves into the descriptive matter so inconspicuously as to hold the reader's attention. One forgets the leaven because the bread is so good.

The manuscript covers a record of his first thirty years of engineering work. After it was nearly completed Mr. Lamme began to revise the material. This work he never completed. In editing the two manuscripts an attempt has been made to give every thing possible from his own memorandum to cover the development in the art of designing dynamo-electric machines.

The material has been grouped into ten chapters with an appendix. The first covers the life of Mr. Lamme from birth through college. The second relates his early test room experience and the third early machines from pre-calculated designs. The next four chapters cover different periods of development. Chapter IV covers the period of 1892 and 1893, with its relation of the work done for the World's Fair and on the Niagara power development. Chapter V takes the period of 1893 and 1894, when the induction motor began to receive serious consideration. Another chapter covers the period from 1895 to 1900, with its demand for alternating-current motors for use in hoist, crane work and the like. Railway electrification is treated in Chapter VII, which covers the period from 1901 to 1919. Three other chapters cover other lines of work done by Mr. Lamme, his personal traits and hobbies and his recollections of some old timers. On the whole, the work is an intimate history of the pioneer development of electrical engineering by one who took a leading part in it. It is especially inspiring to the young engineer.

Personal Items

Burt Hamerstrom Vice-President at San Francisco

Burt Hamerstrom, manager of the commercial department of the Market Street Railway, San Francisco, has been elected a director and a vice-president of the company. Mr. Hamerstrom will continue in charge of the commercial department. No other changes in the directorate or officers were made.

Mr. Hamerstrom's appointment to the company was noted in the ELECTRIC RAILWAY JOURNAL for Oct. 16, 1926, page 749. He spent about ten years as a newspaper reporter and feature writer in San Francisco, Chicago and Seattle. For more than ten years he has been associated with public utilities, serving with the United Gas Improvement Company and Welsbach Company in Philadelphia and with the North American Light & Power Company—Illinois Power & Light Company—in Chicago, where he helped to direct the commercial, customer - ownership, public relations and advertising activities for properties in more than 100 communities in several states.

Charles E. Smith Expert in New York City

With the keys of the city which were unofficially presented to him, Charles Edward Smith, transit expert, will try to unlock the Times Square door for the outpouring of New York City's millions. Mr. Smith, who was appointed by Comptroller Berry to make a transit survey, has already started upon his task, as was mentioned in the ELECTRIC RAILWAY JOURNAL, issue of April 16, page 712.

This Western expert, who will likely submit his report between May 30 and June 1, has had broad experience in railroad construction, in municipal development and in the service of the government. From 1897 to 1908 he acted as civil engineer for various municipalities, railroads, industrial organizations and for the government. In 1908 and until 1915 he was in charge of the maintenance and new construction of 7,000 miles of railroad for the Missouri Pacific. At that time he entered private practice in St. Louis, remaining in that work from 1915 to the outbreak of the war.

Since the war and with the exception of the interruption for war service Mr. Smith has been adviser to the city of St. Louis on railroads, river and utility matters. He built a reinforced concrete river terminal, negotiated franchises and made valuations for settlement of railroads and electric railway difficulties, acted as an arbitrator in wage controversies and gave expert testimony in law suits. Among his specific accomplishments are the construction of a railway belt line around Oklahoma City, electrification of 20 miles of track in St. Louis for heavy electric locomotives and building of numerous bridges for the Texas & Pacific Railroad. While in the government service he supervised and advised upon much of the war-time construction, particularly on undertakings in the South and West.

Mr. Smith was born in Somerville, Mass., in 1877. He received the degree of bachelor of science in civil engineering from the Massachusetts Institute of Technology in 1900. His society membership includes the American Society of Civil Engineers and A.R.E.A. He belongs to the Engineers Club of St. Louis.

Status of Appointments to Ohio Commission

In a Senate caucus it was decided not to confirm the nomination by Gov. Vic Donahey of Walter McKinney for the third place on the Public Utilities Commission of Ohio. However, this action was not reported out on the floor of the Senate and no further action will be taken on the matter at once. The Senate previously had confirmed the Governor's appointment of James W. Huffman, his son-in-law and former secretary, and Judge William Klinger, Lima, to places on the commission. They succeeded George Poor and Charles C. Marshall, whose terms expired some time ago. George Mauller is the other member now serving on the commission. His term also expired some time ago.

C. C. Giles Resigns from Porto Rico Company

Carl C. Giles, for the last two years president and general manager of the Porto Rico Railway & Light Company, San Juan, P. R., has resigned and is returning north. In the short time he has been in charge Mr. Giles has worked wonderful changes in the service of the railway system. The new cars now in service were designed by him to meet tropical needs. Wages were increased, a pension fund and a sick benefit fund were established and bonuses were provided as rewards for particularly meritorious services. It is said that the passage of the Butler bill, which he believed added unnecessary burdens to doing business in Porto Rico, affected his decision about renewing his contract.

Changes in Rhode Island Personnel

Several changes affecting various departments were effective as of May 1 on the lines of the United Electric Railways, Providence, R. I.

Thomas E. Tefft has been elected comptroller to succeed George S. Hutchins, who has resigned.

Ralph E. Nock has been elected assistant comptroller, the position formerly held by Mr. Tefft and, in addition, will for the time being continue his present duties as office manager.

Ralph Gordon, who has been auditor

of property accounts, will assume the position of chief clerk, in the assistant comptroller's office, now held by Arthur E. Cawthorne, who has resigned.

Robert T. Watt will succeed Mr. Gordon as property clerk and will be in charge of property accounts.

Cecil E. Waldron, who has been chief clerk in the office of the superintendent of equipment, has been transferred to the accounting department and will be succeeded by J. Edward Shaw, now employed in the office of the superintendent of equipment.

Thomas G. Webber, who has served as electrical engineer in the office of Vice-President Slade, will assume general direction of the equipment department, as acting superintendent of equipment.

New Members of Indiana Commission in Office

The three new appointees to the Indiana Public Service Commission took their positions on May 1. The appointment of Calvin F. McIntosh, Worthington, and Harvey Harmon, Princeton, to be the Democratic members to succeed Frank Wampler and Clyde H. Jones, respectively, and the reappointment of Howell Ellis, Indianapolis, Republican, were announced by Governor Jackson after several days of consideration of the various applicants for the vacancies. Mr. McIntosh is a member of the federal board of vocational education. Mr. Harmon secured his appointment through the resignation of Mr. Jones and his term will expire May 1, 1929. Mr. Ellis was appointed to the commission in December of last year to fill a vacancy caused by resignation, and his term, as that of Mr. McIntosh, is for four years. Mr. Ellis had served as secretary of the commission for about eighteen months before his appointment to the body. He was a newspaper man before that, assigned to the statehouse for one of the Indianapolis papers.

Richard Siegmann, manager of the Städtische Strassenbahn, Rostock, has returned to Germany after a visit to the United States as a member of the delegation sent to this country to study traffic regulation. He visited New York, Washington, Philadelphia and Buffalo, in which he deemed conditions to be sufficiently representative to serve his purpose. He was especially impressed with the handling of rapid transit traffic on the lines of the Brooklyn-Manhattan Transit Corporation and the Interborough Rapid Transit Company. In an interview with a representative of the ELECTRIC RAILWAY JOURNAL he emphasized the fact that the German companies were quick to see the need for co-ordinating the railway and bus services and said he was struck by the evident extent to which this same trend was apparent in the cities that he visited here and in those about which he had obtained facts. He will report his findings to his own directors and also to Ludwig Spängler, director of the Städtischen Strassenbahnen at Wien and president of the Internationaler Strassenbahn und Kleinbahnverein.

Changes in Buffalo

M. L. Campbell New Interurban Manager, Succeeding Robert C. Larkin —New Incumbent Former Freight Conductor

M. L. Campbell

B. J. Yungbluth, president of the International Railway, Buffalo, N. Y., recently announced the appointment of Marcus L. Campbell, Lockport, as operating manager of the interurban division, effective on May 5. Mr. Campbell has been manager of the Lockport division since 1924. In his new position he will be responsible for service on the Buffalo-Niagara Falls high-speed line, the Buffalo-Lockport-Olcott division, the company's electric freight service, local service in the cities of Niagara Falls and Lockport, the Canadian Park and River division from Chippawa to Queenstown, and the Canadian side of Niagara's Great Gorge Trip.

The new manager entered the service of the company in 1922 as a freight conductor. His ability was quickly recognized. A year later he was made assistant superintendent of the Lockport division and in January, 1924, he became superintendent of that division. Less than two years later he was made freight traffic manager of the company. These two positions he held until his recent promotion.

R. C. Larkin

Mr. Campbell is well known in transportation circles on the Niagara Frontier and throughout the country, having been for some time with the Louisville & Nashville Railroad, the Washington Terminal Company and the American Railroad Association. He also is known for his service with the United States Marine Corps from 1913 to 1919, entering as a private under Gen. Smedley D. Butler and being discharged as captain. During this period he saw 5½ years of foreign service.

In commenting on the appointment, President Yungbluth said that Mr. Campbell's experience and ability have been valuable assets to the company.

Robert C. Larkin, Mr. Campbell's predecessor, was associated with Mitten Management for eight years. He spent four years as operating manager of the Darby, Media and Chester lines of the Philadelphia Rapid Transit Company in Philadelphia and for the past four years has been stationed at Niagara Falls, N. Y., as operating manager of the interurban lines of the International Railway. These include the Buffalo-Niagara Falls high-speed lines, Buffalo-Lockport & Olcott high-speed lines, all freight service, the local lines at Niagara Falls, N. Y.; Lockport, N. Y.; the Park & River division on the Canadian side; the Canadian portion of the Gorge Belt line, and the two international bridges.

Previous to that assignment Mr. Larkin was general manager of the Denver & South Platte Railway for seven years and served for twelve years with the Denver Tramway under the John A. Beeler management.

Broader Field of Safety for Victor T. Noonan

Victor T. Noonan, supervisor of accident prevention for the Chicago Surface Lines, Chicago, Ill., has resigned to become manager of the accident prevention department of the Chicago Motor Club. Mr. Noonan is going into a broader field of public safety work, in which he has already had a wide experience. For six years he was State Director of Industrial Safety in Ohio and afterward he organized the accident prevention work of the Cleveland Railway. In 1923 he became connected with the Chicago Surface Lines and installed a system of accident prevention which, since that time, has produced remarkable results. He established accident prevention committees in all departments, installed accident prevention suggestion boxes throughout the organization, conducted safety meetings for the trainmen and all employees at regular intervals and, to stimulate further the work, started an accident prevention contest in the train service.

Mr. Noonan was chairman of the general advisory council of the Chicago Surface Lines, which represented principal department heads. He was also a member of the Mayor's Safety Commission of the city of Chicago. He was chairman of the committee which had charge of safety during the Eucharistic Congress in Chicago and at present is chairman of the public safety committee of Metropolitan Chicago. He is a member of the board of directors of the Chicago Safety Council.

W. Kesley Schoepf Dead

Former Head of Cincinnati Traction Company Succumbs to Heart Disease at Age of 62—Noted Engineer Active in Railway Field in Many Cities—Organized Cincinnati Car Company

W. KESLEY SCHOEPF, president of the Cincinnati Car Company and former head of the Cincinnati Traction Company, died of a heart attack at his home in Cincinnati on May 6. He had been thought to be recovering from a recent attack of illness, but succumbed suddenly. Mr. Schoepf withdrew from active participation in the transportation field on Oct. 28, 1925, when he relinquished control of the railway in Cincinnati. He continued, however, as president of the Cincinnati Car Company, organized in 1913 to manufacture cars. At the time of his death he was also one of the directors of the Dalton Adding Machine Company and trustee and treasurer of the Hillsdale School for Girls.

Men of strong convictions and direct action like Mr. Schoepf are frequently misunderstood. That was his lot on several occasions, for it is a human failing to appraise by an incident rather than to take into account the acts of a lifetime. But it is by the acts of his lifetime that Mr. Schoepf must be adjudged, and by that token, however much he may have seemed to others at times to be in the wrong, he was a power for good. To few other men, if to any, is the debt of gratitude of Cincinnati greater. Many men now prominent in public life in the city owe their start to him. Acknowledgment to this end was made on the occasion of the banquet that he tendered to the veteran employees of the company when he formally withdrew from railway service in Cincinnati.

On this occasion much fuss rightly was made over the fact that Mr. Schoepf at his own expense presented a gold watch to each of 454 men as a token of his esteem. Naturally this was big news of its kind, the kind that cannot well be kept from the newspapers, but it represented only a tithe of the total of the generous, kindly things done unobtrusively by the man that endeared him to his immediate followers.

Career Started as Engineer

Quite naturally it was within Mr. Schoepf's power to have the material things that money will buy, but it is not platitudinous to say that among the possessions he prized most was the remembrance of the farewell banquet made permanent in the form of a book edited and published under the auspices of the Optimists' Club and the Queen City Club of Cincinnati. This is a work that will now be cherished more than ever by his associates and friends.

This man, who for more than 25 years presided over the railway at Cincinnati as its head, was without college training, but he was a man of liberal education. He was by profession a civil engineer. He had been chief engineer of the Rock Creek Railway, Washington, D. C. He was vice-president of the Eckington & Soldiers' Home Railroad and the Belt Railroad of Washington, D. C. He was general manager and chief engineer of the Columbia & Maryland Railroad, Baltimore, Md. In Pittsburgh he was vice-president and general manager of the Consolidated Traction Company. In Cincinnati he was president and chairman of the board of the Ohio Traction Company, which owned the stock of the Cincinnati Traction Company, the operating company in that city before it was succeeded by the Cincinnati Street Railway, with Walter A. Draper at its head, in the fall of 1925 on the occasion of Mr. Schoepf's withdrawal as an operating executive with the city system.

Mr. Schoepf arrived in Cincinnati from Washington, D. C., on Feb. 21, 1901, about the time that Hugh J. McGowan arrived from Indianapolis. Both were connected with the interests that had leased the electric railway system from the Cincinnati Street Railway. For the short time that Mr. McGowan was president of the company Mr. Schoepf served as chairman of the board. Soon afterward Mr. Schoepf became president of the company, representing the Widener-Elkins syndicate of Philadelphia.

W. Kesley Schoepf

During the 25 years Mr. Schoepf headed the electric railway system in Cincinnati he was, perhaps, more definitely in the public eye than any other man in the city. Electric railway men frequently are. He first delegated public relations work to the late Benson Foraker, son of Senator Foraker, and later to Walter A. Draper, both vice-presidents of the Cincinnati Traction Company. Each in his peculiar way possessed the faculty of turning away wrath. But the most unforgiving enemies of Mr. Schoepf do not deny that in the quarter of a century he made many real contributions to the welfare of the city.

One of these achievements was his part in the rescue of the Zoological Gardens from extinction. At the time he was induced to take hold the property was run down. The stock of animals was small and of scant variety and the attendance of the public decreasing. By hard work Mr. Schoepf brought the Zoo to its former renown and helped to advance it still further in reputation.

In 1903 Mr. Schoepf built the second skyscraper in Cincinnati, the Cincinnati Traction Building, the first being the Union Trust Building. He gave Cincinnati one of its large industries, the Cincinnati Car Company. He started the orphans' outings that have since been taken over by the Cincinnati Automobile Club and other organizations of a civic and professional nature.

In his long tenure as operating head of the railway the only serious conflict with employees was the strike of 1913. Personally his relations with the employees were friendly.

A District Loss to City

The place that he scored for himself was achieved by Mr. Schoepf by his keenness of brain, tireless energy and willingness to "play the game." He was both the doer and the dreamer, quick to translate thought into action, so quick at times that he confused his adherents at the very time he confounded his opponents. These characteristics of the man are reflected in the comment of the Cincinnati *Times* to the effect that:

> The sudden death of W. Kesley Schoepf removes from Cincinnati life one of its most interesting figures. For 25 years he had been constantly in the public eye as the head of the Cincinnati Traction Company. Naturally in the period of that organization's vicissitudes, the period of increasing car fares and decreasing car profits, he loomed large in popular discussion. He had battles to fight, and he fought them with vigor. He had contentions with citizen organizations, labor organizations, public officials and private interests. He asked no quarter and gave none. All in all, however, Mr. Schoepf was a many-sided man—a fast friend, a dauntless foe, a public-spirited citizen and a progressive man of affairs. He also was a patron of art and culture and a liberal steward in philanthropy. He contributed materially to Cincinnati's progression. Cincinnati regrets his going.

Marshall G. Linn, vice-president and general manager of the Des Moines Electric Light Company and the Iowa Power & Light Company, died in Des Moines recently. He first attracted notice in the railway field in 1917 when the railway at Bloomington was purchased and later combined with the Consumers Company by the late William B. McKinley. The combined property was placed in charge of Mr. Linn. Greater responsibility further developed his capabilities and his administration of the Bloomington company ranked with the most successful of any controlled by the Illinois Traction System. In Bloomington Mr. Linn was trained for greater opportunities and when the opening in Des Moines appeared he took charge of the affairs of the Des Moines Electric Light Company. With the formation of the Iowa Power & Light Company, after the company at Des Moines had been acquired by the present Illinois Power & Light Corporation, Mr. Linn was made vice-president and general manager.

Manufactures and the Markets

News of and for Manufacturers—Market and Trade Conditions
A Department Open to Railways and Manufacturers
for Discussion of Manufacturing and Sales Matters

Commercial Car Service Magazine

So that operators of commercial cars may have the benefit of Studebaker's extensive research and experimental work in the field of successful automobile operation and service, a commercial car edition of *Studebaker Service*, a monthly publication for the promotion of universally satisfactory service, has been announced by the Studebaker Corporation of America.

This new publication is devoted entirely to new and most efficient methods of insuring 100 per cent service from Studebaker commercial cars. It deals with every type of commercial car produced by Studebaker. It contains helpful information on the occasional service that is necessary to any automobile and how such service may be rendered in the most efficient manner.

In the first issue of the commercial car edition there is a wealth of material that will benefit the operator and the service manager who are interested in commercial cars. There are expert discussions of "How to Order Parts," "Care of Valves," "Bus Chassis Loads," "Ordering Bus Chassis Springs," "Touch Up Outfits for Lacquer," "Keeping Cars on the Road" and a number of other articles that contain valuable information.

2½-In. Paving Brick Again Recognized

Taking cognizance of an increase in shipments of 2½-in. paving brick from 31,802,533 in 1925 to 58,468,007 in 1926, the permanent committee on simplification of variety and standards for vitrified paving brick of the Department of Commerce of the United States, at its meeting in Washington March 31, reinstated this size in the list of recognized types and sizes.

The revised list of recognized types and sizes of vitrified paving brick as determined by the committee and the percentage of total shipments represented by each size is as follows:

	Per Cent
PLAIN WIRE-CUT BRICK	
2½-in. x 4-in. x 8½-in.	14.1
3-in. x 4-in. x 8½-in.	38.2
3½-in. x 4-in. x 8½-in.	5.9
REPRESSED LUG BRICK	Per Cent
4-in. x 3½-in. x 8½-in. Wire-Cut L,,	14.5
WIRE-CUT LUG BRICK	Per Cent
4-in. x 3½-in. x 8½-in.	6.4
	79.1

NOTE.—Remainder of 20.9 per cent made up of special sizes or types not included in recognized list.

The survey of the industry, made by the United States Department of Commerce to serve as a basis on which the simplification committee annually makes its decisions, revealed a big increase in total shipments of paving brick for 1926 over 1925. Total shipments for 1925 were 353,588,777. Those for 1926 were 413,125,469, or a gain of 59,536,692 for last year. The 2½-in. brick was the only size showing a notable gain in percentage of total shipments, representing 8.9 per cent in 1925 and 14.1 per cent in 1926.

New Reo Line to Be Announced

Two new bus chassis are to be announced by the Reo Motor Car Company, Lansing, Mich. Because of the company's announced decision last January to discontinue bus bodies from the line and because right now the company is between "hay and grass" so far as old and new models are concerned, it has been rumored that Reo has abandoned the bus field. This the company denies. An announcement of interest will be made within the next few months. During the last four months Reo has gone right on delivering bus chassis. Greater Reo values and more advanced designs are ahead and a new field said to have been neglected until now by the bus manufacturers will be developed at the same time that Reo's present field is exploited.

Economic Conference Opens in Geneva

American Delegation Prepared to Help Europe, Not to Attempt to Tell It What to Do to Restore It to Full Industrial Vigor—Stout Defense, if Necessary, of Position of This Country

THE first four days of the International Economic Conference at Geneva, opened on May 4 with 47 countries, including Soviet Russia, represented by delegates, were devoted to a survey of the world's economic ills. There was general agreement that increased production was the indicated remedy, thereby increasing purchasing and consuming power and raising the standard of living. A striking note was the general solicitude for the wellbeing of workers, which was probably a new idea with European employers. In the opinion of W. T. Layton, editor of the *Economist*, a new equilibrium must be established, due, first, to the great increase of industrialization; second, to the fact that the United States is now a creditor nation, but apparently does not desire to buy from the countries she finances, contrary to the policies of former financing nations; third, to the decrease of European emigration; and, fourth, to the alteration of trade relations resulting from the payment of reparations and international war debts. The situation is more acute because Russian imports are small and Central Europe is divided by high tariff walls, resulting in duplication of industrial plants and preventing specialization, which is the essential feature of modern industrialism.

E. J. Mehren, in attendance at Geneva for the McGraw-Hill publications, cabled that Mr. Layton's insistence that the tariff walls of Central Europe must be lowered was approved by numerous speakers. There also was general approval of tariff stabilization regardless of the level, thus encouraging long-time contracts, uniform tariff classification and nomenclature. Long-time commercial treaties were advocated. There was no reference to American tariff rates, but several indirect references to our prohibition of immigration. Financing of backward countries was urged to stimulate production.

Seeing Is Believing

Remember to have your exhibit at Cleveland, when the

A.E.R.A. Meets in October

Reserve Your Space
Between May 16 and June 15

Dr. Carl F. Von Siemens of Germany criticised government intervention in industry, which was particularly interesting as coming from the representative of a country where government assistance and compulsion are considered normal. Zimmerman of Holland cited increased government services and restrictive labor legislation as increasing the industrial burden by raising prices, restricting consumption and reducing trade. The remedies suggested were removal of government interference and reduction in number of non-productive public servants. Only Shidachi of Japan and Layton of Great Britain cited the wastefulness of armaments.

The speech of Henry M. Robinson, chairman of the American delegation, was well received. He sketched the development of our prosperous industrial situation, stressing the determination of American employers to secure needed economies by better management and machinery, but not by wage reduction. He affirmed the American belief that competition stimulates industrial progress and suggested that the American delegation would probably disapprove of international cartels if governments participated or if they were exploitive in character. Answering Sir Max Muspratt of England, who thought that rubber restriction bore equally on every one, Mr. Robinson contented that there was discrimination against America, which uses 75 per cent of the output, as against only 7 per cent by Great Britain.

It is not expected that the conference will have great or important immediate results, but that it will contribute to a better understanding of international problems and will lay a basis for some definite actions now and in the future. Three speakers advocated permanent organization for the study of international economic problems. The plenary sessions closed on May 7, and committee sessions on commerce, industry and agriculture began May 9.

Sokolnikoff of Russia painted an optimistic picture, declaring that industrial and agricultural production are now in excess of pre-war outputs, but the figures are doubted at Geneva. He made a plea for closer capital and trade relations, contending that the capitalist and socialist systems can work harmoniously together. He protested the boycott of Russia.

Obolenski Ossinski of Russia criticised the capitalist system severely, declaring it to be the cause of the World War. He condemned cartels and repeated Sokolnikoff's plea for trade relations, emphasizing the importance of the Russian market. In conclusion he offered eleven suggestions for restoring world trade and prosperity:

1. Cancellation of war debts.
2. Increase industrial wages.
3. Eight-hour day for all workers except miners, who should have six.
4. Fullest liberty for trade union organization and complete liberty for strikes.
5. Relief for the unemployed.
6. Raise funds for the unemployed by taxation.
7. Decrease unproductive expenditure, especially for armaments.
8. Abolish barriers against immigration.
9. Cancel protectorates and mandates and permit self-determination for all peoples.
10. No intervention in China.
11. Suspend economic boycott on Russia and extend credits to that country.

In a cable received from Mr. Mehren dated May 9 he refers to transactions in the various committees on commerce, industry and agriculture. Henry M. Robinson, the American member of the industry committee, told the delegates that there was no excuse for America to discuss general conditions except objectively. This was in response to doubts that American methods were suited to European conditions. Both questioners admitted that waste prevention and increased output were desirable and added that the interchange of methods and practice among industrial firms would be advantageous. The substitution of mechanical equipment for hand labor was considered not immediately possible due to extensive unemployment. Figures on the latter were considered uncertain, inasmuch as 1923 American estimates from two sources varied three million to five millions, with discrepancy not yet discovered. Peyerimhoff of the French coal mines committee eulogized the social harmony prevailing in America and requested information as to how this was obtained. He recognized the fact that class conflict is non-existent in America and showed an excellent understanding of American conditions. He said that Europe is seeking a cure for its ills by first obtaining financial stability.

METAL, COAL AND MATERIAL PRICES
F. O. B. REFINING

Metals—New York	May 10, 1927
Copper, electrolytic, cents per lb	12.775
Copper wire, cents per lb	15.125
Lead, cents per lb	6.73
Zinc, cents per lb	6.50
Tin, Straits, cents per lb	68.00
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.425
Somerset mine run, Boston, net tons	1.825
Pittsburgh mine run, Pittsburgh, net tons	2.175
Franklin, Ill., screenings, Chicago, net tons	†
Central, Ill., screenings, Chicago, net tons	†
Kansas screenings, Kansas City, net tons	2.50
† Quotations withdrawn because of strike	
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	$5.15–20
Weatherproof wire base, N. Y., cents per lb.	16.75
Cement, Chicago net prices, without bags	2.05
Linseed oil (5-bbl. lots), N. Y., cents per lb.	11.60
White lead in oil (100-lb. keg), N. Y., cents per lb	14.50
Turpentine (bbl. lots), N. Y., per gal	$0.625

Copper, at 13 Cents, Comes to Life—Other Non-Ferrous Metals Quiet

COPPER sold in large volume during the week ended May 11, 1927, with prices almost uniformly at a firm 13 cents delivered basis, says *Engineering and Mining Journal.* Little business was reported in tin and lead was only moderately active. Zinc was in good demand and exhibits a somewhat stronger tendency than lead, in spite of a further reduction in ore prices at Joplin. The platinum market continues demoralized, with further important reductions in price.

With large buying by the leading consuming interest, copper became suddenly active on May 6 and a good business followed, though on May 11 there was perhaps a little cessation in the inquiry. Most of the buying has been by consumers in the East, including an occasional order from a wire mill, and the price has been almost uniformly 13 cents delivered. In the Middle West an occasional order has been placed at 13⅛ cents, but sellers have found a disinclination to pay that much, and it seems likely that copper—perhaps Michigan copper—has been offered to Middle Western consumers at close to 13 cents. There is some talk of advancing quotations to Eastern consumers to 13⅛ cents, but apparently no one has yet taken that step.

Most of the orders placed have been for June shipment, with a liberal quantity for July, and an occasional request for May and August. All are quoted at the same price. Foreign business has picked up markedly, and the export association has been limiting the amount sold. The export price is unchanged at 13.33 cents, c.i.f.

The zinc market has been more active than for seven weeks with practically all business at either 6⅛ or 6.15 cents, St. Louis, though some was sold as low as 6.10 cents. Zinc generally is in strong hands. Though stocks increased last month, it is felt that production will be curtailed to accord with the demand, especially now that ore in the Tri-State district has dropped below $40 a ton, and that further price reductions are unlikely.

Statistics of the American Zinc Institute, in tons of 2,000 lb., follow:

Stock, April 1	36,279
Produced	51,626
Shipped	46,697
Stock, April 30	41,208
Shipped from plant for export	1,876
Total retort capacity, April 30	136,644
Number idle retorts available within 60 days	57,297
Average number of retorts operating during April	81,582
Number retorts operating April 30	81,096

Little change had taken place in prices for lead in either the foreign or domestic markets during the week ended May 11. The American Smelting & Refining Company maintained its official contract price at 6.75 cents, New York, and 6.40 cents was the prevailing figure in the St. Louis market. Occasional lots were sold at prices from 2½ to 5 points below these, but the total tonnage at cut rates was not large. Despite the fact that Mexican ore lead is all going abroad, prices in London have been well maintained. A significant feature in the domestic market is that practically all of the moderate volume of business is for May shipment. This indicates "hand-to-mouth" buying in an unusual degree and suggests that one of the periodic buying waves may start if and when consumers reach the conclusion that the bottom of the market has been reached. On May 11 600 tons of antimonial lead arrived in New York from the Burma mines in India. It is believed that this is low-grade material sent here for refining.

On May 5 it developed that very little Straits tin for prompt shipment was available in the domestic market. The price jumped more than a cent, though it was largely nominal. Subsequently some consumers postponed delivery on early contracts, thereby releasing sufficient nearby metal to supply the meager requirements of consumers. The spread between Straits and 99 per cent is particularly wide because of the fact that an ample supply of the lower grade metal from England is afloat.

$200,000 Bus and Rail Terminal in Michigan City

Contracts have been awarded for the construction of the new union passenger station to be used jointly by the Chicago, South Shore & South Bend Railroad and the Shore Line Motor Coach Company, a subsidiary, at Michigan City, Ind. The cost of the station, together with an adjoining garage which will accommodate 40 motor coaches, will be more than $200,000. It will be a two-story structure with offices for operating officials of the motor coach company on the second floor.

Additional ground near the station has been purchased to provide loading facilities for the motor coaches. A steel-covered canopy will be built leading from the station and covering one-half of the loading area to protect passengers in case of inclement weather.

The interior of the station will be tastefully decorated and comfortably furnished. Adequate accommodations for refreshments will be provided through the installation of a counter where light lunches and drinks will be served. The front of the building will have two large full-length plate-glass windows on either side of a double door.

Because of a special arrangement by

which Shore Line Motor Coach passengers may ride on the high-speed trains of the South Shore Line between Michigan City and Chicago—at their option—Michigan City has become an important transfer point. Motor coaches of the Carey and Leach Bus Lines, Inc., operating between Detroit and Chicago, also will use the new station as their Michigan City headquarters.

The station will be built by the J. H. Lorenz Company, Gary, Ind., and the garage is under construction by the Austin Company, Chicago.

Fifteen New Cars Urged by San Francisco Citizens

Various civic organizations are now behind the movement for the immediate purchase of fifteen cars for the new Judah Street line of the Municipal Street Railway, San Francisco, the money for which would be taken from a $290,000 budget item for track. In a sense this reopens a matter referred to previously in the ELECTRIC RAILWAY JOURNAL. Back of the movement is Mayor Rolph, who is understood to have agreed to ask the Board of Supervisors to divert from other city funds for the time being the money for the new rolling stock.

Meanwhile delivery of the fifteen cars ordered eight months ago will be completed during the next three weeks.

Virginia Company Rushing Trackwork

Virginia Electric & Power Company is reported as assembling material for the double tracking of its Bay Shore line in Tidewater, Virginia. It is understood also that the company expects to begin work on this improvement and on the construction of the Church Street track, between Eighteenth and 25th Streets, as soon as the Naval Base line has been revamped.

While work on the Bay Shore line will be in full swing this summer, it appears now almost certain that the double track will not be completed until fall and that the heavy summertime traffic to and from Ocean View, seaside resort, will move this year, as it has in the past, over the present main line through Norfolk and Bay View.

With an even break on the weather, completion of the new track on 25th Street and Hampton Boulevard, which will shorten considerably the running time to the Naval Base, is expected before the battle and scouting fleets come to Hampton Roads for their week's visit on May 28.

Rolling Stock

El Paso Electric Company, El Paso, Tex., has placed an order with the American Car Company, St. Louis, for seven 39-ft. 11½-in. single-end motor bodies to be mounted on Brill 177-EX trucks.

Interstate Public Service Company, Scottsburg, Ind., recently placed an order for six interurban cars with the G. C. Kuhlman Car Company. The new cars will be mounted on Brill 177-EX trucks.

Montreal Tramways, Montreal, Canada, received its first new Versare bus May 4, according to advices from the office of D. E. Blair, general superintendent. Tests of the new equipment will go forward immediately.

Galveston Electric Company, Galveston, Tex., has placed an order for four 44-ft. 11½-in. double-end bodies to be mounted on Brill 177-EX trucks.

Brazilian Traction, Light, Heat & Power Company, with offices in Toronto, Ont., is reported as having placed an order for cars with the Canadian Car & Foundry Company of Montreal, Canada. In some quarters this is taken as indicative of active South American trade with the Canadian industry.

Track and Line

Public Service Railway, Newark, N. J., will lay new rails and roadbed along Cass Street, Trenton, N. J.

Pennsylvania & New Jersey Railway, Morrisville, Pa., will extend its lines from Trenton and Morrisville, Pa., to Manor Park and along the Delaware River front.

Atlantic City & Suburban Railway, Atlantic City, N. J., has been requested by the Atlantic County Board of Freeholders to bring its roadbed up to grade along the shore road.

Utah Light & Traction Company, Salt Lake, Utah, is reported as contemplating the expenditure of $350,000 for repairing, replacing rails, new overhead work and new equipment.

Los Angeles Railway, Los Angeles, Cal., has started work on complete reconstruction of tracks on West Washington Street between Estrella and Burlington. The old 60-lb. rail formerly used will be replaced by the new, heavy 116-lb. steel girder rail, of which the first 550-ton unit of a 2,000-ton order placed by the company arrived in Los Angeles harbor on board the S.S. *Felix Taussig*, May 7. This new rail is not only a great improvement from the standpoint of efficient operation, but also is a long step toward smoother and more comfortable riding for the passengers. Replacement of the old rail is also being made on Figueroa Street, between Eleventh and Washington.

Milwaukee Electric Railway and Light Company, Milwaukee, Wis., will spend nearly $800,000 this year in reconstructing tracks and paving in Milwaukee and suburbs, according to a recent announcement by R. H. Pinkley, vice-president. About $35,000 has been spent at Broadway and East Wisconsin Avenue. Two jobs are now under way; one on 35th Street from Wells to State Street, which is estimated to cost $25,000; the second on National Avenue from 22d to 24th Avenue. Other projects scheduled are: Twenty-fifth Street, Clybourn to Park Hill, $38,500; Juneau Avenue, Third to Seventh Street, $30,800; East Water Street, Michigan to Mason, $25,200; Kinnikinnic Avenue, Falling Heath to Ludlow, $38,000; Third Street between Center and Burleigh, $32,000; Center Street, Third to Eighth, pavement only, $15,500.

Shops and Buildings

Indiana Service Corporation, Fort Wayne, Ind., is rumored as having plans drawn for a $250,000 terminal building and offices at Fort Wayne, Ind. The structure is to be built of brick, concrete and steel.

Trade Notes

American Brass Company, New York City, opened an office in the Military Park Building, Newark, N. J., May 2. J. B. Benedict and L. B. Smith are in charge.

Trenton & Mercer County Traction Corporation, Trenton, N. J., has been granted permission by the Trenton City Commission to lay a double track on Princeton Avenue.

Van Dorn Coupler Company, Chicago, Ill., reports the recent sale of 400 couplers to the Philadelphia Rapid Transit Company and the placing of an order for 302 couplers for the company's new subway cars.

Moloney Electric Company, St. Louis, Mo., a subsidiary of American Brown Boveri Electric Corporation, New York City, will shortly occupy its new plant in St. Louis, which will permit of increased output to meet its present bookings.

Detroit Stoker Company, Detroit, Mich., announces the appointment of A. Kastello as district sales representative for its eastern Canada and Montreal, Que., territories, with headquarters at 915 New Birks Building, Montreal. Mr. Kastello is a well-known Canadian engineer, having served for many years with different railways in Canada in the capacity of mechanical engineer and power plant efficiency engineer.

New Advertising Literature

Economy Electric Devices Company, Chicago, Ill., is featuring its Economy meters in the four-page folder which is a reprint of an advertisement which appeared in ELECTRIC RAILWAY JOURNAL March 19, 1927.

Acme Electric Heating Company, Boston, Mass., has published a new catalog, series C, complete and revised and possessed of valuable information in the electric heating and resistor field.

Smith Welding Equipment Corporation, Minneapolis, Minn., announces the issuance of its new 1927 junior catalog. It is a convenient pocket size edition, giving prices on and illustrating oxy-acetylene equipment.

Samuel Cupples Envelope Company, New York City, is distributing a circular containing samples of its various envelope products. The mailing piece is especially designed for the convenience of the purchasing agent.

Roller-Smith Company, New York, manufacturer of electrical measuring and protective apparatus with works at Bethlehem, Pa., has recently issued two loose-leaf bulletins describing its type FR relays and type HTD d.c. voltammeters.

Master Mechanics Are Leading the Way

IN TWO sections of the country the master mechanics have taken into their own hands the matter of improving their performance. This is being accomplished through the Southern Association of Equipment Men and the Central Electric Railway Master Mechanics' Association. Though working along entirely different lines, the objectives of these two groups are the same, namely, comparison of routine maintenance practices and the stimulation of improved methods.

These men do not come together for ordinary meetings in the usually accepted sense of the term. Their gatherings are actually working conferences and their purpose is to learn from each other. Consequently, there is a benefit to each man which can be applied in his daily work and there is a self-created stimulus toward improvement which is of immeasurable value to the property he represents. There is no better way to arouse ambition in a man's mind than the example afforded by progress on the part of his neighbor.

Both these groups of mechanical men have found a point of common interest which ties them together and furnishes the theme for their meetings. For the Southern men this consists of a continuous comparison of maintenance costs and pull-in records. Regular reports are furnished to a secretary and each member receives a complete record of his standing in comparison with his associates. A truly remarkable improvement in the performance of most of the participating properties has resulted. The Central Master Mechanics' group is tied together by the common problem of interchanging freight equipment. Already its work has resulted in the design of a standard freight car, in the preparation of standard rules for inspection and in considerable progress on a standard set of charges for interchange equipment repairs. It is hard to realize now that these men originally formed their association in the face of executive opposition from some of the properties in the territory!

Nitrocellulose Lacquer Finishes Are Passing Through a Development Stage

SINCE the introduction of nitrocellulose lacquers for painting electric railway cars maintenance men have been extremely interested in the results obtained. The advantages of quick-drying and chemical inertness offer possibilities for reducing the shopping time of cars and increasing durability of the paint that have great economic value. The use of lacquers for painting steel cars is increasing, but there are several problems to be solved which make progress slow. One of the most serious of these is that most of the painting of electric cars is done by placing new paint over the old. The majority of cellulose lacquer manufacturers do not guarantee satisfactory results unless the old paint or varnish is removed completely.

The matching of different shades of color is another problem that has been commented on quite frequently by maintenance men. There seems to be considerably more difficulty in matching a particular color with cellulose lacquer than with the types of enamels and paints commonly used. Lacquer acts quite differently from the usual types of enamels, varnishes and paints used and the spray method of application is necessary. This may cause prejudice among painting forces, which can be overcome only by considerable educational effort, supplemented by improved equipment and facilities adapted particularly for use with cellulose lacquers.

The investigation of painting results made by the equipment committee of the American Electric Railway Engineering Association last year indicated that while many of the cellulose lacquer systems when applied to steel cars had excellent wearing qualities, when applied to wood they gave very unsatisfactory results. It also appeared that there is a wide variation in the qualities and properties of the lacquers of different manufacturers. Railway maintenance men judge all lacquers by the results which they obtain with the particular product they are testing. At present there are 70 or more producers of cellulose lacquer paints and a variation of quality is to be expected quite as great as results from the various oil paints and varnishes. It should be kept in mind that some are sure to prove unreliable, but the success of the entire lacquer principle should be judged by the best results obtained rather than by the failures of inferior grades.

Serious Damage to Pavement Caused by Overloaded Trucks

TIME was when a well-laid pavement lasted many years. No longer is this true. Nowadays pavements often go to pieces before the bonds issued to pay for their construction mature. The reason for this short life, of course, is the widespread use of automotive vehicles. The exact relation between use and wear is of vital interest to those responsible for paving construction, including most of the electric railways, but it is extremely difficult to determine this relation accurately.

Tests made by the United States Bureau of Public Roads show that the impact force of a moving vehicle is much greater than the static load. Hence the design and condition of the springs and tires have a direct

This is the issue in May that is devoted essentially to maintenance and construction subjects

relation to the wear on the pavement. So far as the original design is concerned, it is entirely possible for the public authorities to enforce regulations that will protect the pavement from damage. Methods of maintenance and operation, however, are of equal importance, and are much more difficult to control.

Illuminating figures have been compiled in Connecticut indicating that much damage is due to the overloading of motor trucks. A transportation survey in that state disclosed that among 34,817 trucks actually weighed, 10,523, or more than 30 per cent, were loaded over their rated capacity. The larger trucks were found to be more often at fault than the smaller vehicles. Many carried loads that exceeded not only their own rated capacity but also the maximum legal load of 25,000 lb. Of the total number weighed, 2.1 per cent exceeded this legal maximum.

The harmful effect of this practice is easy to understand. Every truck loaded beyond its capacity subjects the pavement to an excessive strain under the treads of its wheels. Those loaded beyond the maximum limit are even more destructive. Few pavements are designed with a large factor of safety, and any load considerably in excess of the allowable limit is likely to cause serious damage.

It is comparatively easy to limit the rated capacity of a truck to a weight that can be carried safely on wheels with any given bearing area. But it is difficult to prevent the loading of the truck considerably beyond that point. Realization is needed of the harm which results from this practice. Electric railways have a large paving investment at stake, and they might well take the lead in a campaign to prevent this needless destruction.

Order and System Are in the Interest of the Individual

ENVIRONMENT plays a large part in the lives of most of us. It would be incorrect to say that we take on the character of our surroundings, but we do tend to reflect their character. The force in a shop headed by a man lackadaisical in his attitude tends to become lackadaisical in its general conduct. The man who turns a steel car wheel should be no less exact about his work and do the job no less expeditiously and expertly than the banker who is putting through a loan that requires an analysis of the financial stability of a borrower. Each man is probably following the bent of his talents, and each should give to the job before him the best that is in him. Does this sound platitudinous? Does it smack of Henty? Let us admit that it does. Was ever anything accomplished without an ideal?

Of course, craftsmanship in an electric railway shop—if such a term may be applied—does not offer the opportunity for the exercise of that degree of skill which would be possible to a man working, say, as a silversmith. Still, each is an artisan in his line. Each should take an equal interest in the work he turns out. All of which brings up the point that the relationship between the employer and the worker is a bilateral one—that it is reciprocal. The responsibility does not rest on the workman alone.

Men do not do good work in a shop that is cold in winter, improperly lighted at all times, poorly ventilated and ill-equipped for the work that is to be carried out in it. This would seem to be so self-evident that the need would not exist to repeat these strictures against management. Too frequently, however, conditions do exist that militate against a man doing his best. If the management is without pride, soon the men don't care. That is inevitable. In the shop and in the carhouse there should be a place for everything and everything should be in its place. It is possible to be orderly without being fussy. And order makes for the dispatch of work—any kind of work. Shops come to mind that are the last word in appurtenances, and they are the shops in which production is the greatest. This is not a matter of expediency. The man really works hardest who is constantly in a turmoil as to what he shall do next and how he shall go about it. Taylor in his time studies proved this to be the case.

If order and system should rule in the shop and the carhouse, so should it rule with respect to the buildings themselves. The grounds should be kept shipshape. This is easy to do by stimulating interest to that end among the employees. In many instances the shop and carhouse men have been stimulated to greater effort along these lines by competition among them. That is a detail. Where pride alone fails to offer the necessary stimulus, then the task is one that should be formally assigned. Let us achieve these ends by stimulation if possible, but let us achieve them anyway.

Postponement of Depreciation Case Should Not Lead to Neglect

IT WAS good news, indeed, for the electric railway industry when the sub-committee of the depreciation committee, consisting of Ralph R. Bradley, B. W. Warren and Managing Director Storrs, obtained an indefinite postponement of the depreciation hearing before the Interstate Commerce Commission which had been set for May 23. Had the industry been called upon at this time to go through with its hearing the lack of adequate data would have made it extremely difficult to make an effective presentation of the electric railway situation.

Among far-sighted executives it is generally recognized that depreciation must receive adequate consideration by the properties themselves and that on many properties more liberal reserves for obsolescence as well as depreciation must be provided in the future than have been set up in the past. In some few cases, perhaps, inadequate depreciation reserves may be attributed to negligence. But in the vast majority of cases this is not the situation. For a number of years the industry has been faced with the primary problem of meeting its current operating costs and fixed charges. Due to pyramiding costs, on the one hand, and restricted fares on the other, to say nothing of automotive competition that nearly proved to be overwhelming, the principal task of the railway executive for a number of years was to find a way of continuing operations on almost any basis. When one reviews the list of receiverships during the war and post-war years it is not surprising that some properties did not adequately take care of their depreciation.

Now that the industry is fast coming out of the doldrums, under service-at-cost franchises and a more liberal public policy regarding transportation fares, it is important that the rate of fare be determined with an adequate regard for the needs of both obsolescence and depreciation. But the fixing of an arbitrary and inflexible requirement by the commission at this time for setting up depreciation reserves would have set back the entire electric railway industry just when it is beginning to work out its salvation.

Postponement of the hearing by the Interstate Commerce Commission is therefore a welcome respite. It is important, however, that this should not lead to neglect by the industry of so important a matter. The commission's action merely allows more time for adequate preparation of the electric railway case. This the depreciation committee is endeavoring to do. It has a difficult and burdensome task in collecting needed data and is entirely dependent on the co-operation of operating companies. Questionnaires have been sent out for this purpose. Each company called upon for information must do its full part in helping the committee to show why a depreciation order for electric railways at this time is not in the best interests of the properties or the public they serve. Companies whose operations are entirely local in character should be equally interested with those that are interstate carriers, because a ruling by the Interstate Commerce Commission would probably have a very strong effect on the subsequent action of state regulatory bodies. Now that the opportunity is afforded for adequate preparation, it would be extremely unwise to let the matter drag.

Good Patterns Help Reduce Machining Costs

MANY electric railways make their own patterns for certain types of castings and then send them to a local foundry when castings are needed. The castings are machined in the railway company's shops. This procedure usually insures early delivery of the parts needed to return a car to service much more quickly than would be possible otherwise. One great objection to the practice is that sometimes, due to unfamiliarity with foundry practice, patterns are not so designed or constructed that they will produce economical castings.

The importance of high-grade patterns is not confined to the economical production of castings. It includes machine shop costs, expenses of assembly, serviceability of the castings and losses due to rejections, as well as cost and selling price. Patterns constructed properly assist in obtaining better castings, quicker delivery and lower machining costs.

Modern foundries are insisting that patterns be mounted. Nearly all the molding operations, when a loose pattern is used, require hand work, and uniformity is dependent entirely on the skill and judgment of the molder. Mistaken judgment regarding risers may result in shrink holes in the castings, sometimes detected in the foundry, but often not found until considerable machine work has been done. Lack of care in choosing the parting line results in patched molds and castings with improper contour. Excessive rapping of patterns unnecessarily increases casting dimensions and weights and reduces the life of the pattern.

Poorly constructed patterns are likely to warp, which causes dimensional errors in the castings. Loose patterns are subject to more breakage than mounted patterns on account of the molding procedure required. Pattern repairs delay production. Where single castings or very small quantities are used, electric railways frequently consider that the additional cost for a mounted pattern is not warranted, but frequently benefits will result that more than justify it.

In days preceding the present keen competition and intensive production foundries accepted any kind of pattern equipment which might be furnished. As cost and production were of minor consideration, judged by our present standards, castings accepted as satisfactory were produced from such equipment. These conditions have changed, and the fact that foundries have developed improved methods of making castings which necessitate new standards for patterns is an illustration of progress.

Why Not March Along the Hypotenuse

WHEN the German army tried to crush the British on the retreat from Mons, it made the fatal mistake of marching along two sides of a triangle when it could have intercepted the column of the "Old Contemptibles" by marching along the hypotenuse. While it is a far cry from the strategy of Von Kluck in 1914 to the deliberations of the purchases and stores committee of the A.E.R.A., nevertheless we may gain much from a comparison. To wit: During a discussion on May 16, 1927, of the sub-committee's report on the tracing and expediting of ordered material, W. E. Scott of the Philadelphia Rapid Transit Company made a constructive and telling argument against the long-accepted practice of the purchasing department being the official "tickler" for the tardy vendors.

In other words, Mr. Scott proposed that the stores department, after placing its requisition with the purchasing department, make direct contact with the vendor to expedite delivery, thereby eliminating the work of several clerks, to say nothing of proving that a straight line is the shortest distance between two points.

Although with one exception, that of C. A. Harris of the Philadelphia Company, the committee was against Mr. Scott's proposal, he nevertheless made such a conclusive argument that Chairman Fleming suggested that Messrs. Scott and Harris prepare their arguments in the nature of a minority report for discussion at the coming annual convention of the association.

Chairman Fleming undoubtedly acted wisely in taking this means of developing a minority viewpoint. Any method, no matter how radical, that will cut the red tape that is prevalent in all business; that will speed up the selling of popular transportation, should surmount all precedents, no matter how long such precedents have been established. While Mr. Scott's proposition may have some very practical objections from the purchasing department's viewpoint, it seems worthy of serious consideration. In the handling of important contracts it may be better for the purchasing department to follow the matter of delivery. But in many cases this is now done directly by the department for which the order is placed, particularly when that department handles the matter of inspection during construction, as in the case of an order for new cars. In following delivery of the large volume of miscellaneous material that is purchased during the year, therefore, there seems to be merit in Mr. Scott's contention that the stores department is the logical agency for maintaining contact with the vendor. In this age of efficiency and short-cuts none of us want to march along two legs of a triangle when we can accomplish our purpose by treading the hypotenuse.

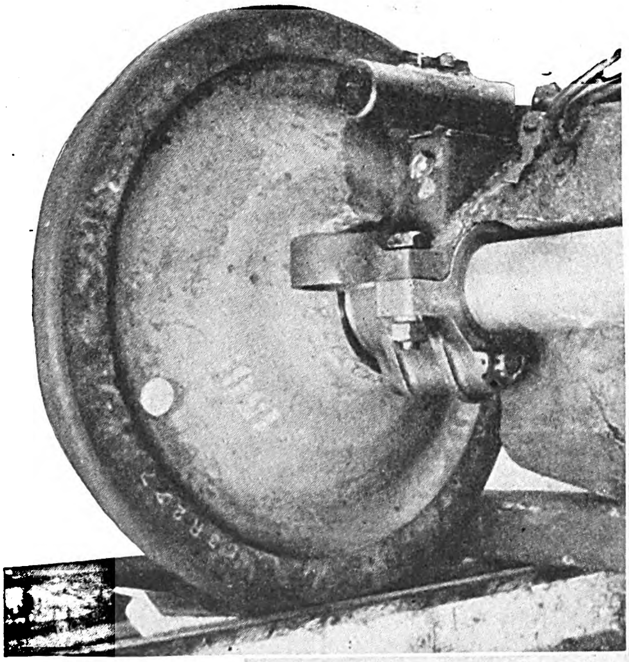
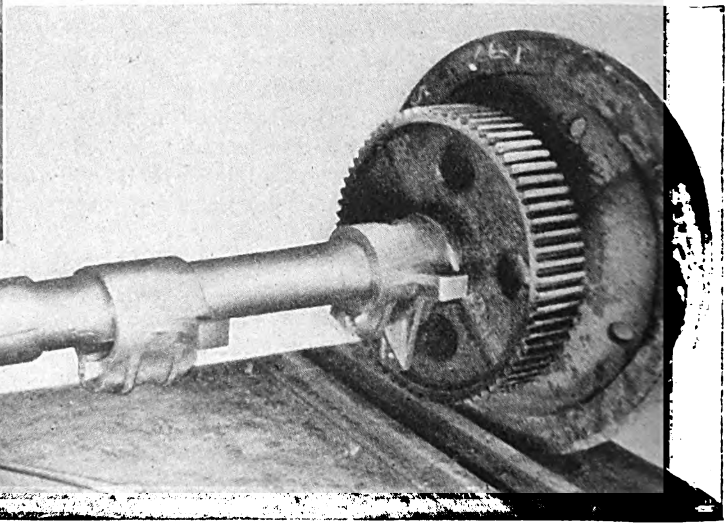
Details of axle bearing used with wedge-type housing

Below, wedge-type axle bearing housing in place on truck

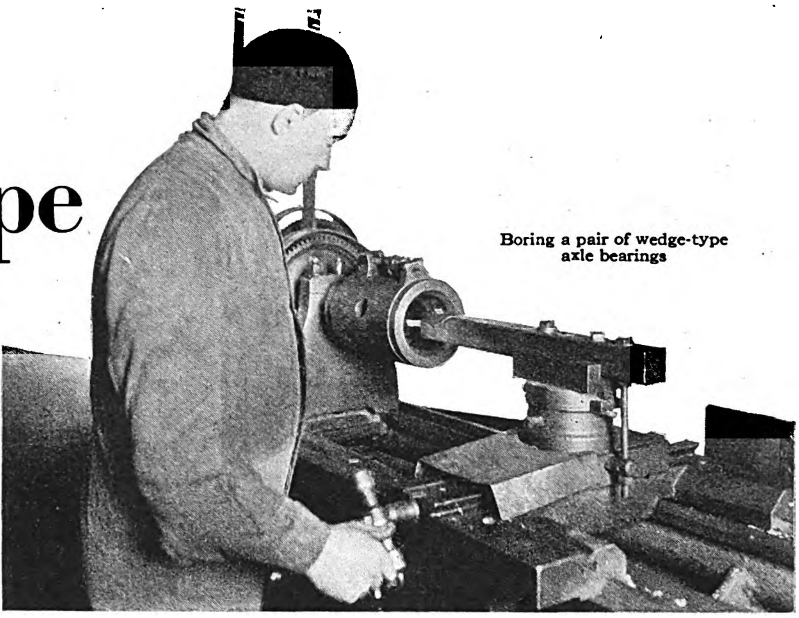




At right, the housings are placed on the axle before wheels are installed

Housing Type Bearing

Adapted for Axles



Boring a pair of wedge-type axle bearings

Wedge type axle bearings used by the Third Avenue Railway, New York City, make accurate fits easy to obtain and, due to the tight fit of bearings in their housings, wear, with its resulting noise and trouble, is reduced

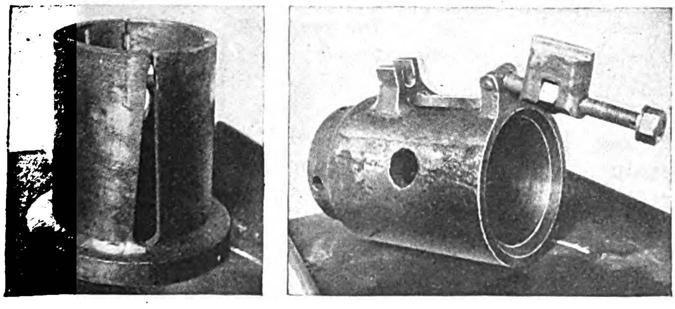
OBTAINING accurate fits for railway motor axle bearings has always been difficult on account of the type of construction used. In order to place them on an axle they must be of a split type. Even though the inside bore fits the axle accurately, when used on old motors there is sure to be found some wear in the axle bearing fit of the motor frame. If the original movement be ever so slight the bearing will be subjected to blows of impact which are destructive and soon cause rapid wear and looseness of fit. Due to the wear of axles in service, the bearing fits are of widely varying sizes. Where axle bearings are carried in stock with bores arranged in steps to fit different diameter axles the workman is supposed to pick one that fits best, but usually he picks one that fits easiest. As a result, bearings start off with a poor fit.

To overcome the troubles which result from improperly fitted axle bearings, J. S. McWhirter, superintendent of equipment of the Third Avenue Railway System, New York, has developed a new type of axle bearing which is now being marketed by the Waugh Equipment Company. These bearings have been applied to the GE-210 and Westinghouse 56 types of motors operated by the Third Avenue Railway, and it is planned to adopt them for all other motors operated by the company.

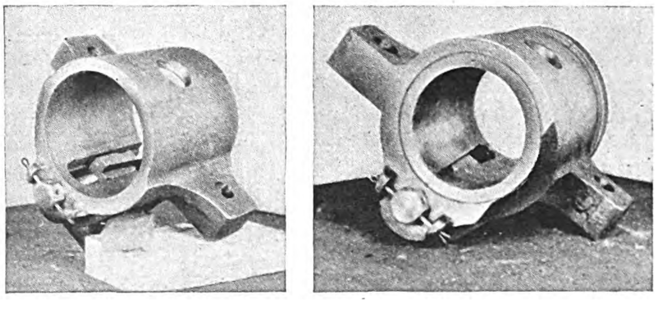
In the construction of this bearing a wedge-shaped piece of nickel steel fits into a corresponding wedge-shaped space at the split of the two halves of the axle bearing. The wedge can be drawn up or loosened by means of a screw, and so the bearing liners are forced tightly against the inside bore of the axle bearing housing which takes the place of the axle cap on the motor. Accompanying illustrations show the details of construction.

The axle bearings are made of bronze and when finished have a ½-in. wall. The opening for the wedge is 4⅞ in. long and each side has a taper of 1 to 16. The large end is 43/64 in. wide and the narrow end 1/16 in. The wedge has an upper section 1.23 in. wide by 1⅜ in. high that fits into a correspondingly sized opening in the housing. This upper section of the wedge is tapped for a ¾-in. stud, which when turned draws the wedge back and forth in the slot in the housing and forces the axle liner tightly into the housing bore. The wedge also serves as a key to prevent turning of the bearing relative to the housing.

The general construction of the housing is similar to that of the axle cap which it replaces, but it is made solid, the thinnest section of the wall being ½ in. On motors having cast-iron babbitted axle bearings there is room for the new housing with ½-in. bronze

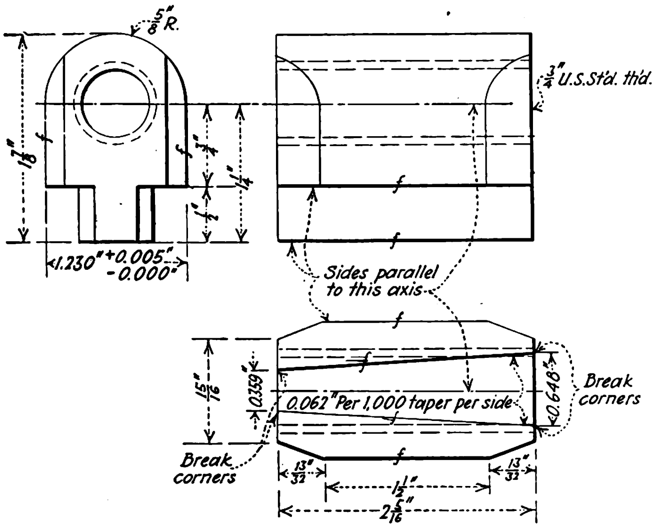


At left, a pair of finished axle bearings ready for installation. At right, type of chuck used for boring wedge-type axle bearings



At left, housing for wedge key axle bearing. At right, bearings in place in axle housing. Screw for tightening wedge at bottom bearings. The Westinghouse 56 motors to which this has been adapted had cast-iron babbitted axle bearings and no additional work was necessary on the motor shells. The GE-210 motors have bronze axle bearings, so it is necessary to rebore the axle bearing fit of the motor shells to ½ in. larger radius to accommodate the new housing.

Since the housings are solid, it is necessary to place them on the axle before wheels are pressed on. This is no disadvantage, however, since the life of the housings is several times that of a pair of wheels, and new bearings can be installed as easily as with the previous arrangement. The housings are bolted to the motor frame with the same bolts that formerly held the axle caps, so no additional drilling and tapping is needed.



Type of wedge key used. This is made of nickel steel and fits accurately the corresponding space in the bearing

Particular care is taken in the various machining operations to make certain that accurate fits will result when the bearings are installed. The two halves of the axle bearing after being finished on the outside are placed in a wedge chuck for boring. This chuck is essentially a housing of the type that will be used with the bearings. With the bearings inserted, the wedge is drawn tightly so the bearing is expanded into position. The chuck is screwed to the lathe headstock and the boring is done with a bar attached to the lathe carriage. With this set-up for boring a fit is assured that will remain the same after the bearing is installed in its housing. Each bearing is fitted to the axle with which it is to run, the inside bore for new axle bearings being 0.015 in. larger than the axle diameter.

The practice of the Third Avenue Railway is to install all bearings at the general overhauling shop. The work is then done by experienced men and is taken out of the hands of inexperienced carhouse men. The installation is very simple; with the housings on the axle the bearings are pushed in and the wedge is drawn. The wedge screw is kept from turning by a cotter pin which passes through the housing and head of the bolt. The housings are bolted into position the same as the ordinary axle cap. Dirt is prevented from getting into the end of the bearings by counterboring the wheel hub so that it forms a permanent dust guard for the bearings.

Overhead Fixtures Inspected on a Car-Pass Basis in Cleveland

By Determining the Number of Car Movements that Can Be Allowed Safely at Points of Severest Service a Maximum Is Established for that Particular Line

By Angus Scott
Assistant Superintendent of Overhead Lines,
Cleveland Railway, Cleveland, Ohio

Excellent results have been obtained from the method of inspection and maintenance of trolley wire fixtures used by the Cleveland Railway, which sets a definite number of car movements as a basis. For ears the number of car movements is established at a point just ahead of car stops where they receive the severest usage. Figures will, of course, vary with different localities, types of material and the equipment running over the lines. The figure that is now being used in Cleveland is 60,000 car passages. When this number of car movements has been covered on a line, a crew will inspect the fixtures and remove the worn-out material.

Taking, for example, a line which has 240,000 car movements per year, 60,000 passages are registered in three months time. In this fashion a table is drawn up to include every line on the system and the renewal dates are set down, as follows:

Line (Limits)	Movements Per Year	Renewal Span, Months	Renewed	Foreman	Next Renewal Date
Thale Ave.—Hill Street to Date Street.	Eastbound 240,000 Westbound 240,000	Three Three	Jan. 1 Feb. 1	J. Lee R. Burt	April 1 May 1

The fixtures between the car stops in the line will of course last the longest. Following this plan, when the utmost life is secured from the material it is removed and a constant inspection of the equipment is maintained quickly and when necessary. Also the points where severe wear is encountered are well taken care of.

The crew going over the line also functions to some degree as an inspection crew. If trolley wire or other equipment is found in poor condition this is noted and reported. Then a specially trained inspector is sent over the area involved. He fills out an inspection report of the type shown in an accompanying illustration, giving micrometer and dynamometer readings. From these data it may been seen readily whether the equip-

ment need be renewed or the amount of life that remains.

Through this method of automatic renewals and inspection the trolley failures on the system have been kept to a low figure. A graph of the breaks and an analysis of them for the year 1926 are given. A great many deductions may be made from the graph and causes determined for the increase of trolley failures or breaks in various seasons of the year and at various locations.

It will be seen that graph *A* is the sum of graphs *B* and *C*. Looking at graph *B* it will be noticed that *B* crosses *C* in the month of February and remains below *C* until October, when it again crosses *C* and remains above for the balance of the year. This relationship simply means that the proportion of trolley breaks due to failure in the wire or fixtures shows up in the months when the weather is coldest. Thus when the first cold spell comes in the fall graph *B* reaches a peak in October.

On the other hand, the number of burn downs is shown to be at a maximum during the fair weather months when track and building activities in all lines are at their height. Graph *C* reaches a peak in the month of July. Studying this graph along these lines discloses other subjects on which desired information readily may be secured.

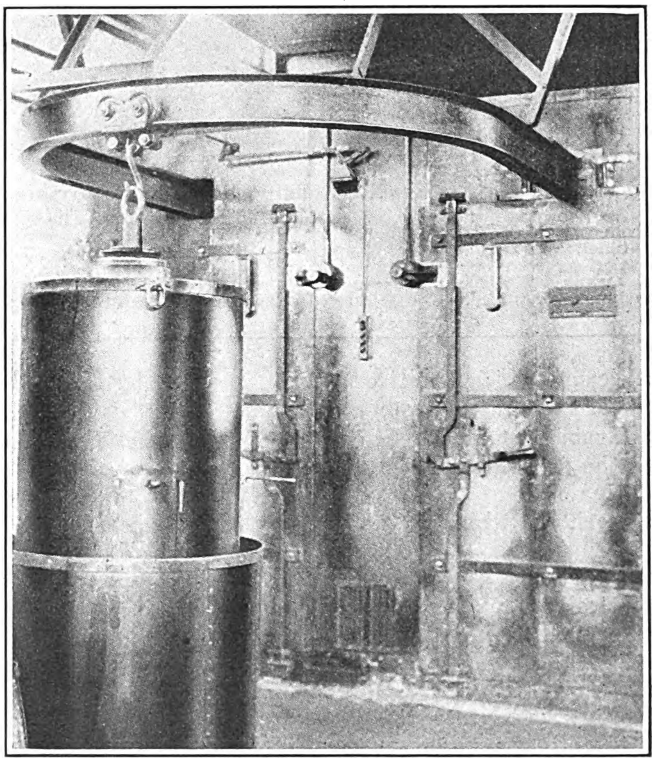
Handling Armatures on Monorail System

Entire Process of Cleaning, Dipping and Baking Carried Out While They Are Suspended by Eyebolts from the Trolley

REWOUND armatures on the Los Angeles Railway are transported on a monorail system through the various stages of final finish, including dusting, dipping and baking. The armature is suspended from the monorail carriage by an eyelet which is screwed into the commutator end of the armature shaft. For the purpose all armature shafts on this property are drilled out at the commutator end and tapped for a $\frac{5}{8}$-in. standard machine screw. The eyelets, made in the shop, are

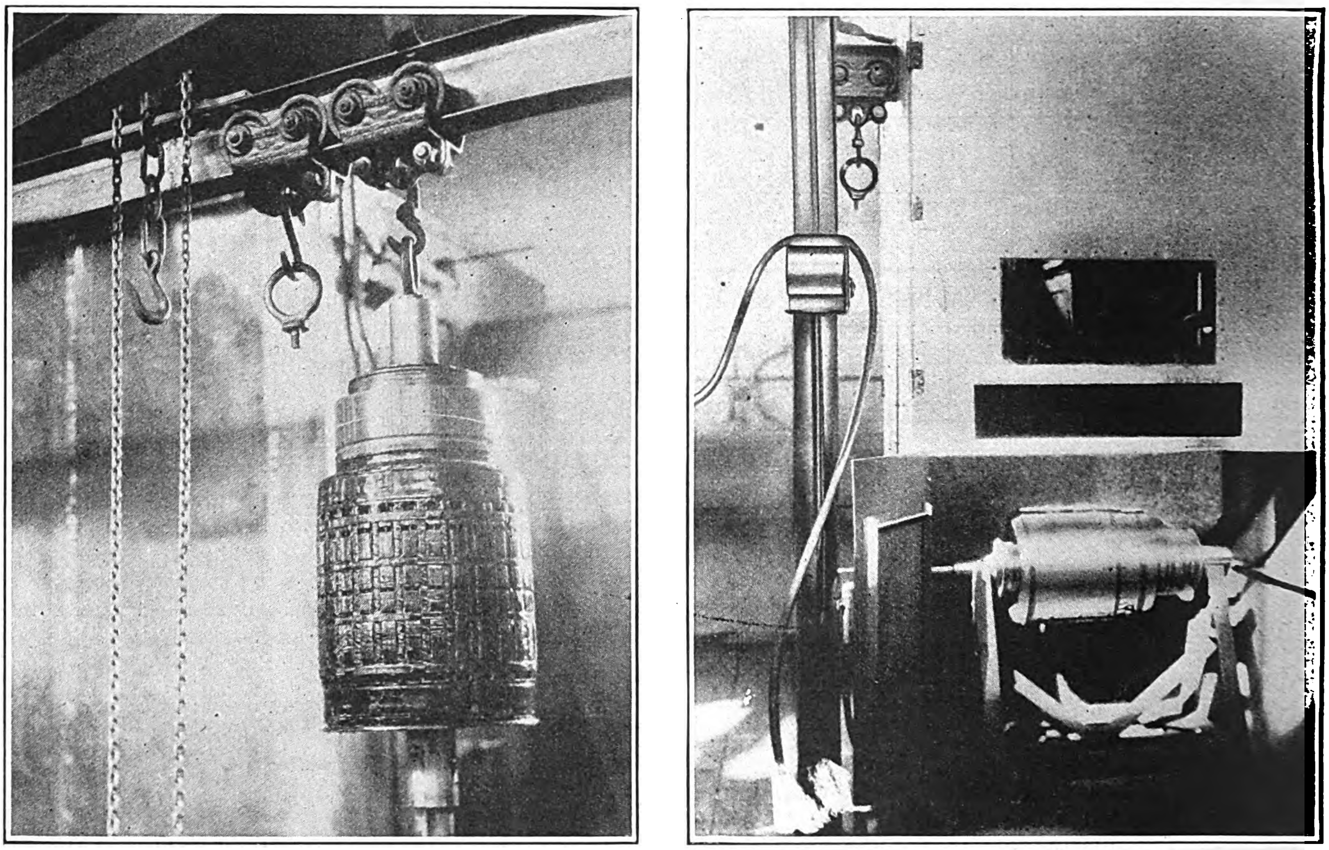


Monorail system used to handle armatures

From the preheater oven, on the right, the monorail conveys the armature on a curved piece of track to the main heater, on the left. Between the two heaters is the dipping vat, which is raised by hydraulic pressure to submerge the armature.

forged out of ¾-in. round steel to an inside diameter of approximately 3 in.

After the armature is repaired or rewound it is transported on its carriage truck to the monorail system, where it is raised by a ½-ton differential hoist to the monorail carriage. First, the armature is run into the cleaning cabinet. An opening in the side of this sheet metal cabinet permits the operator to play air at a pressure of 90 lb. on the suspended armature. This removes the dust and dirt from the crevices in and around the winding. The air is exhausted from this chamber by a blower fan which carries the air through a cleaner which removes the dust and dirt by means of water running over screens.



Handling equipment used for armature cleaning, dipping and baking operations

As shown in the view at the left, armatures are suspended from a carriage on a monorail system and conveyed to cleaning cabinet, preheating oven, dipping vat and main heater. The eyelet screwed into the commutator end of the shaft serves as a means of raising the commutator to the carriage, where it is hooked in place. The ½-ton differential hoist is shown.

The illustration at the right shows how armatures are first cleaned in a cabinet, where air at 90 lb. pressure is played upon them. An opening in the cabinet enables the operator to insert the nozzle of an air hose to blow off dust and dirt. This armature has not been raised to the conveying monorail carriage, but is resting on its work dolly truck.

From the cleaning cabinet the armature is conveyed to the preheater, which is an oven capable of accommodating four of the large size armatures. It has doors at each end which permit the armatures to be run in on the monorail. A temperature of 205-deg. F. is maintained in this oven by electric heating coils thermostatically controlled. After twelve hours of preheating the armature is removed, progressing to the dipping vat, where the insulating compound is applied. The monorail makes a complete 180-deg. curve out of the preheating oven into the first and second main ovens. Midway between the preheater and main heater on the monorail is the dipping vat. In this particular installation the vat, with 50 gal. of Sherwin-Williams black Ajax compound, is raised approximately 3 ft. by means of a hydraulic ram. The movement of the ram is controlled by both intake and release valves, so that the height of the dipping may be closely controlled. Before the armature is submerged in the insulating compound a sleeve is placed over the lower end of the shaft to protect it. This sleeve is of such length as to inclose the entire shaft. It is held in place by three springs on the inside which grip the shaft close to the armature spider and hold it securely.

The armature is submerged for approximately two hours, after which the vat is lowered and the armature allowed to drip for a few minutes before being conveyed into the heater. A small pan is hung beneath the armature as it goes into the main heater to catch the drippings.

Each main heater will hold eight armatures and is electrically heated with automatic thermal control to a temperature of 205 deg. F. The armatures are baked in these ovens for 48 hours. A feature of these ovens is the automatic shut-off of power. A control button placed adjacent to the door is actuated by a projecting arm and pointer mounted on the door. When the door is closed the button is depressed and the power turned on. When opened the button is released and the power shut off. This prevents accidents which might result should an operator enter the oven with the power on.

With this system of cleaning, dipping and baking the armature room has an output of one armature every three hours.

Maintaining
Proper Gear-Center Distances*

By P. A. Pontius
Renewal Parts Engineer
Westinghouse Electric & Manufacturing Company

With modern types of railway motors there are ten surfaces where wear will cause spreading of gear centers. The minimum desirable wear for these surfaces is given

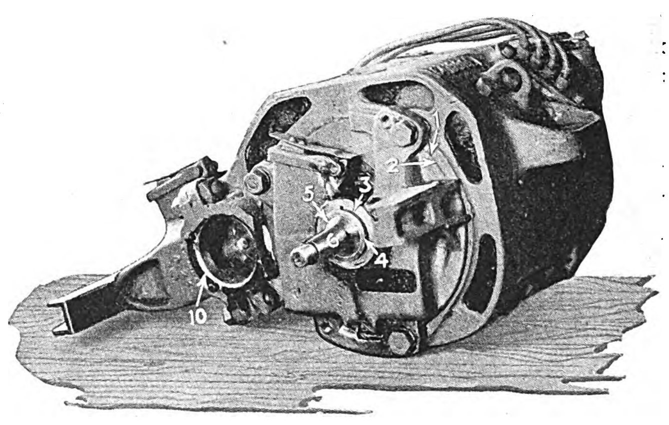
WHEN a railway motor is put in service the gear-center distance is as close as commercially possible to the mathematical dimension specified between the center of the armature shaft and the center of the gear axle for which the motor has been designed. This close fit will be lost more and more with the increased wear of different motor parts. The wear of any or all of the following ten surfaces will affect the gear-center distance: (1) Housing seat in the frame, (2) frame seat on the housing, (3) armature bearing seat in the housing, (4) outside of armature bearing, (5) bore of armature bearing, (6) shaft, (7) axle, (8) bore of axle bearing, (9) outside of axle bearing and (10) axle bearing seat in frame and axle cap.

The first question in the state of evolution of all motors in service is undoubtedly the following: "What is the allowable maximum wear on these different surfaces, i.e., how much wear may be allowed before taking the motor out of service for repair?" This question will be answered in the following for each of the ten surfaces in subsequent order:

No clearance should be allowed between surface 1, housing seat in the frame, and surface 2, frame seat on the housing. A greater allowance than metal to metal fit should always be available; that is, the exact diameter of the housing should always be greater than the fit in the frame. The housing should in no case be loose in a box-type motor and a split-type motor should not be allowed in service if the housing is not clamped tightly enough to keep it from moving in its seat.

If the bolts are kept tight with proper fits, there should be no wear. If the housing is once loose, the wear will increase rapidly, and the housing bolts will tend to work loose and considerable bolt breakage may result. Usually an improved bolt material can prevent, but not eliminate entirely, this breakage. The extensive wear will soon demand a very costly repair of the frame and housing or necessitate a new housing, besides the expense for new and high-grade bolts and the trouble caused by bolt breakage. If the motor is withdrawn from service in due time the comparatively inexpensive repair of the housing only may be necessary. The time for those repairs will be less. Thus the equipment soon can be again on the road, increasing the revenue per car. The total number of cars necessary will be less to maintain a given schedule if the time for repairing the cars and motors is reduced.

Between surface 3, armature bearing seat in the housing, and surface 4, outside of armature bearing, no clearance should be allowed. The metal fit should be such that the bearing is kept in the housing without additional help of the key. The key should be considered as an additional safeguard only to prevent the bearing from turning should it work loose on the road, as a loose bearing may turn so far that the bearing shell closes up the oil opening in the housing, depriving the bearing of the necessary lubrication so that a hot bearing would undoubtedly follow. If the bearing is loose in the housing the established clearance will increase rapidly, as the pounding action of the motor will reduce the outside of the bronze shell and the keyway in the housing will wear. The use of steel bearing shells to reduce the rapid wear on the outside cannot be recommended. Bronze shells are necessary in order to have the additional wearing surface for the armature shaft if the babbitt lining should melt out from hot bearings.



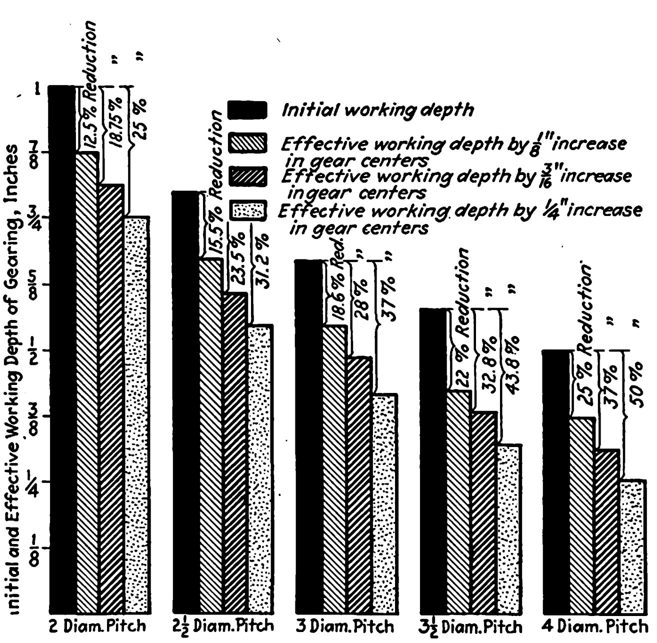
There are ten surfaces subject to wear which affect the gear-center distance

1. Housing seat in frame. 2. Frame seat in housing. 3. Armature bearing seat in housing. 4. Outside of bearing. 5. Bore of armature bearing. 6. Shaft. 7, 8 and 9 are not shown in the illustration. 7. Axle. 8. Bore of axle bearing. 9. Outside of axle bearing. 10. Axle cap and frame bore.

However, as soon as the loose bearing is noticed the motor should be taken out of service and repaired before the bearing fit and the keyway in the housing are worn, as this will necessitate a costly and time-losing welding or machining job, or both.

---

*This is the first of two articles dealing with wear that affects distance between centers of armature and axle shafts.



Reduction of gear mesh caused by increase in gear-center distance and end play

It is recommended that surface 5, bore of armature bearing, and surface 6, shaft, be allowed to wear in service only until there is a total clearance of $\frac{1}{32}$ in. between them. For motors of 50 hp. and above $\frac{1}{16}$ in. is recommended. These close limits on the radial wear are necessary to increase the life of gears and pinions. It also prevents pounding of the armature and wear of motor parts. It eliminates excessive vibration of the armature, reducing wear of commutator, carbon brushes and brush-holders, as well as the breakage of armature coil leads. All these parts will be affected unfavorably by the increased clearance between the armature shaft and bearing bore.

In regard to breakage or wear in the motor caused by interference of stationary parts with rotating parts the maximum total armature end play for motors in service should not exceed $\frac{3}{16}$ in. For motors of 50 hp. and above $\frac{1}{4}$ in. may be allowed. These limits will help to maintain the alignment of the total width of the pinion with the total width of the gear. With reduced armature end play the axial pounding of the armature in the motor will be lessened and interference of the brush-holder with the commutator neck will be eliminated.

In limiting the total wear of surface 7, axle, and surface 8, bore of axle bearing, the reduction in the mesh of gears and pinions is mainly to be considered. A wear in service should be permitted until $\frac{1}{16}$ in. total clearance between axle and bearing bore is reached; that is, diameter of worn bore minus diameter of worn axle should not be larger than $\frac{1}{16}$ in. for motors smaller than 50 hp. A total wear of $\frac{1}{8}$ in. may be allowed for larger motors.

In addition to the above radial wear it is necessary to limit the motor end play. The maximum total motor end play in service should not exceed $\frac{1}{4}$ in. for motors smaller than 50 hp. one-hour rating. For larger motors $\frac{3}{8}$ in. may be allowed. These limits depend mainly on the clearances between the gear and gear case and other points of interference on the truck. It should not be overlooked that the motor is suspended unsprung on the axle side and shocks of the motor are transmitted through the axle bearing to the axle. These shocks are caused (1) by the vertical pounding of the armature depending on the radial wear of shaft and armature bearing; (2) by the axial pounding of the armature depending on the armature end play; (3) by the vertical pounding of the motor depending on the radial wear of axle and axle bearing, and (4) by the axial pounding of the motor depending upon the motor end play on the axle.

BEARING CLEARANCE AND END PLAY RECOMMENDED AND TOLERATED FOR RAILWAY MOTORS

Recommended maximum reduction of $W \times F$ within 30 per cent.
Tolerated reduction of $W \times F$ within 40 per cent.

Depth for different spreads in gear centers and for different diametral pitches

These numerous actions of the motor are transmitted to the truck and track, causing wear on all parts affected.

No clearance should be allowed between surface 9, outside of axle bearing, and surface 10, axle bearing seat in frame and axle cap. The bearing should be clamped tight in its seat in order to prevent it from being shaken about. The loose bearing will soon be hammered smaller on the outside, as the motor will pound on the bearing with energy proportioned to the motor weight and the power transmitted from the pinion to the gear when the motor is started. The continuous knocking of the axle against the bearing when the wheels pass over rail joints or switches will also tend to reduce the outside of the bearing. It is, therefore, necessary to make these bearings from high-grade bronze alloy, which, however, should not be so hard as to cause excessive wear on the axle. Cast iron or malleable iron babbitt-lined bearing shells have generally been eliminated.

If the axle bearing is loose it should be clamped tight by means of axle cap bolts or by replacing the loose bearing. The motor should be taken out of service as soon as it is found that the new bearing cannot be clamped tight. This is to prevent excessive wear on the frame and axle cap, which would cause loose dowels or worn keyways.

REDUCTION OF GEAR MESH CAUSED BY INCREASE IN GEAR-CENTER DISTANCE AND END PLAY

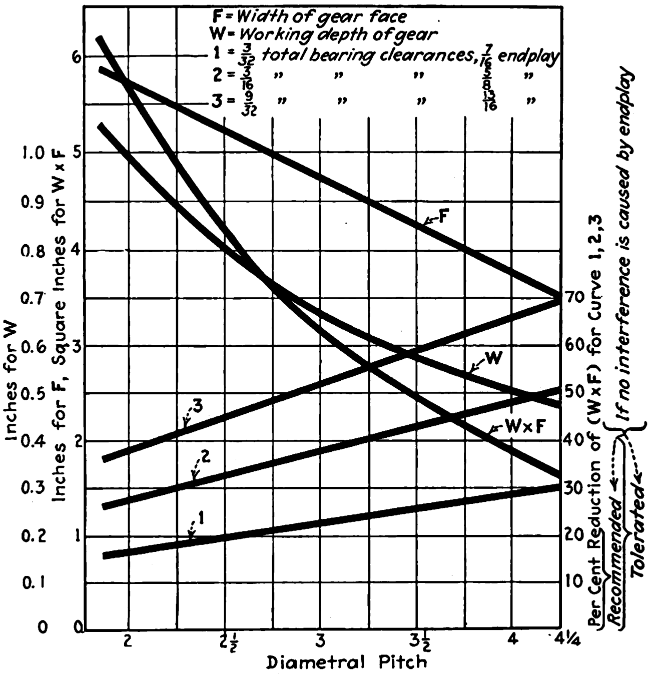
DP—Diametral pitch, inches.
F—Width of gear face, inches.

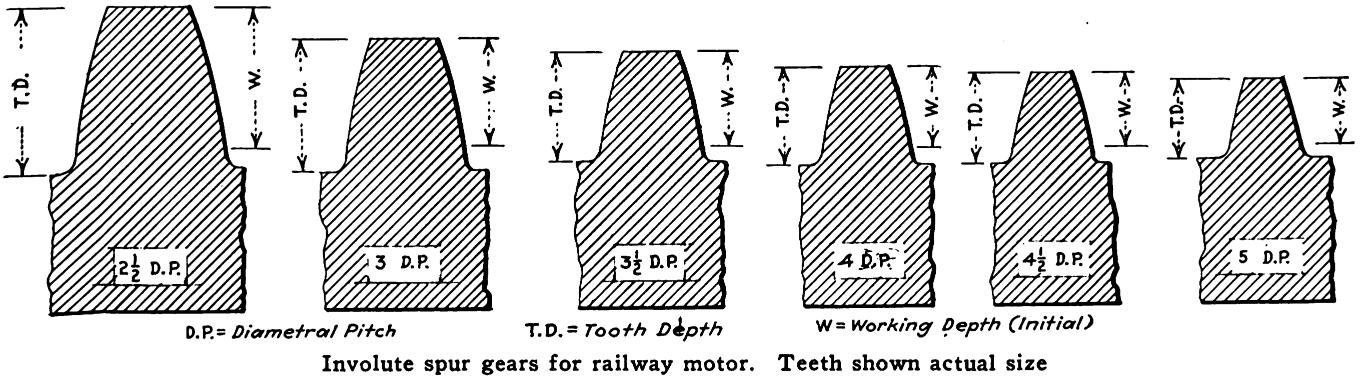
After the several surfaces have been considered the effect of the above clearance on the gear-center distance will be investigated. Experience has shown that the wear on the axle bearing of railway motors occurs very little off the vertical center line of the axle and that the maximum armature bearing wear is approximately 20 or 25 deg. away from the vertical center line of the armature shaft; in other words, the actual gear spread is a fraction of the total bearing wear. However, in order to simplify this investigation it is assumed that the worst conditions may prevail; that is, that the wear on the motor is such that the sum of all clearances between the different surfaces is equal to the maximum increase in gear-center distance. With increased gear-center distance the actual working depth will be smaller than the initial.



Spread of gear centers due to wear between points 5-6 and 7-8

In addition to the working depth, the width of the gear face has to be considered. Under the worst conditions the maximum total end play may be equal to the sum of armature end play plus motor end play. Similar increase in gear-center distance will reduce the depth of gear mesh (working depth) and the end play will reduce the alignment of the pinion width with the gear width. The reduced depth of gear mesh or effective working depth has to be multiplied with the effective gear width and the product of these factors should be compared with the initial dimensions when the gearing is properly aligned. This comparison will show the total reduction in the area of the gear mesh. The reduction in this area will increase the pressure per square inch on the teeth of the gearing and, therefore, the wear increases, which again reduces the mileage obtained on the gear and pinion of such motors. An accompanying table gives the per cent reduction of the product (Working depth) × (width of gear face) when properly aligned for the prevailing pitches and width of gear face of motors in service are calculated. The assumed clearances and end plays for the reductions are also indicated in the tabulation.

A maximum reduction of approximately 30 per cent of working depth times gear width should not be exceeded; 40 per cent is not considered good practice. However, it may be necessary to increase the allowable reduction to this limit on roads where the necessary



Involute spur gears for railway motor. Teeth shown actual size facilities are not available for babbitting bearings and machining motor parts.

In the graphs showing reduction of gear mesh caused by increases in gear-center distance and end play, the diametral pitches of the gearing are plotted on the horizontal axis. The initial working depth of the gear teeth is shown on the vertical axis by graph *W* each depth above its pitch. The width of gear face is indicated by graph *F*. This width of the gear face is assumed to be continually decreasing in proportion to the increase in diametral pitch. The width *F* multiplied by the working depth *W* is the same as the measurement (curve $W \times F$) for the area of the gear mesh. The product of $W \times F$ is also plotted on the vertical axis above the respective pitch. Graphs 1, 2 and 3 indicate the per cent reduction of the $W \times F$ under consideration of their respective armature and axle bearing clearances between points 5-6 and 7-8 plus armature and motor end play as specified. The per cent of reduction which each point of these graphs represents can be found by the scale given on the vertical axis on the right-hand side of the illustration. The different values taken from the graphs are given in the following tabulation for 3 and 4¼ diametral pitch:

Diametral pitch (D.P.)	3	4¼
Assumed width of gear (*F*), initial, inches	4¾	3½
Working depth of tooth (*W*), initial, inches	0.67	0.47
$W \times F$, square inches, gearing aligned perfectly	3.15	1.65
Per cent reduction of $W \times F$ (1) $\frac{3}{32}$ in. increase in gear-center distance, $\frac{7}{16}$ in. end play	23	30
Per cent reduction of $W \times F$ (2) $\frac{3}{16}$ in. increase in gear-center distance, $\frac{5}{8}$ in. end play	38	50.5
Per cent reduction of $W \times F$ (3) $\frac{9}{32}$ in. increase in gear-center distance, $\frac{13}{16}$ in. end play	52	59

The 30 per cent reduction recommended and the 40 per cent tolerated are indicated on the scale for the per cent of reduction. The reduction of $W \times F$ depends largely on the clearance between the wearing surfaces. The end play is of less importance than the gear mesh.

The maximum allowable increases in gear-center distance and end play should depend on the diametral pitch of each motor. The recommended maxima (within 30 per cent) have been calculated and the respective dimensions for armature and axle bearing clearances and end play are given in another table for the most prevailing pitches and gear widths. The corresponding dimensions for 40 per cent reduction of $W \times F$ tolerated by smaller roads are also shown in the same tabulation.

The allowable armature end play and motor end play should be checked carefully in regard to interference of stationary part with rotating parts within the motor or of motor parts with parts of the truck. It should be borne in mind that the life of many motor parts as well as gears and pinions and truck and track will be affected by the foregoing limitations.

Figures Corrected

IN THE article "Base Plate Joint Developed by Eastern Massachusetts Street Railway," published in this paper April 30, two minor errors appeared. At the top of page 775 under "General Summary of Bending Tests," the load for the fishplate joint instead of reading 266,300 lb. should be 244,200 lb., and on the same page under the "Summary of Tests on 9-in. Girder Rail," the same average figure, given as 266,300 lb., should read 244,200 lb., as above. This mistake was made in the original data computation and was due to the fact that the preparation of the material for the article was hurried. On page 776 the two joints on 7-in. tee rail shown in illustrations in the right-hand column were welded with 7-in. x 36-in. x 1-in. plates.

Depot Car Attracts Travelers

FOR many years the taxicab companies in cities large and small have solicited patronage at steam railroad depots, so that the traveling public has cultivated the habit of using the taxicabs almost exclusively from the station to the hotels. It remained for the El Paso Electric Railway to take advantage of its valuable trackage rights in front of the Union Depot at El Paso, Tex., and install special depot service which would draw patronage. On a spur track from one of its main lines in front of the depot is parked a specially painted car which by its attractiveness and the advertising on its sides invites the arriving railroad passenger to use it to get from the station to the hotels. The car is of the one-man, double-end Birney type painted red and blue, trimmed in gold. Covering both sides of the car are the words—"This Car Will Take You to Your Hotel and Also Connects with Juarez, Old Mexico, Street Cars."

The haul is something less than 1 mile to the business section, where the car loops and returns over the same route. Service is given all day, the schedule being varied somewhat so that the car meets arriving trains.

Cincinnati Is in Midst of Intensive Reconstruction Program

Terms of new franchise necessitated considerable track reconstruction. Co-operation between the city and railway facilitates progress. Elimination of noise and riding comfort are given careful consideration

ELEVEN miles of 5.21-ft. gage track was rebuilt in Cincinnati, Ohio, during 1926, as the first step in an elaborate program of track reconstruction. This was included in the terms of the franchise granted to the Cincinnati Street Railway, which became effective on Nov. 1, 1925. This reconstruction is only part of an extensive plan for the rehabilitation of the entire property.

Although 11 miles of single track was reconstructed last year, it is planned to make 1927 a year of still greater activity. The program calls for rebuilding at least 27 miles of single track. In the franchise it is anticipated that a considerable part of the total trackage will be reconstructed by 1930.

A thorough analysis of the conditions of the track throughout the entire property showed that after years of service certain sections had become worn out, loose, distorted and in immediate need of replacement. On the major portion of these sections the tracks were completely removed and new foundation, ties and rails installed in accordance with the company's adopted standard design.

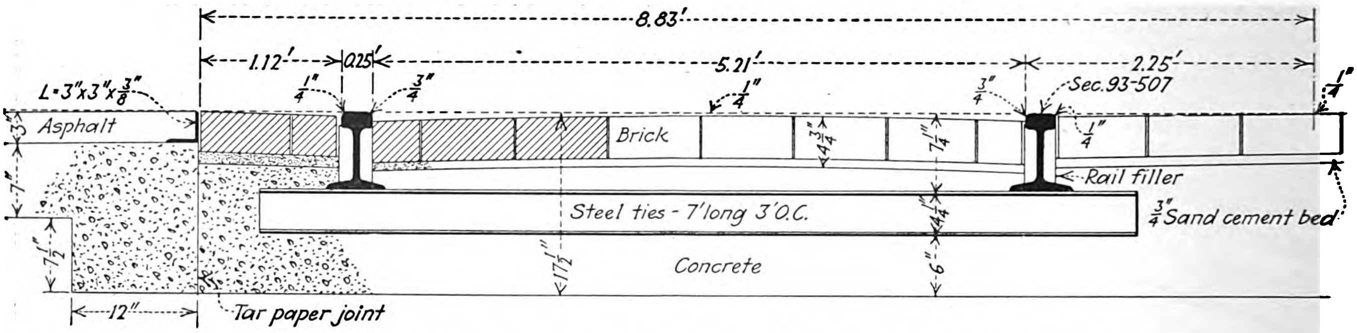
Although the franchise specified reconstruction of certain tracks due to necessary street improvements, the company nevertheless went to considerable expense to rebuild several other sections not covered by the franchise. This additional work, performed primarily to improve the riding qualities of the cars and eliminate unnecessary noise, has caused favorable comments from the communities affected and has had the effect of increasing the public friendliness.

The old foundation of the section of track located in Madison Road between Elmhurst and Observatory Road was retained and, as a result, caused some little difficulty and a slight departure from the company's standard construction. After the pavement was removed from this section it was found that the concrete was in perfect condition and suitable for years of further service. It was accordingly decided to remove and scrap the worn-out rails and ties. The tie pocket centers in this old foundation for wooden ties were 2 ft. apart, whereas the company's standard tie pocket spacing for steel ties is 3 ft.

TEMPORARY TRACK USED TO CONTINUE TRAFFIC

Excavation work was started on April 26. It was decided to work on one track at a time and continue service on a two-track basis, with a temporary track erected on the pavement adjacent to the track under construction. Rails were laid to gage on wooden ties spaced on 24-in. centers. Excavated refuse was placed around and between these ties as ballast. Rails, stone, cement, ties, etc., were speedily delivered to the job by means of motor trucks and rail cars, the method of transportation depending on the urgency and the traffic situation. When possible all excavation was done with power machinery.

Due to the size of the tie pockets and the elevation of the top of the concrete foundation retained it was much cheaper to use a steel tie and a rail of slightly different dimensions from the company's standard than to attempt cutting the concrete to suit the standard material. As a



Cross-section of standard track construction used by Cincinnati Street Railway

result a 6-in. T-rail and a 7-ft. Carnegie M-24 tie with No. 23 clips and bolts were used instead of the company's standard 7-in. T-rail and a 7-ft. M-25 Carnegie steel tie with No. 23 clips and bolts. Girder rail of 140-lb. section was installed on all curves. Steel ties were placed in the old concrete tie pockets with 2-ft. centers and bolted to the rail. A ½-in. space was left in the rail joints to allow sufficient space for thermit welding of the joints. Carey elastite filler was used on either side of the rail.

After the track was gaged, lined up and brought to grade concrete was poured in and around the ties and rails in sections. This acted as a retaining foundation for maintaining the alignment, at the same time leaving room for the thermit welding of the joints. The rail was made solid throughout its entire length and no provision was allowed for any additional expansion or contraction.

The concrete for the pavement in the track area was mixed 1:1½:3, whereas the concrete for the track foundation was mixed 1:3:6. A piece of two-ply tar paper separated the city street pavement foundation at the railway line from the railway track foundation. Similar separation of the track surfacing from the street surfacing was accomplished by means of a 3-in. x 3-in. x ⅜-in. angle laid on the railway line parallel with the rail.

Although the type of construction used on Madison Road is slightly different from the company's standard, it is believed that it will prove equally serviceable. After the completion of the first track the second was torn up and rebuilt in the same manner. Reconstruction was brought to a successful completion without a single service or vehicular interruption of any great duration. This Madison Road job consisted of rebuilding approximately 8,302 ft. of track. An average gang of 70 men was employed on this work for approximately 220 days.

FULL CO-OPERATION EXISTED

The first year's program consisted of the reconstruction of 21 sections of track varying from a minimum length of 344 ft. to a maximum length of 9,800 ft. The tracks removed had been in continuous operation for the past fifteen to twenty years. As it was found that considerable variation existed in the construction, each section had to be analyzed independently and considered as a separate problem. A careful study was made of all details involved and a definite program of procedure was decided upon. Careful preliminary plans of operation were prepared to assure non-interruption of service and a decision reached as to the best method. The decision to use a single track or to install a temporary one for the maintaining of non-interrupted service on a certain section was given to the interested parties before the work was started. Explicit orders were also issued to keep the vehicular traffic in motion.

Full co-operation existed between the railway company and other public utilities. Where it was thought that conduit or other lines of these companies might interfere with the track construction, ample notice was given in order that provisions could be made to take care of the relocation without causing any interruption of the work.

Details regarding grades, roadway, drainage, etc., were discussed with the city engineers prior to starting the reconstruction as well as during its progress. This co-operation between the railway and the city engineer-

Progress chart used by Cincinnati Street Railway for 1926 track reconstruction work ing staff brought the city and railway in closer relationship and permitted the work to proceed without serious interruptions.

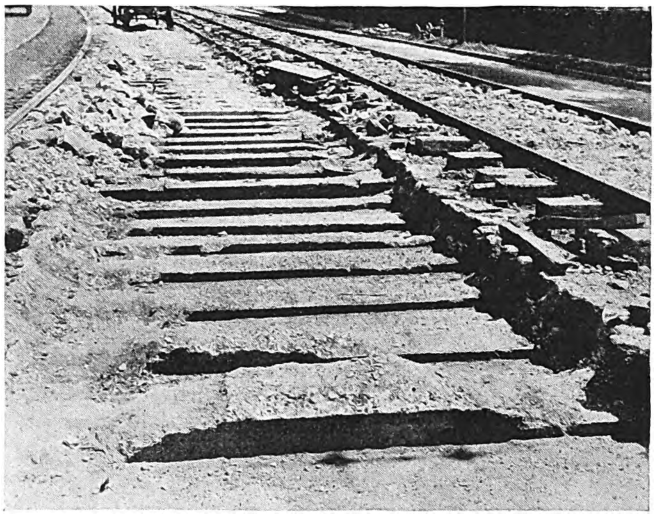
STANDARD CONSTRUCTION WITH STEEL TIES

The company's standard construction used on the other sections consisted of 7-in. T-rail, section 93-507, installed on M-25 Carnegie steel ties 7 ft. long with No. 23 clips and bolts. These ties were spaced on 3-ft. centers and were mounted on a 1:3:6 concrete foundation, 6 in. thick. Concrete was poured around the ties and up the web of the rail to such a height as would permit of the installation of a brick or Durax pavement. A ¾-in. sand cushion was used under all pavement. All rail joints were thermit welded.

A ¼-in. space was left between the pavement and the outside of the head of each rail. The pavement between the rails was laid in an arched formation with the top of the arch ¼ in. below the top surface of the rail and ¾ in. below the top surface of the rail at its connecting point with the rail. Carey elastite filler was installed on either side of the rail.

The arrangement with the city for the company's program of track construction was not completed early enough in the year for the company's own organization to handle the extensive program. It was considered advisable to employ a contractor to take over a portion of the work so that it would be completed before winter weather forced suspension of construction. The work was carried on in an efficient manner by the use of modern excavating, concrete mixing and material handling apparatus.

When the track reconstruction program was arranged for 1926 the maintenance of way department of the Cincinnati Street Railway prepared a program chart incorporating the location and length of each section, together with the expected date of starting and the estimated date of completion. With daily notations this print indicated the actual progress of all work and afforded a means for the department to see the entire situation at a glance. All reconstruction work was carried on without any service interruption. Careful consideration was given to the kind of track pavement to be adopted for each section reconstructed, in order that it would harmonize fully with the adjoining street pavement. Some sections required a Durax pavement in order to obtain this harmonious effect, whereas others required brick. Where neither of these were suitable concrete was used.



Old concrete foundation on Madison Road after removal of rails and wooden ties

Realizing that unusual noise in any part of the system would cause immediate complaint from the residents of the community affected, the railway gave this subject careful consideration. When the 1926 program was arranged an examination was made of the track sections involved and where there was any doubt whether repair work would eliminate the noise the tracks were completely reconstructed. This matter will be given still greater attention in 1927. Not only were low joints, cupped or corrugated rails considered from a noise standpoint but from a maintainance standpoint as well. It was appreciated that if these defects were allowed to remain the track foundation and pavement would ultimately be destroyed and reflect similar destruction upon the rolling stock. This, of course, would result in higher maintenance costs.

A complete inspection of the track and roadway has been completed for the 1927 program. Plans, specifications and construction schedules are being formulated to carry on the work in an efficient and uninterrupted manner.

Although the franchise does not necessitate the completion of the work before 1930, the company nevertheless is endeavoring to comply with its terms before the specified time.

Safety Guards in Wilkes-Barre & Hazleton Shops

Study of Working Conditions Resulted in the Design and Installation of an Elaborate System of Shrouds for Moving Parts

NEAT, rugged and well-designed safety guards recently were installed to protect all moving elements of the machinery in the Hazel Park shop of the Wilkes-Barre & Hazleton Railroad, Hazleton, Pa. The installation of these guards was the direct result of a safety campaign inaugurated some time ago, and to which considerable time and study were devoted. It had for its primary object the reduction and as far as possible the complete elimination of various kinds of accidents within the organization. All departments were analyzed thoroughly, including track, roadway, overhead, overhauling and inspection shops and storehouse.

In the Hazel Park machine shop an intensive study was made of the operations performed by each employee for the purpose of determining possibilities of danger of bodily injury to the men. As a result of this study, a few changes were made in the shop arrangements and methods. Material constantly used for maintenance, as well as all waste materials, was centralized so as to give greater working freedom. Safety guards were installed on all moving elements of the machinery which in any way appeared to endanger life or limb.

The Hazel Park shop is rather narrow. Along one wall are installed various bins, benches and tool closets for the storage of material and tools required for daily use. On the opposite side of the shop, along the windows, are the various pieces of shop machinery, such as drill presses, lathes, wheel press, boring mills, armature repair stands, numerous small machines and work benches. In addition, the master mechanic's office and storage space are also located on this side of the shop. A standard 4-ft. 8½-in. gage track is installed throughout the entire length of the shop, on the storage bin side. A portion at the end of this track is taken up by the babbitting department. When cars are jacked up above the track the aisle space between the car bodies and the shop machinery is very small.

This shop is used to maintain not only twenty motor cars, one freight motor car and one electric locomotive of the Wilkes-Barre & Hazleton Railroad, but in addition 41 motor passenger cars of the Lehigh Traction Company. When the track is filled with cars the men are constantly moving in close proximity to the moving machinery and the possibility of bodily injury is necessarily increased.

All of these factors were carefully considered in connection with the study of the characteristics of each machine. Proper safety guards were designed. It was decided to use No. 8 Steelite wire with mesh varying from ¾ in. to 1 in., depending on the location of the apparatus to be protected and the possibility of danger. A steel angle of ⅛x¾ in. section was selected to support the wire mesh, on account of its ability to retain its shape after being bent in various curves. Each machine was studied individually and a design adopted which took into consideration the thorough protection of its parts, the solid fastening of the guard to the machine, as well as providing for accessibility to the moving parts for repair work with a minimum of disturbance to the guard itself.

To protect large parts where there was little danger of fingers or small particles coming in contact with them, a wire mesh screening 1 in. in diameter was used, but where there was danger of personal injury or of small particles coming in contact with the machine, ¾-in. mesh was adopted.

Accompanying illustrations show the relative location of well storage bins, track and machinery before and after the safety guards were installed. Additional illustrations show the safety guards used for individual machines.

All the guards were manufactured along the same general line, the thought being the incorporation of ruggedness, neatness and maximum of protection. Each piece of screening and angle was cut to size and shaped by means of forms. Each piece of screening was then laid in its proper angle frame. On top of it a reinforcing strip of flat steel ⅛x½ in. was placed and all were held together rigidly with ¼-in. rivets. Where any doubt existed as to there being sufficient strength to the finished product, an additional ¼-in. x 1-in. horizontal metal strip was installed and riveted to the angle framing. Where necessary to arrange for periodic inspection or maintenance, the guards were provided with hinged doors or hand holes. Each guard was fitted with brackets for fastening to the machine being protected. The guards were all manufactured in the Hazel Park shop under the supervision of James Brown, master mechanic.

Eliminating Hazards in Car Operation

A COURSE in safety for platform employees of the transportation department of the Tennessee Electric Power Company was inaugurated by J. J. Connors, safety director. The entire department is divided into groups of fifteen men and regular weekly meetings are held for each class. The method used in conducting these classes is known as the "job analysis method," originated by the Federal Board for Vocational Education.

In analyzing the safe operation of a street car every detail is brought out. It has shown in these classes that an operator performs eight distinct movements in taking on a single passenger. The operations are further subdivided, developing the fact that there are thirteen hazards which may result in accident while bringing the car to a stop. Opening a car door develops four more hazards and five hazards are present in closing it. In starting a car eight additional causes of possible accidents arise, and numerous other hazards are encountered in piloting the car through the city streets.

In the final analysis of the problem there are 119 accident possibilities from the time the operator begins to bring his car to a stop to take on a passenger until he has completed the operation of his car to the next block.

The class, under the direction of Mr. Connors, passes on the different methods for safe operation and the best ones offered are adopted as standard. The result is that nothing can possibly happen in the average operation of a street car but that the operator has some known means of avoiding it.

Cold Steam Process Used for Cleaning

CHARLESTON INTERURBAN RAILROAD
CHARLESTON, W. VA., May 16, 1927

To the Editor:

There should certainly be no doubt in any one's mind as to the value of making cars striking in appearance and clean and comfortable to ride in. In the first place, a color scheme of high visibility is at all times a reminder to the public of the presence of the service and has the same purpose as the "repeat" advertising of national products. The cleanliness and brightness of cars is, of course, an invitation to ride, while dirty, dingy, noisy cars attract no one except those who must take that means to get to their destination.

In my opinion, 90 per cent of the value of modernizing equipment is attained by repainting and putting the car in good mechanical and electrical condition. This is particularly true where the roadbed is in good condition. I believe further that cars of really antiquated design cannot be modernized profitably. To sum up the matter, it is merely a question of adopting a higher standard and a more rigid schedule of maintenance than any railways have adopted in the past. The added features of modernization, such as soft, spring-cushion seats and linoleum-covered floors are all good business getters, but the problem of the smaller railways is to make the 90 per cent improvement and operating results will eventually justify the purchase of the latest types of rolling stock, incorporating these nicer refinements in their original design.

In February, 1926, owing to the death of the president of this company, Arthur M. Hill was elevated to the post of vice-president and general manager. It has only been during the last few months that he has been able to devote very much thought and effort to the question of modernization. He has, however, started a program of repainting and rebuilding and this work is proceeding at the rate of about two cars a month. It is hoped to increase this to at least three cars a month.

We have adopted orange as an outside body color, with natural wood finish on doors and window frames. The inside colors being used are white headlining, light green walls to the window ledges, with a somewhat darker green from the window ledges to the floor. This two-tone green combination has been carried around the interior of the cabs as well. All exposed piping and equipment are being painted the same color as the back wall of the cab to camouflage them, in place of inclosing such parts. Floors are being renewed and painted. In some of the cars we have adhered to the rattan upholstery, while in others we are using an imitation leather. We intend to vary the interior color scheme on subsequent cars merely for the sake of variety, but expect to adhere to a two-tone combination. We believe that this variation should not extend to the outside colors.

We are also paying a great deal more attention to the cleaning of the cars, particularly the inside. An installation for cleaning cars by the cold steam process is being made at the present time.

Although our rolling stock had not been allowed to get in really bad condition, we found that a great deal of effort could be spent profitably on rebuilding of trucks, welding of broken motor frames, building up of housings, renewing worn bearings, repairing compressors, controller parts, etc. At the same time we have renewed such minor parts as worn straps, frayed and knotted bell cords, greasy and torn motormen's curtains, and the like.

A number of our cars need painting and the inclination is to neglect the rebuilding work in order to get out repainted cars on a faster schedule. However, we believe that a great deal of the effect on the public is lost when old, worn equipment is permitted to go out in the same condition except for a new coat of paint.

The city equipment operated by this company is for the most part fairly light weight and of steel construction, so that it is comparatively easy to modernize. We have some older wooden equipment with monitor roofs, weighing more than 900 lb. per passenger seat, and this equipment we do not intend to remodel.

Our own repainting plans have not progressed far enough for us to make a dollars and cents comparison between old and rebuilt equipment. We do not expect any marked improvement in this direction for at least a year because of the fact that we are scattering the rebuilt equipment as widely as possible over the various lines of the system in order not to appear to favor any one line. As there is a more than even chance that a waiting passenger may be forced to board an old car, it is not expected that any considerable number of people will abandon other means of transportation in favor of car service. The real effect will come, we feel, when 60 to 80 per cent of our equipment has been rebuilt.

J. E. ALBERT,
Assistant to General Manager.

International Railway Cleans Up and Paints Up

IN LINE with the city-wide spring clean-up campaign the International Railway, Buffalo, N. Y., has painted 134 cars and buses so far this year. The schedule now calls for every car to go through the paint shop at Cold Springs every eighteen months. Particular attention is being directed to the appearance of the Niagara Falls high-speed cars. Simultaneously with advance in fares on the interurban lines a campaign to improve the equipment on the line was begun by the company.

Since the increase has been granted nearly all high-speed cars have been repainted and refinished, and work is now being extended on the Lockport division. The painting schedule calls for refinishing and the placing in the cars of the new announcement of the connection with the Gorge Trip. The cars are finished in a bright yellow, with the lettering along the lower side panels and the front dash in a dark mahogany. The front panels below the motorman's cab carry the wording: "Buffalo-Niagara Falls High-Speed Line." The side panels display the I.R.C. monogram and the new wording: "Buffalo-Niagara Falls High-Speed Line Connecting with Niagara's Great Gorge Trip."

A contract has also been let for equipping the high-speed line throughout with automatic block signals. The I.R.C. electrical force will install the new equipment when it is received.

ELECTRIC RAILWAY JOURNAL will be glad to furnish press proofs of this page for posting on bulletin boards and will supply electrotypes of this series at cost for use in company publications.

J. M. Zimmerman and E. L. Proctor, West. Elec. & Mfg. Co.

The Judges Who Will Pass Upon the Articles Submitted in "Journal's" Maintenance Competition

WITH the co-operation of Daniel Durie, president of the American Electric Railway Engineering Association, judges who will serve in connection with the ELECTRIC RAILWAY JOURNAL'S maintenance competition have been selected. They include the three chairmen of the standing committees having maintenance work to do. They are A. T. Clark, Baltimore, chairman of the committee on rolling stock; F. McVittie, Rochester, chairman of the committee on power distribution; Howard George, Newark, chairman of the committee on way and structures; Guy C. Hecker, special engineer of the American Electric Railway Association, and Charles Gordon, editor of the ELECTRIC RAILWAY JOURNAL. These men are recognized leaders in the work of their particular departments and as chairmen of the various engineering association committees their standing will lend weight to the decisions they render.

Judges of the "Journal's" Maintenance Competition

Top, left, Howard George; top, right, Guy C. Hecker; center, A. T. Clark, chairman; lower, left, Charles Gordon; lower, right, F. McVittie.

As recognized leaders in the work of their particular departments and as chairmen of the various engineering association committees, the standing of these men will lend weight to the decisions they render

A. T. Clark

Mr. Clark is superintendent of rolling stock and shops of the United Railways & Electric Company, Baltimore, Md. He has been connected with the company there since 1907. He was graduated from the Sheffield Scientific School with the degree of M.E. In the past he has served with the J. G. Brill Company, the Southwark Foundry & Machine Company, the Link Belt Engineering Company and the Bethlehem Steel Company.

F. McVittie

Mr. McVittie is electrical engineer of the New York State Railways, Rochester Lines. He is a Canadian by birth, received his early education in the public and high schools at Rochester, N. Y., and his technical training at Rose Polytechnic Institute, Terre Haute, Ind. For the past twenty years he has been connected with the New York State Railways in various capacities, and in 1917 was appointed electrical engineer of the Rochester Lines.

Howard George

Mr. George is with the Public Service Production Company, Newark, N. J. He took his present post in the fall of 1925. Before that for five years he was engineer of maintenance of way for the Public Service Railway, another subsidiary of the Public Service Corporation. He has been connected with the companies in New Jersey since 1906. He served the company first as field engineer, then as division engineer, assistant to the chief engineer and as engineer of maintenance of way. During the term of his service in this last-mentioned capacity the responsibility was made his for the design and construction work on building operations, his transfer to the production company was a natural result of the widened activities of the man.

G. C. Hecker

Mr. Hecker has been special engineer of the A.E.R.A. since March, 1922. In that post he succeeded J. W. Welsh, now executive secretary of the association. His connection with the industry dates from 1903, when he became connected with the Citizens Traction Company, Pittsburgh. He was advanced eventually to the position of chief electrician, a post that really carried responsibilities much greater than the title he held would indicate. In 1920 he became a general engineer in the railway department of the Westinghouse company and from that position he went to the association. He has to his credit to a scholastic attainment the completion of the course in electrical engineering at the Carnegie Institute of Technology at Pittsburgh.

Charles Gordon

Mr. Gordon is by training a car equipment engineer. He served formerly in this capacity with the Chicago Surface Lines, responsible under H. H. Adams for engineering development in connection with the operation of about 4,000 surface cars engaged in the hardest kind of city service. He entered the railway field in Chicago in 1912, upon his graduation from the electrical engineering department of the University of Illinois, and continued in railway work until the fall of 1917, when he entered the army air service. On his return to civilian life he served with the Vacuum Oil Company for a year, but then became equipment engineer with the Chicago Surface Lines, with office in Chicago. He entered journalism with the ELECTRIC RAILWAY JOURNAL in 1923.

All Articles in This Section Submitted in Maintenance Competition

THIS section contains the first group of items submitted in ELECTRIC RAILWAY JOURNAL'S maintenance competition. The judges whose names are published on the adjoining page will select one of these for the first $25 prize awarded for the month of May. The winner will be announced in next month's maintenance issue, dated June 18. In addition, the author of each item in this section will receive $5 immediately. The winning article, together with all others submitted before Aug. 1, 1927, is eligible for the capital prizes of $200, $100 and $50 respectively, as previously announced.

Maintenance Men, Don't Overlook This Opportunity of Winning Recognition! There are eleven of these monthly prizes left, besides the three capital prizes. Get your articles in early. That gives you a better opportunity of winning one of the early monthly prizes. Track and distribution men are particularly urged to enter the contest. At present, the equipment department has by far the best showing. Don't complain later that the track and line was not properly represented. This is your contest. Get those maintenance kinks in now! See the April 16, 1927, issue, pages 700 and 701 for full details.

REMEMBER!

ANY employee of an operating electric railway or electric railway bus subsidiary may compete for the prizes to be given by ELECTRIC RAILWAY JOURNAL for short maintenance items suitable for publication in this section.

The author does not necessarily have to be the originator of the idea or device. An article may be submitted by several persons or by a department and need not be written by the person in whose name it is submitted.

Articles may treat of any maintenance practice or device used by any department of an electric railway and should be preferably 100 to 200 words in length and accompanied by one illustration. Brevity consistent with a proper presentation of information will be given weight in judging articles. In no event should they be longer than 400 words with more than two illustrations.

Manuscripts should be mailed to the editor of ELECTRIC RAILWAY JOURNAL, Tenth Avenue at 36th Street, New York, N. Y. To be eligible for the capital prizes, the envelope must bear a postmark dated before Aug. 1, 1927.

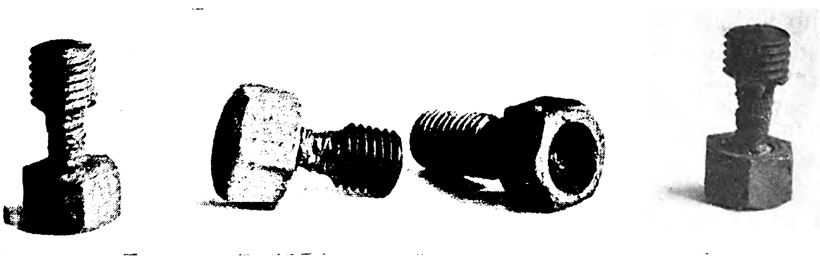
Method of Removing Broken Cap Screws*

BY P. A. GILBERT

Foreman Welder Rolling Stock and Buildings Department,
Philadelphia Rapid Transit Company, Philadelphia, Pa.



Broken cap screws which have been removed by welding an extension with nut for turning

IN THE maintenance of certain types of motors operated by the Philadelphia Rapid Transit Company considerable difficulty was experienced due to breakage of cap screws holding the axle bearing caps in place. Frequently this breakage occurred in such a way that a short end of the cap screw still remained in the aperture. This prevented the insertion of a new cap screw until the broken portion was removed. To facilitate the removal of these broken ends a special procedure is used in the shops.

First an acetylene torch is used to heat the aperture long enough to burn out any accumulation of oil or grease that may be present. Following this a column of metal is built up on top of the broken end of the cap screw by electric welding. This is brought up to a height so that it will extend somewhat above the top of the aperture. An old nut of proper size is then dropped down over the column of metal and the welding operation is continued until the hole in the nut has been filled up and is thus welded in place. With this method the nut is firmly welded to the broken part of the cap screw through the column of metal, and a wrench can be applied for removal.

An inexperienced welder may have some difficulty in performing this operation, particularly if the aperture is under ¾ in. diameter. To overcome this the end of the electrode is wrapped with friction tape, which serves to prevent it from coming in contact with the side of the hole. The tape, of course, burns off as the arc progresses. It is very seldom that this treatment has failed to remove the broken end of the screw.

SIGNALS—1

Clearing Indicator Assists One-Man Operators*

By Jay McDonald
Signal Maintainer Chattanooga Traction Company, Chattanooga, Tenn.

A CLEARING indicator which shows the motorman when the signal has cleared behind him is used with all Nachod signals on the lines of the Tennessee Electric Power Company, Chattanooga, Tenn. It has been found of particular assistance in one-man operation. The clearing indicator lamp is the same as is used in the signals. It is inclosed in a small box with a hinged top. The light shines through a 5-in. bull's-eye lens. The color of the lens is optional with the railway. The box which we are using is 7 in. x 7 in. x 4 in. It is placed on a pole about 10 ft. above the ground and far enough from the clearing contactor to be visible plainly to the motorman when the trolley wheel passes under the clearing contactor. The lamp used is a 50-watt, 220-volt size and is wired in multiple with the red light in the signal with two wires each No. 10 solid weatherproof. The clearing indicator shows the motorman when he has cleared the block and also indicates when another car is following him through the block.

In the accompanying diagram an outbound car hitting the setting contactor will set a white light in signal *A* and a red light in signal *B* together with a light in the repeater or indicator. When a car hits the clearing contactor the lights are cleared in the *A* signal, the red light in the *B* signal and the light in the indicator in front of the clearing contactor. The diagram does not show the operation of the white light in the indicator.

ROLLING STOCK—ELECTRICAL—14

Convenient Hydraulic Bearing Press*

By Equipment Department
Georgia Power Company

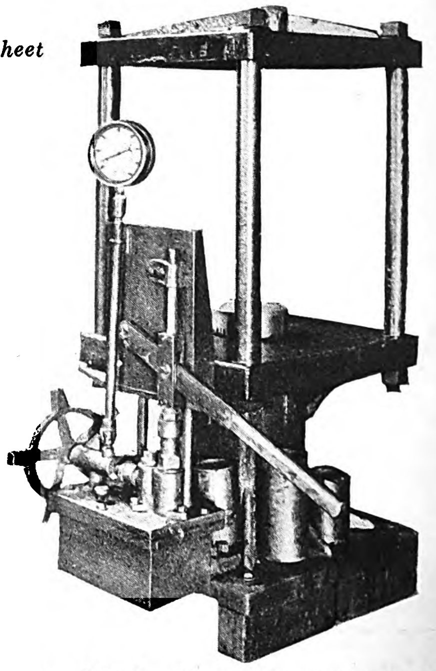
FOR pressing armature bearings into housings, the Georgia Power Company, Atlanta, Ga., uses two hydraulic presses, one at the main shop of the railway and the other at an operating carhouse where armatures are changed.

The base and top plate are made of cast iron. The base contains the pressure cylinder and provides bolting lugs for the reservoir and pump. The top and bottom plates are fastened together with four 1½-in. bolts. Extra heavy pipes of 2 in. diameter are used as spacing sleeves over the bolts. The distance between the face of the ram and the top plate is 21 in. and the travel of the ram is 15 in. The cylinder is lined with a ½-in. sleeve bored out to a diameter of 5 in.

The pump used in connection with the press is a single-acting check-valve type. It is operated by a lever having a four to one ratio. The pump piston rod has a top guide to keep it in line. The pressure release is controlled by a handwheel which is shown at the back of the press in the illustration.

The pressure gage is arranged to indicate from 0 to 30 tons. It is protected by a choke in the pipe, which prevents sudden shock pressures reaching the gage. An assortment of sleeves and mandrels are used to take care of the various diameters of bearings used.

Since the installation of the press at the main shops a saving of 75 per cent in time alone has been realized in the removing and pressing-in operations. The use of the press has eliminated broken babbitt and bruised ends of bearings which, with the previous method, resulted from driving bearings in and out with a hammer and copper block. Another advantage is that positive knowledge is obtained of the fit of the bearing and the pressure used for forcing it into position.



Type of hydraulic bearing press used in the shops of the Georgia Power Company

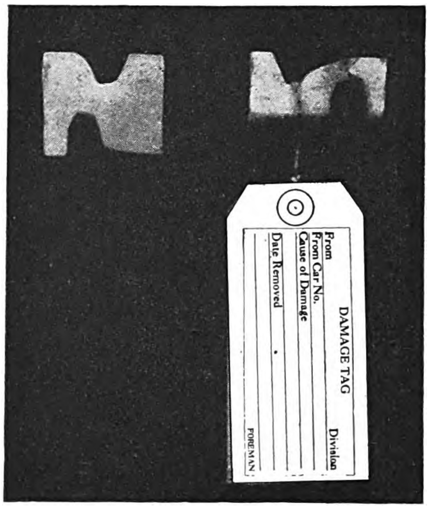
Parowax Method for Determining Flange Wear*

By J. B. Blaiklock
Master Mechanic Washington Railway & Electric Company, Washington, D. C.

IN ORDERING cars to the shop for a change of wheels it is sometimes difficult for a carhouse foreman to judge correctly the condition of the flanges and report only those wheels for change that have reached the limit of allowable wear. In order to provide for the removal of wheels at uniform limits of flange wear and so that the various carhouse foremen on the Washington Railway & Electric Company's system can keep the mechanical department office informed properly as to flange wear of wheels parowax impressions are made. The practice of taking these impressions was established seven years ago and has proved quite satisfactory.

The accompanying illustration shows two impressions that were taken and sent in to the mechanical department office. Impressions are made in a piece of ordinary parowax about ⅝ in. thick by 1 in. x 2 in. This size will take care of flange impressions for two wheels. The impression is made by pressing the wax against the flange of a wheel which has first been warmed by means of a blow torch to a temperature just sufficient to soften the wax. The impression is then numbered and dated and is sent to the mechanical department office, where it is examined by the master mechanic, who determines whether the car should be shopped and wheels removed or whether it should be continued in service for a longer period. If the latter course is decided upon the wax impression is filed away for future reference and attention.



Parowax impressions of steel wheel flanges

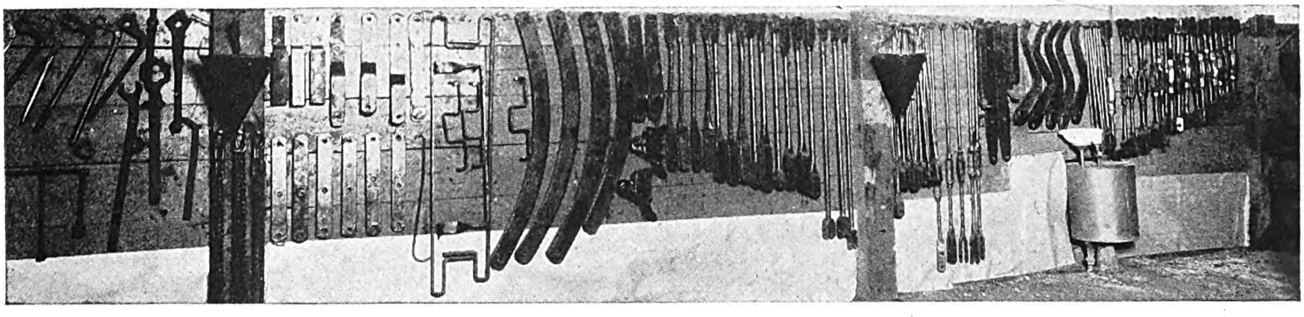
ROLLING STOCK—TRUCKS—7

Tool and Truck Maintenance Parts Board*

By R. M. O'Brien
Superintendent of Rolling Stock and Shops
New Orleans Public Service, Inc.,
New Orleans, La.

A COMBINED tool and truck maintenance parts board which is in use in the Canal shop of New Orleans Public Service, Inc., is proving of great convenience. A check system is not used with this board, as it is under the supervision and care of the foremen. Unless the tool board is completely filled the day foreman will not accept it from the night foreman, and vice versa. This board is located near the center of the shop so that walking distance to it is reduced to a minimum. The visible storage of the maintenance parts tends to make any depletion of stock below certain limits very noticeable to the foreman. This type of board helps materially to improve the appearance of the shops and keeps them neat and clean.



Tools and maintenance parts are kept orderly and neat by means of this type of board

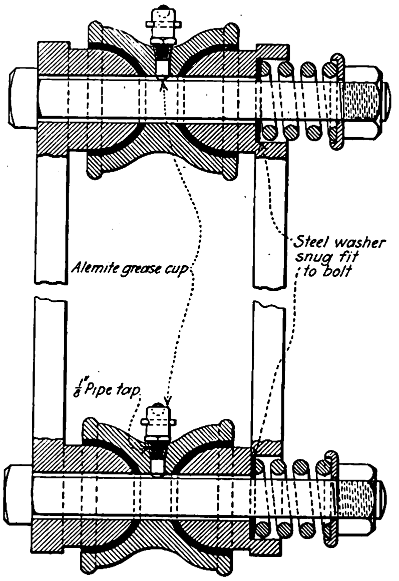
Alemite Lubrication for Half-Ball Brake Hangers*

By A. Taurman
Superintendent of Equipment, Way and
Structures Birmingham Electric
Company, Birmingham, Ala.

USE of grease cups so as to provide Alemite lubrication for Brill half-ball brake hangers has lengthened the life of these hangers 100 per cent on trucks operated by the Birmingham Electric Company. This has also reduced the wear so that much of the chattering and noise which existed prior to this installation has been done away with. An accompanying diagram shows how these grease cups are attached. The hangers are drilled and tapped for a ⅛-in. pipe fitting at the points where the Alemite cups are placed. The only other change made was to provide a closely fitting metal washer around the bolt at the point where the spring rests against the hanger. With this arrangement the opening at each end was closed effectively. All brake hangers of this type on trucks of the Birmingham Electric Company are being equipped with the Alemite grease cups in this manner.



Application of Alemite grease cups to half-ball brake hangers

ROLLING STOCK—TRUCKS—8

Dolly Truck for Crippled Cars*

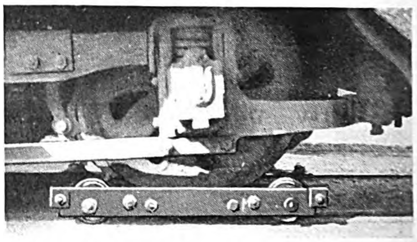
By R. T. Chiles
Master Mechanic Cumberland County Power
& Light Company, Portland, Me.

FOR the past two years we have used a specially designed small truck or dolly for bringing in cars with broken axles, broken gears or other troubles that develop in service which prevent a pair of wheels or an armature from revolving. The truck can be placed in position under the car in about twenty minutes and it requires no chains or fastening to hold it. The pair of wheels to be removed from the running rail is jacked up, together with the car body, and the small truck is pushed into position. The wheels are then lowered until they rest firmly on the inside of the side frames.

Small truck used for bringing in crippled car

The motor geared to this axle, or with four-motor equipments the pair of motors, one of which is geared to the axle, is cut out either at the controller or by removing the carbon brushes. The car can then be operated on its own power without difficulty. The small trucks will pass through special trackwork as readily as a standard car wheel. They can be used with any type of double or single truck car and with wheels from 26 in. to 34 in. diameter, and with a rim width of 4 in. Cars have been brought in a distance of 16 miles on this truck at a speed from 12 to 15 m.p.h. without undue heating of the wheels of the truck.

The general construction of the truck is shown in the accompanying illustration. The side frames are of 1-in. by 4-in. steel, the end crossing bars of 3-in. x 3-in. x ⅜-in. angles and the diagonal braces and motor rests of 3½-in. by ¾-in. steel. The wheels of the truck are 5⅝ in. diameter, with 3-in. tread, 1-in. flange thickness and ¾-in. flange height. They were turned up from 7-in. diameter steel billets and have bronze bushings. Axles are 2½ in. diameter and are drilled so that they can be filled with grease for lubrication. The wheel base is 29½ in. and the truck has a length over all of 41 in., a width of 65 in., and weighs 528 lb. The weight of the car is carried on four bolts, each 1½ in. diameter, shouldered between the side frames of the truck.



Truck installed under 24-ton car

Improved Equipment

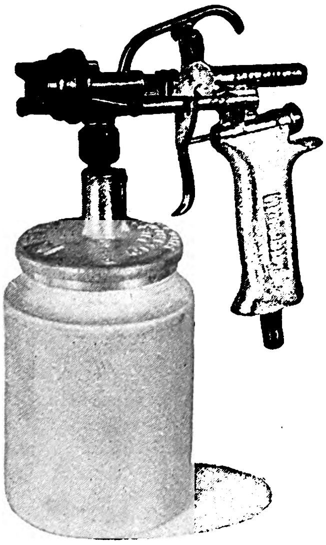
Additional Tools for Electric Railway Maintenance

MANY letters of commendation have been received from our readers regarding the value of short descriptions of improved equipment for railway maintenance. We started the publication of such items in the March 19, 1927, issue, in which sixteen pages were included. Some additional items were published in the April 16 issue and now we are adding the third installment. Such descriptions of the latest tools which can be adapted to electric railway maintenance work enable those responsible for maintenance practices to visualize the shortcomings of their particular equipment and provide for changes which will put their maintenance work on a higher plane. Modern tools speed up repairs and assist in making a railway prosperous.

Paint Spraying Gun

ALEXANDER MILBURN COMPANY
1416-1428 West Baltimore Street,
Baltimore, Md.

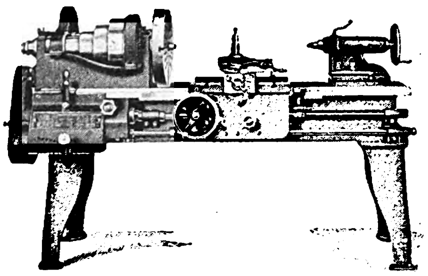
EITHER a siphon feed, pressure feed or gravity feed spray can be used in this spray gun. An adjustment in the multiple head produces a horizontal or vertical flat fan spray or a round spray. When dusting is desired a trip lever is raised, allowing the air to blow alone and shut off the paint supply completely. Both the air and paint valves are operated simultaneously. By pulling the trigger paint flows to the atomizing chamber, is expanded and is forced into the pores of the surface to be covered. A self-centering fluid pin is furnished with the gun which increases or decreases the volume of paint. The gun is all metal, evenly balanced and provided with a natural hand grip.



Standard Cone Head Lathe

REED-PRENTICE CORPORATION
Worcester, Mass.

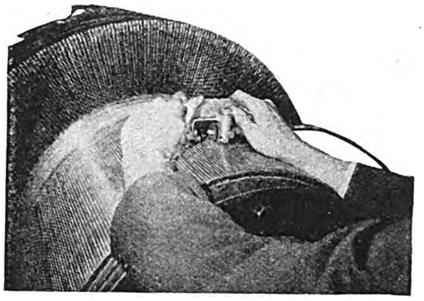
SIXTEEN-INCH standard lathes of this manufacture have four step cones, which in conjunction with gearing of suitable pitches adapts these lathes for a wide range of light and heavy work. The head spindle is made from a steel forging with journals hardened and ground. The spindle bearings are square cast-iron housings which fit snugly into square seats in the headstock. They are lined with babbitt, bored with a diamond and hand-scraped to the spindle. A compound rest is usually furnished with the machine but a plain rest can be furnished if desired. Power cross feed is furnished with both types of rests. An independent feed rod is furnished so that the lead screw is used only for thread cutting. Each machine has a quick change gear box providing 60 changes to both lead screw and feed rod. There are two 13-in. friction pulleys on the countershaft and of a width suitable for a 3½-in. belt. The standard equipment consists of a countershaft, steady rest, tool post, large and small face plates, thread-chasing dial and all necessary wrenches. Motor drive is furnished if desired.



Imperial Under-Cutter

MARTINGALE ELECTRIC COMPANY
Box 2660, Lakewood Branch, Cleveland, Ohio

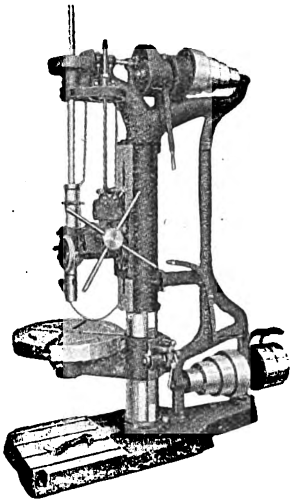
SIMPLICITY of adjustment is a feature of this improved model of the Imperial Under-Cutter. It is claimed to do rapid, clean cutting and to run without vibration. It will cut either the "V" shaped or "U" shaped slot. It has a micrometer screw to adjust the "V" shaped slot guide and a "V" shaped roller guide to ride in an adjacent slot to guide the cutter. A depth gage regulates the depth of slot and a micrometer screw adjusts depth of gage. This cutter is self-cleaning at all times and automatically prevents under-cutting too deep. It practically avoids the possibility of leaving strips of mica along the edges of the bars flush with the commutator surface. Furthermore, it obviates the necessity of going over the commutator the second time to clean out the slots and remove the strips of mica left by square tooth saws. The danger of short circuits between bars is eliminated. The under-cutter is operated by a ¼-hp., 750-r.p.m. motor and is capable of working at the rate of approximately 1 in. per second.



Sliding Head Drills

NILES TOOL WORKS COMPANY,
Division of Niles-Bement-Pond
Company, Hartford, Conn.

SLIDING head drills of the type illustrated have their spindles made of high carbon steel, finished by grinding. There is a ball bearing thrust, quick advance and return. The tool is driven by semi-steel bevel gears of three to one ratio. The spindle speed is graduated and eight speeds are provided. The feed box is located directly on the head and the gears are of hardened steel and run in oil. Handles for changing speeds are stamped with figures to show advance of spindle in thousandths of an inch per revolution and are located within full view and convenient reach. An automatic stop and depth gage is also provided. The sliding head has a long bearing on the column and slides on wide ways



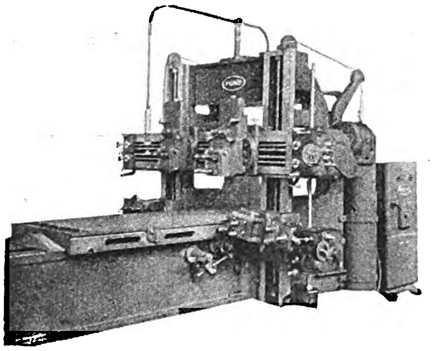
by means of a rack and pinion. The frame has a ribbed and planed base, a large column finished by grinding, a yoke with all gears guarded, a back brace and belt shifter. The table revolves on its center and can be swung out of the way so that the work may be placed on a base plate. The drive is by a four-step cone and sliding back gears operated by a lever. This machine is made in sizes 24, 26, 28 and 32 in.

Planer

NILES TOOL WORKS COMPANY
Division of Niles-Bement-Pond Company,
Hartford, Conn.

ONE of the distinct features on this type of planer is the electric feed and traverse controlled by the pendent type switch and levers shown on the gear box at the end of the rail. Single four-position levers, one for each head, control the direction of feed or traverse. These levers, as well as the lever at the top of the gear box for elevating and lowering the cross rail, are all thrown in the direction of motion desired.

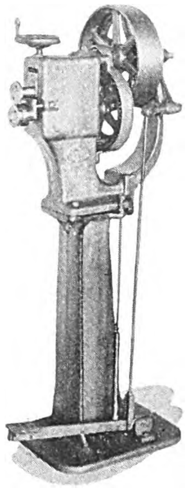
The feed and traverse motor is controlled by the pendent switch and the actual distance the heads or rail travel can be controlled either from the pendent switch or by the levers, whichover is more convenient. The amount of feed is set by a direct reading dial shown on the gear box and ranges from 1/64 in. to 1 in. Electric feed and traverse through the motor on the end of the rail make for simplicity, as the usual feed box in the bed has been eliminated. A self-contained gear box flooded with oil contains all the feeding and traversing mechanism. The control levers are duplicated at the ends of the cross rail, so that with the pendent switch swinging to any position the operator has full control of the traverse and automatic feed engagement of the tool heads, the cross rail elevating, lowering and clamping, as well as control of the table for setting up work from whichever side of the machine is more convenient. The side heads have independent electric feed, also rapid power traverse for raising and lowering. The side head tool can be brought up close to the rail head tool. Also, the rail head and side head tools are in the same vertical plane so that extra length of stroke is not required when using the side head. All driving gears in the bed and the table rack are made of steel and are of the Maag type. They run in oil, and in addition have oil pumped through directly to them. The oil pump is driven from the driving gears in the bed and also furnishes forced lubrication to the table ways. These machines are made in sizes from 36 in. to 72 in.



Machine for Filing and Beveling Cross-Cut and Rip Circular Saws

WARDWELL MANUFACTURING COMPANY
110-112 Hamilton Avenue, Cleveland, Ohio

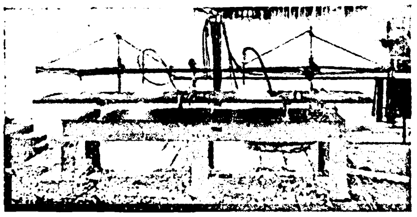
FILING and beveling cross-cut and rip circular saws of diameters from 6 in. to 18 in. can be done by the model Y machine shown. It can be operated by a direct-connected motor or belt drive as desired. This machine will automatically sharpen saws at a speed of 70 ft. per minute and it is claimed that hand work cannot equal it in accuracy.



No. 1A and No. 2 Oxygraph

AIR REDUCTION SALES COMPANY,
342 Madison Avenue, New York City

CUTTING of steel of any thickness from ¼ in. to 20 in. is accomplished with speed and precision on the Oxygraph. The pantograph principle is employed with a motor-driven cutting torch, to copy a drawing, pattern or templet. The pantograph frame of the No. 1A Oxygraph supports a machine torch and an electric motor driving a tracer wheel which acts as a tractor to propel the pantograph in any horizontal direction desired. The relation between the tracer wheel and the machine torch is such that a drawing or pattern is reproduced to half scale.



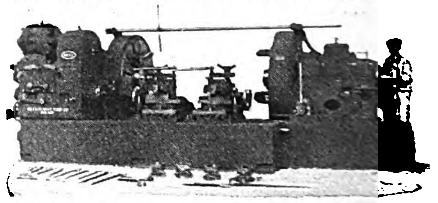
The No. 2 Oxygraph shown is designed for larger and heavier work and has two pantographs which support a horizontal bar mounting one or two machine cutting torches, the motor and the tracer wheel. Designs are reproduced on the No. 2 Oxygraph to full scale. Machine torches of great power have been developed for oxyacetylene and oxyhydrogen cutting with the Oxygraph that operates successfully on the heaviest work.

The cutting action of the torch flame is smooth and rapid, and as any shape can be cut it is comparable to a metal saw of great power, capable of cutting steel 15 in. thick at the rate of 4 or 5 in. per minute, following straight lines, curves and angles, acute or obtuse. Cutting may be started at the edge or within the edge of a piece if conditions require it. The Oxygraph torch flame quickly perforates and thus the cost of drilling and handling is saved. The edges of the cut pieces are square and smooth and in many cases no machining is required for finish. If extreme accuracy is required, the cutting can be done so close to the line that the machining is a light finishing operation only.

Wheel Lathe

NILES TOOL WORKS COMPANY,
Division of Niles-Bement-Pond
Company, Hartford, Conn.

WHEELS from 18 in. to 42 in. diameter on the tread can be turned in this machine. The bed is of a box section casting strengthened by box braces. On the bed are mounted two heads and the tool rests. The left-hand head carries the main driving mechanism, whereas the right-hand head is movable along the bed by a ratchet lever. This head is adjusted to a sliding fit and is clamped to both sides of the bed by a single lever. All driving gears are inclosed and are provided with an automatic lubricating system. The headstock is so arranged that either d.c. or a.c. drive box may be applied.

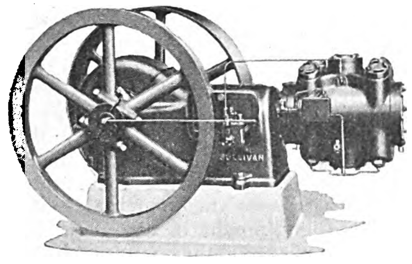


The faceplates are mounted on spindles. T-slots carry the semi-automatic sure-grip drivers which engage the tires directly and enable the full power of the motor to be utilized at the tools. Thrust of the faceplates is taken by the rear spindle bearings with three friction washers. The left-hand faceplate has fast speeds for facing hubs and turning journals or boring car wheels. However, special attachments are necessary for these operations. The faceplates are driven by bolted gears, which engage with steel pinions mounted on a shaft that extends through the center of the bed. The tool rests have in-and-out adjustment on their bases, which in turn have longitudinal adjustment on the bed. The feed is positive and the range per revolution of faceplate is obtained by six feeding strokes, giving practically a continuous speed. A calipering attachment enables the operator to measure the diameter of the wheel without leaving his position at the tool post. All exposed gears are guarded. The machine can be driven by belt or by a variable or adjustable speed motor, as desired.

Belt-Driven Air Compressor

SULLIVAN MACHINERY COMPANY
122 South Michigan Avenue, Chicago, Ill.

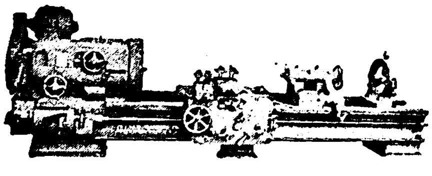
ONE of a line of single-stage wafer valve-type air compressors is shown herewith. The single air cylinder carries the belt pulley on one end and a flywheel on the other. The connecting rods are of open-hearth steel, and are strong and reliable. The babbitt linings are made in halves, and the connecting rod is furnished with wedge-adjusted bronze boxes. The die-cast babbitt bearings of the shaft are carried by seats, facilitating replacement. All parts are accessible. The air cylinder and head are water-cooled. Air cylinder lubrication is accomplished by means of an oil pump connected to the crankshaft. All other moving parts are lubricated by the splash system. An automatic unloader assures constant air pressure. Where the floor space is limited, an idler pulley and bracket can be furnished. These machines run in capacity from 68 to 1,472 cu.ft. They are rugged, simple, compact and economical to operate.



Geared Head Engine Lathe

MANNING, MAXWELL & MOORE, INC.,
Putnam Machine Works, Fitchburg, Mass.

POWERFUL and heavy lathes of this type are made in sizes 36 to 42 in. The deep box section bed is designed with a longitudinal central truss having a cast rack against which the tailstock is braced. The headstock can be driven by a belt, a constant speed motor or an adjustable speed motor. It is of the all-geared type, entirely inclosed, and driven through a friction clutch, mounted on the initial driving shaft. The machine is started and stopped from the apron. Eighteen spindle speeds of a selective type are obtained by the manipulation of only three levers. The headstock contains eighteen gears to obtain the eighteen spindle speeds. A pump provides oil for lubrication of all bearings and gears. The pump and oil tank are located externally on the back of the lathe.

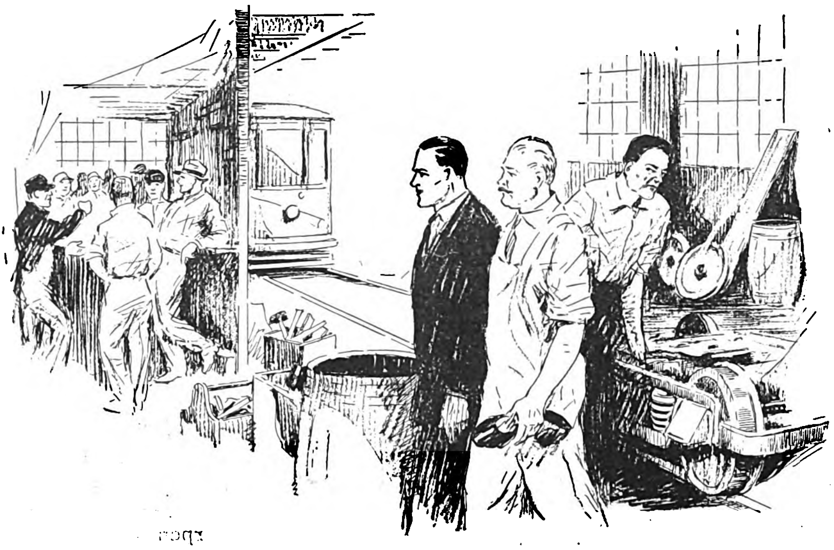


The tailstock is kept in alignment with the head by an inverted V on the rear and has a flat bearing on the front. It has a floating binder to insure correct alignment of the spindle. The four clamping bolts are all operated from the front or working side of the machine. The tailstock is equipped with a side bracket with gear attachment to move it along the bed. The carriage is scraped to fit the entire length of the bed. Each machine has a screw cutting dial, so that all threads can be cut without reversing the lead screw. The compound rest has a swivel base and is graduated in degrees. A unit quick change gear box is bolted and doweled to the front of the bed. It provides 32 changes of threads and feeds in connection with the gearing from the headstock. The steady rest, as regularly furnished, has a capacity of 2 in. to 15 in. diameter on the 36-in. lathe, and from 4 in. to 20 in. diameter on the 42-in. lathe.

Taper attachments, rapid power traverse, cutting compound, circulating system, or metric screw cutting equipment can be furnished if desired.

Dick Prescott Faces the Issue

With Some Misgivings



DICK PRESCOTT, assistant superintendent in the Consolidated Railway & Light Company's shop, quickly realized the seriousness of the situation which Bill Johnson, truck shop foreman, reported. The men refused to go to work. So Steve White, his old friend, the carpenter shop foreman, had been right! Those murmurings he had heard among the men had meant real dissatisfaction and not merely idle gossip of loose tongues.

There was suddenly in Dick's mind an intense feeling of depression and weariness. He had tried to play fair with the men and was thoroughly unprepared for anything of this sort. Had he expected too much? Had he relied too much on his faith that men like to work in a well-managed shop and will take pride in being part of a progressive organization?

"Surely this can't be true," thought Dick. "These men are not objecting to the improvement in efficiency and methods which have been made in the shop. No man with the slightest pride in his make-up would be content to go back to the old shipshod and wasteful methods. I am sure that some of these fellows were getting really enthusiastic about the new order of things and the improvements that have been made in the shop."

There Dick was baffled. He was at a loss to explain any cause of dissatisfaction. Nothing had been done which was not obviously for the improvement of service, reduction of cost or elimination of needless loss in time. Apparently something had suddenly gone wrong. There must be some misunderstanding. Dick refused to lose his confidence in the men and in their fairness of mind when given an opportunity to understand that their interests and those of the company were identical.

These thoughts flashed through the young assistant superintendent's mind quickly. For a moment only he sat silent after Bill Johnson had bluntly reported trouble among the men. There came the idea of appealing to his superior, Tom Mullaney, for aid. He longed for an opportunity to consult with Steve White. But Johnson stood at his elbow and Dick refused to show even the slightest sign of weakness in dealing with this first real test of his ability as an executive. He had been fair and square with the men and he decided to face the issue with them directly, taking the full responsibility for his action.

"Just what seems to be the trouble, Bill?" he asked, calmly.

"Don't know," replied the truck foreman. "Men standin' around lookin' at each other, but won't go t'work."

Dick suspected that Johnson knew more or suspected more than he was ready to talk about. "All right," he remarked, "I'll go right down with you."

As the two men walked into the truck shop, Pete Welsher, shop inspector, whose underhanded work had finally brought on real trouble, puttered around a truck in the far corner of the shop with a sneer on his face.

"Now let's see what this smart young bird's goin' to do," he muttered to himself. "He didn't learn nothin' about this in college, I'll bet."

Association News & Discussions

C.E.R.A. Master Mechanics Hold Two-Day Session

Inspect Shops of Pittsburgh Railways, Westinghouse Air Brake Company and Westinghouse Electric & Manufacturing Company—Further Progress Made in Standardization of Freight Equipment

ATTENDANCE at the Pittsburgh meeting of the Central Electric Railway Master Mechanics' Association on May 11 and 12 was the largest since its organization. This was likewise one of the busiest meetings ever held by the association. The two days were crowded full with the business session and inspection trips to carhouses and shops of the Pittsburgh Railways, the Wilmerding plant of the Westinghouse Traction Brake Company and the East Pittsburgh plant of the Westinghouse Electric & Manufacturing Company.

Every minute of time was occupied in covering the strenuous program laid out by those in charge of the arrangements. During the business session reports of standing committees were gone over, discussed in detail and adopted or referred back with suggestions for further work. Much progress was made in determining standards for freight car equipment in interchange service.

Some slight changes in the details of design of the standard C.E.R.A. box car were adopted. The standard length of coupling hose was changed from 22 in. to 18 in. A set of standard car inspector's gages was approved. A. W. Clarke of the American Car & Foundry Company reported progress in getting approval from the Interstate Commerce Commission of standard safety appliances for interurban box cars. Chairman T. H. Nicholl of the standards committee was complimented by President G. R. Green for the exhaustive and carefully prepared report that was brought in by his committee.

A report of the uniform charges committee was read by Secretary Earlywine. This was received with no objections. The arbitration committee, under the chairmanship of J. B. Corderman, brought in a report regarding a dispute on charges between two member companies that had been referred to it. The decision of the committee was approved by the association.

There ensued a discussion of troubles with the Form 12 coupler resulting from the rough handling of trains or the movement of trains longer than the capacity of the coupler. H. Cordell reported that he had materially reduced this coupler trouble on the Chicago, North Shore & Milwaukee Railroad by the use of a heavier draft spring made up of rectangular steel in place of the round material normally used in this model coupler. A question regarding the operation of so-called 3-in. tread cast wheels that do not actually measure 3 in. was raised by A. J. Challeen. It was voted that such wheels should be rejected for interchange movement.

In the inspection of shops and carhouses of the Pittsburgh Railways the new car washing machines developed and being installed by that company proved to be of great interest. Painting processes used by the Pittsburgh property and the Moorite process of paint removal, which was originally applied in Dallas, Tex., and described on page 292 in the Feb. 13, 1926, issue of ELECTRIC RAILWAY JOURNAL, aroused considerable comment.

The morning of the second day was spent in the Westinghouse Air Brake plant at Wilmerding. After going over the plant and inspecting the manufacturing processes the principal features of brake equipment in use on C.E.R.A. freight and passenger equipment were explained, discussed and inspected. Demonstrations of valve grinding were made for the visiting mechanics by expert workmen. Luncheon was served in the Westinghouse Electric plant in East Pittsburgh and the master mechanics were the guests of that company for the remainder of the day. Those parts of the plant which were of most direct interest and which could be covered in the short time available were inspected.

C.E.R.A. master mechanics at Westinghouse Air Brake Company plant, Wilmerding, May 12, 1927

First row, left to right—John B. Wright, West. Air Brake; A. A. Crawford, Youngstown & Ohio River R.R.; N. M. C. Horner, West. Air Brake; R. S. Bull, Pitts. Rys.; T. H. Nicholl, Union Traction Co.; G. R. Green, Chicago, So. Bend & Northern Ind. Ry.; P. V. C. See, Northern Ohio P. & Lt. Co.; E. J. Jonas, Cincinnati St. Ry.; John Zoll, Louisville Ry.; A. J. Challeen, Detroit United Rys.

Second row, left to right—F. G. Hickling, West. Elect. & Mfg. Co.; Charles Gordon, ELECTRIC RAILWAY JOURNAL; Lawrence Wilcox, West. Tract. Brake; A. F. Rolston, Columbus, Delaware & Marion Elec. Co.; J. A. Duffy, M. W. P. P. S. Co., Fairmont, W. Va.; B. A. Hupp, M. W. P. P. S. Co., Fairmont, W. Va.; O. F. Kemper, West. Ohio R.R.; C. F. Dennis, G. C. Kuhlman Car Co.; L. P. Morris, West. Elect. & Mfg. Co.

Third row, left to right—R. E. Miller, West. Air Brake; B. M. Hartsock, West Trac. Brake; A. W. Reddersen, Indiana Service Corp.; J. B. Corderman, Lima Toledo R.R.; F. A. Bundy, Lima Toledo R.R.; C. E. Keefer, Altoona Logan Valley Elect. Ry.; J. D. Barnhart, Illinois Tract. System; W. I. Conant, Ill. Tract. Syst.; M. W. Barnell, Cincinnati, Hamilton & Dayton Ry.; H. Cordell, Chi., North Shore & Mil. R.R.; W. B. Renshaw, and W. H. Beattys, Jr., West Tract. Brake Company.

Fourth row, left to right—F. P. Snyder, Oakwood St. Ry., Dayton; J. A. Robinson, Consol. Car Heat. Co.; A. B. Wood, West. Air Brake; W. M. Bisel, West. Tract. Brake; G. W. Sword, Oakwood St. Ry.; W. G. Brooks, West. Elect. & Mfg. Co.; M. M. Lloyd, Chi., South Shore & S. Bend R.R.; H. J. Meyer, Beaver Valley Tract. Co.; J. W. Osborn, Cleveland, Southwestern Ry. & Lt. Co.

Fifth row, left to right—A. W. Clarke, Am. Car & Fdry. Co.; L. E. Earlywine, secretary C.E.R.A.; Chas. Sigler, Winona Railroad; R. S. Torgerson, *Electric Traction;* B. W. Sullards, Van Dorn Coupler Co.; R. A. Whisner, Dayton-Xenia Ry.; F. Schmitt, South. Ind. Gas & Elect. Co.; J. H. Trissler, Monongahela West Penn Pub. Service Co.; F. C. Martin, Wheeling Traction Co.; R. Boiselle, Westinghouse Tract. Brake Co.

Top row, left to right—O. L. Franzer, Gary Rys.; R. E. Cornwell, C., S. B. & N. I. Ry.; H. F. Coleman, Ind. Service Corp.; T. W. Cox, I., C. & E. Tr. Co., Springfield, Ohio; C. W. Duncan, Greenfield, Ind.; A. Brownworth, L. S. E. Ry., Sandusky, Ohio; C. C. Kantner, Western Ohio Ry.; J. R. Robinson, Monongahela West Penn Ry.; W. L. Margetts, Gen. Elect. Co.

At noon on Wednesday the visiting mechanical men were the luncheon guests of the Pittsburgh Railways and at dinner they were entertained by the two Westinghouse companies. Speakers at the Wednesday evening dinner included W. T. Rossell, general manager Pittsburgh Railways; President G. R. Green, Henry Cordell, master mechanic Chicago, North Shore & Milwaukee Railroad; J. D. Barnhart, master mechanic Illinois Traction System; T. H. Nicholl, superintendent motive power Union Traction Company, and P. V. C. See, superintendent of equipment Northern Ohio Power & Light Company. Lawrence Wilcox of the Westinghouse Traction Brake Company acted as toastmaster.

Mr. Rossell declared that the industry is moving forward and is making progress in many directions. The new cars in Springfield, Mass., and Joliet, Ill., are signs of the times, he said. Every property is making some progress. Each excels in some things. It is important, therefore, he said, that every effort be made to keep abreast of improvements made by other properties and to apply these new ideas. He felt that every progressive management should send its men out on frequent inspection trips. "No one property can lead in all things," he said, "and it is therefore important that we learn from each other." In the effort to improve maintenance practices on the Pittsburgh Railways, it was found that maintenance requirements alone are so complicated and give opportunity for such important economies that it has been considered wise to avoid adding the additional complication of manufacturing activity. For that reason all possible manufacturing work is being eliminated in favor of better organized maintenance.

President Green expressed appreciation of the courtesies extended by both the manufacturers and the Pittsburgh Railways. He called attention to the progress made by the association and to the valuable work which it is doing in facilitating the movement of interchange freight in the entire C.E.R.A. territory. Henry Cordell said that if managers generally understood the value to master mechanics of getting together for the interchange of ideas and the inspection of others' practices meetings of this kind would receive wider support.

The next meeting will be held on Sept. 8, 1927, in South Bend, Ind.

Bus Convention to Be Held at Philadelphia

THE first annual convention of the Motor Bus Division of the American Automobile Association will be held at Philadelphia at the Ritz-Carlton Hotel on June 15 and 16. One of the important addresses will be made by A. J. Brosseau, president Mack Trucks, Inc., and chairman highways committee, National Automobile Chamber of Commerce. Mr. Brosseau will speak on "The Field of the Motor Bus."

Other speakers on the program include H. G. Wells, member Public Utilities Commission of Massachusetts, who will speak on "Interstate Regulation of Motor Vehicles"; F. J. Scarr, consulting motor transportation engineer and formerly in charge of the Pennsylvania Railroad's auxiliary motor vehicle service, whose topic is "The Relation Between the Motor Bus and Steam Railroads"; Prof. Henry R. Trumbower of the University of Wisconsin, formerly economist of the U. S. Bureau of Public Roads, who will speak on "The Economics of Highway Transportation," and C. T. McConnell, vice-president Ohio Motor Bus Association, whose topic is "System a Prerequisite of Successful Bus Operation."

Appointments in Pennsylvania Association

SECRETARY H. A. BUCH of the Pennsylvania Street Railway Association announces that J. E. Wayne, vice-president and general manager York Railways, has been appointed vice-president of the association and S. S. Crane, vice-president and general manager Altoona & Logan Valley Electric Railway, has been appointed to the executive committee.

COMING MEETINGS
OF
Electric Railway and Allied Associations

May 31-June 1-2—**Canadian Electric Railway Association, annual convention, Winnipeg, Man.**

June 6-8—**American Association of Engineers, annual convention, Tulsa, Okla.**

June 9-11—**Midwest Electric Railway Association, annual meeting, St. Louis, Mo.**

June 13-16—**National Association of Cost Accountants, annual convention, Palmer House, Chicago, Ill.**

June 15-16—**American Automobile Association, Motor Bus Division, Ritz Carlton Hotel, Philadelphia, Pa.**

June 19-23—**International Street and Interurban Railway Association, annual conference, Copenhagen, Denmark.**

June 20-24—**American Society for Testing Materials, 30th annual meeting, French Lick Springs Hotel, French Lick, Ind.**

June 20-24—**American Institute Electrical Engineers, convention, Book-Cadillac Hotel, Detroit, Mich.**

June 24-25—**New York Electric Railway Association, annual meeting, Hotel Champlain, Bluff Point, N. Y.**

June 29-July 1—**Central Electric Railway Association, summer meeting, Book-Cadillac Hotel, Detroit, Mich.**

June 30-July 1—**Tramways and Light Railways Association, annual meeting, Bath, England.**

July 22-23—**Central Electric Railway Accountants' Association, Tuller Hotel, Detroit, Mich.**

July 27-29—**Association of Equipment Men, Southern Properties, 12th semi-annual meeting, Atlanta, Ga.**

Sept. 8—**Central Electric Railway Master Mechanics Association, South Bend, Ind.**

Oct. 3-7—**American Electric Railway Association, annual convention, and exhibit, Public Auditorium, Cleveland, Ohio. Exhibits open at noon of Oct. 1.**

Canadian Convention Program Announced

DETAILS of the program for the 23d annual convention of the Canadian Electric Railway Association have been made available by Secretary Eustace Smith, Jr. Headquarters will be at the Fort Garry Hotel, Winnipeg, Manitoba, and the convention will be held in the Winnipeg Rink.

Sessions will begin at 10 a.m. on Tuesday, Wednesday and Thursday, May 31, June 1 and 2. The program follows:

Tuesday, May 31

9 a.m. Registration.
10 a.m. Business meeting.
11 a.m. Reports of committees: Motor bus and truck; safety and accident prevention; rail corrugation; publicity and merchandising of transportation.
12:30 p.m. Discussion of timely topics: "Car Inspection and Noise Reduction," led by C. Comba, Calgary, and J. E. Watkins, Winnipeg.
1 p.m. Luncheon; official welcome by Mayor R. H. Webb; address by a representative of the American Electric Railway Association.
2:30 p.m. Inspection of exhibits.
4 p.m. Trip to Windsor Park golf course.
9:30 p.m. Supper dance, Fort Garry Hotel.

Wednesday, June 1

9 a.m. Paper, "Economical Distribution of Power," by A. J. Westman, Montreal.
Discussion led by R. A. Brown, Calgary.
11:30 a.m. Discussion of timely topics: "Methods of Conducting Energy-Saving Campaigns," led by D. W. Houston, Regina, and F. D. Burpee, Ottawa.
Trolley Wire, Relative Merits of Phosphor Bronze and Cadminum," led by J. F. Neild, Toronto, and E. V. Caton, Winnipeg.
12:15 p.m. Paper, "Electric Railway Freight Handling," by T. H. Stoffel, Westinghouse Electric & Manufacturing Company.
1 p.m. Luncheon; Speaker, Carl W. Stocks, editor BUS TRANSPORTATION.
2:30 p.m. Inspection of exhibits.
7:30 p.m. Cabaret dinner-dance, Fort Garry Hotel.

Thursday, June 2

9 a.m. Paper, "The Development of Miscellaneous Revenue," by W. H. Boyce, Pittsburgh, Pa.
Discussion led by C. H. Dahl, Winnipeg, and G. E. Waller, Hamilton.
11:45 a.m. Discussion of timely topics: "Depreciation of Buses and Trucks, by Age or Mileage," led by D. E. Blair, Montreal, and W. A. Ernst, Grand River.
"Zone Fare Collection on Interurban One-Man Cars and Buses," led by H. E. Weyman, Levis, and M. C. McElligott, Canadian Cleveland Fare Box Company.
12:30 p.m. Election of officers and general business.
1 p.m. Luncheon.
2:30 p.m. Inspection of exhibits.

For the entertainment of the ladies on Tuesday, there will be an automobile trip beginning at 4 p.m., returning to Fort Garry Hotel for tea. On Wednesday automobiles will leave the Winnipeg Rink and the Fort Garry Hotel at 11:30 a.m. for the Motor Country Club, where luncheon will be served.

In connection with the convention there will be exhibits of electric railway and bus equipment. Some 25 exhibitors already have reserved space of approximately 10,000 sq.ft.

The personnel of the exhibits committee is F. J. Pratt, purchasing agent Winnipeg Electric Company, chairman; E. H. Smith, Canadian Westinghouse Company; Norman Franks, Canadian General Electric Company; A. L. Brown, Northern Electric Company. C. H. Clancy, Toronto, is director of exhibits.

The entertainment committee consists of M. C. Gilman, Winnipeg Electric Company, chairman: F. A. Becker, Canadian General Electric Company; G. E. Miles, Canadian Westinghouse Company; D. D. O'Toole, Northern Electric Company; W. H. Reynolds, E. F. Phillips Electrical Works, Ltd.

An innovation this year is a booth in which will be displayed statistical charts, publicity data, bulletins, etc., which have been issued by the association during the year. The booth will be in charge of J. C. Barker of Toronto.

Radio Interference Studied in New England

RADIO interference and public relations problems featured a well-attended and enthusiastic meeting of the New England Street Railway Club at Boston on May 12. Much discussion occurred concerning practical methods of making the fan's life happier through location of faults in his own equipment and the improvement of operating conditions on cars and lines. President Robert B. Stearns occupied the chair. The meeting was held, as usual, at the Copley Plaza Hotel and brought out a large number of operating men interested in radio reception and the effect of various classes of disturbance upon it. Following the regular dinner, Hon. Lewis Goldberg of the Massachusetts Department of Public Utilities gave a straightforward address upon public relations, outlining the problem of bus versus street car service as it confronts the commission, pointing out the policies leading to the development of good public relations and emphasizing the economic aspects of the Massachusetts system of rate regulation, with special reference to the determination of the rate base in public utilities. Conspicuous in the afternoon proceedings was an address by C. W. Horn, superintendent of radio operation Westinghouse Electric & Manufacturing Company, outlining recent progress in the radio art. Written discussions were contributed by James Thompson, signal department, United Electric Railways, Providence, R. I.; J. B. Crawford and Harry Elliott of the Concord Electric Railways, and E. F. Bickford, electrical engineer Eastern Massachusetts Street Railway, Boston. Abstracts of these papers and discussions will appear in a later issue.

Transportation to Canadian Convention

PREPARATIONS have been made to attach a special car to the Canadian National Railway train leaving Toronto at 9 p.m., Eastern standard time, on Saturday, May 28, for Winnipeg. The train will arrive in Winnipeg about 10 a.m., Monday, May 30. There will be a reduction in fare on this train if ten or more applications are received. Those desiring accommodations should communicate at once with Eustace Smith, Jr., secretary Canadian Electric Railway Association, Toronto, Canada.

Arrangements have been made so that exhibits may be shipped from the United States in bond duty free for exhibition purposes only. Shipments should be addressed to the exhibitors, care of Winnipeg Rink, Langside Street, Winnipeg, Manitoba, for C.E.R.A. convention. Notification should be sent to George H. Young & Company, customs brokers, 303 Confederation Life Building, Winnipeg, accompanied by two invoices. Further information can be obtained from Chairman F. J. Pratt of the exhibits committee, Winnipeg Electric Company.

American Association News

T. and T. Program

THE program committee of the Transportation and Traffic Association held a meeting at the office of the Cleveland Railway on May 6. Those present were: W. H. Boyce, chairman; A. R. Myers, Paul E. Wilson, W. F. Weh, R. W. Emerson and J. W. Welsh. The committee discussed plans for the coming convention and finally agreed on a number of recommendations which it will make to the executive committee of the Transportation and Traffic Association at its next meeting. If the recommendations of the committee are approved the major part of each session will be devoted to discussion of one of the reports of the three major committees. It is planned to devote Monday to bus operation, Tuesday to traffic and safety and Wednesday to service betterment.

A suggestion will be made that a very brief entertainment period be provided for each session, probably in the form of a musical recital. In addition one or more speakers will be scheduled for each session. It was also suggested that at one of the sessions a demonstration be given of the bus schools of the Northern Ohio Power & Light Company.

If the plan of the program committee is carried out the committee reports will neither be read nor approved, but instead the program committee will list the outstanding points or phases of the report as topics for discussion with a predetermined list of speakers.

Purchases and Stores

WITH almost a full attendance, the committee on purchases and stores met at association headquarters in New York City on May 16. Among the important subjects discussed were: "Review of Existing Purchases and Stores Section of the Manual for Revisions and Correction"; "Continued Study of and Recommendations Regarding the Disposal of Unused Inactive Material"; "Study of Routine Methods to Be Followed in the Purchase and Stores Department Recommending that a Report be Made on the Uniform Method of Distributing Material by Supply Trains or Trucks"; "A Uniform Practice of Testing or Inspecting Material on Receipt or at Factory."

After some discussion and favorable comment, the sub-committee's report on subject No. 2, "The Disposal of Unused and Inactive Material," was permitted to stand as previously adopted.

When discussing subject No. 3, which included a routine method to be followed in receiving, tracing and expediting material, a letter from W. E. Scott of the Philadelphia Rapid Transit Company was presented in which he urged that it should be the function of the stores department to follow up and expedite the delivery of material. Mr. Scott was sustained in his argument by C. A. Harris of the Philadelphia Company. So important were the points brought out by these committeemen that Chairman Fleming suggested that their remarks form the basis for a minority report to be submitted at the next annual convention of the association.

At the afternoon session the question of testing and inspecting materials caused considerable discussion, especially that portion of the sub-committee's report which recommended that the stores department assist in the inspection and testing of minor materials. It was held that although the function of major tests rested with the engineering departments of the individual companies, the stores department could be of assistance. After deciding not to specify what materials the stores department should test and with a slight alteration in the text the report was allowed to stand.

The following members were present: J. Fleming, chairman; John Y. Bayliss, A. S. Duncan, A. L. Fischer, B. W. Forkner, A. E. Hatton, F. A. Jordan, T. H. McGarry, A. A. Ordway, W. E. Scott, and W. J. Walker.

Overhead Current Collecting Devices

SPECIAL rolling stock committee No. 11, overhead current collecting devices, held a meeting at the Engineers' Club in Philadelphia, Pa., on May 3, 1927. There were present at this meeting H. Savage, chairman; H. S. Murphy, W. C. Klein and D. L. Smith.

The committee has sent out a questionnaire to the member companies to obtain information on the collection devices used by them at the time of the meeting. A number of replies to this questionnaire had been received. These replies were read and discussed in detail. It was finally decided to arrange the information obtained in a condensed form for presentation to the standing committee on rolling stock at its meeting to be held on June 7 and 8 at the association headquarters in New York City.

The News of the Industry

Figures of Oakland Value

Present Reproduction Cost Put at $40,626,426 by Company's Engineer—Fare Hearing June 21

An adjourned hearing on the application of the Key System Transit Company, Oakland, Cal., for permanent higher rates was held before members of the California Railroad Commission in Oakland on May 10. After valuation figures had been presented, further adjournment was granted until June 21. At that time reports of the engineers of the Railroad Commission will be filed and further testimony taken.

Richard Sachse, consulting engineer for the company, presented figures showing that the present reproduction cost of the Key System is $40,626,426; $29,163,200 on a reproduction cost less depreciation, and $29,987,074 on the historical reproduction cost system. Mr. Sachse said:

> It may fairly be said that with the completion of this detailed inventory the question of the fair value of the property has been answered. The problem will no longer be as to what the Key System is worth and what constitutes a reasonable return on such an unknown quantity, but rather on how the public service that the company is rendering with an unquestioned investment of more than $30,000,000 can be made self-sustaining. This problem becomes still more important when it is remembered that a street railway business, even more than other going concerns, cannot stand still, but that continual large capital expenditures must be made.

The survey completed by Mr. Sachse cost $100,000. It describes every piece of property owned by the Key System as it existed on Dec. 31, 1926. The work was so carried out that it will be possible from now on for the company to keep its inventory up to date.

C. C. Vargas, comptroller of the company, showed that the net return for last year was $1,200,000 and that it will not be more than half of that this year, making it necessary for the company to pass the dividend and enabling it to pay only interest on bonds.

There was no discussion at the May 10 hearing on the question of fare readjustment. This will come up at a later date. The East Bay cities oppose higher rates and have gone on record against the present 7-cent railway and 21-cent ferry fares.

The spring elections have just been held and new city officials chosen in Oakland and Berkeley and it is probable that the new officials will ask for further adjournment on the ground that they want more time to study the case.

Officials of the Key have intimated to civic leaders that they may offer a compromise on the fare question. One plan being considered is the mileage system of assessing fares.

No definite proposition has as yet been officially made, but it is understood that something of the kind is being considered. The company says that it is losing money on the operation of its bus lines and on its "long riders."

At the present time it is possible for passengers to ride from San Leandro to Berkeley and Albany for a 7-cent fare. This may be changed, so as to put the city into zones, with a graduated scale of fares.

Contracts Let for Westchester Extension

The New York, Westchester & Boston Railway will undertake at once to extend the double-track, all-electric lines of its eastern division to Rye, N. Y. Contracts for the job have been let to the engineering firm of Dwight P. Robinson & Company, and the work is expected to be completed within a year.

During the past three years the railroad has instituted all night service and special commuter express trains on all its lines in Westchester. It has authorized the extension of tracks and passenger accommodations at its Harlem terminal, and through its subsidiary, the County Transportation Company, it has inaugurated in Westchester a system of motor coach lines to serve newly developed suburban communities, L. S. Miller, the president, has pointed out.

Enabling Legislation Introduced

Chicago Surface and Elevated Lines Finally Agree on Unification Plans —Bills Presented to Legislature Call for Transfers, Subways, Home Rule, Indeterminate Permits and Provision for City Acquisition

IN THE brief period of an hour last Tuesday morning, May 17, Chicago appears to have moved closer to a complete and harmonious settlement of its troublesome traction question than in all the recent months of unavailing talk and fruitless negotiations. For no sooner had word been received from Springfield that five traction bills had been introduced seeking the necessary legislation to make effective the various franchise fundamentals recently discussed by city and traction officials than announcement was made in Chicago that a plan for a merger had been agreed to by representatives of both the surface lines and the elevated lines.

The traction bills presented by Senator Barr in behalf of the two transportation companies differ in some respects from those recently framed by Corporation Counsel Samuel Ettelson at the instance of Mayor Thompson, but they embody principles fully agreed to by the Mayor during conferences in recent weeks with traction executives and bankers. The bills themselves merely represent the efforts of the companies to make their consolidation plan legal. Since Mayor Thompson's return to office, all of the differences between the companies which have heretofore slowed up progress appear to have been settled.

If the legislators should pass—prior to their adjournment next month—the necessary legislation provided for in the five bills and the companies are consolidated, there will then remain the negotiation of a franchise ordinance between the city and the companies, and finally a public referendum on the ordinance some time in the fall. Both Mayor Thompson and Governor Len Small have indicated that they will not support traction legislation unless a referendum is provided for. Adoption of the program as it now stands would mean that Chicago would have unified local transportation service with universal transfers between street cars, elevated trains, buses and subways, the latter to be built by the city by means of special assessments and use of the present $50,000,000 traction fund. The City Council would dictate the terms of the ordinance, but would relinquish control of service to a county transit commission.

Except for the modified home rule provision, the traction bills, as formulated by the companies, reflect the same stand taken by traction representatives and bankers throughout negotiations with the city during the past six months. In seeking legislative enactment of the terminable permit plan in place of the twenty-year franchise now allowed by state law, however, the companies acquiesced to the creation of a local Cook County transit commission of five members, two to be appointed by the Governor of the state, two by the Mayor of Chicago and one by the county board.

The transit commission, which would be made a part of the state department of trade and commerce, would control all public utilities in Cook County, of which Chicago is the hub, just as the Illinois Commerce Commission now controls all utilities of the state. The plan is a variation of the metropolitan transportation district proposal offered by Mayor Thompson during his last administration, a plan that failed of adoption by the Legislature by two votes. Members of the new commission would be residents of Cook County and would serve four years, each to receive a salary from the state of $12,000 a year, with a secretary at a salary of $7,000.

The legislative program provides for

the major details of local transportation and rapid transit development in Chicago and suburbs as follows:

> Unified operation of all local transportation facilities—surface lines, elevated lines and omnibuses.
>
> Transfers between surface lines and rapid transit lines at convenient connecting points.
>
> Subways to relieve downtown congestion and facilitate rapid transit.
>
> Immediate development of rapid transit service to localities now suffering for lack of it.
>
> "Home rule" control, regulation and supervision of local transportation by a Cook County transit commission.
>
> "Indeterminate permits" instead of twenty-year grants, in the case of all future street railroad grants by the City Council.
>
> Retention of the city's right to prescribe the terms and conditions of any grant, including provision for acquisition of the local transportation system.

The legislation required for giving effect to this comprehensive program is covered in five bills which provide:

Subways

Bill No. 1 authorizes the city of Chicago to build subways, to be financed wholly or in part by general bonds, special assessment, of use of the city's traction fund, and to lease the same on such terms and for such length of time as the City Council may deem wise. The expense of removing or relocating existing underground utility facilities which may be in the way of a subway is assumed in the first instance by the city but with the right to provide for its reimbursement from lessees of the subway: this, to avoid long drawn out disputes and possible litigation with other utilities.

Indeterminate Permits—Municipal Ownership

Bill No. 2 amends the cities and villages act of 1872 by dropping the twenty-year limit on future street railroad grants and by providing that frontage consents will not be required for putting tracks in subways.

Bill No. 3 applies the terminable, or indeterminate, permit principle so generally approved in current discussion. It provides that future grants of authority to construct and operate, or maintain and operate, a street railroad shall continue in force until the property is purchased by the city or until terminated for nonuser or misuser, according to law.

This leaves to the city the right to prescribe, in any grant, such terms and conditions as it may see fit, except that the grant may not be for a fixed term of years and that the terms and conditions may not be inconsistent with the laws relating to public utilities.

The indeterminate permit provision is necessary to meet the financial requirements for carrying out the program for unification and development of local transportation in Chicago. It does not affect existing unexpired franchises, but applies only to future grants.

For Unified Local Transportation

Bill No. 4 permits a single company to acquire and own the street railroads, the elevated lines, the bus lines and other local transportation facilities. It is expressly provided that nothing in the Act shall be construed to authorize street railroad construction or operation without the consent of the local authorities in city, village or incorporated town.

Home Rule Regulation

Bill No. 5 provided for a Cook County transit commission of five members, having jurisdiction over the proposed unified company and all of its lines.

Local responsibility—"home rule"—is assured by providing: (1) That all five members of the commission shall be residents of the county and (2) that two of them shall be named by the Mayor of Chicago and one by the county board. The other two are to be named by the Governor.

In this connection it is explained that in Cook County ten of the fifteen members of the county board are voted for and elected only by citizens of Chicago. Therefore, three members of the Cook County transit commission—two named by the Mayor of Chicago and one by the county board—will always be directly responsible to the people of Chicago. All expenses of the county commission will be borne by the state and these expenses will be subject to approval by the Governor.

The county commission also meets the necessity of recognizing the physical facts of Cook County. There are now in the county, outside of Chicago, more than 85 cities and villages. Many of them are large sized communities, already served by the elevated lines. The future growth of this great metropolitan district will disregard corporate limits and will undoubtedly require extensions of lines throughout the district outside of the city of Chicago.

The point is made that a law giving to the Chicago City Council the power of regulation over a company serving many other cities and villages outside of Chicago would be of doubtful legality to say the least. Nor would it be practicable to have the company's lines regulated in part by the city and in part by the Illinois Commerce Commission. The bill is regarded as the nearest approach to home rule that is both legal and practicable.

A statement signed by Henry A. Blair, president of the Chicago Railways, Britton I. Budd, president of the Chicago Rapid Transit Company, and Leonard A. Busby, president of the City Railway, says:

> The bills have been drawn to meet the necessities of the peculiarly complex and "special" traction situation in Chicago, without contravening the state's constitutional prohibition of special or class legislation. They contain no "jokers." They meet the peculiar complexities of the Chicago situation without disturbing existing conditions in other parts of the state; and they are, at the same time, practicable for application in other parts of the state if circumstances comparable to those of Chicago ever arise there.

As yet Mayor Thompson has offered no definite legislative program, but insists that any solution must assure good service, just wages, decent working conditions and a fair rate of return on actual investment. The Mayor's attitude toward home rule closely approximates the plan put forward in the companies' legislative bills. A public hearing on the three traction bills prepared some time ago by the Corporation Counsel's office at the direction of the Mayor, will be held by the joint senate and house committee in Springfield about May 25. The bills provide for consolidation of elevated, surface and bus lines and for the terminable permit plan as a substitute for the present twenty-year franchise.

Poughkeepsie Recognizes "No Accident" Employees

A marked falling off in accidents is the result of a three months "no accident" contest carried on the lines of the Poughkeepsie & Wappingers Falls Railway, Poughkeepsie, N. Y. The plan is to be continued for another three months campaign.

Prizes of $5 for each member of the winning crew were awarded on May 3 when the men received their pay envelopes. There were seven men on the losing crew who had clear records during the period covered in the contest and consolation prizes of $2.50 were awarded each man. Captain Rhodes of one of the winning crews entered the employ of the company 37 years ago as a horse car driver. E. Schoonmaker, captain of the other winning crew, has been in the employ of the company for more than twenty years.

George W. Wells, general manager, said that the majority of the accidents reported in the past three months were due to motorists driving away from curbs without giving the proper warning signal to the motorman; that there were few accidents involving pedestrians and bicyclists.

Paving Law in Arkansas Upheld

In a decision rendered on May 16 the United States Supreme Court held that an act of the Arkansas Legislature which in effect compelled the Fort Smith Light & Traction Company to bear the expense of certain street paving in Ft. Smith, Ark., was not an arbitrary or unreasonable exercise of the legislative functions.

Under authority of an act of the Arkansas Legislature of 1919, amended in 1921, the utility surrendered its franchise to operate in Fort Smith for an indeterminate permit to operate subject to regulations of a utilities commission. The franchise provided that it should pay the cost of paving streets between its rails and to the end of the ties, and limited its fare to a maximum of 5 cents.

In 1923 the Legislature enacted a law requiring street railways under certain conditions which were met in this particular case, to pave between their rails to the end of the ties and which empowered improvement districts to do the paving and charge the cost to the railway in the event the companies refused to do the work themselves. The Fort Smith company was asked to pave certain streets under this law and refused, whereupon the work was done by the Board of Improvement of Paving District No. 16 of the city of Fort Smith.

The company resisted an attempt to make it pay and the suit resulted. The company claimed that the law of 1923 was unconstitutional in that it was an impairment of a contract. It also charged that the law was so phrased as to apply only to this particular railway in Arkansas.

The Supreme Court held that the act was not arbitrary or unreasonable. It pointed out that while the law of 1919, under which the company surrendered its franchise and obtained an indeterminate permit, did not provide that the company should defray the cost of paving, at the same time it did not exempt the company from such charges and that it was not unconstitutional for the act of 1923 to be so framed as to apply only to the Fort Smith company in effect.

New York State Wage Conferences End

Wage conferences between James F. Hamilton, president of the New York State Railways, and the Rochester-Syracuse-Utica, employees' agreement committee ended on May 18. The result will be submitted to the employees for a vote on May 25. Officials declined to give out the result of the negotiations. The men sought an increase of 9 cents an hour.

Question of Suburban Fares Raised in Cleveland

By the terms of a franchise which a committee of the City Council of Cleveland, Ohio, has rejected, Cleveland Heights agreed to a rate of fare on the lines of the Cleveland Railway always 1 cent higher than the rate within the city. In return the company contracted to make certain extensions within the suburb. The claim of the Cleveland committee, supported by the street railway commissioner, is that this 1-cent differential is not sufficient to pay the cost of service. It proposes, instead, a differential which in case city riders pay 7 cents, as they do now, Heights riders would pay 10 cents.

The 1-cent differential was recommended by the metropolitan committee. According to the Cleveland *Plain Dealer* it represents what that committee, after a painstaking study, believed was a fair adjustment between city and suburban car riders. How difficult it is to fix transportation costs accurately, however, was acknowledged by the committee, which declared in its report:

> Any attempt to provide service-at-cost for the individual car rider must of necessity produce only an approximate result . . . It is only the imaginary average car rider, the man who rides for an average distance on an average line, who gets his service exactly at cost.

The opinion of the *Plain Dealer* is that if the Cleveland Council attempts to club any suburb into accepting a franchise which the suburb's own judgment thinks unfair—particularly, when the suburb's position in the controversy is indorsed by an authority as good as the metropolitan committee—it will set back the progress of traction peace on which the welfare of the whole community hinges. That paper said:

> Years of increasing difficulties for Cleveland's traction system led to the creation in 1925 of the metropolitan transportation committee and its recommendation of a program of co-operation between the city and the suburbs. That program, widely commended at the time, is imperiled by the attitude of a council committee. If it is destroyed, we will see re-established the same chaotic conditions that alarmed the community previous to 1925 and brought the metropolitan body into existence.

Increase in Fares Asked in Sacramento

The Pacific Gas & Electric Company has applied to the California Railroad Commission for authority to increase fares on its electric railway system in the city of Sacramento, alleging that the present rates and fares are inadequate to produce a fair return upon the investment in the properties. The company asks permission to establish the following passenger rates:

One-way fares on all lines, 7 cents; weekly pass, good over entire system transferable with unlimited use to the holder during the calendar week issued, $1.50; school tickets, to be limited to children under thirteen years of age, and to be accepted only on regular school-days between the hours of 8 a.m. and 4:30 p.m.; special car rate, minimum charge, $5.

Newspaper tariff, 10 lb. per 100 papers, 6,000 papers, $4.50; 11 to 45 lb. per 100 papers, 6,000 papers, $7.50; 46 to 75 lb. per 100 papers, 6,000 papers, $10.50; all over 75 lb. per 100 papers, 6,000 papers, $13.50. Bundles weighing in excess of 40 lb., and not to exceed 150 lb. to be handled only when in charge of messenger paying regular fare.

The company alleges in its application that its railway system has an average historical cost of the depreciable property during the calendar year 1927, in excess of $2,460,000, and that the reproduction cost, as of Jan. 1, 1927, exceeded $3,825,000. Operating revenues during 1926 did not exceed $713,941, it is stated, while the operating expenses were $602,505. The depreciation-fund set aside during 1926 to cover actual deterioration and probable losses was not less than $81,227, leaving a net income of $30,209, or a net return of 1.19 per cent of the historical cost of the 44-mile property.

Tornado Damage in St. Louis

A car washing shed of the United Railways at Spring Avenue and North Market Street, St. Louis, Mo., was unroofed in a near-tornado that swept that city on May 9.

The long arched roof, blown off in one piece, was carried north into St. Ferdinand Avenue, blocking that street. A part of the heavy framework crashed down upon a group of nine steel cars.

Street car service suffered at various points in North St. Louis because of the storm. Company officials report there were 100 interruptions of more or less consequence. These interfered with owl service, but at daybreak cars were running regularly on all but the Manchester and Broadway lines.

The Manchester cars were rerouted via the Market and the city limits lines, while shuttle service was maintained on the west end of Manchester Avenue to Maplewood.

North Broadway was blocked until 10 a.m. in the vicinity of O'Fallon Park and Broadway cars were detoured at Franklin Avenue via the Bellefontaine line to West Florissant Avenue and thence via the Taylor line to Broadway. Shuttle service was maintained on Broadway from Franklin Avenue to Salisbury Street.

Fallen trees, poles and wires were responsible for many troubles. The wind reached a velocity of 72 m.p.h., and its force was so great that iron trolley poles along the Grand Avenue viaduct spanning Mill Creek Valley were bent as if twisted by a giant hand. Many wood poles were snapped in two.

Charles L. Henry Memorial by C.E.R.A.

"Whenever the history of electric railways in Indiana and their extensions in the other parts of the United States is written there will be coupled with their growth and development the name of Charles L. Henry, whose memory will be ever cherished and enshrined in the hearts of a grateful people." This is the concluding sentiment in a memorial and resolution adopted at a meeting of the executive committee of the Central Electric Railway Association at Fort Wayne, Ind., on May 4, 1927. It was resolved that a copy of this memorial be sent to the bereaved family of Mr. Henry and inscribed upon the records of the Central association.

"L" Removal Plan in Brooklyn Deferred

Although Borough President Byrne of Brooklyn was moving to speed action on the removal of the "L" from downtown Fulton Street the problem was relegated to the distant future on May 9 at an organization meeting. Recently the appointment of Matthew S. Sloan, head of the Brooklyn Edison Company, as chairman of a committee of 100 was announced. Forty-two civic organizations, including the Civic Council, composed of the representatives of nearly 100 groups, and the Chamber of Commerce have adopted resolutions demanding the removal of the "L" from the business section downtown. A bill was passed and signed by the Governor giving the city the right to condemn the structure.

In connection with the matter of the consideration of the Fulton Street project the Committee of One Hundred has adopted another resolution. This calls for a petition to be presented to the Board of Estimate urging that body to act favorably upon the plans for the proposed Fulton Street Subway. The resolution also favors the elimination of other remaining elevated roads in Brooklyn after the removal of the Fulton Street structure.

Britton I. Budd Medals Awarded for Saving Lives

The medal for the saving of human life, recently established by Britton I. Budd, within the electric light and power and electric railway companies of which he is president, as an award of honor for any employee who saves the life of any one, anywhere and at any time, was presented recently to two employees of the Public Service Company of Northern Illinois, one employee of the Chicago Rapid Transit Company and posthumously to a late employee of the Chicago, North Shore & Milwaukee Railroad. Those receiving the medals on the electric railway properties and their citations were:

Lyman Dean, deceased, motor coach operator for the Chicago, North Shore & Milwaukee Railroad. On Oct. 25, 1926, Dean was driving eighteen school children, when his coach was caught in the path of a Chicago, Milwaukee & St. Paul Railroad train at Northbrook crossing, near Chicago. Dean remained at his wheel and succeeded in backing the coach far enough off the tracks so that only the front end, where he himself sat, was struck. None of the children was killed. Dean is survived by his wife and three children. Mrs. Dean received the medal from Mr. Budd.

Melville Cover, 21 years old, inspector in the communication department of the Chicago Rapid Transit Company, on Sept. 13, 1926, saved the life of Ralph Grieg, eight years old. The child was brushed from a trestle of the Chicago, Aurora & Elgin Railroad into the Des Plaines River. Cover, who was a passenger aboard the train, saw the lad strike the water and he dived from the train into the river 25 ft. below. He removed the boy to a sandbar and then proceeded to the work of reviving him.

Centralized Train Control on North Shore Line

A new plan of organization of the transportation department of the Chicago, North Shore & Milwaukee Railroad, Highwood, Ill., was put into effect recently by John F. Egolf, general manager of the railroad. Under this plan the superintendent of transportation is responsible for all activities of the department. The number of men reporting directly to him has been decreased from seventeen to nine, and he is relieved of detailed supervision of one of the divisions. Both these improvements free him for the more important work of directing the operations of the department.

One of the most important changes in organization was the discarding of the three-division arrangement in favor of one division and the placing of control of all train operation on all lines (except in terminals) under a new official, i.e., the division superintendent of main lines. Train operation in terminals and all terminal activities are placed under the control of the division superintendent, Milwaukee terminal; division superintendent, Waukegan terminal, and division superintendent, Chicago terminal, respectively.

Train dispatching is all done from one central point, North Chicago Junction, whereas formerly it was done from two remote points, Milwaukee, Wis., and Highwood, Ill. Train dispatchers are responsible for dispatching and recording the movement of trains, but they are relieved of recording the reporting of trainmen. This reporting is now taken care of by employees at the respective terminals and at Highwood. The chief dispatcher is responsible for train dispatching and for assignment of runs to trainmen.

With this and other details of organization in effect, the operation of trains is unified and authorities and responsibilities are direct and clearly defined. Likewise, the plan is economical, for although additional supervision was provided both at the Chicago and Milwaukee terminals, there are fewer employees under the new plan than under the old.

State Supreme in Revoking Franchises

Under a decision handed down by Supreme Court Justice Crosby at Buffalo, the state of New York is the only legal power that can revoke franchises of the International Railway, Buffalo, N. Y. The decision followed the application of the company for an injunction restraining the municipal authorities from revoking six franchises of the International in various streets of the city for alleged non-compliance with orders of the Public Service Commission. The court, however, entered no final order in the matter and suggested that Frederic C. Rupp, municipal corporation counsel, and Henry W. Killeen, of counsel for the railway, try to agree. If they cannot agree, then the court will enter a final order.

Justice Crosby says the original franchises were granted by the state of New York with the city consenting and says the rights can only be revoked by the state, which granted them. The court held, however, that the city should be permitted to pass any and all resolutions, serve any and all notices and papers and do all things that may be necessary or expedient as preliminary steps to the bringing of a proper action to accomplish the revocation of the railway's franchise.

Report at Cincinnati Favorable to Railway

Electric railways furnish the cheapest and most convenient service for moving large masses of people, says the report of the committee on street railways of the Cincinnatus Association of the city of Cincinnati. Among conclusions set forth in the report are:

> 1. A realization that the competition of the automobile has driven the electric railway out of the field of natural monopoly, and therefore it should hereafter be conducted along lines of a private industry, side by side with independent bus lines, so that the enterprise which gives the best service will eventually win out and drive the other entirely out of the field. Our knowledge of the science of urban transportation indicates that electric railways furnish the cheapest and most convenient service for moving large masses of people and it is, therefore, unthinkable at present that this means should vanish from our cities.
>
> 2. Municipal ownership. Whatever the pros and cons of municipal ownership may be, it is agreed that it could not immediately solve the problem. Furthermore, public ownership and public operation in the present state of laws governing municipal action, and especially in the light of present municipal finances, would make its adoption impossible short of a considerable period of years.
>
> 3. Private ownership and operation on a sound, fundamental basis of regulation and control. On this final alternative in the form of the service-at-cost plan recently adopted after five years of negotiation, is based our hopes for the future.

In referring to the report, the Cincinnati *Enquirer* says editorially that public ownership is a delusion and that the question of how best to co-ordinate the bus and the railway service is the problem which must be worked out.

The pamphlet is published with an introduction by the Cincinnati Street Railway. That company says:

> A short time ago a committee was appointed by the Cincinnatus Association and charged with the duty of making a study of the local railway and general transportation situation with special reference to operation under the city control and service-at-cost plan by the Cincinnati Street Railway. The members of the committee were well qualified for making a careful and disinterested study of the subject and devoted an unusual amount of time and attention to the work. The report of the committee was presented to the association by the meeting of its members, but was not given general distribution.
>
> The Cincinnati Street Railway cannot agree with all of the premises in the report or accept all of its conclusions. Notably, we think that street railway industry is by no means immersed in the gloom that Mr. Lowenberg sees. The industry is looking up in all places. Other than this, the points of disagreement are such as might well arise out of an honest difference of opinion, and the report contains so much of value in the way of information, explanation and analysis of the close and mutual relations between the transportation system and the public that in my opinion it should be made available for wider distribution. The permission of the committee having first been secured, the report is now published in the present form.

This statement is signed by Walter A. Draper, president of the Cincinnati Street Railway. The report of the committee was rendered in the name of Laurent Lowenberg, chairman, and Leonard Smith, Jr.

Sanitary Regulations Fixed by Legislation in Ontario

Passengers on street cars in Ontario are to have roomier and more sanitary rides hereafter. That is the way the newspapers are broadcasting the account of legislation recently enacted. The regulations limit the number of passengers to one and two-fifths of the proper seating capacity, but permit an additional five passengers on rear platforms. They require also a thorough cleaning of the car interiors daily, adequate ventilation, thermometers in each car, celluloid covered straps and cushions that are readily cleaned. Eustace Smith, secretary of the Canadian Electric Railway Association, is reported to have characterized these regulations as too stringent and to have said that "a literal interpretation of them would ruin some companies."

Chicago Students Must Pay for Car Damage

Acts of vandalism committed on cars of the Chicago Rapid Transit Company, Chicago, Ill., were publicly condemned by officials of the Chicago public schools in a recent decision requiring students of the Englewood High School to make full restitution for damage done to the cars of a train on the elevated lines. The occasion was on March 24 when homecoming students riotously celebrated their team's winning of the city basketball championship. Two hundred students boarded the train at a north side station, smashed windows and electric lights and ripped advertising posters from the walls of the cars.

Rochester Subway to Be in Operation by August

That the New York State Railways will operate the municipally built subway and freight line in the bed of the abandoned Erie Canal in Rochester, N. Y., was assured by final action of the Common Council on May 10. The line will be operated for a three-year trial period under general terms of the service-at-cost contract between the railway and the municipality.

The question of who was to operate the subway has agitated Rochester for the past two years. More than a year ago the late Mayor Clarence D. Van Zandt appointed a committee to draft recommendations on the operation of the line after a survey. Some three months ago the committee reported in favor of operation by the railways only after a majority sentiment in favor of the report had been ascertained through public hearings and a poll of industries. Agreement to the proposal had been obtained from the four steam railroads entering the city.

An important function of the city railroad will be its use for freight switching connecting the railroad lines with important industries throughout the city. The subway line will provide high-speed transportation for outlying sections and will direct interurban traffic from the streets, thus helping to solve an important traffic problem. Supervision of the new line will be under City Railway Commissioner Barnes.

Excess Paving Costs to Be Paid by Denver Tramway

The Denver Tramway, Denver, Col., and the city of Denver have been at cross purposes for more than a year relative to the tramway paying a certain amount for street paving. The company flatly refused to pay. The outcome of this and some other matters pertaining to the company and the city is docketed in the federal court. However, on May 5 the tramway informed the city that it would pay the excess cost of paving streets on which it operates cars, it costing more to pave streets on which there are car tracks than those on which there are no tracks.

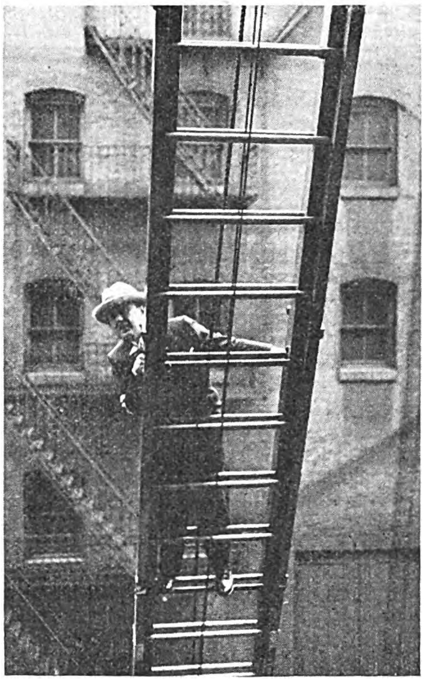
Committee Named to Negotiate Los Angeles Purchase

Following the suggestion of Dr. Delos F. Wilcox, acting in an advisory capacity for the city of Los Angeles, Cal., in the matter of the proposed increase in fares requested by the Los Angeles Railway, the City Council on May 14 named a special committee to negotiate with Henry E. Huntington, the owner of the railway system, or his representative, as to the best price and the most favorable conditions for the acquisition without the necessity of issuing bonds against the general credit of the city. This committee was authorized to ascertain terms upon which the city can procure a standing option to buy the railway lines.

The action of the City Council was not unanimous, there being considerable opposition to the proposition. It was contended that the ownership of the lines of the Los Angeles Railway by the city would mean an actual increase in fares from the present rate of 5 cents to 6 cents or possibly 7 cents. This contention was over-ruled and the committee named.

Engineer Ridgway Talks on Transit in Seattle

The City Council on May 9 unanimously adopted the principle of rapid transit for Seattle, Wash., and requested the rapid transit committee to make further investigation and submit a plan of financing. Robert Ridgway, New York, at the committee's request, arrived in Seattle from San Francisco and spent May 12 going over the ground. That evening a banquet was tendered in his honor by the rapid transit committee. It was attended by the entire City Council, board of public works, comptroller, attorney and treasurer, planning commission and representatives of banks, railroads, port commission, schools, parks and newspapers and by merchants and others, also delegates from about 30 civic organizations. It was impossible for Mr. Ridgway to remain longer. He could not, of course, make a report upon such short investigation, but in response to questions at the banquet stated he saw no faults with the committee's plans. The principal object in inducing him to visit Seattle was to confer upon the city's procedure and consult with him generally.

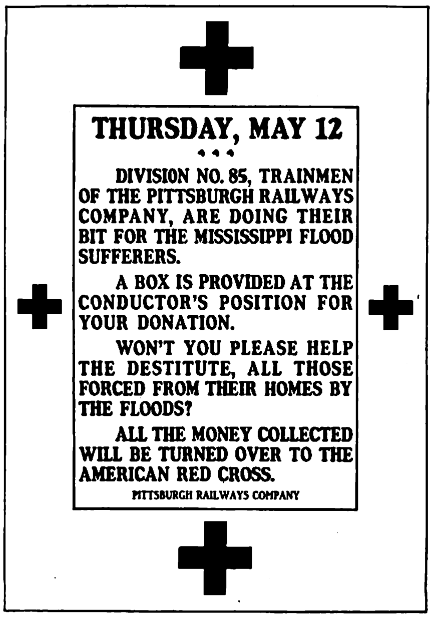


Joe Schenck nears the top in Pittsburgh drive

The Unusual Again in Pittsburgh

Through the opportune presence of the famous motorman-conductor vaudeville team of Van and Schenck, the Pittsburgh Railways was able to enhance its wholehearted Red Cross work on behalf of the Mississippi flood sufferers. On Thursday, May 12, a platform was set up on the street alongside the building of the Philadelphia Company, which controls the Pittsburgh Railways. The 40-piece Railway Employees' band volunteered to play and the Philadelphia Company's quartet to sing between the various vaudeville acts put on by Van and Schenck and other generous artists.

A hook and ladder company, through the courtesy of Richard Smith, fire chief, set up a mighty ladder which Joe Schenck offered to climb rung by rung for every dollar collected by the 25 uniformed railway inspectors. With Gus Van acting as chief barker for his partner, the dollars came in until Joe found himself on the top rung at the sixth story, as a $250 collection indicates.



THURSDAY, MAY 12

DIVISION NO. 85, TRAINMEN OF THE PITTSBURGH RAILWAYS COMPANY, ARE DOING THEIR BIT FOR THE MISSISSIPPI FLOOD SUFFERERS.

A BOX IS PROVIDED AT THE CONDUCTOR'S POSITION FOR YOUR DONATION.

WON'T YOU PLEASE HELP THE DESTITUTE, ALL THOSE FORCED FROM THEIR HOMES BY THE FLOODS?

ALL THE MONEY COLLECTED WILL BE TURNED OVER TO THE AMERICAN RED CROSS.

PITTSBURGH RAILWAYS COMPANY

The appeal of the placard was irresistible

The biggest help from a dollar and cents standpoint came through the action of Division 85, Amalgamated Association, whose trainmen offered to serve as collectors on the cars. To this end, 1,700 Red Cross collection boxes were placed alongside the fareboxes in the cars and a placard displayed in the windows. The Pittsburgh Motor Coach men did likewise. In this way a total of $2,753 was collected, including the returns from street entertainment. So eager were some of the passengers to contribute that they presented car tokens when cash was lacking.

The collection made was not only substantial in itself, but was a splendid advertisement for the cause at large.

Six Cents on All Lines Sought in Los Angeles

Application for an immediate emergency 6-cent fare on all lines operated by the Los Angeles Railway Corporation was filed on May 17 with the California Railroad Commission. A hearing permanently to increase the rate of all yellow lines is now before the commission. The 6-cent rate, according to a statement issued by George J. Kuhrts, vice-president and general manager, is necessary to maintain the present railway system pending the outcome of the present hearing relative to the 7-cent rate hearing.

Mr. Kuhrts says the railway has urged the greatest expedition in the hearing because of its unfavorable financial condition. He said that the company's earnings had further declined and the financial statement for 1926 showed that the company did not earn the interest on its bonds and borrowed money. The estimate for the year 1927 showed that the company would earn even less and fall short of earning its interest charges by about $1,000,000. He added that the railway would be unable to proceed with its plans for the purchase of additional equipment and the carrying out of improvements unless the immediate relief, available through the emergency 6-cent fare, was granted.

More Suburban Electrification Work at Philadelphia

The Pennsylvania Railroad has started the physical work of electrifying its Octoraro branch, extending from Philadelphia through Lansdowne, Morton, Media and Swarthmore to Wawa and West Chester. The first concrete foundations for poles to support overhead wires on the Octoraro branch are now being laid. The work will proceed out the branch to West Chester, a distance of 27 miles.

Steady progress is being made on the electrification work between Philadelphia and Wilmington. All the new larger and higher signal bridges made necessary by the pantographs on top of the electric cars have been installed.

Longer Platforms Speed Chicago Service

Extension of station platforms on all lines of the Chicago Rapid Transit Company, Chicago, Ill., to accommodate eight-car trains has recently been completed. The work started in July, 1925. It cost $701,929. The longer trains and faster operation made possible by this improvement have resulted in a noticeable lessening in congestion and in increased convenience and comfort for riders. At stations on the elevated loop in downtown Chicago as many as three trains may now load and unload passengers simultaneously.

The removal of "L" columns supporting the structure from the center of the street to the curb along Wabash Avenue at intersections has also been completed. This work was undertaken by the company to help relieve traffic congestion in downtown streets. It is part of a three-year program of relocating structure columns in the "Loop" district to be concluded in 1928.

Another Problem in Saturation

The automobile has been its own enemy in urban transportation. For a brief period it robbed public utility carriers of their passengers, but as its use for transportation to the office and shopping zones increased, the traffic problem was created, until today the public is beginning to realize that the individually-owned and operated automobile during business hours is a liability rather than an asset. New York City, because of its geographical restrictions, knows what the saturation point for the automobile will be like, and in that city street car and bus riding has increased. In Detroit, however, a directly opposite condition obtains.

Street railway and bus operators have begun to sense the change. An Eastern city is witnessing an experiment with pneumatic-tired street cars. Even in Washington the sight of luxuriously upholstered buses and street cars, in which one may recline with all the comfort of the fireside chair, is not unusual. Street railway advertising has begun to stress the parking problem as compared with the comfort and convenience of street cars. Mass transportation is bound to be the development of the future, for no other adequate use can be made of every square inch of street surface.—*Washington Post.*

"Zero Hour" Strikes Again in Atlanta

The second "zero hour" drive of the Georgia Power Company in Atlanta is being held from May 10 to May 26 and the Atlanta Safety Council, under the slogan "Help Prevent Accidents," is co-operating in every way to make the campaign more successful. The "zero hour" idea, originated with W. J. Rountree, safety director of the company. It proved so successful in reducing accidents on its first trial some weeks ago that the second drive has been planned, which will have the co-operation of the school department, press and other agencies. On May 10 "zero hour" was fixed from 7 until 8 o'clock in the morning. Since then the "zero hour" has been moved up one hour each day, closing with an hour between 11 and 12 midnight on May 26. During this hour trainmen throughout the city will be particularly careful in their efforts to avoid accidents.

Identification Number Conspicuously Displayed in Detroit

In maintaining a friendly spirit of public relationship, the city of Detroit, Department of Street Railways, believes that the matter of providing a more conspicuous means of identification of its public representatives is an important factor. In furtherance of this plan new badge numbers have been mounted on trainmen's caps, and can be easily distinguished at a distance of 30 ft. or more. The initials and numbers are white enamel and stand out very prominently against the black enamel background. Discernibility is made even more pronounced by the black silk cap on which the badges are worn. On the old type badge the number was so small that it could not be deciphered without close inspection. This was somewhat embarrassing to a patron who might have occasion to report the employee for some offense or possibly commend him for his efficient and courteous conduct. Delivery is now being made on an order for 6,500 of these badges.

Kewanee System Described

The products and activities of the city of Kewanee, Ill., are made the subject of comment in the May issue of *Current Topics*, the official publication of the Illinois Power & Light Corporation. Emphasis is laid on the utility services rendered in the fields of the electric light and power, gas and city railway. All these services are supplied by the Kewanee Public Service Company, which in addition operates the Kewanee & Galva Railway, an interurban line between the two cities.

The Kewanee Public Service Company became affiliated with the North American Light & Power group on Sept. 10, 1926.

Buffalo Men and Management Aid Community Fund

William E. Murphy, president of the International Railway Co-operative Association, announced on May 10 that at a convention of all employee representatives under the Mitten co-operative plan it had been decided that each employee would contribute from his pay to the joint charities drives of the Niagara Frontier. Later, at a meeting of the general committee, representing both employees and employers, it was agreed that the total amount would be matched by the company. The sum so obtained will be distributed in accordance with the budgets of the various drives. Under the new law, the first contribution of $2,500 to the Community Fund was made on May 10. During the campaign every street car in the city carried in space donated by I.R.C. a dash sign reminding citizens of the drive.

News Notes

Drops Five-Cent Fare.—Abolition of the last general 5-cent railway fare in Massachusetts was approved on May 13 by the State Department of Public Utilities. It granted the request of the Union Street Railway, New Bedford, for an increase to 10 cents or four rides for 25 cents. The commission stipulates half fare for school children.

Tramway Rewards Firemen. — The Denver Tramway, Denver Col., sent a check for $100 to the Denver Firemen's Pension Fund. This was in appreciation of the good work done by the firemen when the company's sand elevator caught fire on March 30.

Service to Island Taken Over.—The Toronto Transportation Commission, Toronto, Canada, took over the ferries running to the Island (summer resort and park owned by the city) on March 1. The private agreement had expired, so the city bought both passenger and freight boats, about ten in all. The fare charged is the ordinary railway rate of 7 cents.

Wheeling Citizens to Decide on Paving.—At the general election to be held in Wheeling on May 26 the people will decide whether or not the Wheeling Council should be permitted to contract with electric railways as to their paving obligations. The bill covering changes in the Wheeling charter passed the West Virginia Legislature, but a provision was inserted calling for a referendum vote of the people on such authority. If the referendum carries it means that the Wheeling Traction Company will be permitted to enter into a contract with the city whereby it will place and maintain the concrete base under the tracks while the city will care for surface paving.

Railway Will Pay Toward Bridge Improvement.—The United Railways & Electric Company, Baltimore, Md., again has demonstrated its desire to help bring about improvements in the city. The company has notified the chief engineer of Baltimore, Bernard L. Crozier, that it will pay $10,000 toward a proposed bridge to carry Clifton Avenue over Windsor Mill Road. The new bridge will be of concrete and will be constructed by the city. It will cost about $150,000. The structure will replace a wooden one over which the street cars operate. The United is not required by law or the terms of its franchise to pay any part of the cost.

The Young Visitors.—"Boys' Day in Industry" was heralded in the general offices of the Los Angeles Railway, Los Angeles, Cal., recently when nineteen high school boys representing thirteen high schools visited the plant in an educational tour. A special bus loaned through the courtesy of the bus department conveyed the boys to the South Park shops, where they were introduced to Master Mechanic Stephens, General Foreman of Carhouses William Brown and General Shop Foreman Walter Brown. No part of the plant was overlooked in the quest for knowledge. Now the company is offering the youths who were on this trip $5 for the best essay and $2.50 for the second best essay on their tour of the company's properties. *Two Bells*, the official publication of the company, recommends "hold 'er down to 300 words."

C., H. & D. "News" in Circulation.—At no fixed date, but at intervals more or less irregular, the Cincinnati, Hamilton & Dayton Railway, with operating offices in Hamilton, Ohio, will issue the Cincinnati, Dayton & Hamilton *News* whenever the company has anything worth while to say. This sheet has wide circulation, being distributed not only on all the cars, both city and interurban, but goes forward to members of various trade organizations and clubs in Dayton and Cincinnati, including the women's organizations. Advertisements are run in all of the local papers, briefly summarizing the high spots in the *News* issue and a news story is furnished to the newspapers.

Contention Over Paving Expense.—A paving dispute has arisen in Albuquerque, N. M., over the City Electric Company's refusal to pay for the paving between car tracks and 1 ft. on each side. The city put in the paving and then sued the company for the costs, plus 12 per cent from April 19, 1924, amounting to $32,749. On May 6 the State Supreme Court sustained the city and declared that it had a lien for the amount on the company's property; that unless the company paid, the property would be seized and sold and the city permitted to bid, but not in excess of the amount the company owed.

Wages Remain Same in New Orleans.—The present contract between the New Orleans Public Service, Inc., New Orleans, La., and the union of trainmen will be allowed to stand for at least another year. The contract was signed Aug. 12, 1926, after prolonged negotiations. It is for three years, but either side has the privilege of reopening the question of wage scale prior to May 1 of any year during which the agreement is effective. No request for modification has been made and the time for such request this year has passed.

Tokens in Oakland.—Use of tokens in payment for car rides has been instituted by the Key System Transit Company, Oakland, Cal. These tokens are offered for sale to passengers by conductors at the rate of five for 35 cents. They also will be given as change to those who desire them. President Lester S. Ready said that the token system was being introduced in Oakland and the East Bay cities for the convenience of the traveling public; that an investigation had proved that many of those who patronized streetcar and bus systems preferred to handle one token, representing one ride, rather than three coins. "There also will be a great saving of time in loading the cars during rush hours." he claimed, "for the use of a single token will save the congestion that now occurs from making change." Passengers may use either coins or tokens, but he believed that the use of the latter would become general after their convenience had been established.

Recent Bus Developments

Coach Sale Disapproved

Commission Rejects Proposal of Indianapolis Street Railway to Purchase Bus Company

The Indiana Public Service Commission on May 13 disapproved the proposed purchase of the Peoples Motor Coach Company, Indianapolis, by the Indianapolis Street Railway for $500,000. The commission held that the price was unreasonable and that the financial condition of the railway is not sufficiently sound to make the purchase. The commission said:

> The oral testimony offered and the exhibits do not agree in all respects, but these disagreements need not be entered into for the purpose of this cause, because a reconciliation of such differences would not affect the determination of this cause. The commission believes that the cause depends more upon matters of principle and public policy than on figures.

The order sets out that the physical property valuations brought out in the hearing include $237,318, estimated by Earl Carter, engineer for the commission; $250,000 estimated by A. Smith Bowman, president of the coach company as intangible assets, and $234,000 for the present value of the 40 buses of the company, and $233,622, physical value fixed by Harry Alexander, acting for Mack Trucks. In this connection the commission said:

> The above appraisals are typical of the evidence introduced. The difference between the present value of the tangible assets and the $500,000 to be paid for the common stock, plus the obligations of not less than $92,000 to be assumed by the petitioner, represents the value of the business or going concern value and working capital. That sum would be $241,000 on the basis of $500,000 purchase price and $333,000, the highest estimate of tangible assets on the basis of $592,000 purchase price including liabilities assumed. Even the lesser of these sums is not within reason as indicating going concern value and working capital.
>
> If the proposed purchase price were reasonable—if it were a prudent investment—the reasonable ability of the purchaser to pay the consideration proposed should be considered before authorizing the purchase.

It also is pointed out that the legal rate of interest in Indiana is 6 per cent and that testimony showed the best bid obtainable on the notes was 8 per cent. The order says that these facts lead the commission to believe that this investment would be hazardous and that since the motor coach company "is now serving the public with fair success, both in service to the public and in yielding financial return to the operator, a transfer of the operation should be based upon ample assurance that it would be run successfully. Such conviction has not been warranted by the evidence in this cause."

The order also says that under the two, there is no provision to give the public any direct financial advantage of the saving, but to transfer the savings to the railway. The commission says further:

> The commission believes that surplus earnings by one public utility should inure to the benefit of the public rather than to be applied to eliminate a deficit suffered by another public utility. Public convenience and necessity is the basis and the reason for the existence of these public utilities. After a fair return from its operations, the additional benefits should flow to the public, whose streets it uses, whose convenience it must serve and whose necessities it must meet. The commission cannot agree to the proposed transfer of the Peoples Motor Coach Company property or to the total denial of the public to participate in savings in the operation of said property in the event of such transfer and in the event of such savings being as estimated or less than estimated.

The order says Mr. Bowman's testimony showed the original investment of his company in 1923 was only $45,000 and that the remainder of the property has been paid for out of the earnings of the company since that time. As the commission sees it, "the public, by its patronage, paid for much the greater part of this property."

John McCardle was the only commissioner who voted against the order.

De Luxe Coach Line from Los Angeles to Sea

Entry by the Pacific Electric Railway, Los Angeles, Cal., into de luxe motor coach service is to begin on a new line to be operated between Pershing Square, Los Angeles, and Castellammare via the highly scenic Beverly Boulevard.

Four parlor coaches will be operated hourly over this route. Each will have a seating capacity of 29 passengers. No more than that number of passengers will be carried. The plans are to make this service of the very highest type, both as to running schedule and equipment used. The date service is to start will not be announced until the buses are received.

In this connection it is interesting to note that a check made recently shows that the company is operating 165 motor coaches. Of these 122 are used in places outside of Los Angeles proper and 43 in local service within the city, this latter figure representing half of the coaches of the Los Angeles Motor Bus Company, owned jointly by the Los Angeles Railway and the Pacific Electric Railway. The combined investment of the company in garages, motor coaches and equipment incidental to their operation exceeds $1,500,000.

Buses Between Indianapolis and Louisville

Through bus service between Indianapolis, Ind., and Louisville, Ky., has been resumed by the Interstate Public Service Company. For the present only two buses are operated each day, but following the completion of the highway work from Indianapolis to Louisville more buses will be added. Bus tickets are good on all of the Interstate interurbans the same as regular interurban tickets, except on extra fare trains.

Three Bus Lines May Replace Railway Service in Lincoln

The Lincoln Traction Company, Lincoln, Neb., has applied to the State Railway Commission for authority to abandon three more railway lines and substitute buses. By an arrangement with the Omaha, Lincoln & Beatrice Railway, an interurban running from the business section to the suburbs of University Place and Bethany, it will withdraw bus service from Lincoln to the former town, and will also cut out a long loop through the residence district of University Place, where it comes into competition with the interurban. The local company says that this bus also competes with its own cars to that suburb, and that the district eliminated is adequately served by the interurban. The buses will stop at 38th and Holdrege Streets, a mile closer the city.

Discontinuance of rail service is also sought on its South Fourteenth line, a distance of 3 miles. This rail service is now supplemented with bus service.

Abandonment of rail service on its North Tenth Street line for a length of 2 miles is also asked. Buses will be substituted. The rails are now down on a street that is to be resurfaced, but the company says it has not the $12,000 required as its share of the improvement. Abandonment also of rail service to Lakeview and Capital Beach, the latter a summer resort, 2 miles west of the city, and substitution of buses is asked.

It is the claim of the company that none of the lines named is paying operating expenses; that it is constantly suffering losses and deficits from its general railway operations in the city, and is not earning a sum sufficient to pay taxes, operating expenses and fixed charges. It shows that it is endeavoring, under great financial handicaps, to continue to render transportation service to the city and that each one of the requests made is in behalf of that program.

Buses on Worcester Suburban Run

Announcement was made on May 17 by officials of the Worcester Consolidated Street Railway, Worcester, Mass., that the electric railway lines in the Blackstone Valley serving towns from Worcester to Uxbridge will be discontinued on May 21 and buses substituted on Sunday, May 22.

Wanted—A Jitney License Ordinance in Louisville

Jitneys are operating on the streets of Louisville, Ky., without paying bus licenses. The bus license ordinance expired on May 1 and no new ordinance has been passed by the General Council to take its place. Passage of a new bus license ordinance was held up by the sinking fund commissioners pending a decision by the Court of Appeals on the injunction suit of the Louisville Railway to enjoin the operation of buses on the streets of Louisville.

Plans of the sinking fund commission is to boost the license of jitneys, based on the number of passengers carried by the machine. The old fee was $25 a year flat. There are approximately 300 jitneys operating on the streets there this year, and based on an average $50 rate, the sinking fund would collect approximately $15,000 in license. This is double the amount now received. Another feature proposed for the new ordinance is to place the jitneys under control of the Board of Public Works.

New York Bus Contracts Blocked Again

Lacking the votes within the Board of Estimate to award a bus franchise to the Equitable Coach Company or to any other of the bidding companies, Mayor Walker of New York City refused to let the matter go to a vote at the May 19 meeting of the board and laid it over for one week.

In the opinion of most observers at City Hall the action means that the board is so hopelessly deadlocked on the bus question that it will be impossible to reach an agreement before the Board of Estimate adjourns for the summer on June 16.

Minneapolis Company Protected from Encroachment

Lake Minnetonka territory has been protected for the Twin City Rapid Transit Company, Minneapolis, Minn., and its bus subsidiary by a decision of the Minnesota Railroad and Warehouse Commission denying the petition by the Northland Transportation Company to pick up passengers at the intermediate stations of Hopkins and St. Louis Park, served by both railway and bus lines of the Rapid Transit Company, for transportation into the Twin Cities over its long-distance routes.

The Northland makes pick-up passengers at Excelsior on Lake Minnetonka, long served by an electric railway for transportation over state highway No. 12, which is outside the center of that town, at 50 cents a head, or 15 cents more than the railway fare to Minneapolis. The commission directed that if greater transportation service to Hopkins and St. Louis Park is required the proper procedure is appeal to the commission.

The commission said that the idea of competition in rendering local transportation in metropolitan areas has long since been discarded in the United States.

Enjoins Buses on Interstate Lines.—Judge Henry T. Lummus, in Superior Court, recently enjoined the Interstate Motor Coach lines from operating any motor vehicles for carrying passengers between Worcester and Whitinsville and intermediate towns of Millbury, Sutton, Grafton and Northbridge, acting on the bill of equity brought by the Worcester Consolidated Street Railway against the Interstate Motor Coach Lines. The bus line is enjoined from operation until it has secured a license from the City Council of Worcester and the selectmen of these several towns. In the bill the Worcester Consolidated declared it has equipment in and for the conduct of passengers in these towns estimated at $2,000,000 and pays taxes on the same to the city of Worcester and these towns.

Bus Service Extended. — The San Diego Electric Railway, San Diego, Cal., has applied to the Railroad Commission for certificates of public convenience and necessity authorizing it to extend its bus service from Fifty-sixth Street in the City of San Diego, along El Cajon Avenue to La Mesa, outside the city of San Diego; and also from the junction of Imperial Avenue and 34th Street in the city of San Diego to the La Mesa district.

Bus Line Sold.—Sale of the Le Roy-Caledonia-Scottsville line of the Rochester Interurban Bus Company, a subsidiary of the New York State Railways, to the Western New York Motor Lines, Inc., has been announced. The Western New York company, with headquarters at Batavia, N. Y., operates the de luxe Blue Bus service between Buffalo and Rochester and several smaller lines in the territory.

Company Wants Exclusive Bus Rights.—The City Council of Seattle, Wash., has been formally notified by the Seattle & Rainier Valley Railway that all negotiations for a transfer fare reduction on the valley line are to be ended unless the company is given exclusive right to operate buses along Empire Way. It had been virtually agreed that the company would reduce from 10 cents to 8⅓ cents fares that include transfer to the municipal lines. In return it was insisted that the company be given a monopoly of transportation in the valley. Walter M. Brown, general manager, informed the Council that Marshall E. Sampsell of Chicago, president, in a telegram has reiterated the demand for exclusive transportation rights. The city is operating a bus line on Empire Way and residents of the district have protested its removal.

Buses in High Point.—A bus system supplanted railway cars in High Point, N. C., during the latter part of April by the Southern Public Utilities Company. Five buses were put on as a trial. When the North Carolina Public Service Company discontinued railway service it conceded its carrying rights to Chester Hawkins of the Southern Public Utilities Company rather than increase the carrying facilities. In the event that the bus system should fail, however, the Public Service Company will re-establish railway service according to a contract with the city officials.

Would Operate Over Chesapeake Bridge.—The United Railways & Electric Company, Baltimore, Md., has applied in the name of the Baltimore Coach Company, under which its bus lines are operated, to be permitted to operate a line of buses between Baltimore and Ocean City, Md., when the Chesapeake Bay is bridged. A bill permitting the bridging of the bay was passed at the last session of the Maryland General Assembly. In filing the application now with the Maryland Public Service Commission, it is pointed out, the United will be in a preferential position when the bridge is constructed.

Financial and Corporate

Inland Empire Purchase Approved

Interstate Commerce Commission Sanctions Deal by Which Great Northern Acquires Interurban System

Interurban lines and all other property of the Spokane & Eastern Railway & Power Company and the Inland Empire Railroad were taken over by the Great Northern Railway on May 10, following receipt of an order from the Interstate Commerce Commission permitting the purchase. The Great Northern has organized a new subsidiary, the Spokane, Cœur d'Alene & Palouse Railways, which will acquire the interests of the two former operating lines in the territory out of Spokane, Wash., headquarters.

The properties have been operated since Dec. 1 by the Great Northern staff under a purchaser's agreement. With the permanent change, F. S. Elliott, general superintendent of the G.N., acquires the new electric properties as a part of his division. Other officials of the new company will be J. M. Doyle, superintendent; B. Lantry, assistant superintendent, and J. W. Hungate, electrical superintendent. A portion of the staff of the old Inland organization was taken into the G.N. offices at Spokane. W. J. Johnston, assistant general manager of the Inland, and operating head, will retain his present offices in the interests of the Harris Savings & Trust Company, Chicago, representing certain bondholders.

The terminal building, depot and headquarters of the Inland system for more than twenty years have been abandoned for this purpose. The electric lines now operate out of the main Great Northern depot. This means the abandonment, also, of the former main electric line through Main Avenue, one of Spokane's busiest streets.

The Interstate Commerce Commission approved the sale of the electric railways on the basis of their being unable to operate profitably under existing conditions and because of promise that the Great Northern may make the lines pay as a part of a large general system.

The properties involved include 40.35 miles of road from Spokane to Hayden Lake, Idaho; 10.39 miles from Spokane to Flora, and other shorter sections, all of the Spokane & Eastern system, and 88.9 miles of line from Spokane to Moscow, Idaho, and 36.8 miles from Spring Valley to Colfax of the Inland Empire system.

Authority is granted to the new Spokane, Cœur d'Alene & Palouse Railways to issue $860,000 of demand notes and to assume obligation and liability in respect of $442,000 of first mortgage bonds, with the Great Northern assuming liability for the bonds. This came from an agreement of the two original lines to sell all property for about $1,250,000. The Spokane, Cœur d'Alene & Palouse will borrow $860,000 from the Great Northern, giving notes at 5 per cent.

The purchase of the electric "feeder" lines by the Great Northern is in keeping with the general program of electrification of the company in the Pacific Northwest.

Refinancing for Baltimore Company

As the result of a conference held on May 10 a plan is under consideration which involves a change in the capital structure of the United Railways & Electric Company, Baltimore, Md., through the purchase or exchange of one form of security for another. News of this activity was released recently by Alexander Brown & Sons, fiscal agents of the company. They could not now state definitely that such a plan would be approved and if it were what the terms would be and its effect on present securities. However, the plan so far discussed contemplated an offer of 60 per cent of par in cash for income bonds, provided substantially all present holders desired to accept such an offer.

Recent sharp advances in the incomes and other securities were noted, but Alexander Brown & Sons had not participated in this buying and thought it proper that security holders should have this information before them for their guidance.

W. M. Frazee Receiver of the Indianapolis & Cincinnati

Will M. Frazee, Rushville, Ind., has been appointed to succeed the late Charles L. Henry as receiver for the Indianapolis & Cincinnati Traction Company, which is involved in a litigation to foreclose a $2,000,000 mortgage. Mr. Frazee was one of the organizers of the railway and was purchasing agent and claim adjuster until a few years ago, when he disposed of his interests in the line.

Balance in Detroit Increases

For the year ended April 30, 1927, the total operating revenues of the Department of Street Railways at Detroit, Mich., were $24,503,355, against $24,230,554 for a similar period last year. These figures included railway operating revenue for the two years of $21,768,982, against $23,035,168, and a coach operating revenue of $2,734,372 and $1,195,385 for the year ended April 30, 1926. Total operating expenses were $18,918,615, against $18,491,413 for the year ended April 30, 1926. Included in these figures are $16,423,622 and $17,303,345 railway operating expense in 1927 and 1926 respectively and coach operating expense of $2,494,993 and $1,188,068 for the year ended April 30, 1926. Net revenue from all sources was $5,858,718, against $5,952,105. The net income for the 1927 period was $3,190,036, against $3,280,286. The balance for the period was $589,809, against $572,265 in the 1926 period. Total railway passengers numbered 466,644,059, against 495,966,850 in the 1926 period. Total coach passengers were 34,323,201, against 15,903,956 for the year ended April 30, 1926.

$1,795,000 Chicago Rapid Transit Bonds Offered

The National City Company and Halsey Stuart & Company, Inc., New York, on May 17 offered an additional issue of $1,795,000 Chicago Rapid Transit Company first and refunding mortgage 6 per cent bonds, due in 1953, at 93 to yield 6.56 per cent. Net earnings of the company in 1926 applicable interest and reserves amounted to $3,899,565, as against $2,452,850 interest on divisional mortgage bonds, equipment obligations and first and refunding mortgage bonds, including the present issue. The company operates the elevated lines in Chicago.

Springfield Earnings Show Gain

Transportation earnings of the Illinois Power Company, Springfield, Ill., for the year ended Dec. 31, 1926, were $720,727, compared with $708,984 for the year previous. These figures were contained in the income statement of the company submitted to the board of directors covering operations for 1926 compared with the preceding year. The company carried 107,909 fewer revenue passengers than in 1925. Comparative figures showing revenue passengers carried during the past five years are as follows:

1922	11,431,799
1923	11,150,971
1924	10,661,451
1925	11,286,894
1926	11,178,985

Effective on May 15 the schedule of fares on the railway and bus system was revised to eliminate the four tickets for 25 cents rate and the monthly family tickets. In lieu thereof, the report states, rates of two tickets for 15 cents and eight tickets for 50 cents were established, which, plus a 10-cent cash fare, are the rates now in force.

During the year the company purchased two 29-passenger buses to supplement railway service in Springfield, making a total of ten owned by the company.

No public financing was done in 1926 other than the sale of 7 per cent preferred stock on the customer-ownership plan. At the end of 1926 2,801 persons owned stock or were subscribing for it, an increase of 289 over that of the previous year.

Grand Rapids Railroad Accepts Obligations

The City Commission of Grand Rapids, Mich., has passed a city ordinance permitting the Grand Rapids Railway to sell its franchise and privileges to the Grand Rapids Railroad. The new company will accept all the obligations and liabilities of the Grand

Rapids Railway. Prior to the passage of the ordinance, Gerald J. Wagner, the city's consulting engineer, informed the commission that approximately $920,000 of stock of the old company had been deposited in anticipation of the readjustment.

Net Earnings Increase

United Railways, Baltimore, Reports Increase in Revenue Passengers Carried—Improvement Work Continues

After paying all operating expenses and fixed charges, including interest on income bonds, the balance on the United Railways & Electric Company, Baltimore, Md., for the year ended Dec. 31, 1926, was $1,845,839. From this was deducted $818,448 for dividends and $835,785 for depreciation, the balance going to surplus. The facts were included in the annual report to the stockholders. The net earnings of the company over the past five years available for interest payments, after caring for all operating expenses taxes and rentals, but before depreciation have been as follows:

Year	
1922	$4,495,927
1923	4,615,585
1924	4,579,550
1925	4,605,089
1926	4,669,854

COMPARATIVE STATEMENT OF EARNINGS AND EXPENSES OF THE UNITED RAILWAYS & ELECTRIC COMPANY

Operating Income	1926	1925

Taxes, per cent	10.00	9.82
Operating expenses, depreciation and taxes, per cent	74.55	74.66

* Credit.

Since 1906 the company has set up depreciation reserves aggregating $15,150,000, out of which more than $13,630,000 has been put back into the property for reconstruction and improvements and for property retired, leaving a balance of $1,520,541 in the reserve account. During the past five years the company spent $13,594,216 for maintenance and depreciation.

In 1926 the company reconstructed 15.2 miles of track. During the past eight years 131.8 miles of track was reconstructed, or nearly one-half of all the tracks in city streets are under frequent service. Twelve additional articulated cars were constructed in the company's shops. The total number of this type that has been constructed and is now in service is 34. There have also been constructed and placed in operation eleven cars of the permanently coupled type.

The agreement with the employees covering wages and working conditions terminated on Dec. 31, 1926. As a result of a conference with representatives of the employees' association, a two-year agreement was reached effective Jan. 1, 1927, providing for an increase in wages of all employees of 1 cent per hour for 1927 and a like additional increase for the year 1928.

During the year the company, in conjunction with the United Railways Association of Baltimore, an organization of employees, expended for free medical and nursing attendance $86,950 and for pension and insurance payments $111,464. Effective March 23, 1926, the company placed $5,000,000 in life and permanent disability insurance for its 5,000 employees.

On the subject of bus service the report states that the company now owns or controls practically all the buses operating within Baltimore city and suburban territory. In addition, the company owns what is known as the "Gray Line," sightseeing tours.

Reference was made to a survey made in Baltimore in the fall of 1926. In that report it was disclosed that of the more than 765,000 persons who daily entered and left the business section other than by walking more than 67 per cent used the street cars, 2.3 per cent used buses, 1.5 per cent used taxis and 29.2 per cent used private automobiles. Street cars carrying two-thirds of the traffic represented 12 per cent of vehicles used, against 88 per cent of automobiles.

In a belief that an explanation of what became of the fare would interest stockholders and the public C. D. Emmons, president, shows in the report the diminishing returns of the 7½-cent adult ticket fare. The average fare received by the company is 7.31 cents because of the lower rate of fare to children and commuters. He explains thus:

Of this 7.31 cents—

Approximately $5\frac{4}{10}$ cents or...5 42/100 cents was paid to employees for wages; to manufacturers for necessary supplies and material; to the tax collector and for depreciation.

5.4c

Approximately $1\frac{5}{10}$ cents or ...1 46/100 cents was paid for property rented and for money borrowed. (This represents the company's bonded debt held by approximately 115 Savings and other Banks in Maryland; and approximately 12,000 individual investors.)

1½c

Approximately ⅓ cent or...35/100 cent was paid to 2,242 stockholders.

The balance was credited to surplus.

Quarterly Surplus in Philadelphia $15,503

The quarterly income account of the Philadelphia Rapid Transit Company, Philadelphia, Pa., and some passenger statistics are shown in the accompanying table.

INCOME ACCOUNT OF THE PHILADELPHIA RAPID TRANSIT COMPANY FOR THE QUARTER ENDED MARCH 31, 1927

Operating revenue	$14,489,838
Operation and taxes	10,986,995
Operating income	$3,502,842
Non-operating income	209,845
	$3,712,687
Payments to City: Sinking fund and Frankford Elevated	240,049
	$3,472,638
Fixed charges, dividends and management fee	3,457,134
Surplus	$15,503

PASSENGER STATISTICS OF THE PHILADELPHIA RAPID TRANSIT COMPANY FOR THE QUARTER ENDED MARCH 31, 1927

	Passenger Revenue	Passengers Carried	Average Rate in Cents per Passenger
Surface, subway and elevated	$12,055,626	229,020,898	5.26
Motor bus	690,623	7,552,880	9.14
	12,746,250	236,573,778	5.39
Taxi	1,545,682		
Total	$14,291,932		

Indianapolis February Statement Reports on Depreciation Fund

Gross earnings of the Indianapolis Street Railway, Indianapolis, Ind., for the month of February this year totaled $451,207, a decrease of $9,472 compared with the corresponding month last year, it was shown in a report just filed with the Indiana Public Service Commission. Operating expenses decreased $11,378, having totaled $334,561 this February. Net earnings for that month this year from operation were $116,646, compared with $114,740 for February of last year.

An interesting sidelight in the document is contained in the special report on the depreciation reserve fund, which to date shows a deficit of $336,809. When the present fares were put into effect several years ago by the company it was understood that all surplus should be held in a depreciation reserve account, available for use only in the rehabilitation and repair of equipment. The members of the Indiana Public Service Commission had estimated that the higher fares would account for an increase of approximately $500,000 in the company's revenues, but the reverse proved true. The depreciation reserve account since the first has stood in the red, mounting higher and higher each month.

New Director in Savannah.—George H. Baldwin, Jacksonville, was recently elected a member of the board of directors of the Savannah Electric & Power Company, Savannah, Ga., to succeed his father, the late George J. Baldwin.

Capital Increased. — The Kentucky Power Company, Augusta, Ky., which recently purchased the electric utilities at Maysville, Ky., from the Cochrane interests, has filed amended articles for the Maysville Street Railroad & Transfer Company, increasing the capital from $107,000 to $157,000.

Galveston-Houston Issue Offered.—Lee, Higginson & Company, Estabrook & Company, Parkinson & Burr and Stone & Webster and Blodget, Inc., are offering an additional issue of $1,200,000 Galveston-Houston Electric Company secured gold notes, series B, 6 per cent, June 1, 1931, at 97.41.

Final Hearing on Valuation of Easements.—The Maryland Public Service Commission has set May 26 as the date to hear the final arguments on the valuation of easements of the United Railways & Electric Company, Baltimore. In the valuation case held some time ago the commission placed a total value of $77,000,000 on the company's property, $7,000,000 being for easements. It was contended by the people's counsel that these easements should not be included and the case reached the courts. The Court of Appeals held that the method used by the commission in valuing the easements was wrong but the placing of a valuation was upheld.

Reports Operating Loss for 1926.—The Hammond, Whiting & East Chicago Railway, Hammond, Ind., operated at a loss of $11,619 during 1926, according to a report filed with the Indiana Public Service Commission on April 30. Total revenue for the year was $22,520, according to the statement. The road carried 328,290 passengers, who paid an average fare of 7.73 cents. Approximately 33 miles of track is contained in the system, which connects with the Chicago City Railway.

San Jose Gross Is $13,754.—The San Jose Railroads, operating in San Jose, reports to the California Railroad Commission its 1926 operating revenue at $385,545 compared with $389,550 for 1925. The operating expenses, excluding taxes, are $348,034 for 1926 and $343,033 for 1925, leaving net operating revenue of $37,511 for 1926 and $46,517 for 1925. During 1926 taxes charged to operation amounted to $25,265 and for 1925 to $25,426. Deducting the taxes leaves operating income of $12,245 for 1926 and $21,091 for 1925. Adding to the operating income the non-operating income of the company and deducting non-collectible revenue and rents a gross corporate income remains (which represents the amount available for interest, amortization of debt discount, other fixed charges, non-operating expenses, dividends and surplus, of $13,754 for 1926 and $22,921 for 1925.

Threatening Situation in Johnson City.—The Johnson City Traction Corporation, Johnson City, Tenn., is suffering from enormous inroads on its revenue and traffic by buses and private passenger cars. So serious has the situation become that it is stated that unless traffic improves it will become necessary to discontinue the operation of the system. At the present time the company is operating only five cars. Its traffic is only about half what it was several years ago.

Surplus for Nine Months Lower.—For the nine months ending March 31, 1927, the total revenue from all sources of the Interborough Rapid Transit Company, New York, N. Y., was $46,793,095 an increase of $812,288 over the corresponding period of last year. Expenditures for operating and maintaining the property increased $1,545,509. Taxes payable to the city, state and the United States increased $169,547. Rentals and other income deductions decreased $46,016. The net result for the nine months was a surplus of $507,687, against a surplus of $1,364,439 for the corresponding period of last year. The comparison is influenced by the strike during the month of July, 1926, as well as the fact that in July of 1925 there was a lump sum payment of $770,000 on account of the new advertising contract, against which there was no similar payment this year.

Bank Files Claim Against Chicago Railways. — The Illinois Merchants Trust Company, Chicago, as trustee for $33,866,631 series A, B and C twenty-year bonds of the Chicago Railways, filed a priority lien on May 6 against the railway in the United States District Court. The action was taken to protect the claim of these bonds to a place second only to the first mortgage bonds, of which the Harris Trust & Savings Bank, Chicago, is trustee, in the distribution of the assets of the company in case of foreclosure. The railway passed into the hands of receivers on Feb. 1, when its twenty-year franchise expired.

$54,811 Gross Income in 1926.—The San Francisco, Napa & Calistoga Railway, operating from Vallejo to Calistoga, reports to the Railroad Commission its 1926 operating revenue at $231,199 compared with $246,913 for 1925. The operating expenses, excluding taxes for 1926, are reported at $164,816 and at $157,322 for 1925, leaving net operating revenue of $66,383 for 1926 and $89,591 for 1925. During 1926 taxes charged to operation amounted to $14,708 and for 1925 to $16,928. Deducting the taxes leaves operating income of $51,675 for 1926 and $72,662 for 1925. Adding to the operating income the non-operating income of the company and deducting non-collectible revenue and rents, results in a gross corporate income, which represents the amount available for interest, amortization of debt discount, other fixed charges, non-operating expenses, dividends and surplus, of $54,811 for 1926 and $76,383 for 1925.

Net Operating Income $40,000 a Month.—Substantial decreases in operating expenses have enabled the Omaha & Council Bluffs Street Railway, Omaha, Neb., to keep the red out of its net income. Revenues are now running about $240,000 a month, or about 3 per cent less than a year ago, but a reduction of expenses has enabled the company to show a net operating income of $40,000 a month. This leaves about $2,000 a month above interest and taxes. These figures do not include the bridge revenues nor that part of the system which is operated in Iowa. The first seven days in May showed revenues of $56,471, against $58,325 for the corresponding period in 1926.

Will Abandon Schomberg Line.—The Toronto Transportation Commission, Toronto, Ont., plans to abandon the Schomberg radial line. It runs a distance of 14.4 miles through somewhat poor country. Schomberg is about 15 miles from Toronto. The commission says it has been losing money yearly on the Schomberg proposition. A recent editorial in the Toronto *Star* suggested that Schomberg should not lose its freight connection with the Canadian National Railway. The government-owned road should acquire it and use it for freight purposes only, under which it might pay.

Would Discontinue Freight Service.—The Schenectady Railway applied to the Public Service Commission on May 9 for permission to discontinue on June 1 freight service on all of its lines between Schenectady and Ballston Spa, between Schenectady and Albany and between Schenectady and Troy. It states that for a number of years it has been operating this electric freight business at a loss.

Gross Corporate Income $34,252.—The Central California Traction Company, operating from Sacramento to Stockton, reports to the California Railroad Commission its 1926 operating revenue at $490,526 compared with $592,036 for 1925. The operating expenses, excluding taxes for 1926, are reported at $440,444 and at $483,069. for 1925, leaving net operating revenue of $50,082 for 1926 and $108,966 for 1925. During 1926 taxes charged to operation amounted to $30,049 and for 1925 to $31,195. Deducting the taxes leaves operating income of $20,033 for 1926 and $77,771 for 1925. Adding to the operating income the non-operating income of the company and deducting non-collectible revenue and rents, results in a gross corporate income, which represents the amount available for interest, amortization of debt discount, other fixed charges, non-operating expenses, dividends and surplus, of $34,252 for 1926 and $94,727 for 1925.

Twelve-Mile Line Abandoned.—The Public Service Commission of Oregon on May 10 authorized the Portland Electric Power Company to suspend operation of its suburban line from Montavilla to Troutdale, a distance of about 12 miles. This route has been losing money for some time as the residents of these towns use either private cars or the bus line for transportation.

Personal Items

New Directors and Vice-President for Georgia Power Company

Four new directors from as many cities in Georgia have been elected by the Georgia Power Company, Atlanta, Ga. They are: Billups Phinizy, president of the Southern Mutual Life Insurance Company, in Athens; John M. Graham, president of the National City Bank, Rome; George E. Patterson, executive vice-president of the Fourth National Bank of Macon, and J. Leonard Rountree, president of the People's Bank of Summit, Georgia, and a former state legislator from Emanuel County.

At the same meeting William E. Mitchell, Birmingham, was elected vice-president and general manager of the company, to succeed W. H. Taylor, who resigned several months ago to become vice-president of the United Gas Improvement Company. Mr. Mitchell, for many years a leading figure in the water power development of the South, is one of the best known men in electrical circles in the country.

Personnel Changes on Market Street Property

Effective May 10, M. McCants was appointed vice-president in charge of transportation and J. M. Yount vice-president in charge of equipment and maintenance of the Market Street Railway, San Francisco, Cal. In announcing the changes the management expressed the desire to place Mr. McCants in a position where he could devote his entire time to transportation. In appointing Mr. Yount to the vice-presidency in charge of equipment and maintenance the management has delegated to him the supervision of all work connected with shops, tracks, overhead lines, cables and substations. Messrs. Legare, Bivins, Foster, Peterson and Delaney will report to Mr. Yount. J. W. Delaney, effective May 11, was appointed superintendent of equipment.

In accord with the Byllesby policy of making promotions and advancements from its own personnel, five other Market Street Railway men have been appointed, as follows:

F. W. Allen, commercial manager. He was formerly superintendent of Geneva division, a position he has held since Nov. 1, 1902. Mr. Allen entered the service of the company on June 23, 1894, as a motorman at Geneva division. Later he became clerk and car dispatcher, ultimately receiving the title of division superintendent.

The post vacated by Mr. Allen will be filled by E. H. Lincoln, who has been assistant superintendent of McAllister division since Sept. 1, 1924. Mr. Lincoln entered the service of the company as a conductor at 28th Street division. Later he became a clerk. On Sept. 15, 1923, he joined the bureau of employment and training as instructor of conductors.

P. O'Marie, superintendent of ferry terminals since 1921, becomes superintendent of Sutro and McAllister divisions. Mr. O'Marie was employed as a motorman in May, 1901, at Turk and Fillmore division on the old Park and Ocean line. He remained with the line when it was transferred to Oak and Broderick division in 1903. In the same capacity he went to Sutro division in 1908, where he remained until 1915, when he was made inspector at Turk and Fillmore. His appointment as division superintendent of Sutro will enable Superintendent John P. Jones to devote more time to his rapidly growing Turk and Fillmore and Washington and Mason divisions.

Byron Gunn leaves his place as starter at Third and Townsend Streets depot, where he has been since 1916, to become superintendent of ferry terminals. He joined the company as a conductor in 1909.

H. L. Sanders Heads Cincinnati Car Company

Henry L. Sanders, former vice-president of the Cincinnati Car Company, was elected president of the company on May 17; A. L. Kasemeier was re-elected vice-president in charge of sales; J. Howard Elliott was elected vice-president in charge of production and purchases; E. C. Bernhold was elected treasurer and will continue as secretary. Thomas Elliott will continue to serve the company as consulting engineer. Among other officials are Charles J. Ellis, who will be chief engineer and assistant to the vice-president in charge of production, and Dave M. Ritchie, who will be sales engineer and assistant to the vice-president in charge of sales. S. E. Reith will remain as assistant secretary and assistant treasurer.

J. P. Alexander Westinghouse New England Manager

J. P. Alexander has been made Boston manager of the Westinghouse Electric & Manufacturing Company in charge of all sales and service in New England. During the twenty years that he has been associated with Westinghouse Mr. Alexander has become a prominent figure in the electrical industry in New England and has gained a wide experience which makes him particularly fitted for the responsibilities of his new position.

Mr. Alexander was born in Chambersburg, Pa., and attended Chambersburg Academy, which at that time was conducted by his father. He graduated from Lafayette in 1907 with the degree of electrical engineer and enrolled on the Westinghouse company's apprentice course at East Pittsburgh in July of that year.

Upon completion of the apprentice course he entered the railway department at East Pittsburgh and remained there until 1911, when he went to the Boston office as railway engineer. In 1913 he became a railway salesman, located in the Springfield, Mass., office, and two years later went to the New Haven, Conn., office as railway and central station salesman.

He was made manager of the transportation division at Boston in September, 1922, and manager of the New Haven, Conn., branch office in 1924.

Archie G. Andrews, for twenty-three years with the Rockford & Interurban and the Rockford City Traction Companies, Rockford, Ill., has been appointed superintendent of operation of the Royal Rapid Transit Company, Madison, Wis., in active charge of 400 miles of bus routes. During his association with the Rockford traction interests he advanced from conductor to trainmaster, in which capacity he served for seven years. During the last two years he has been superintendent of transportation.

Obituary

George E. Maltby

George E. Maltby, vice-president and formerly general manager of the Jamestown Street Railway, the Jamestown Motor Bus Transportation Company and the Jamestown, Westfield & Northwestern Railroad, Jamestown, N. Y., died suddenly at Los Angeles, Cal., on April 29, where he had been spending the winter.

Mr. Maltby was a familiar figure in the electric transportation era and had been identified with the Broadhead interests in various executive capacities almost since its inception in the late '80s. Some time ago he relinquished active control of the lines on account of ill health, but retained the title of vice-president.

Clyde F. Kalp

Clyde F. Kalp, treasurer of the West Penn Railways, Pittsburgh, Pa.; the West Penn Power and a number of other public service companies, is dead. He started as a new-business solicitor for the West Penn Power Company at Connellsville, Pa., early in 1910. In 1915 he was transferred to the Pittsburgh office of the company and spent several years in the research department, and later was engaged in the construction of the Windsor power station. Some months after the declaration of war Mr. Kalp was graduated as a first lieutenant of infantry from the training school at Fort Oglethorpe, Ga. He later was attached to the 52d Infantry, Sixth Division, and also served as an instructor at several army camps in the South.

He returned to Pittsburgh in 1919 and entered the treasury department. Through diligent application to his duties he was made assistant treasurer, and upon the death of C. C. McBride was elected treasurer of the West Penn companies on May 20, 1925.

Besides being treasurer of the West Penn Railways, Mr. Kalp was an officer or director in many other companies, among them being the Allegheny Valley Street Railway, Monongahela West Penn Public Service Company and the Wheeling Traction Company.

Mr. Kalp was born at Mount Pleasant, Pa., on May 4, 1891. He was graduated from the local public schools.

R. S. Maddock, superintendent of equipment of the United Electric Railways, Providence, R. I., died on April 23. Since he became superintendent many improvements were placed in effect and he had a campaign planned many months in advance which in the words of *All Aboard*, the official publication of the company, would have made the repair shop second to none. Mr. Maddock entered the service of the United Electric Railways on March 18, 1923, as assistant superintendent of equipment. He was appointed superintendent of equipment on May 1, 1926, at which time W. D. Wright, then superintendent of equipment, retired. Mr. Maddock was 44 years old.

John Mooney, superintendent of the Flatbush division of the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., died recently. Mr. Mooney was 48 years old. He entered the service of the company many years ago as a trainman and was promoted successively through the various posts to the position at Flatbush, a post he had filled for a long time.

Frank S. Elgin, at one time co-receiver with T. H. Tutwiler of the Memphis Street Railway, Memphis, Tenn., died recently. His receivership embraced other utilities in Memphis before they emerged from financial troubles about the time of the World War. Mr. Elgin was a prominent lawyer and a former United States marshal for the western division of Tennessee.

Amos Caverly, driver of the first horse car in Minneapolis, Minn., died recently in that city, where he had lived since 1871. Mr. Caverly was 82 years old. He always maintained a great interest in the railways. He liked to tell of the first electric car installed for demonstration purposes and of his many experiences, which would seem somewhat out of the ordinary at the present time. Before he went to Minneapolis he operated a car on the lines of the local railway in Lowell, Mass. He was born in Newport, Me.

Viscount Cowdray, English financier, builder of tunnels, a developer of Mexican, Persian and Russian oil fields, died in Aberdeen, Scotland, on April 30. W. D. Pearson, who later became Lord Cowdray, headed the firm of S. Pearson & Company, public utility contractors, founded by his grandfather in 1889. The engineering feat which won him most renown in America was the construction of the Pennsylvania Tunnels at New York. At the age of 21 he took charge of his first contract. Under his management S. Pearson & Company became internationally prominent. He successfully completed the tunnel under the Thames at Blackwall, a pioneer accomplishment, and went on to contract for every kind of public works, varying from the railways and harbor docks to water works and drainage systems. Lord Cowdray was born in 1856. He was educated in a private school and was early trained in the business that had been founded by his grandfather.

World Clinic on Economic Ills Goes Forward in Geneva

Leaders of Forty-seven Countries Discuss Methods of Recovery and Agree as to Diagnosis—Unemployment and the Interdependence of Nations Among the Outstanding Topics

BY EDWARD J. MEHREN
Vice-President McGraw-Hill Publishing Company, Inc.
Staff Correspondent in Attendance

GENEVA, May 5—For two days representatives of 47 countries have been listening to a diagnosis of the world's economic difficulties. Twelve countries have been heard from. The encouraging feature is that the diagnoses agree—surely a good basis for the discussion next week, in committee, of the details of remedies.

What is the diagnosis on which the speakers, each speaking for his delegation, so far agree? There are, so they indicate, a number of diseases: First, that purchasing or consumptive power was curtailed by the war; second, that many trade barriers, and not merely high tariffs, have been erected, such barriers as fluctuating exchanges, high freight rates, troublesome customs formalities, quickly changed tariffs, which discourage long-time contracts, etc.

Of these diseases the restriction of purchasing power was most frequently stressed, but suggested remedies were not so readily forthcoming. Prof. Karl Gustav Cassel (Sweden), in a learned address, intimated that the restored purchasing power of backward countries might be a powerful stimulus if capital for their development were forthcoming in larger volume, and Karl F. von Siemens (Germany), again by intimation, pointed out the burdens to industry caused by the expansion of government functions and government intervention in industry. Dr. Zimmerman (Holland) also developed the same thought. Enlarged government functions withdraw men from productive enterprise and make them a tax on industry and thus on consumption. Government interference also burdens industry. The result is the reduction of purchasing power. Among government interventions Herr von Siemens cited high customs or tariffs not justified by natural differences, import prohibitions, export bounties and wage regulation. All these mislead industry into self-sufficiency, discourage technical progress and, in sum, depress the standard of life.

A.E.R.A. Convention
Each Unanswered Question
Means a Delay
If You Hesitate Now You Will Repent Hereafter

As to trade barriers, the International Chamber of Commerce, represented in the discussion by Walter Runciman, has proposed the stabilization of tariffs, that is, that tariffs shall not change too often and without due notice.

UNEMPLOYMENT DISCUSSED

Naturally the question of unemployment has been very fully traversed, for it is recognized as one of the most serious results of Europe's economic dislocation. It is inevitably tied up with lack of purchasing power and the remedy for the latter is necessarily found in the remedy for the former. But in the handling of this subject there has been a solicitude that goes beyond its consideration as a cold economic fact. The human distress is keenly felt and expressed.

INTERDEPENDENCE OF NATIONS

One other point secured universal agreement—that nations are interdependent and that their dislocations react on each other. In fact the conference itself is the best evidence that the interdependence is a moving thought of all the countries of Europe.

Of tangible suggestions was Herr von Siemens' comment on the conditions necessary for international cartels, a subject sure to receive much discussion. He suggested that they were feasible only under three conditions: (1) that the industries in countries concerned must be accustomed to co-operate and come to an understanding; (2) that constituent national groups can only be formed where the number of those concerned is not too large, and (3) that the agreements must cover a commodity which is clearly definable and also comparable.

Dr. Zimmerman stressed the growing importance for present industrial countries of their potential home market, since backward countries tend to establish their own industries and thus cut down their imports of manufactured goods. This means an effort to increase home consumption and therefore to raise the standard of living.

Mr. Jouhoux (France) proposed the organization of two economic bodies, one to meet at least every three years to lay out the policies for the second body, which would be a standing economic council to carry on through committees studies of important economic questions.

Finally, to an American, there was a special appeal in two points of Herr von Siemens' address: his appeal, first, for the preservation of individualism and, second, for openmindedness and flexibility in one's economic and industrial attitude.

POSSIBLE RESULTS

What will be the result of this world conference?

The question is asked and answered dozens of times each day between sessions and in hotel corridors. The answer is always the same: Do not expect too much. The problems are extremely complex. The solution must be worked out slowly. But the groundwork can be laid here. The superstructure will come at a later similar gathering. Walter Runciman (England) put the broad fundamental well in these words: "Those who are concerned to maintain business prosperity in all countries are convinced that a mutual understanding in international economic and business problems is the surest guarantee for a growing volume of trade and for the maintenance of the higher standards of life and comfort which are the legitimate aspirations of modern democracy."

Interstate Public Service Orders Six Interurban Cars

Following are specifications for the six one-man, two-man interurban cars ordered April 8 by the Interstate Public Service Company, Scottsburg, Ind., from the G. C. Kuhlman Car Company, Cleveland, upon which delivery has been promised in 90 days:

Number of units	6
Type of unit	One-man, two-man, motor, passenger, interurban, double-end, double-truck
Builder of car body	Kuhlman
Date of order	4-8-27
Date of delivery	90 days
Weights:	
Car body	19,624 lb.
Trucks	10,000 lb.
Equipment	7,876 lb.
Total	37,500 lb.
Bolster centers	22 ft.
Length over all	45 ft. 6 in.
Length over body posts	33 ft. 6 in.
Truck wheelbase	5 ft. 4 in.
Width over all	8 ft. 6 in.
Height, rail to trolley base	11 ft. ¾ in.
Window post spacing	30 in.
Body	Semi-steel
Roof	Arch
Doors	Four, end
Air brakes	Westinghouse, variable load
Armature bearings	Plain
Car signal system	Faraday high-voltage and Westinghouse type S-T
Compressors	DH 16
Conduit	Flexible
Control	HL
Couplers	Tomlinson, Form 110
Curtain fixtures	Curtain Supply Co.
Curtain material	Pantasote
Door mechanism	National Pneumatic
Doors	Folding
Fare boxes	Cleveland
Finish	Pratt & Lambert enamel
Floor covering	Battleship linoleum
Gears and pinions	Nuttall helical
Glass	Plate and standard
Hand brakes	Brill, stop handle
Heaters	Consolidated, truss plank
Headlights	Imperial type WDF
Headlining	Agasote
Interior trim	Mahogany
Journal bearings	3¾x6, plain
Journal boxes	Brill
Lamp fixtures	G.E. short-circuiting fixtures
Motors	Westinghouse 510 E, No. 4, inside hung
Paint	Orange
Roof material	Canvas
Safety car devices	National
Sanders	Nichols-Lintern
Sash fixtures	Curtain Supply Co.
Seats	Brill No. 201-A
Seat spacing	36 in.
Seating material	Genuine leather
Steps	Three, one folding
Step treads	Kass and Sahkar
Trolley	Retrievers, Knutson No. 5
Trolley base	Ohio Brass, Form 4
Trolley wheels	Moor Jones, 6 in.
Trucks	Brill 177-E, 1X
Ventilators	Brill, car type
Wheels	Rolled steel, 28 in.
Special devices	Minier window wipers, Drew motorman's mirrors

Copper Breaks Through 13 Cents—Business Quiet

NONE of the non-ferrous metal markets was active during the week ended May 18 and prices for each of the major metals were lower, according to *Engineering and Mining Journal*. On May 18 copper could be had at 12.875 cents in Connecticut, zinc at 6 cents in St. Louis and lead at 6.60 cents in New York. These are new low levels for both zinc and lead for several years. Platinum has weakened further, whereas antimony, quicksilver and tin have shown little net change.

On May 12 a fair business was done in copper at 13 cents delivered in the Connecticut Valley. Since then, however, buyers have shown practically no interest in the market. Small sales have been made at 13 cents in the East and 13¼ in the Middle West, and on May 18 first hands sold at 12.875 cents delivered in Connecticut. Although producers until this date had held consistently at 13 cents—some of them are still asking this figure—a fair tonnage of second-hand metal for May delivery has changed hands at prices ranging from 12.825 cents to 12.875 cents. Various interpretations are placed on the April statistics that appeared last Thursday, but it is clear that consumers are not greatly impressed. Foreign business has been quiet, with Copper Exporters, Inc., maintaining its price at 13.35 cents c.i.f.

Lead has sold in reasonable volume during the past week, though it has been distinctly a buyers' market. The American Smelting & Refining Company maintained its New York contract price at 6.75 cents until Monday, when, on hearing of price concessions by other sellers, it was reduced to 6.65 cents. The reduction was accepted as a matter of course by buyers and did not stimulate business to any great extent. With the St. Louis market down to 6¼ cents, there would seem little reason for any one paying more than 6.60 cents, New York basis, for the freight rate from St. Louis is only 35 cents per 100 lb. Most of the buying has been for May shipment, though producers would gladly sell in two or three months ahead at the same price. Battery manufacturers continue conspicuous by their absence from the market.

Buying of tin has been spotty, with no great excitement in the market. Spot supplies continue almost unob-

ELECTRIC RAILWAY MATERIAL PRICES—May 17, 1927

Metals—New York

Copper, electrolytic, cents per lb.	12.70
Lead, cents per lb.	6.625
Nickel, cents per lb.	35.00
Zinc, cents per lb.	6.37
Tin, Straits, cents per lb.	67.00
Aluminum, 98 or 99 per cent, cents per lb.	26.00
Babbitt metal, warehouse, cents per lb.:	
Commercial grade	61.00
General service	31.50

Bituminous Coal

Smokeless mine run, f.o.b. vessel, Hampton Roads	$4.425
Somerset mine run, Boston	1.875
Pittsburgh mine run, Pittsburgh	2.10
Franklin, Ill., screenings, Chicago	‡.
Central, Ill., screenings, Chicago	‡....
Kansas screenings, Kansas City	2.50

Track Materials—Pittsburgh

Standard steel rails, gross ton	$43.00
Railroad spikes, drive, 9/16 in. and larger, cents per lb.	2.90
Tie plates (flat type), cents per lb.	2.35
Angle bars, cents per lb.	2.75
Rail bolts and nuts, cents per lb.	3.95
Steel bars, cents per lb.	1.85
Ties, white oak, Chicago, 6 in.x8 in.x8 ft.	$1.45

Hardware—Pittsburgh

Wire nails, base per keg	2.50
Sheet iron (24 gage), cents per lb.	2.90
Sheet iron, galvanized (24 gage), cents per lb.	3.75
Galvanized barbed wire, cents per lb.	3.20
Galvanized wire, ordinary, cents per lb.	2.40

Waste—New York

Waste, wool, cents per lb.	12-18
Waste, cotton (100 lb. bale), cents per lb.:	
White	12-17.50
Colored	7-14

‡ Quotations withdrawn because of strike.

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), cents per lb.	11.6
White lead in oil (100 lb. keg), cents per lb.	14.50
Turpentine (bbl. lots), per gal.	$0.625
Putty, 100 lb. tins, cents per lb.	5.25-5.50

Wire—New York

Copper wire, cents per lb.	15.00
Rubber-covered wire, No. 14, per 1,000 ft.	$5.15-20
Weatherproof wire base, cents per lb.	16.75

Paving Materials

Paving stone, granite, 5 in. New York—Grade 1, per thousand	$130
Wood block paving 3½, 16 lb. treatment, N. Y., per sq.yd.	$2.70
Paving brick 3½x8½x4, N. Y., per 1,000 in carload lots	51.00
Paving brick 3x8½x4 N.Y., per 1,000 in carload lots	45.00
Crushed stone, ¾-in., carload lots, N. Y., per cu.yd.	1.94
Cement, Chicago consumers' net prices, without bags	2.05
Gravel, ¾-in., cu.yd., f.o.b. N. Y.	1.75
Sand, cu.yd., f.o.b. N. Y.	1.00

Old Metals—New York and Chicago

Heavy copper, cents per lb.	11.00
Light copper, cents per lb.	9.50
Heavy yellow brass, cents per lb.	7.00
Zinc, old scrap, cents per lb.	4.00
Lead, cents per lb. (heavy)	5.375
Steel car axles, Chicago, net ton	$17.75
Cast iron car wheels, Chicago, gross ton	14.50
Rails (short), Chicago, gross ton	16.25
Rails, (relaying), Chicago, gross ton (65 lb. and heavier)	28.50
Machine turnings, Chicago, gross ton	7.50

tainable, so the prices are largely nominal. August tin can be obtained at concessions of 3 to 4 cents from the prices asked for spot. Quotations for 99 per cent tin cover delivery in a week or two. Spot 99 per cent is unobtainable in any quantity.

In spite of a great deal of talk, zinc miners in Joplin continue to produce about 13,500 tons of concentrate per week, against sales of about half that quantity in each of the last two weeks. The price has been cut to $38 and it is possible that material curtailment will be brought about soon. Price of slab zinc has declined from day to day during the week, with the bulk of the business on May 17 and 18 being done at 6 cents. High grade is nominally at 8 cents in the Eastern district.

$350,000 Improvement Program for Utah Company

The Utah Light & Traction Company has reported that it is about to undertake a $350,000 improvement program. The announcement of the proposed project was made by E. O. Howard, president of the company, at a luncheon in Salt Lake City recently.

Rock Island Places Five Electro-Gas Cars in Service

Five electro-gas-driven cars have recently been delivered to the Chicago, Rock Island & Pacific Railroad. They will replace steam train service on branch lines. The cars will accommodate 77 passengers. Their motors develop 275 hp. and provision has been made for the installation of another motor of the same rating. They are designed at present to haul one trailer. General dimensions are as follows: Engine room, 10 ft.; baggage and express compartment, 11 ft. 6 in.; smoking room, 9 ft.; main compartment, 38 ft.; width, that of a standard steel coach.

The cars were designed by J. E. Wanamaker, chief electrical engineer of the Rock Island, and they were jointly built by the St. Louis Car Company, Electro-Motive Company, Winton Engine Company and General Electric Company.

The car trucks are of the cast-steel type, and the frames, of one piece, were furnished by the Commonwealth Steel Company, East St. Louis.

Duco lacquer of olive green color, the Rock Island standard, was chosen for the outside finish. The inside trim is of Honduras mahogany, natural finish. Ample basket racks are conveniently located for the passengers. Toilet and drinking fountain facilities are located in the rear end of the main passenger compartment.

The Rock Island converted two of its 45-ton steel cars into gas-electric units of this type. Work was done in the company shops at Horton, Kan.

In addition to the five passenger cars the Rock Island, in its own shops at Horton, Kan., has completed the conversion of two 40-ft., 45-ton steel cars into two gas-electric units, each being equipped with two sets of 275-hp. units, the motors being designed with sufficient capacity for use in continuous low-speed heavy freight service. These power plants are so built and installed that they can be controlled as one unit, with a total capacity of 550 hp. The engine man is able to run one or both power plants to meet the schedule requirements, cutting the power plants in or out as may be necessary for capacity and economy. One power plant handles the motors on the forward truck and the second one handles the motors on the rear truck. Twenty of the 40 ft. in the car is left for use for revenue service.

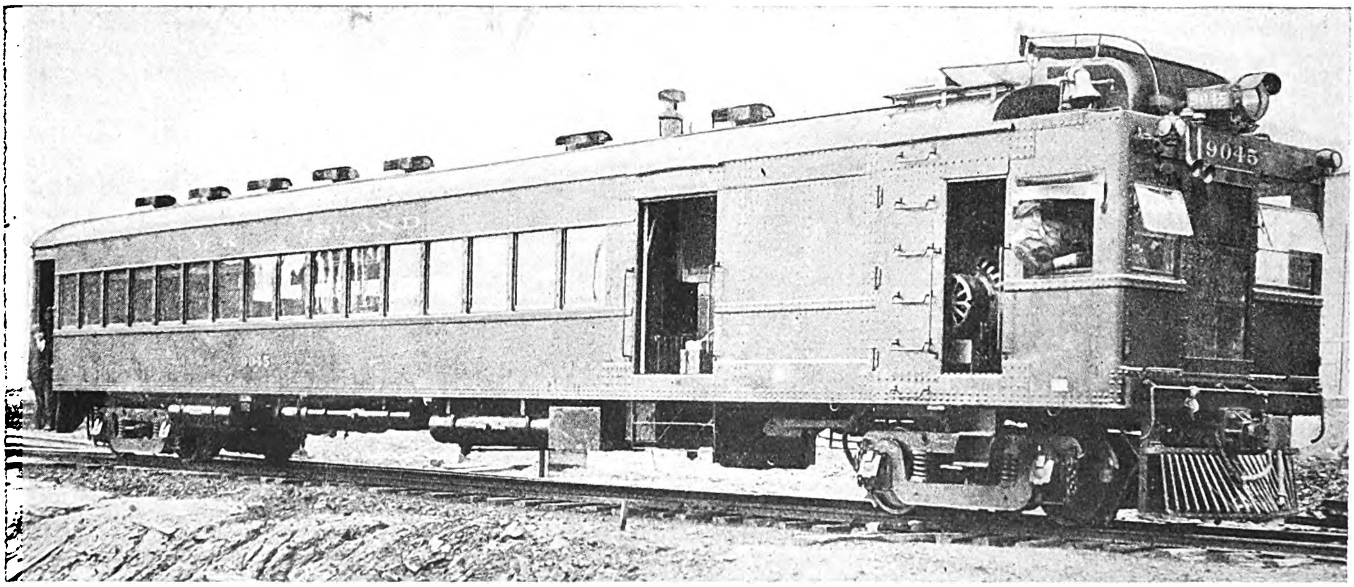
The cars as converted weigh approximately 75 tons each and are designed for pulling two or three trail cars in regular local passenger service. One of these two cars was first equipped with a low gear ratio so as to carry on some experimental work to determine their adaptability for light switching and light local branch line freight service. Upon completion of the experiments the low ratio gears were replaced with standard passenger gears, as the cars are to be used in local passenger service.

F. R. Fageol Heads New Ohio Company

F. R. Fageol, first vice-president of Fageol Motor Company of California, and formerly vice-president and director of American Car & Foundry Motors Company, with which Fageol of Ohio was merged in 1925, is now president of Twin Coach Company, a newly organized corporation. The company was founded by a group of Northern Ohio capitalists, and will begin operations shortly in the former Fageol Motors Company plant at Kent, Ohio. The Twin Coach Company is a Delaware incorporation, with capital of $4,000,000 of 8 per cent preferred and 400,000 no par common shares.

Secretary of Commerce to Address Trade Convention

Foreign traders from 40 states will listen in Detroit to an address by Secretary Hoover to be made May 26 at the fourteenth National Foreign Trade Convention. The convention will meet on May 25, 26 and 27 and 2,500 foreign traders are expected to attend. The Secretary's subject will be "American Foreign Trade" and a nation-wide radio



Five of these electro-gas units were recently placed in service by the Rock Island to replace steam trains on branch line service audience will listen in to what is anticipated to be one of the notable business addresses of the year.

More than 40 speakers, prominent in all phases of the country's foreign trade activity, will address the convention's thirteen group and general sessions. Some of those who appear on the program include Julius H. Barnes, president of the Barnes-Ames Company, New York; W. F. Gephart, vice-president of the First National Bank, St. Louis; Turner Jones, vice-president of the Coca Cola Company, Atlanta; Prof. L. D. O'Neil of Boston University; John A. Russell, editor of the *Michigan Manufacturer and Financial Record;* W. C. Sproull, advertising manager of the Burroughs Adding Machine Company; ex-Gov. James P. Goodrich of Indiana; J. A. H. Kerr, vice-president of the Security Trust & Savings Bank, Los Angeles; Robert V. Beucus, advertising manager of Bauer & Black, Chicago, and C. C. Martin of the National Paper & Type Company, New York.

New Financing Plan Proposed for Seattle Cars

A new plan for financing the purchase of new street cars for the Seattle Municipal Street Railway, Seattle, Wash., despite pending litigation which has apparently closed the market to railway department bonds, is under consideration by the City Council. The plan would not enable the city to procure at once the 80 new street cars which were authorized in an ordinance for the sale of $1,420,000 in bonds enacted before the railway became involved in the litigation, but it would provide funds for the railway department to buy the cars in lots of perhaps four or five. Councilman Ralph D. Nichols suggested the plan. Under it funds set aside annually by the water department into a sinking fund for bond redemption would be used to purchase interest-bearing utility warrants issued by the railway, the proceeds of these sales to be used by the railway in purchasing new cars.

The suggestion was prompted by an ordinance which came before a committee of the Council authorizing the investment of $78,000 from the water bonds redemption fund in street railway warrants, issued two years ago for the construction of the Fifteenth Avenue Northeast extension of the railway system. These warrants are bought by private firms at a discount of 8 per cent from their face value.

Rolling Stock

Brooklyn & Manhattan Transit Corporation, Brooklyn, N. Y., placed in service last week the first of the 67 articulated cars ordered nearly a year and a half ago, and which were mentioned in the JOURNAL for Dec. 25, 1926. Eight additional units will be ready within a few days. The new car is running on the Fourth Avenue line between 95th Street and the Queensborough Plaza.

Petaluma & Santa Rosa Railroad, Petaluma, Cal., has been authorized by the Railroad Commission to remodel its passenger equipment in order to operate the same as one-man safety type cars with dead-man control. This action was taken by the commission following a hearing conducted by Commissioner Leon O. Whitsell at which the utility submitted its record of earnings showing deficits as follows: 1926, $36,401; 1925, $26,133; 1924, $26,006; 1923, $33,270; 1922, $16,287. The utility operates three lines from Sebastopol, Sonoma County. The use of one-man cars is proposed for a period of six months as an economy measure. Rigid safety regulations are contained in the commission's authorization for the operation of one-man cars. The system comprises 33 miles of track.

Track and Line

Oregon Electric Railway, Portland, Ore., has agreed to pay 30 per cent of the $60,000 cost of an overhead crossing above its tracks on the Capitol highway at Multnomah station.

Seattle Municipal Street Railway, Seattle, Wash., has been authorized by the City Council to make four extensions to the city's street railway lines, to cost $52,500. Three of the improvements will be in the University district and the other in the southern end of the city.

Worcester Consolidated Street Railway, Worcester, Mass., is prosecuting work on the many improvements involving an expenditure of $1,500,000 in that city. A force of 150 men is relaying double track in Park Avenue from May Street to Main Street, a distance of 7,000 ft.

Municipal Railway of St. Petersburg, Fla., is relaying rails on the Big Bayou line at the approaches to the new concrete arch bridge over Salt Creek.

Wisconsin Traction, Light, Heat & Power Company, Neenah, Wis., and the **Wisconsin Power & Light Company** have agreed to use the same car tracks in Neenah. The track formerly used by the cars from Appleton will be torn up. Both companies will use the tracks over which the Oshkosh cars were formerly operated. A new curve will be constructed to connect the two lines on the one track on East Wisconsin Avenue.

Municipal Railway, Seattle, Wash., is reported as about to commence work on a regrading and retracking project on the Westlake Avenue street car lines. The work will cost $85,000 and will include cutting down the roadbed from 1 ft. to 3 ft. from Valley Street to the south end of the Fremont bridge, laying new rails and ties on the double track and temporarily rerouting Fremont bridge cars over Dexter Avenue. Eight crews of 30 men each will be assigned to the work. In addition to this, after a hearing, attended by 300 residents of the Ballard district, the utilities committee of the Council voted to recommend passage of an ordinance appropriating $42,300 for the construction of a double street railway track along Fifteenth Avenue Northwest to 67th Street and a single track line from 67th Street to 85th Street, which is on the corporation line of the city.

Shops and Buildings

Kansas City Public Service Company, Kansas City, Mo., is reported as the purchaser of a triangular shaped lot of approximately one acre, fronting on Summit Street at 41st Street, which will be used as the site of a new carhouse to care of its work cars. The property adjoins that bought by the company last January.

Springfield Traction Company, Springfield, Mo., through A. E. Reynolds, general manager, has announced tentative plans for the erection of a modern garage to take care of the general overhauling and painting of buses. The work will be started on the project just as soon as the plans are drawn. The building is scheduled for completion by early fall. According to the tentative plans the plant will have a capacity of 25 buses and is to be divided into a modern machine shop, heating plant, painting and washing departments.

Worcester Consolidated Street Railway, Worcester, Mass., has obtained a permit to build a carhouse on Grove Street. The new structure will be erected on land that has previously been used for sidetracking and storing the extra cars of the company in the open air.

Trade Notes

Society for Electrical Development, Inc., New York City, announces that new general offices of the society are now in the Graybar Building at 420 Lexington Avenue, adjoining the Grand Central Terminal.

H. B. Chamberlain, who entered the employ of the Tuco Products Corporation, New York City, in 1910 and who in the past few years has been assistant to D. W. Pye, president, has recently been appointed vice-president, with headquarters at 30 Church Street.

Robert T. Kent, until recently superintendent of prison industries for the State of New York, has been appointed to the position of general manager of the Bridgeport Brass Company, Bridgeport, Conn.

J. de N. Macomb has been appointed assistant to the vice-president in charge of railroad sales of the Inland Steel Company, Chicago. Mr. Macomb was graduated from the University of Kansas in 1898 with the degrees of B.S. and M.S. He entered railway service with the Atchison, Topeka & Santa Fe Railway on Aug. 1, 1899, and has been in the employ of that company continuously.

New Advertising Literature

American Brown Boveri Electric Corporation, New York City, announces that circular No. D.M. 10,000 is available for distribution. This sixteen-page illustrated publication describes the A.B.B., Camden, N. J., plant, organization and products, particular emphasis being placed on the company's most recent engineering achievements in industrial fields.

Latest Developments in Chicago Point Toward a Successful Solution

ENCOURAGING transportation news comes from Chicago. An important step has been taken toward unraveling the complicated tangle into which the country's second largest city has permitted its transportation facilities to become ensnarled. An agreement has been reached among the transportation companies on a general program. It is the logical first step toward a solution of that community's outstanding problem.

Again the old formula of straightforward business methods seems to have worked. Once the parties at interest were able to get around a table and frankly to compare their views—motivated by a sincere desire to find a solution which would be at once fair to the community and to the security holders—order began to come out of chaos and the tangled mass of conflicting interests has begun to unravel. Even the hardest knot of all—home rule regulation—shows signs of giving way before patience and co-operation. A suggested county transit commission, consisting of two representatives appointed by the Governor, two by the Mayor and one by the county board, sets up the mechanism for a regulatory body which will be both sympathetic to the city's needs and at the same time protected in a measure from destructive local politics.

Progress in the solution of Chicago's transportation problem has only started. But it *has* started. There are still many hurdles ahead, the first of which is the State Legislature, where five enabling bills must be passed within a month. The City Council and the Mayor have not yet openly expressed their stand. After legislation is passed—if it is passed—there is a franchise to be negotiated. Finally, the whole proposition must be submitted to a referendum of the city's voters.

On the face of things, then, Chicago still is a long way from a final settlement. But there are some very significant factors that point strongly toward ultimate success of the present program. A united front among the companies is the first and probably the most important. They have, however, gone further than that. They have not only agreed on a program, they have openly and frankly stated it. They have put all their cards on top of the table; have gone to the Legislature with what they consider the best plan for the healthy improvement of transportation and have openly told the city and its people that there is no cleverly worded legal phraseology in which jokers are hidden.

This time the Chicago problem is being approached in what must impress all parties at interest as a straightforward, businesslike manner. The modern conception of business dealings is that both parties gain from a transaction. The old theory was that one party is always the loser. Transportation as an industry has suffered much from application of the old principle in dealings between a community and its transportation companies—and the communities have by no means been the only offenders. Chicago is beginning to apply modern business methods to work out its transportation difficulties—and those methods have been successful in every other city where they have been applied.

An Unforgettable Lesson from the Skies

ROGET'S THESAURUS has been exhausted by men and women in every walk of life, in every clime and nation, to praise the incomparable feat of Charles Lindbergh. This blonde scion of a pioneer race is a man whom "the gods delight to honor." In less than 40 hours he advanced the science of transportation to a degree that inflames the imagination and benumbs expression. He "splashed at a ten-league canvass with brushes of comet's hair." The trajectory of his roaring plane described another rainbow for the hearts of men. Hurtling through the uncharted ether, a young man dreamed dreams while old men saw visions.

Our ardor for his physical feat may cool with the years. We may forget the encomiums of kings and presidents, but deep in the consciousness of the American people will always live the tremendous lesson which his daring revivified. In short, that the courage of one's convictions is the lifeblood of the pioneer.

None of us is too great to relearn this lesson which an American youth, this Navigator of Progress, blazoned across 3,000 miles of the heavens.

Workmen's Automobiles— An Economy or a Luxury?

RIDING to work in a private automobile is cheaper than using public transportation, according to an editorial published in the April issue of *Scientific American*. Operating costs are figured in the editorial at 15 cents per automobile-mile, or 5 cents per passenger-mile, on the basis of three persons per vehicle. The fare on the local car and bus line is 10 cents. Apparently science and economics have become jumbled in the thoughts of the writer of this editorial, because he has neglected entirely the vital factor of distance traveled. In the instance to which he refers, the distance probably averages about 4 miles, making the actual cost per trip approximately 20 cents per passenger by automobile, or double the cost of public transportation.

An investigation made last summer by the Norton Company, Worcester, Mass., to discover how many of its employees came to work by automobile was the basis for the editorial. The company found that 740 automobiles were owned by its 2,900 employees. Of these 419 were driven to work daily, carrying on the average three employees each, or 1,257 in all. Thus approximately 40 per cent used automobiles to reach the plant. This investigation was made to determine what parking facilities were needed.

No study was made by the Norton Company of the relative cost of various means of transportation. Nevertheless, as many of the automobiles used by the employees were found to be of small, light types, the average operating cost is doubtless about 15 cents per vehicle-mile, or 5 cents per passenger-mile, as assumed in the *Scientific American's* editorial. As a matter of fact, investigation shows that the cost is seldom if ever divided equally among the three passengers, but is borne largely by the automobile owner. Hence the assumption of 5 cents per passenger-mile operating cost is hardly justified. Moreover, the Norton plant is some 4 miles from the center of Worcester, and many of the employees must travel that or a greater distance to reach their work. When this important factor is considered, the economic advantage swings over quickly to the 10-cent common carriers.

After all that has been written of late about the relative cost of operating street cars, buses and automobiles, it is surprising to find any one who thinks that private transportation is cheaper than public transportation. Tireless efforts are required, however, on the part of the transportation agencies to counteract the mischief done by the dissemination of these false theories. The old adage that the shoemaker should stick to his last still holds good.

For Thirty Years This Company Has Paid Dividends

EVEN allowing for what some are inclined to look upon as a very favorable operating arrangement with the city, the Montreal Tramways management is certainly doing an exceptional job. This is reflected in the digest of the annual report of the company published elsewhere in this issue. The surplus for the year after paying four quarterly dividends of 2½ per cent each, which called for the disbursement of $400,000, was $279,159. Carried forward from the previous year was an accumulated surplus of $1,014,037, so that the surplus at the end of the year recently ended was $1,293,197.

In the face of a showing of this kind it might be expected that there would be a disposition to permit things to remain as they are and to sit back and garner the reward of what has been done in the past. There is, however, no such attitude. The company proposes to carry on and carry on intensively. To this end the directors expect to submit to the civic authorities a general plan of improvement embracing subways and elevated railways.

The railway at Montreal does not operate under conditions that are ideal. The city's climatic conditions, with storms of exceptional severity, constitute a serious problem. Moreover, the grades there are heavier than in any other Canadian city except perhaps Quebec, where the traffic density is not so great as it is in Montreal. Again, the city's older thoroughfares, dating from an age-long past, are very narrow, so that in these sections the railway has a limited use of its own right-of-way. Despite these natural handicaps, the people of Montreal are carried from point to point, season by season, with a minimum of delay and discomfort. Many of these factors are not apparent in the annual report, but they have an important bearing in interpreting the results achieved.

The cynic who may be inclined to scoff at repetition of the aphorism that virtue is its own reward should turn to the record of dividends paid by the Montreal Tramways covering an uninterrupted period of 30 years, and to the statement of the accumulated surplus as it stood on Dec. 31, 1926. As for the officers of the company, it should be heartening to them to know that their efforts to improve the roadbed wherever necessary, increase the fleet of buses, add to the rolling stock and otherwise keep abreast of the times are not escaping public recognition.

Greater Uniformity Needed in Operation of Traffic Control Signals

RADICALLY different rules exist in neighboring cities having traffic control signals. In 27 such cities in New York State nine conflicting regulations are in effect. Only the natives know what is expected of the automobile driver in any particular municipality. Many of the regulations are confusing even to the natives. For example, a traffic policemen in a small town recently explained the local rules by saying, "To turn to the left, you pull over to the right, and when the signals says 'stop' you go."

To remedy the present chaotic conditions a committee appointed by the New York State Conference of Mayors and Other Municipal Officials and the Empire State Gas and Electric Association recommends the adoption of a uniform practice. The recommendation is based on a study of existing practices throughout the state. An abstract of the report of the committee appears elsewhere in this issue. Only general suggestions are made concerning the type of signals and their location. Definite recommendations, however, are made concerning the operation of the signals.

In the opinion of the committee only two colors, red and green, should be used in traffic control signals. The amber light often used between the red and green lights is believed to be unnecessary. Pedestrians should cross an intersection in the direction of moving traffic or during an interval when red lights show in all directions. In warning signals, as differentiated from control signals, the amber light should be used exclusively. All turns should be made on the green light, except as otherwise directed by a police officer or where diagonal streets or other unusual conditions make a variation necessary.

It is emphasized that the purpose of automatic traffic signals is to expedite traffic movement rather than to hamper it. If the system is to be successful, the duration of stoppages due to the signals must be less than would occur without them or the delay must be offset by greater ease or safety of movement. Synchronized progressive and co-ordinate systems are discussed in detail in the report. The progressive system provides continuous movement and discourages speeding. An objection to this system, however, is the necessity to have equal periods for the red and green lights. That is unsatisfactory where there is more traffic on a principal thoroughfare than on the cross streets. Synchronized control is open to criticism because traffic is brought to a dead stop periodically and unnecessary delays often result.

What the committee characterizes as co-ordinated traffic control was developed to overcome the objections to the other two systems. The committee believes that the selection of a particular system must depend largely on the conditions that exist on the street on which the traffic control system is to be used.

Whether or not all of the recommendations meet with general approval, there can be no doubt that standardization is urgently needed. A long time must elapse before the present conflicting regulations are brought into uniformity, but with patience and perseverance it can be done. Standardization of railroad gages has been accomplished, although it was once thought to be impossible. So, too, standardization of traffic control can be accomplished when the resultant advantages are brought home to the public. The report of the committee represents an important step in this direction.

Its Dividends Far Exceed Its Premiums

THE National Safety Council is the spiritual as well as practical expression of the brotherhood of man in industrial life. No one can attend its meetings or review its tremendous achievements without realizing that membership in it is of inestimable value. No other form of life insurance is as cheap considering the benefits it bestows. One does not have to die to realize these benefits. Its dividends far exceed its premiums; premiums that are expressed in healthy, happy, unmaimed men and women. Figure its worth in terms of dollars and cents: Membership per 10,000 employees is only $250. Granting that in a year, by reason of the council's teaching, one life is saved valued at $10,000, there has been made not only a lucrative investment but a definite contribution to humanity.

The council is a co-operative, non-profiting association that numbers among its members the greatest minds in industrial life. Every minute in the day through its agencies human life is being conserved. This alone should make it imperative that every industrial organization and every other organization whose ideal is service should be enrolled as a member.

Florida—and Some Other States—Needs to Get Up to Date

FLORIDA is behind the times in its dealings with public utilities. It is so far behind the times that it is about 30 years out of date. In 1899 it passed a law limiting franchises to a period of 30 years. At that time the public utility industry was in its infancy, particularly in Florida, and it was supposed that irrevocable stipulations could be made for rates, charges and service. To correct this condition a terminable permit bill has been introduced in the Legislature.

So out of date are some people in Florida that it has been found necessary to explain the terminable permit by the eclectic method, despite the fact that the Railroad Commission has on more than one occasion materially increased railway fares fixed by contract, and that the Supreme Court of Florida, confirmed by the Supreme Court of the United States, has held that the Railroad Commission has this right and that it is its duty to make rates compensatory.

To this end Peter O. Knight, president of the Tampa Electric Company and author of the bill recently introduced, is using large newspaper space to enlighten the Legislature. He is reminding the people of Florida that the terminable permit idea has been indorsed by the National Association of Railroad and Utilities Commissioners, Investment Bankers Association of America, the American Bar Association, the National Municipal League, the National Civic Federation and the wartime Federal Electric Railways Commission.

Mr. Knight's statement was made of his own volition. It is a forceful presentation for which he takes entire responsibility, if such a term may be applied to a measure intended to operate in the best interests of everybody concerned and destined to bring Florida up to date with respect to its dealings along economic lines with the utilities which operate within its borders. Yet Mr. Knight has felt it necessary to offer to debate the merits of the bill before the joint session of the Legislature. So far there has been no indication that his challenge is likely to be accepted.

Nothing more effective than the passage of this bill could be done to invite capital into Florida under assurance that its rights will be fully protected. The author of the bill is correct when he says that common sense, good business and integrity all demand that when a public utility obtains a permit to do business in a community, it should be permitted, if it behaves itself and acts properly, to continue with its business unmolested, unless, perchance, the municipality sees fit to purchase the property. There can be no two sides to this question. The matter is incontrovertible.

Less Law and More Common Sense Needed

BEHIND a mahogany bench on a low platform sat three men. Two were chuckling together over some joke. The third dozed. Seated immediately in front of this bench was a middle-aged man fumbling with a mass of papers. In a wearied tone, he was answering questions asked by a bespectacled lawyer at a nearby table, frequently consulting his records for data before replying. From outside came the clatter of street traffic, drowning for short periods the monotonous sequence of question and answer. Apparently the lawyer was trying to trap the witness into some admission that could be used against him later. Nine-tenths of the questions had little or no bearing on the subject under discussion, serving merely to cloak those of real import. Here and there around the large room were scattered six or seven other men. One was reading "Breezy Stories." Another was standing looking out of the window. Several were whispering together. Between trips to the adjacent hallway to "catch a smoke," a couple of newspaper reporters took occasional notes. It was the fourth day of a hearing before the state regulatory commission, sitting to determine the reasonableness of certain fares charged by the local transportation company.

Proceedings such as this are the besetting sin of our present method of utility regulation. Reason and common sense are discarded, while valuable time is wasted in tedious legal arguments—often far away from the point at issue. The public—theoretically an interested party—has neither the inclination nor the ability to follow the endless twistings and turnings of the testimony. Despite their best efforts, the regulatory officials cannot give continuous, close attention to the rambling debate. If in the end a sensible decision is arrived at, it is in spite of these protracted hearings, not because of them. What is needed to improve our methods of utility regulation is less law, fewer lawyers and more common sense.

Standardization of Traffic Signals Recommended

Joint committee of municipal officials and representatives of lighting industry in New York State suggests general adoption of two-color indications with all turns made on green light

ADOPTION of standards for the design, location and operation of traffic signals is recommended by a joint committee of the New York State Conference of Mayors and Other Municipal Officials and the Empire State Gas and Electric Association. The findings of the committee are based on thorough investigation and study. Particular attention has been paid to automatic signal installation. It is recommended that the only colors which should be used in traffic control signals are red and green. Turns should be made on the green light. In warning signals amber should be used exclusively.

In reply to a questionnaire sent out by the New York State Bureau of Municipal Information at the request of the committee, 27 cities stated that they had traffic control signal lights in operation. Of these cities two reported that traffic control signal lights were being installed at the time; even stated that they were installed in 1926 and in six cities they were installed in 1925. In other words, within the past two years nineteen cities of the 27 have undertaken this type of traffic control. This indicates that city officials are giving considerable attention to the subject and also illustrates the need of careful study in order that the best practices may be developed and standardized.

Only one of the 27 cities reported that the lights were not proving successful. In this particular place the officials seem satisfied with the principles of signal light control, but do not feel that their system is adequate for local needs. They state that a change is being considered.

Ten cities reported that the introduction of traffic control lights had effected a considerable reduction in their accidents. One estimated this reduction to be 80 per cent, and five other cities reported that no accidents had occurred at intersections where the signal lights were in operation. Eleven cities stated that the lights had effected considerable relief in traffic. One city claims that this relief is due to the fact that drivers avoid the signals and thus use streets that are not so congested.

In answer to the question, "Are your lights operated singly or from a central station?" the following answers were received:

Singly operated	11
Operated by groups	2
Operated from central stations	9
Combination of central station and central operation	4
No answer	1

The answers to the question, "Are they operated on a synchronized or stagger plan?" are as follows:

Synchronized	16
Individual operation	7
Stagger system	2
No answer	2

In reviewing the returned questionnaires, it was evident that the officials filling them in did not understand the exact meaning of the "stagger plan." For this reason the figures given above are not believed to be absolutely correct.

Five cities report that they are now using the two-light system: One reports that it is now using the three-light system, but is planning to change it to the two-light system. The cities using the two lights seem to feel that this is the safest plan of operation. Only one city, which is now using the two-light system, has worked out a plan for overlapping these signals at the time they are changed.

There is considerable variance in the time allowed for each change of signal in the various cities. This ranges from as small an interval as twenty seconds to an interval of two minutes used for the north and south streets of New York City. The time allowed for the change interval varies from four to twenty seconds. Only a few of the cities make a difference of the time interval for the street of maximum travel as against the other intersecting thoroughfares. Fourteen cities report that the timing of the devices is standard for their community; that is, all lights are operated on the same interval and no change is made to satisfy changing conditions. Seven report that timing is designed to fit conditions at the intersection and four indicate that the traffic signal is operated by hand during heavy traffic.

The regulations in effect in the various cities for making turns at intersections where traffic control signals are used vary somewhat, as shown by the following list:

All turns on green light	16
Right turn on red, left turn on green	2
Right turn on either light, left on green	2
All turns on either green or amber	1
Both turns permitted on red light, if there is no interference	1
Right turn on green, left turn during change interval, but either turn on either color when turning off main street. Right turn on either color when turning off side street	1
No left turns permitted during busy hours	1
No rule on the subject	1
No answer	2

Fourteen cities report that they have no regulation for the control of pedestrian traffic at intersections where signal lights are used. Eight cities report that they have such regulations. Of the cities reporting no regulations three state that the matter is handled by the police officer on the post and that they have been able to obtain the co-operation of the public. Of those having regulations, the following experience has been obtained in enforcing them:

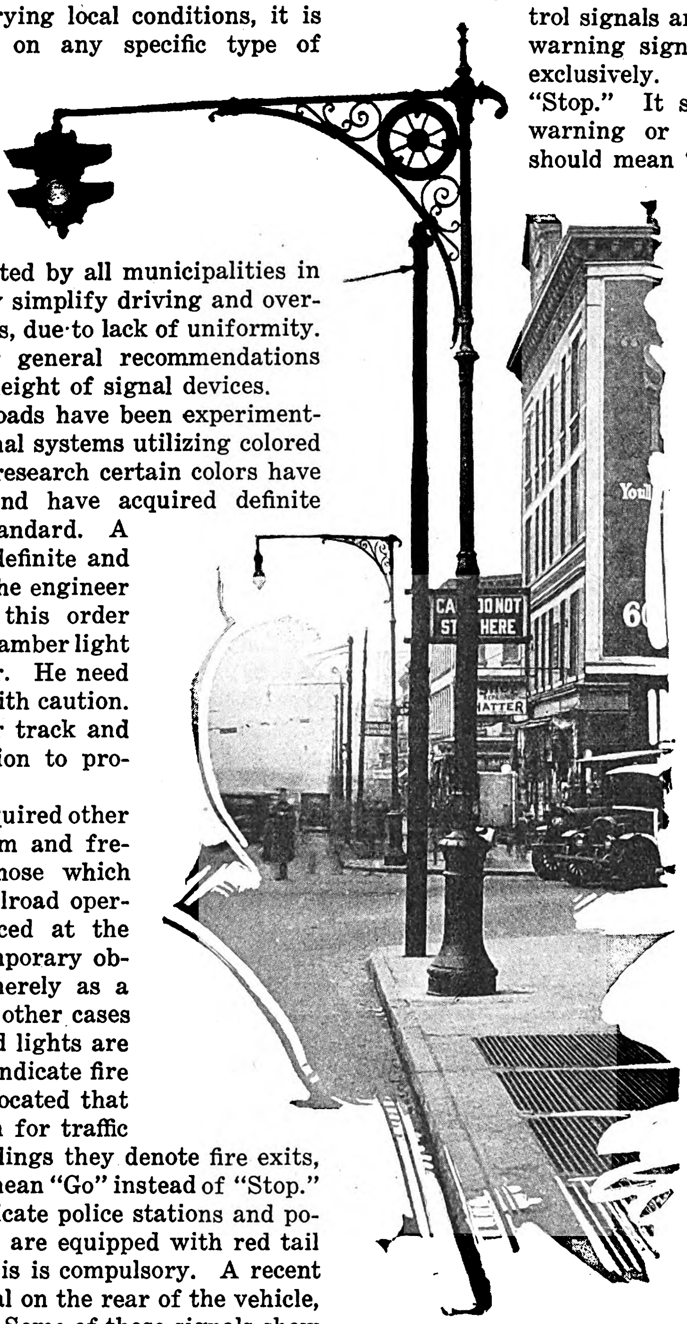
No difficulty	3
Slight difficulty	1
Very difficult	1
Not effective because of lack of penalty	1
No answer	2

On account of widely varying local conditions, it is impractical to standardize on any specific type of traffic signal or signs or any particular layout of control devices. It is possible, however, to recommend a uniform meaning of signals, which if required by state law or in the absence of such, if adopted by all municipalities in New York State, will greatly simplify driving and overcome the present complexities, due to lack of uniformity. It is also possible to offer general recommendations regarding the location and height of signal devices.

For many years the railroads have been experimenting with and developing signal systems utilizing colored lights. As a result of this research certain colors have come into universal use and have acquired definite meanings which are now standard. A red light is an order, very definite and in no case to be ignored, to the engineer to stop. Failure to obey this order brings severe penalties. An amber light is a warning to the engineer. He need not stop, but must proceed with caution. A green light means a clear track and gives the engineer permission to proceed freely.

Colored lights have also acquired other meanings quite distinct from and frequently contradictory to those which have become standard in railroad operation. Red lights are placed at the street excavations or on temporary obstructions, in some cases merely as a warning of danger, while in other cases a full stop is necessary. Red lights are also quite generally used to indicate fire alarm boxes, frequently so located that they may easily be mistaken for traffic control signals. Inside buildings they denote fire exits, and in this case they really mean "Go" instead of "Stop." Green lights are used to indicate police stations and police call boxes. Automobiles are equipped with red tail lights, and in some states this is compulsory. A recent development is the stop signal on the rear of the vehicle, in addition to the tail light. Some of these signals show red, some green and some amber. Devices are also on the market to indicate turns which are about to be made, and some cars, particularly taxicabs, are being equipped with numbers of colored lights, principally red, green and amber, for advertising or display purposes.

The use of colored lights to regulate street traffic is still in the developmental stage. Generally, an attempt has been made to adopt railroad signal methods and meanings to street traffic. The conditions are different and some confusion has been the natural result. This, with the variety of other uses of the same colors, makes it practically impossible for the motorist or pedestrian to know what is expected or required. Steps should be taken at once, first, to standardize on the colors to be used for the regulation of street traffic; second, to adopt definite and uniform meanings for such colors; third, to eliminate other uses of these colors where a different meaning is intended. Mention has been made above of some of these other uses.



Two color signals visible in four directions afford effective control

As a result of its study the committee recommends that the only colors which should be used in traffic control signals are red and green. In traffic warning signals, amber should be used exclusively. Red should always mean "Stop." It should never be used as a warning or cautionary signal. Green should mean "Go." Amber should mean "Proceed with Caution." It should be used exclusively and only for precautionary signals, either fixed or flashing.

In order to avoid confusion, all other use of red, green or amber lights, so located that they may be mistaken for traffic signals, the committee believes should be discontinued.

In some instances, due to the expense involved, traffic control signals are not placed at every intersection on a street where traffic control is desirable. Such a plan is not the most effective and should be considered only as a temporary one, intermediate signals being installed as soon as the finances permit. Until the system is completed, however, some plan should be adopted to prevent traffic from massing at the intersections where the signals are in operation and to inform traffic in cross streets of its approach to a signal-controlled street.

One of the most difficult and at the same time one of the most important problems in regulating traffic is the matter of turns, particularly left turns. Naturally, in the absence of any standard code, many different methods for solving the problem have been adopted based on strictly local conditions. They may be entirely satisfactory so far as local traffic is concerned, but there is now so much long-distance and intercommunity traffic that standardization has become highly desirable, if not absolutely necessary.

The replies to the questionnaire indicate that at least nine different methods are used in New York State alone for making turns at intersections where traffic is regulated by traffic control signals. The committee feels that purely local conditions should not be permitted to govern regulations affecting turns, but rather that all municipalities should adopt similar regulations on this point. The problem, therefore, is to discover the methods or rules which, on account of their logic, will appeal to the motorist and which will be most generally satisfactory and effective in reducing accident hazards and facilitating the movement of traffic.

Left turns interfere with and are dangerous to both vehicular and pedestrian traffic. Right turns may retard vehicular traffic, but are hazardous chiefly to pedestrians.

As far as is physically possible, drivers wishing to make a right turn should be encouraged to keep near the right curb; those planning a left turn should keep near the center of the street, and those wishing to go straight ahead should stay between these two lines. Some cities have found it advisable to indicate these three traffic lanes by markings on the street surface where the street is of sufficient width. In the majority of cases found in the congested areas of cities, the width of the street will permit of only two lines of vehicular traffic in one direction. Even here, however, drivers should keep near the side of the driving space toward which they wish to turn.

The left turn, where the corner is "cut," produces one of the most hazardous conditions at an intersection. Vehicles making such a turn intersect other lines of moving vehicles at dangerous angles and approach pedestrians from unexpected positions. In the opinion of the committee all left-hand turns should be made to the left of the center of the intersection. If, on the other hand, traffic were to follow a course to the right of the intersection it would twice intersect traffic.

If a red light is to be interpreted as an order to stop, and a green light as a permit to proceed, these meanings, to be consistent, should apply whether traffic is to proceed straight ahead or is about to make a turn. To specify that a driver wishing to make either a left or right turn should stop on green light and proceed on the red is inconsistent and tends toward confusion.

PEDESTRIANS MUST BE PROTECTED

The committee feels that no traffic signal system is complete unless in addition to preventing traffic accidents and congestion it also affords adequate protection to the pedestrian. It is the natural tendency of persons on foot to cross an intersection whenever an opportunity affords. It is difficult to control pedestrian traffic by signals. It would seem preferable, therefore, to provide opportunities for crossings by the use of signals to motorists, and to permit the movement of pedestrians only in conformity with the movement of vehicles. Pedestrians should be permitted to cross an intersection only in the direction of moving traffic or when all traffic is halted. This can be accomplished by local ordinance supplemented by education.

In recommending the use of only two colors, namely, red and green, in traffic control signals, the committee fully appreciated the need of an interval between the movement of traffic in one street and that in the cross street. This is essential in order that vehicles, and particularly pedestrians who have started to cross an intersection, as directed by a green light, may reach the opposite side before the traffic from the intersecting street is permitted to move. It is felt that in many instances this interval is of insufficient length to provide for the safety of pedestrians. It is the opinion of the committee that this interval should not be designated by the use of any additional color, such as amber, as there is a tendency on the part of drivers to take advantage of the change by speeding across an intersection or by slipping ahead into it, prior to an authorized change of traffic movements. This defeats the purpose of the interval and creates an unnecessary hazard, particularly where pedestrians are involved. It is felt that if the red light is shown in all four directions during the interval, this tendency and the resulting hazard would largely be overcome. It has been suggested that the application of this plan to certain existing signal systems would involve some expense and that an alternative arrangement be made whereby the red light would overlap the green during the clearance interval. The committee feels that such an arrangement would produce the same conditions as are now produced by the amber light and therefore would be unsatisfactory. It further feels that the expense involved of showing red lights in all four directions would be thoroughly justified by the additional safety secured.

It is impossible to suggest a standardization for the location of traffic control signals, as local street conditions and available finances will, of course, govern the actual layout. The committee, however, has considered the various methods in use at the present time and has listed three outstanding plans of installation at an intersection. These are given in the order which the committee feels should be given precedence.

1. Four lights, one on each corner, each light showing only in one direction, the controlling light in each case being the one on the far right corner to approaching traffic.
2. Two lights placed on diagonally opposite corners, each one showing in two directions.
3. One light located on one corner and showing in four directions.

The purpose of automatic traffic signals is twofold—to expedite traffic movement, not to hamper it, and to minimize accident hazards at intersections. All automatic signals, however, enforce the stoppage of one line of moving vehicles while the line on the intersecting street is proceeding. This period of delay should be less than would be caused under normal conditions if the traffic at the intersection was not regulated or the delay should be offset by a greater ease and safety of movement. Unless one or both of these conditions is produced, the delay is unwarranted. In other words, no automatic traffic signals should be installed unless they are essential. Furthermore, they should not be operated during hours of the day when traffic will move effectively at the given intersection without the signal. A traffic count made on several days and under varying conditions will provide an excellent guide as to the periods when each should be in operation.

ADJUSTING SIGNALS TO LOCAL CONDITIONS

It is frequently advisable to install an automatic traffic signal at an intersection of two streets that do not carry an equal flow of traffic or where the proportion of traffic on one street as compared with that on the other differs considerably at different hours of the day. At such places full consideration should be given to the relative flow of traffic in the two intersecting streets and the automatic traffic signal timed accordingly. For instance, if the normal traffic in a north and south street is twice as heavy as that in an east and west street, twice as long a period should be permitted by the signal for the movement of the north and south traffic. It may be necessary to change this timing interval at certain hours of the day to satisfy the changing conditions resulting from "rush hour" movement. The exceptional conditions at some heavy traffic intersections in New York City have made it necessary during certain "rush hours" to surplant temporarily the traffic signal by a police officer, who has authority to regulate traffic in accordance with immediate requirements, regardless of the signal. The more flexible the system the more effective it will be and the greater approval it will receive from the traveling public.

There seems to be a generally accepted principle that some interval should be allowed between the flashing of the red and the green signal. The purpose of this interval is not so much a warning of the impending change as it is to permit of a clearance of the intersection before such a change. As mentioned before, there is a tendency to indicate this period by overlapping the red signal on the green. This plan the committee disapproves, preferring the use of red lights in all four directions. The time of this clearance period should be sufficient to permit vehicles and pedestrians which have entered an intersection to reach the opposite side before the direction of traffic is changed. If the period is longer, unnecessary delay will be caused. If shorter, an accident hazard and a confusion of traffic will result.

The principles just outlined are fundamental to all traffic signal installations. The application of these principles is dependent on local conditions and local design. Although the practices followed in the operation of traffic signals are changing constantly as new and better methods are devised, those in use at the present time may be grouped under four general headings:

Individual Operation.
Synchronized System.
Progressive System ("Wave," "Platoon" or "Staggered").

Wherever the control or traffic of one intersection affects the movement of traffic at another controlled intersection some plan of co-ordination should be developed. Otherwise, unnecessary delays and crowding will result. Furthermore, the vehicles released at one intersection may just reach the next controlled one as the red light flashes on, thus forcing a stoppage. This is contrary to the principle of automatic lights that were designed to facilitate the movement of traffic and not to halt it unnecessarily.

SYNCHRONIZED PLAN IS SIMPLEST

The simplest method of co-ordination is the synchronized plan used originally in New York City. In accordance with it a number of signals are operated together as a unit. For instance, all the signals in the system will show red in the same direction at the same time and will be changed simultaneously. This permits of a north and south movement throughout the controlled section, while east and west movement is halted. Under the synchronized system the relative quantity of traffic or intersecting streets at a given intersection cannot govern the timing of the individual signal, but the relative flow of north and south traffic as compared with that of the east and west traffic throughout the area must be used to govern the timing of the entire system. Provision should be made for breaking the synchronized system into small units for emergency operation, and a hand-operated device should be installed at each signal.

WAVE PLAN PERMITS CONTINUOUS MOVEMENT

When the synchronized system is used all vehicles are forced to stop at least once during the change of signals. The progressive system sometimes called the "wave," "platoon" or "staggered" system and successfully operated on Sixteenth Street in Washington, D. C., was designed to overcome as far as possible this necessity for stopping. In accordance with it, all signals in the system are changed simultaneously, but they are grouped as to the color displayed.

This plan permits of approximately continuous movement of traffic in both directions while at the same time it discourages speeding, as the speeder would be halted at nearly every intersection. The progressive system is most effective on a wide thoroughfare where blocks are of equal length. Where they are not, a varying number of blocks may be grouped in such a way that the driving distance of each group is approximately the same.

No consideration can be given under the progressive system to the relative flow of traffic, either in individual intersecting streets or by direction, considering the entire controlled area as a unit. On the other hand, the period permitted for the red and green lights must be of equal duration. In cities where a predominance of traffic is in one direction this works a rather serious handicap, particularly if the system covers more than one through street. The co-ordinated system being successfully used in the Loop district of Chicago was designed to overcome this difficulty and provide a system which, as far as practicable, would take into account local conditions at intersections and time of travel between the same. Each signal may be changed at a different time, but unlike the individual method of operation, the changing of all signals is co-ordinated. Similar to the progressive plan it provides for an approximately continuous movement of vehicles not exceeding the speed limit.

CO-ORDINATED SYSTEM IS MOST FLEXIBLE

The co-ordinated method of traffic control is one of the most flexible systems yet devised. This method, with the auxiliary apparatus required, may, however, most satisfactorily serve special traffic conditions. The co-ordination of traffic may be secured in two ways, either by central control or by the use of individual motors of a synchronous type.

In operating it a given intersection is selected as a starting point and the proper timing of its signal is determined. The next intersection is considered in like manner, but its cycle of changes is started a sufficient time after the start of the cycle at the basic intersection to permit vehicles to move from one to the other, considering speed limitations and conditions of travel. The same plan is then applied to each intersection of the selected street within the controlled area and is subsequently applied to parallel streets, taking into full consideration the result and effect on cross streets. Certain allowances will be found necessary in order to co-ordinate the system for the entire area, but the resulting ease of movement in the section as a whole should offset the disadvantages of these particular allowances.

Complete accommodation for passengers has been provided in this suburban station of the Montreal Tramways

Montreal Tramways Installs Modern Suburban Station

ONE of the improvements recently made by the Montreal Tramways is a loading platform and station at the terminus of the Cartierville line, in the Parish of St. Laurent, on the island of Montreal. The former town of Cartierville is situated on the Rivière des Prairies, or what is locally known as "Back River," on the island of Montreal, and is now comprised in the area of the city of Montreal. The station is located on the Gouin Boulevard at a distance of 11.7 miles from the center of the city.

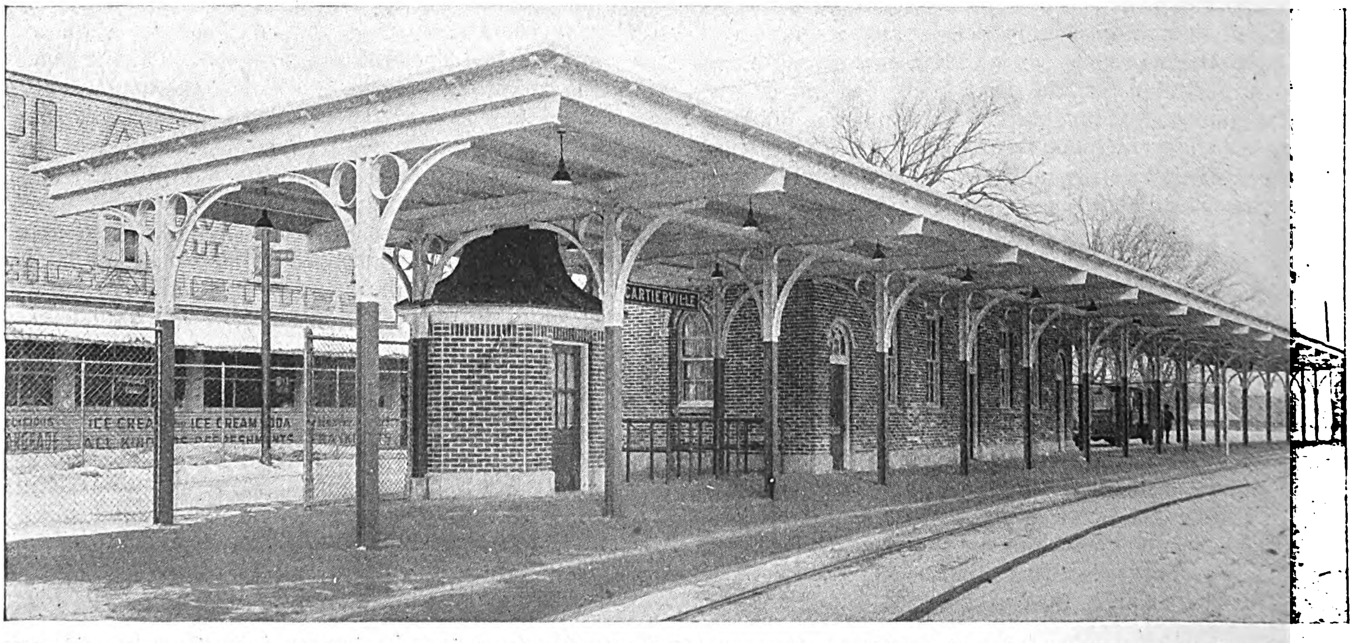
The building, situated between Ranger Street and the company's right-of-way, consists of a station and kiosk, both of rustic brick on Montreal limestone base and concrete foundation, with stone trimmings of Bedford limestone and flat center drainage roof of tar and gravel laid on gypsum slab.

The station, which is a one-story building about 55 ft. x 18 ft. 6 in., contains a waiting room, 30 ft. x 16 ft.; employees' room and conveniences for employees and public. It is heated by a hot water furnace.

The kiosk is used for the sale of tickets when the station is operated on the prepayment plan. It is used for the most part in summer, when the park and other features cause a congestion in this locality. The average number handled on Sundays and holidays during the summer months is between 25,000 and 30,000 people per day, the bulk of the traffic being in the afternoon and evening.

The platform has an average width of 22 ft. on the unloading side and 38 ft. on the loading side, with an asphalt floor laid on a 4-in. concrete slab on cinder foundation. It is covered with a center-drained roof supported on steel posts and I-beams, the roof being covered with "Armco" iron. A Paige wire fence divides the platform into two parts, the narrow part being used for unloading, the wider part, with gates, etc., being used for loading.

At the rear of the station, connecting Ranger Street with the right-of-way of the company and forming a loop with Gouin Boulevard, is a driveway paved with scoria block, for the use of motor buses, public vehicles and the like. It also provides parking space for taxis.



CARTIERVILLE

This attractive suburban station was built by the Montreal Tramways to provide shelter for passengers at Cartierville. It can be operated on the prepayment plan when desired

Transportation in the Eternal City

Rome's hills and narrow streets in the downtown section complicate its transportation problem. Some favorable conditions are present and the trolley cars are carrying the bulk of the traffic

By Henry W. Blake
Senior Editor Electric Railway Journal

IN ROME, Italy, the main transportation problem is not different from that in American cities, namely, that of getting vehicles through the central district quickly. Conditions surrounding this problem in Rome, however, differ considerably from those in the average American city of like population. Some of these circumstances are more favorable to a solution, others less so. The less favorable circumstances will be considered first.

Chief of these is the narrowness and crookedness of the streets in the central portion of the city. In its newer portions, Rome has broad avenues and boulevards, often with a reservation in the middle or on one side for the car tracks, but in the center of the city streets are 25 ft. and 30 ft. wide, often with sidewalks only 24 in. wide. Some important streets even have no sidewalks. Most of the car line streets in downtown Rome are so narrow as to permit only one line of traffic in each direction. Thus, the Via Due Macelli, which leads into the important Piazza Di Spagna, has two tracks and is one of the three or four heaviest car traffic lines in the city, yet measures only about 8 m. (26 ft. 3 in.) from house line to house line.

Besides being narrow, most of the streets in the older parts of Rome, where the principal business district is located, are quite crooked, so that sharp curves in the electric railway track abound. At such points the head of the rail sometimes has to be laid within 36 to 40 in. of the house corner, so that at such places it would be somewhat dangerous for a person to stand while a car is passing. Finally, Rome is a city of hills, of which there are seven altogether. This means many steep grades with curves.

These handicaps to electric railway operations are undoubtedly great. There are, however, several favorable conditions. One is the comparatively small amount of other street traffic, except pedestrians. Automobiles, of course, are far less numerous in Europe than in the

United States. Horse-drawn and auto taxicabs are present, with some private cars, but, as a whole, the vehicular traffic is much less dense than in cities of the same size in the United States. What there is of it besides the electric cars keeps as much as possible on the streets which have no car lines, or, at least, it keeps away from the narrow streets which have car lines. Fortunately, there are several broad thoroughfares of this kind through Rome. Traffic policemen are not much needed, and they are a comparative rarity.

Another favorable circumstance is a comparatively long spacing of car stops. This spacing averages 250 m. (835 ft.) in the center of the city and from 300 m. to 400 m. (1,000 ft. to 1,335 ft.) in the outskirts. This permits a fairly good schedule speed (about 12 km. per hour or 8½ m.p.h.) for cars within the city limits. Still another good condition is the favorable ordinances affecting electric railway operation.

The comparative absence of rush-hour and slack-hour traffic conditions such as exist on electric railways in cities of corresponding size in the United States is helpful to tramway operation. A more exact way of stating this circumstance perhaps would be to say that there are four rush-hour periods instead of two. As in many other cities in continental Europe ordinary business largely ceases during the noon lunch period. At this time most of the downtown offices as well as the stores (with the occasional exception of a large department store) are closed. The doors are locked, the shutters are put up and customers are not expected until the afternoon opening hour. The period of lunch varies from one to two hours. It begins at from 12 to 12:30 and ends at from 1:30 to 2:30 p.m. Rome is not alone in this custom, as has already been explained. It is followed also in Paris, Milan and other cities.

As most of the persons thus released from business go home to lunch (if not living too far away) the four peaks of the tramways can be understood. In consequence, largely the same headways are followed by the tramcars throughout the day and there is a very much larger proportion of straight runs for the men than in the United States.

Incidentally the explanation should be made that while the offices and stores close for a considerable period for

déjeuner la fourchette, they work later in the afternoon than is customary in most American cities, i.e., the offices remain open until 7 or 7:30 p.m.

Hence, the railway system is able to offer good urban transportation, while its low fares and the many steep hills in the city are reasons for attracting passengers to its lines. Table I gives passengers carried during the six years 1920-1925 inclusive, nearly all of the lines being within the city limits.

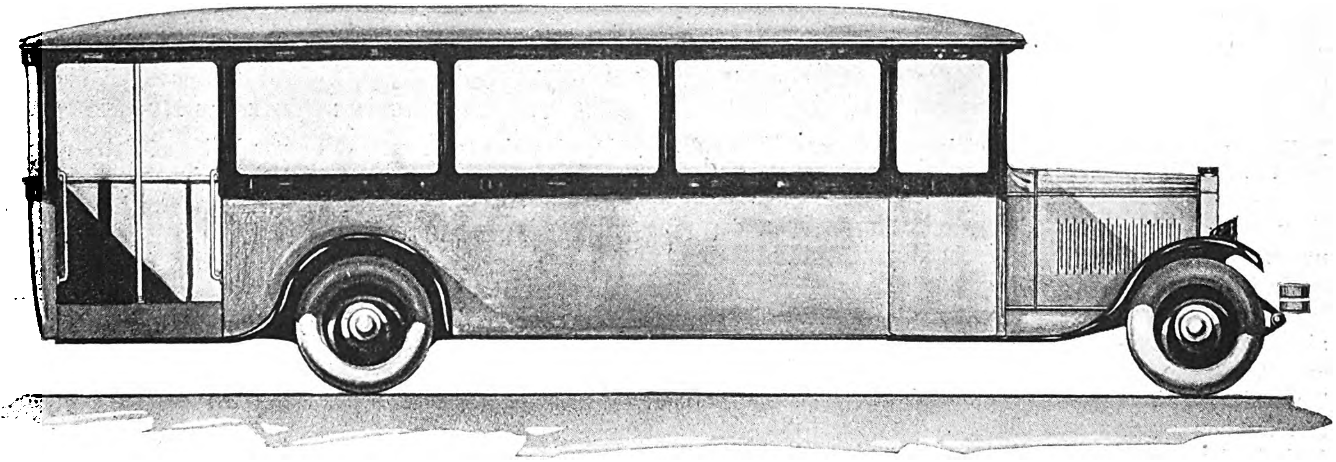
TABLE I—PASSENGERS CARRIED ON ROME TRAMWAYS SYSTEM

Year	Total	Per Motor Car-Km.*	Per Motor Car-Mile*
1920	140,696,992	11.368	7.105
1921	139,562,222	9.280	5.800
1922	144,233,975	7.568	4.455
1923	154,164,622	7.684	4.5554
1924	150,663,079	6.971	4.357
1925	186,635,463	7.129	4.456

* Based on one trail car-mile being equal to one-half a motor car-mile. This is the general European method of calculation.

TYPE OF CAR USED

At present the Rome system has a total of 400 motor cars and 267 trailers. Standard types of car used are shown in accompanying illustrations. Both motor cars and trail cars are mounted on single trucks. Elevation and section drawings also are shown. The seating arrangement varies in different cars. In the type illustrated, there are cross seats for two passengers each on both sides of the center aisle, although a large number of the cars, perhaps most of them, seat only three passengers across the car. With all seats except the four end seats holding two passengers each, the seating capacity of the car would be 28 passengers. With a row of single seats on one side of the car, its seating capacity would be 24. Slat seats are used.



Rome Tramways has ordered 30 buses of this type for feeder service

The remainder of the equipment includes a bow trolley, Westinghouse air brake with axle compressor, hand brake and short circuiting brake, two 40-kw. (53-hp.) motors and General Electric B-54-M controller. The starting resistance is on the roof. Completely equipped this car weighs about 14 metric tons (30,800 lb.).

The city is having two double-truck cars built for experimental use at the works of Carminati & Toselli, Milan. Plans and elevations of these two cars are shown in accompanying drawings. They seat 41 passengers each, and each has a nominal standing capacity for 46 passengers in addition. The front truck is equipped with two motors. The other is idle. The total weight is 15 metric tons (33,060 lb.), of which 9½ tons (20,940 lb.) is on the motor truck. Both cars are equipped with air brakes, and one with regenerative braking. The latter type was included primarily for safety and not for economy of current.

The wheels on both the present standard and the new cars are 800 mm. (31½ in.) in diameter, making a rather high two-step entrance and exit.

In the present standard single-truck car, the platform entrances on both sides are inclosed by hinged gates with interconnected folding steps. On the devil-strip side these gates are kept down, but in practice the gates on the curb side of the car are always kept open. In the double-truck car there are extra doors on both front and rear platforms. These doors are normally kept closed, but can be opened in case of heavy loading or unloading.

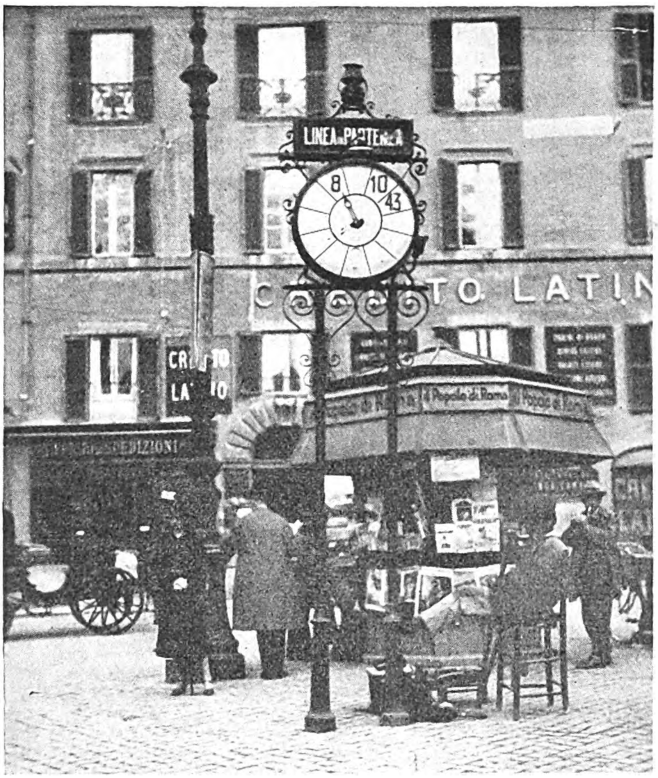
The exterior of the car is attractively painted a cardinal red on side panels and sash, with brownish yellow trimming. The crest of the city with the letters S.P.Q.R. (*Senatus Populus que Romanus*) appears in the center of the side panel.

The standard single-truck trail cars are similar in seating arrangement and general design to the single-truck motor cars. Not every motor car hauls a trailer. During 1925 there were about twice as many motor car kilometers run as trail kilometers, the figures respectively being 20,969,018 and 10,421,462. In Table I the method followed for calculating total ton-kilometers (or ton-miles) is the conventional one generally followed in Europe of including only one-half of the trail car-miles, on the theory that in cost one motor car-mile is about equal to two trail car-miles.

BUSES USED IN FEEDER SERVICE

The Rome tramway system also has on order 30 buses of the type shown in an accompanying sketch. Fifteen of these buses will have seats for 28 passengers and standing room for 32. The other fifteen will be somewhat smaller, having seats for 22 passengers and standing room for 28.

These buses will be put to two uses. One will be as tramway feeders in sections of the city which do not yet have enough business for car lines. The other will be on lines where the car routing has had to be changed because of street congestion. Here buses will be used partly as substitutes for cars which have been rerouted through another street, but the length of run made by the buses will be much shorter than that of the former car line and no transfers will be given. Bus operation is regarded as considerably higher in cost per vehicle-mile



Indicator to tell passengers which car will next leave the terminal is operated electrically by the dispatcher

than car operation and the proportional difference is probably substantially greater than in the United States.

Up to the present no buses have been in operation by the Rome Tramways. There are in the city, however, about 24 storage-battery buses, operated by a private company, the Societa Anonima Transporti Ugolini. These buses have been in service about three years and are run on streets not occupied by car lines. These include the Corso Umberto I, the most fashionable shopping street in Rome. The routes over which these storage battery buses are used are fairly level, a rare condition in Rome.

SPACING AND NUMBER OF STOPS

The Rome Tramways has accomplished a great deal in the way of merchandising transportation. This work has been in charge of the traffic department. Part of its efforts has been given to increasing the schedule speed of cars by cutting out what the management believed to be unnecessary stops. This naturally met considerable opposition from interested parties anxious to have certain stops continued. But as a result of two years of effort 72 stops were discontinued and many others were more scientifically located. As a result the management believes that of its present 300-odd stopping places, more than 250 are rationally placed. The time of stops is shortened by the large number of island platforms for waiting passengers which have been installed in Rome.

ROUTES DESIGNATED BY NUMBERS

So much effort has been made in Europe toward identifying car routes by numbers and of advertising them by these numbers to the public that particulars will be given of the practice in Rome which has perhaps gone further in this direction than in most other European cities. In the first place, every car carries its route number and lettering showing the route termini conspicuously on head signs and also on signs at the sides of the car roof, as shown in the views of the car exteriors. The head signs are illuminated at night. Two disks inside the car with the route numbers in white on a black background are also being tried in some of the cars, to determine how useful this information will be.

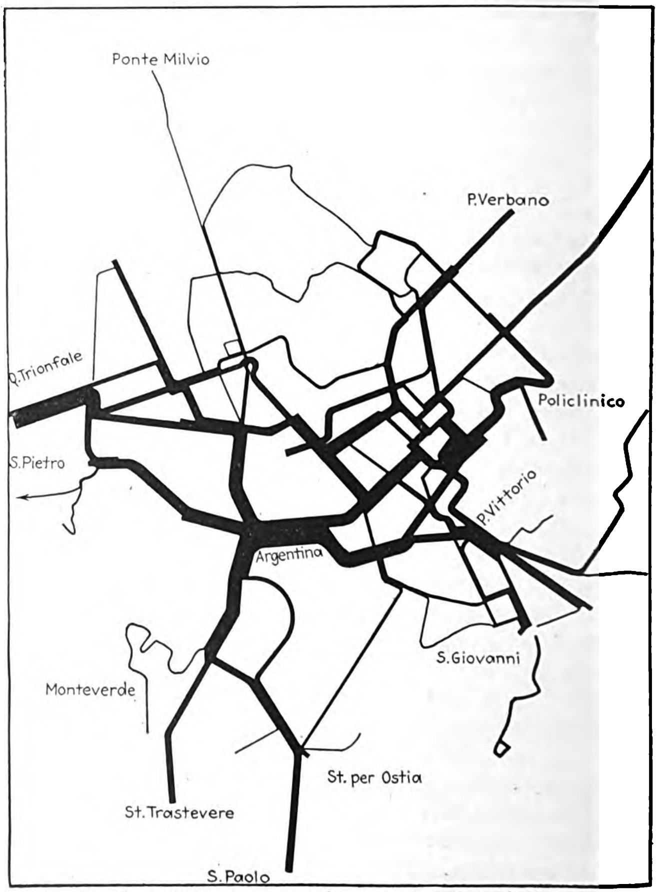
Each car carries in its right-hand front window and left-hand rear window a poster giving a list of the principal streets and the route termini, the latter being printed in red. These posters are duplicated, back to back, so that they can be read either from the inside or the outside of the car. A direction sign is carried in the left-hand window of the front vestibule with an arrow pointing to the terminus toward which the car is going. On the Piazza Colonna-Piazza S. Choce line, for example, the sign would show the arrow pointing to Piazza Colonna if the car was going in that direction and to the S. Choce terminal if the car was going in the reverse direction.

The numeral sign on a belt line car is surmounted by an arrow pointing to the right or left, depending on whether the car circles the city in a right-hand or left-hand direction. Not all of the plans outlined have been installed on every car, but all are on some cars for trial.

ADVERTISING THE ROUTES BY NUMBER

Distinguishing route signs would be of little value if the riding public were not taught to identify the various routes by these numbers. Passengers are helped to do this in several ways.

One is by the information published in route racks erected at stopping points. All routes stopping at any



Traffic flow diagram showing cars and trains for the maximum hour during January, 1927 particular point are listed by number in these racks and a short description is given opposite the number of each route. This system of marking car stops is a comparatively new one, and not all of the stops are so identified as yet.

Besides these methods the plan customary throughout Italy is also followed. This is to hang from the span wire at a car stop a metal sign reading "Fermata." The letters are in black against a white background and are so large that the signs can be read for a considerable distance away. On the whole this plan seems more positive and satisfactory than that of placing a stripe or two stripes on an adjoining trolley pole. The stripe convention may signify a stop to a stranger or it may not. He is never quite sure.

Another method of familiarizing the riding public with the route numbers is by a "tramway guide." Such a handbook containing a list of the various routes and other helpful information such as length of route, headway, etc., is published and sold to the public for a small sum. This handbook contains two excellent maps of Rome on one side of the sheet in colors with the most important buildings and other points listed in red, while the map on the other side is printed in light gray ink, and over it is printed in red a chart of all the car routes with their distinguishing numbers.

It would be difficult to overemphasize the value as a traffic promoter of these methods of advertising the different routes. The practice has become so accepted that residents of Rome come to know just what routes to take for desired journeys, and the tourist can quickly obtain and absorb the same information. In fact, the standard guide book tells the tourist which route by number he needs to take him to any desired point, and the larger guide books contain maps of the routes by number.

The practice described is not unique in Rome, as several cities in Italy have similar systems, though not worked out as completely.

A number of other transportation improvements were noted during a recent visit to the Rome system. One was a clever indicator to show to waiting patrons which car will be the next to leave a stub terminal. This point, Piazza San Silvestro, is at present the terminal of three lines, Nos. 8, 10 and 43. The dial shown in the view is marked with these three numbers and the hand is moved from one number to another electrically by a starter whose booth is located at the terminal. This hand shows the number of the route for which the next car will leave.

A chart of this kind has been prepared for each route showing all stopping points and connections with other lines

The number of electrically operated track switches now in Rome is being constantly increased, in spite of the comparatively low cost of labor in Italy. On Jan. 1, 1926, there were 26 such switches on the system. Light signals to warn other vehicles of an approaching electric car have been installed at a number of curves or other points where the view ahead is obscured by intervening buildings. These signals are not greatly different in principle from the automatic type of warning signal used at grade crossings of steam railroads in America and carry the words on an illuminated dial: "Attenti al Tram," or "look out for the street car." They are unusual because in Rome they are used exclusively in city tramway service at sharp corners.

Several covered waiting stations have been erected. A number of headway recorders have been installed at different strategic points.

ONE-MAN OPERATION BEING TRIED

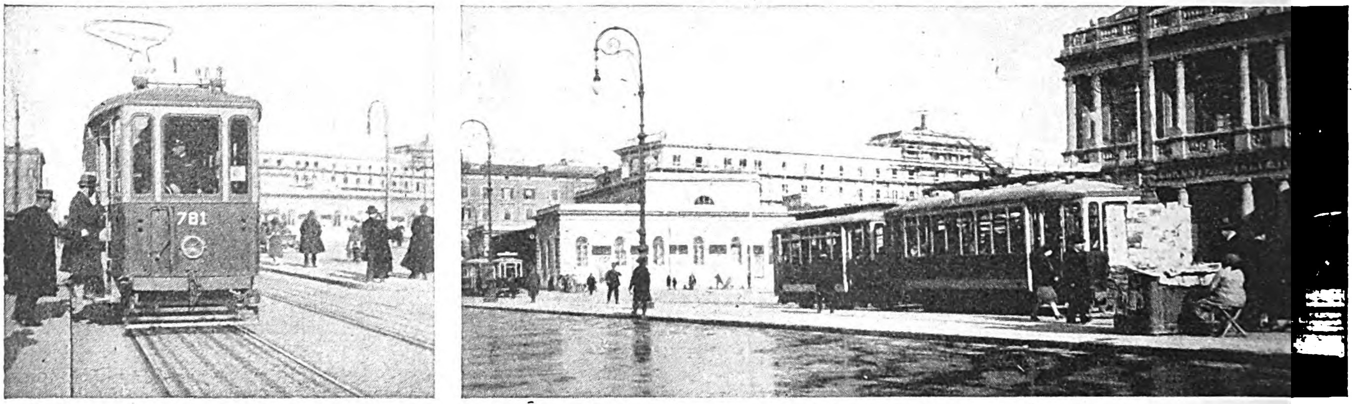
As yet only a belt line in the suburb of Monte Sacro uses one-man operation. On all other lines a conductor is used on each car, and this means of course two conductors on a two-car train. In retaining two-man operation Rome does not differ from most other electric railway systems in Europe. Among the reasons which have impelled Rome to continue this practice the following may be mentioned.

TABLE II—YEARLY WAGES PAID BY THE ROME TRAMWAYS

Class of Employee	Number Employed on Dec. 31, 1925	Basic Yearly Wage Lire	Basic Yearly Wage Dollars	Increase in Yearly Wage Made Every Two Years (Limited to Five Periods or Total of Nineteen Years Lire	Increase in Yearly Wage Made Every Two Years (Limited to Five Periods or Total of Nineteen Years Dollars
Inspectors, instructors, etc.	90	12,500	567	380	17
Motormen	737	19,800	491	320	14
Conductors	1,032	9,300	423	280	13
Carhouse helpers, track men, etc.	115	7,900	359	250	11

Note:—On the basis of 22 lire to the dollar.

1. Labor cost is much less than in the United States so that the saving from one-man operation is not so great. The wages paid the four principal classes of transportation employees in Rome is given in Table II. These figures are given on a yearly basis, as that is the basis of the five-year contract made between the management and the men on Dec. 15, 1923, to continue through 1928. The hours per week are 52, and in addition to the wages paid a certain part of their uniforms is given to the men without charge, the amount depending on the years of service.



Island platforms are used extensively in Rome. The one shown here is located in front of a principal railroad station

2. A second reason given for the continuance of two-man operation is the low speed of the cars and the non-use of platform gates. The Rome Tramways has notices requesting passengers to board cars by the rear platforms and leave by the front platforms, as well as notices forbidding passengers to board or leave cars while in motion. Both rules are disregarded, especially that requiring cars to be boarded by the rear platform. This makes hand fare collection almost obligatory.

3. A final reason for the retention of the conductor is the system of fare collection employed. This is the common European plan of issuing fare receipts torn serially from a pad. However, as most of the Rome system is now on a flat fare basis of 50 centessimi on week days and 60 centessimi on Sundays, it would seem that prepayment could be used if this were the only objection to it. That this is not impossible is shown by the fact that the Rome management is now considering the use of portable fare registers instead of the pad system.

The disadvantages of the latter are great. Its use means not only that the car is littered with used receipts discarded by passengers, but the plan is expensive in stationary and in the employment of inspectors who board the cars to see if all passengers have paid their fares. Also, it is more subject to abuse by both passengers and conductors than a fare box or a register with hand collection.

Before starting its single one-man car line the management issued an extended schedule of instructions to passengers. Among them is noted the rule that passengers are requested to offer to the one-man operator the correct fare when boarding, and that the operator has the right to refuse admittance to the car to all persons who do not present the exact fare.

SYSTEM IS OPERATED BY MUNICIPALITY

The present owner and operator of the Rome Tramways system (with the exception of one line) is the city of Rome, the management being intrusted to a board known as Azienda delle Tramvie del Governorato di Roma. Municipal operation was begun in 1911, when the city started service on several lines, in addition to those which were then being operated by a private company—Societa Romana Tramways-Omnibus. Gradually the lines of this company (with the exception of No. 16) were absorbed by the municipality, the greater part being taken over in 1919.

The single line not yet taken over (No. 16) is an important route. In addition the company owns a street railway tunnel under the Quirinal Hill, which is used by line 16 and also by a number of the municipal routes. The franchise for this tunnel and for line 16 does not expire until 1940. It is quite probable that the city will acquire both tunnel and line before that time by purchase.

RAPID TRANSIT NEEDED

An accompanying traffic flow diagram shows the need of some relief to the tramway system in the way of rapid transit. The through arteries are few and are now considerably congested. They will become more so as motor car traffic in the streets increases, as it is certain to do. Some relief could be gained by a tunnel under the Capitoline Hill, but eventually Rome will have to have some sort of rapid transit system like other large national capitals. This condition is realized by the city authorities and a commission has been appointed to consider plans. At present a north-and-south line and an east-and-west line are proposed, and shafts are being sunk at different points to determine the nature of the subsoil. Trains of five cars are being considered for the first installation. The project would be financed by the city with some assistance from the national government.

Momentary Stresses Developed While Bucking Railway Motors

A maximum torque fourteen times the full load value may occur under certain conditions. High current peaks may result in cracked shafts and pinions or other mechanical damage to a motor

By L. M. Aspinwall
Railway Equipment Engineer
Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.

MAXIMUM sustained stresses in electric railway motor armatures, shafts and gears are limited by the slipping point of the wheels on the rail, but, unfortunately, the momentary stresses are not so safeguarded. The force required to accelerate or retard any given mass is directly proportional to the rate of change in velocity. Therefore, a sufficiently rapid change in the velocity of the rotating parts will cause the corresponding forces to assume tremendous magnitude. There is, of course, nothing new in this statement of a simple fundamental law of physics, but we wish to emphasize it, as the following discussion deals with momentary stresses produced by sudden changes in velocity.

Theoretically, the torque which can be developed by a series type railway motor is limited only by the current which can be passed through the motor. The current, in turn, is limited by the impressed voltage, time of application, motor resistance, counter emf., inductive emf., flash-over point and safety cutout devices. It is perfectly possible, under certain conditions in actual practice, for the current to reach such momentary values as will produce stresses far in excess of the slipping point of the wheels.

In the following discussion particular consideration is given to the conditions produced when motors are "bucked" at various car speeds and the possible stresses to which axles and gears may be subjected under these conditions. In general, those familiar with railway work understand what is meant by bucking the motors, but as this term is sometimes erroneously used a few words of explanation here will probably not be amiss.

Assuming a car to be running away with power off the line or the circuit breaker open, bucking is accomplished on a four-motor equipment by merely throwing the reverser, and on a two-motor equipment by reversing and moving the controller handle up to any one of the parallel notches. Under these conditions the motors immediately pick up as generators, the two motors which are in parallel generating voltages which are in opposition, and as the characteristics of the two machines are never exactly matched, one quickly overcomes the voltage of the other and reverses its field. The two machines are then generating in series through a circuit consisting of the resistance of their fields, armatures and the connecting wiring.

Bucking should only be used as a last resort in cases of emergency where all other means of stopping the car have failed. If the car speed is sufficiently high the current rises quickly to a point where one or both pairs of wheels slip. If both pairs of wheels slip the current drops quickly to a value where the wheels again take hold. The current then rises until the wheels again slip, and this cycle is repeated with great rapidity, producing a series of jerks, which action is responsible for the origin of the term bucking.

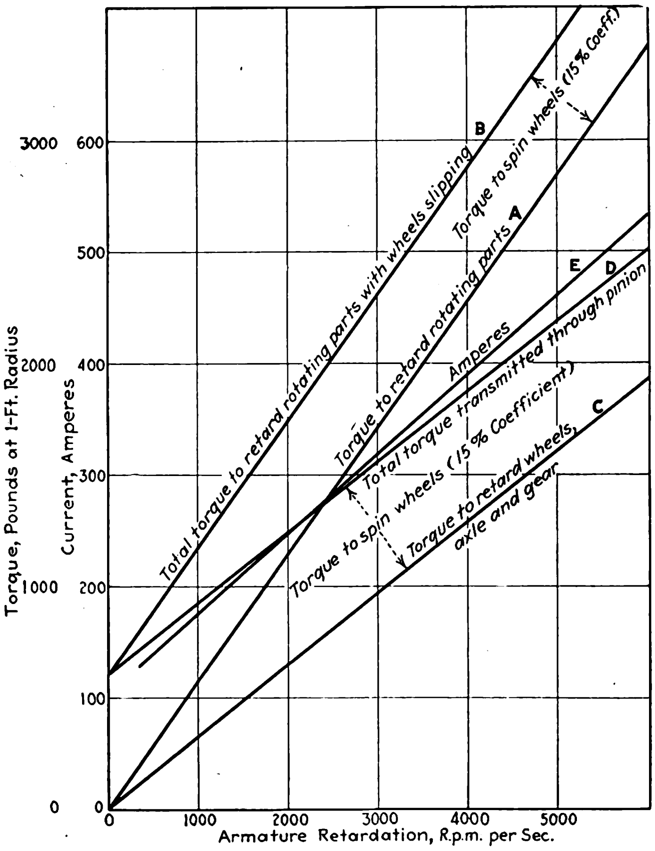


Fig. 1—Torque and current relations in retardation of armature, wheels and axle

Curves are for a quadruple equipment of Westinghouse 532-B motors with 17:67 gear ratio and 33-in. wheels. The load is 5.75 tons per motor and the adhesion 15 per cent with wheels slipping.

Frequently only one pair of wheels slips and this pair is locked or driven in the reverse direction by the current generated from the motor, which is still rotating in the same direction as the car motion.

In some cases cars have been wired with what is known as a loop circuit in order that this emergency

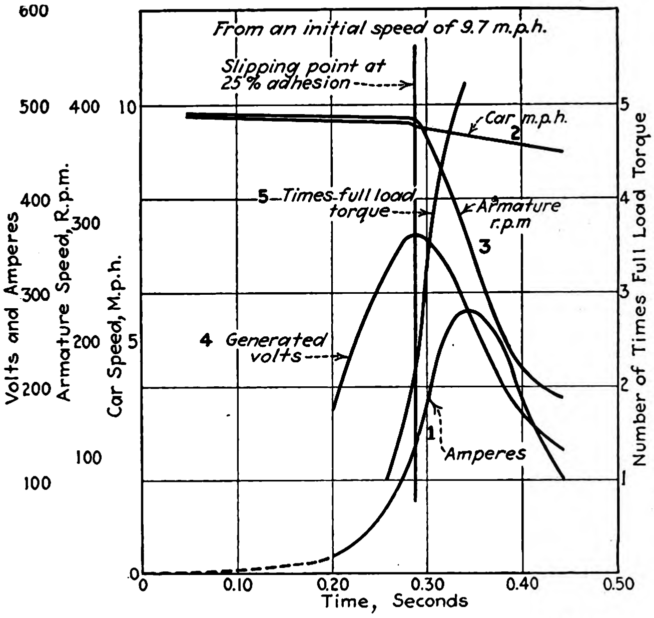

Fig. 2—Transient conditions during period of bucking for motor with characteristics given in Fig. 1

The total resistance of the loop circuit is 0.9375 ohm. The motors were bucked from an initial speed of 9.7 m.p.h., giving the ampere curve 1 as recorded in an oscillogram. The other curves were calculated from curve 1 and available data.

feature of bucking could be used with less erratic results. The loop circuit consists merely of a connection which is established across the terminals of the motors during bucking, so that the two motors generate in parallel through this path.

The Westinghouse 532-B motor was selected for the purpose of this analyzation for the reason that oscillograms were available which were taken on this motor under bucking conditions, with loop connections, and formed a basis for calculations and check.

The first step in this study was to calculate the forces necessary to accelerate, or retard, the component rotating parts, such as armature, wheels, gears and axle, assuming a 17:67 gear ratio and 33-in. wheels. The result of these calculations has been plotted in Fig. 1. Curve *A* on this graph shows the total torque required at the armature to retard the armature, plus the wheels, axle and gear at various rates expressed in armature r.p.m. Curve *C* shows the torque necessary to retard the wheels, axle and gear only and is, in general, the curve in which we are particularly interested, as this curve, plus the torque necessary to slip the wheels, shows the total torque transmitted through the armature shaft and pinion.

In the case under consideration a weight of 11,500 lb. was assumed on each axle, and to spin the wheels at 15 per cent adhesion required 1,720 lb. tractive effort, or a torque of approximately 600 lb. at 1 ft. radius on the armature shaft.

Curve *B* is plotted 600 lb. above curve *A* and shows, therefore, the total torque required to spin the wheels at 15 per cent adhesion and to retard the total rotating parts at various rates. The approximate current necessary to produce this torque is shown by curve *E*, the values for which, above 150 amp., were obtained by extrapolating the normal torque curve of the 532-B motor.

It should be noted particularly that with a high current, say 500 amp., the torque necessary to spin the wheels, which is indicated by the vertical distance between curves *A* and *B*, is a small portion of that required to retard the rotating parts and is not, therefore, a limiting factor.

Curve *D* shows the torque necessary to spin the wheels with 15 per cent adhesion and to retard the wheels, axle and gear at various speeds.

From the foregoing it will be understood that in Fig. 1, for a given current through the motor, *B* shows the total torque which must be carried by the armature coils and teeth and *D* shows the total torque which must be transmitted through the armature shaft and pinion.

Bearing in mind these relations between the torque necessary to spin the wheels and the torque to retard the rotating parts, let us pass to a consideration of the transient values which occur when the motors are shorted on a loop circuit and allowed to build up as generators on a car running at a given initial speed.

The instant the motor circuit is closed the current starts to build up at a rate which is a function of the speed, the field strength and the impedance of the circuit. When the current has reached a value which gives a tractive effort equal to the slipping point of the wheels, say 25 per cent, the wheels start to spin on the rails at a speed less than the corresponding car speed and the coefficient of adhesion drops to say 15 per cent. From this point on the only force which can act to retard the mass of the car is equal to 15 per cent of the weight on the wheels plus the windage, but the force which can act to retard the rotating parts is limited only by the current through the motors. The current through the motors continues to rise after the slipping point is reached and the armature continues to slow down at an increasing rate until the maximum current point is reached.

After passing the maximum point the current decreases until the tractive effort falls to a value which is just sufficient to balance the coefficient of adhesion,

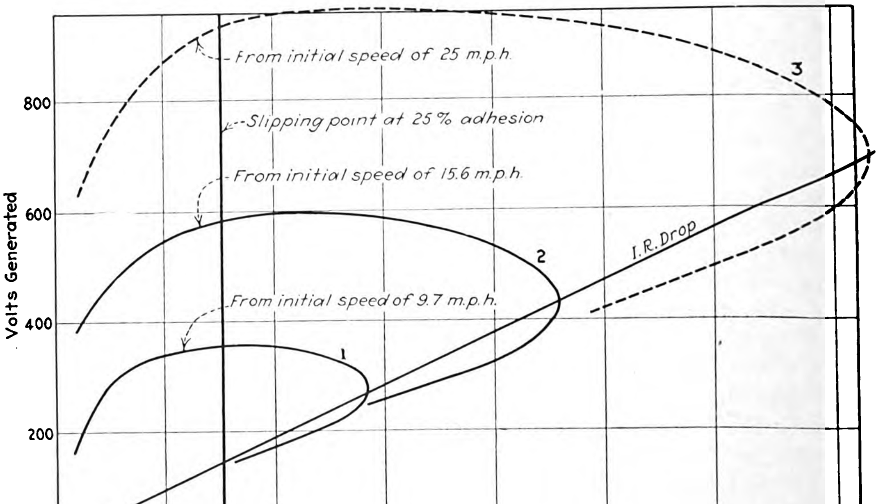

Fig. 3—Characteristic motor performance when bucking on a loop circuit

Curves 1 and 2 were determined from oscillograms taken on the equipment with characteristics given in Fig. 1. Curve 3 was calculated from Curves 1 and 2.

at which point the wheels may again grip and the cycle be repeated starting from a lower speed.

The rate at which the armature is retarded at any instant depends on the current, and the actual speed reduction depends on the duration of time for that current value, therefore it is evident that in order to figure the transient values we must determine the rate at which the current builds up.

From one of the oscillograms taken on type 532-B motors under bucking conditions, as previously mentioned, we are able to determine the current-time values on a test starting with an initial car speed of 9.7 m.p.h.

With this data we have been able to calculate the results shown in Fig. 2. The ampere-time curve (1) on this sheet is plotted directly from the oscillograph readings. The car speed curve (2) and the armature revolutions per minute (3) have been calculated from the ampere-time curve in the same manner as that employed in laying out an acceleration curve, starting with the known initial car speed.

For example, different current values were assumed and the time interval between each of these current increments was noted from the oscillogram, and the corresponding tractive effort from the motor characteristic curve. From the above data the reduction in car speed between current increments was figured up to the point where the tractive effort reached the slipping point of the wheels at 25 per cent adhesion.

After passing the slipping point of the wheels, Fig. 1 was used to determine the rate of retardation of the armature and other rotating parts for each current increment and the decreased speed of the armature was calculated for each point.

From the point where the wheels start to slip the speed of the car and the speed of the armature bear no relation whatever to each other, as the car continues to be retarded only under the influence of the spinning adhesion and windage, whereas the armature is being retarded at a constantly increasing rate as the current continues to rise. After the armature speed curve (3) had been figured out, the curve for generated voltage (4) was deduced from the known saturation curve of the motor.

Curve 5 has been added to this sheet to show the number of times that the torque exerted for the different current values exceeds the normal full load motor torque. It will be noted that the maximum value in this particular case is 5.2 times full load torque.

On curve 1, Fig 3, the generated voltage has been plotted against the current for the same values as shown on Fig. 2. Curve 2 on this same sheet was calculated from another oscillograph curve in the same manner as curve 1. This second curve started, however, from an initial speed of 15.6 m.p.h. Curve 3 was constructed from an initial speed of 25 m.p.h. on the basis of the data obtained in curves 1 and 2.

The total resistance of the loop circuit, including the motor and wiring, was 0.9375 ohms and the curve marked *IR* is this value multiplied by the current. The vertical distance from the *IR* curve to any of the three curves represents the inductive volts. The maximum current value for each curve naturally occurs at the point where the curve crosses the *IR* curve, for at that instant there is no change in the current and consequently no induced voltage, so that all of the generated voltage is taken up in the *IR* drop. An inspection of curves 1, 2 and 3 shows that they are of the same form, but of a magnitude increasing in practically direct proportion to the initial car speed at which "bucking" is started.

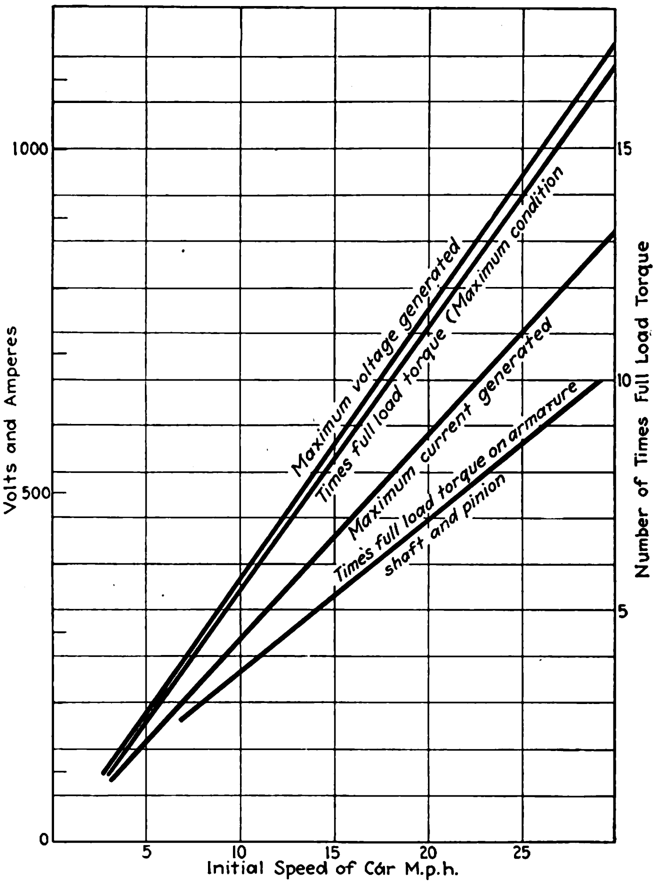

Fig. 4—Maximum values of voltage, current and torque generated while bucking the motor with characteristics shown in other figures from various initial car speeds

From the above it is apparent that it is only necessary to determine the form of the current-time curve for a given equipment for one given speed and the performance for any other speed can be readily deduced. It will be noted that in this particular case the maximum voltage is generated at a short interval after the wheels start to slip and that the maximum current occurs a little later when the generated voltage has fallen to approximately 72 per cent of its maximum value.

In Fig. 4 are shown in simple straight line functions the final results obtained from curves previously mentioned. From this curve it is possible to see at a glance the maximum voltage, current and torque which can be generated when bucking motors on this particular equipment at various initial speeds. For instance, if the motors are bucked at a speed of 25 m.p.h. the maximum voltage generated will be approximately 950 volts, the maximum current 730 amp. and the maximum torque fourteen times that of full load.

The values on this curve are the maximum with the conditions as assumed and, of course, under certain operating conditions the values may not be as great. On the other hand, it must be remembered that with a greater weight per axle and a higher coefficient of adhesion the conditions will be considerably worse.

It might be argued that these values will never be reached in practice due to the fact that the motors would flash over. No doubt flashovers would limit the maximums to a certain extent, but we do not have any definite data as to just what these limits would be. It should be remembered that the fact that the maximum voltage and maximum current are not coincident will have some influence on this question. Tests have been made as to the flashing points on different motors with various speeds and voltages, with moderate currents, but the data are rather meager as to the "flashover" point with tremendously oversaturated fields.

We do know that on tests made on type 532-B motors in Baltimore in 1920 currents in the neighborhood of 475 amp. per motor were obtained without flashovers, and the writer has seen the potential go up to approximately 1,000 volts on other motors when used for braking, also without apparent flashover.

In 1914 a test was made with a three-car multiple-unit train, bucking the motors at a speed of 40 m.p.h. The wheels on the front car revolved backward through the stop, while those on the rear cars alternately rolled and slid. When the train came to rest every motor was smoking and there were numerous flat spots on the wheels. No records were made of the current values in this test, but no doubt they were terrific and the stresses correspondingly large.

This discussion has considered particularly the effect of bucking motors, but it must be remembered that these high current peaks may be produced in other ways. It is quite probable that cracks in shafts or pinions may be started in some cases by these tremendous momentary stresses and that later on they develop into inexplicable failures under apparently normal service conditions.

Joliet Worm-Drive Trucks Impress Railway Men During Test

Experimental trucks mounted under temporary body for demonstration run. Fixed bolster construction proves successful

JOLIET'S new worm-drive street car trucks, developed by J. R. Blackhall, vice-president of the Chicago & Joliet Electric Railway, in collaboration with the Timken-Detroit Axle Company, Westinghouse Electric & Manufacturing Company and other equipment makers, were given an official test run under varying conditions of track between Joliet and Lockport, Ill., on May 13. In the estimation of more than 50 street railway officials, electrical engineers and manufacturers' representatives who attended, the demonstration was comprehensive and thoroughly satisfactory.

Aside from a slight ring or hum to the wheels when operating at high speed, a condition which Mr. Blackhall contends exists entirely in the wheels and not in the gears, the new trucks fully measured up to expectations. The Timken company is now co-operating with Mr. Blackhall to still further improve the operation. A detailed description of the truck, which represents the most important major change in truck design in many years, appeared in the April 2 issue of ELECTRIC RAILWAY JOURNAL.

To provide some degree of contrast for comparison during the demonstration runs, two regular city-type street cars were used on the 12-mile test trip, one mounted on the new worm-gear trucks, the other on trucks of the conventional type. On the outbound trip, the entire group of 60 visitors were loaded into the car equipped with the new trucks. On the return, half of the passengers were asked to ride the old-style car so that they might notice the difference in riding qualities.

The automotive trucks, developing a maximum speed during the trip of 34 m.p.h., negotiated sharp curves, 5-deg. grades, and special trackwork with the utmost ease and smoothness. As the car was put through its paces the visitors were greatly impressed with the comparatively quiet operation, simple method of control, and unusually comfortable riding qualities of the trucks.

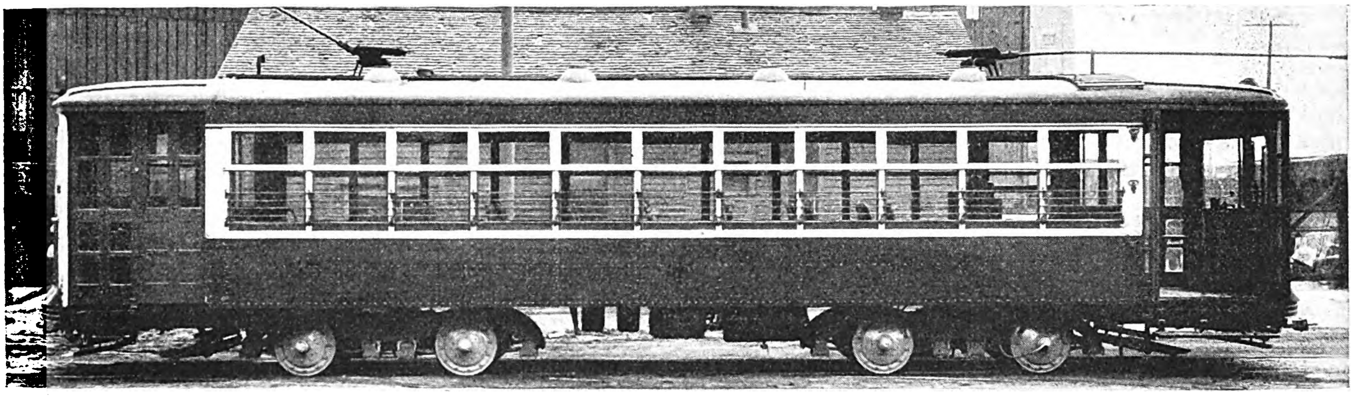
At one stage of the trip the passengers were requested to leave both cars so that they might closely observe the behavior of the new-type trucks in crossing a double-track steam railroad line. Although both cars took the crossover at approximately the same rate of speed, it was noticed that there was considerable jolting and rattle as the ordinary standard trucks passed over the intersection. On the other hand, the new trucks sped over the crossing with an almost inaudible click.

In rounding curves at high speed, there was a significant absence in the test car of the customary shrieking of wheels and swaying of the body. This Mr. Blackhall attributed to the differential drive in the axles, which, as in the case of automotive vehicles, permits the outer wheel to revolve faster than the inner one. The action of the trucks on curves and special trackwork, even at full speed, was steady, smooth and quiet.

Instead of a floating bolster such as employed on the worm-drive car recently tested at Springfield, Mass., the Joliet trucks have a stationary bolster. Riding action depends upon the long half elliptic side springs mounted in Masury rubber shock absorbers on the side frame, instead of shackles. Several of those present were impressed by the success of this fixed bolster construction and considered that it actually improved the riding qualities of the car.

Some idea of the relative performance of the old and new type of trucks may be gathered from the following table, which was compiled by Mr. Blackhall and handed to his guests at the conclusion of the test:

	Car With Automotive Trucks	Car With Ordinary Trucks
Total miles	12.0	12.0
Total kilowatt-hours	23.0	23.0
Total passengers	58.0	None
Estimated passenger weight	5.07 tons	
Estimated car weight	16.00 tons	18 tons
Total estimated weight	21.07 tons	18 tons
Kilowatt-hours per car-mile	1.92	1.92
Watts per ton-mile	90.8	106.5
Saving in watts per ton-mile, per cent	14.8	
Kilowatt-hours outbound	15.2	11.5
Kilowatt-hours inbound	7.8	11.5
Kilowatt-hours per car-mile outbound	2.53	1.92
Kilowatt-hours per car-mile inbound	1.30	1.92



Worm-drive trucks under regular city car body

In judging the results of the demonstration, visitors were asked to bear in mind the fact that the trucks are intended for use with a light-weight city-type car, built of duraluminum (17 SD aluminum alloy) and representing an entirely new departure in construction and design. While in the body used on the demonstration run no particular thought was given to such matters, the new car will be provided with rubber-tile flooring and other devices to deaden noise. All materials for the car have been ordered, and delivery is expected from the manufacturer, the Cummings Car & Coach Company, of Paris, Ill., some time in August. The car will have an over-all length of 41 ft. 3 in. and will accommodate 52 seated passengers. Its weight is estimated to be only about 22,000 lb. complete, as compared with the 38,500-lb. cars now operated on the Joliet line.

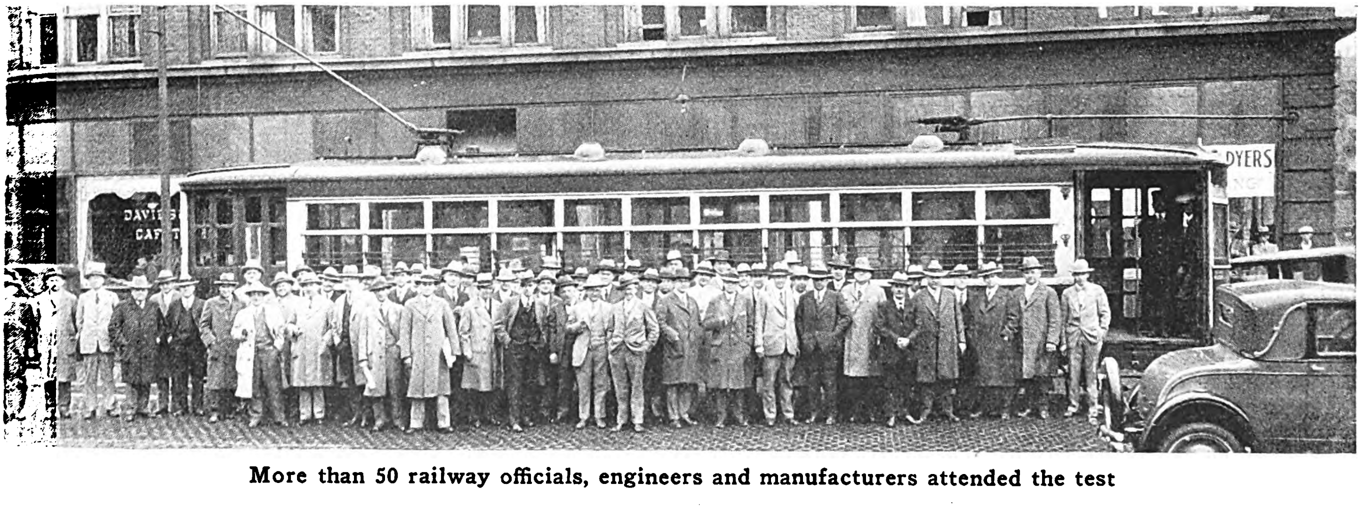
The Westinghouse automotive-type diaphragm braking system used with the new trucks was examined with particular interest by the inspection party. Much favorable comment was heard on the simplified design and the noticeable absence of rattling, due to complicated brake rigging. A small hand brake for use in case of air failure is the only conventional rigging in the entire truck frame. With more than 80 sq.in. of braking area per wheel, as compared with a possible 40 in. on ordinary trucks, the equipment demonstrated extraordinary capacity for quick, smooth and quiet stops. In fact, it was felt that the brake rigging as now designed provides greater retarding power than is necessary.

By virtue of the increased speed, quicker acceleration and retardation of this type of truck, Mr. Blackhall hopes to be able to decrease the number of cars needed to handle present loads on his system by 20 per cent. By mounting the lighter-weight high-speed Westinghouse motors on spring-suspended members of the truck frame rather than directly on the axles, it is his belief that the wear and tear on the rails, as well as on the cars, will be considerably reduced. In addition he feels that track construction costs will be lowered; because lighter-weight rails may be used. It is estimated by the manufacturers that between 750,000 and 1,000,000 car-miles will be obtained from the worm-gear drive.

The new trucks were placed in regular operation in city service immediately following the test. They are an outgrowth of more than two years of study to develop a type of equipment that will popularize street car riding. Through the development of this improved truck, Mr. Blackhall evidences his sincerity in consistently advocating for many years the application of scientific research to street car construction and design.

The following men were present during the demonstration run:

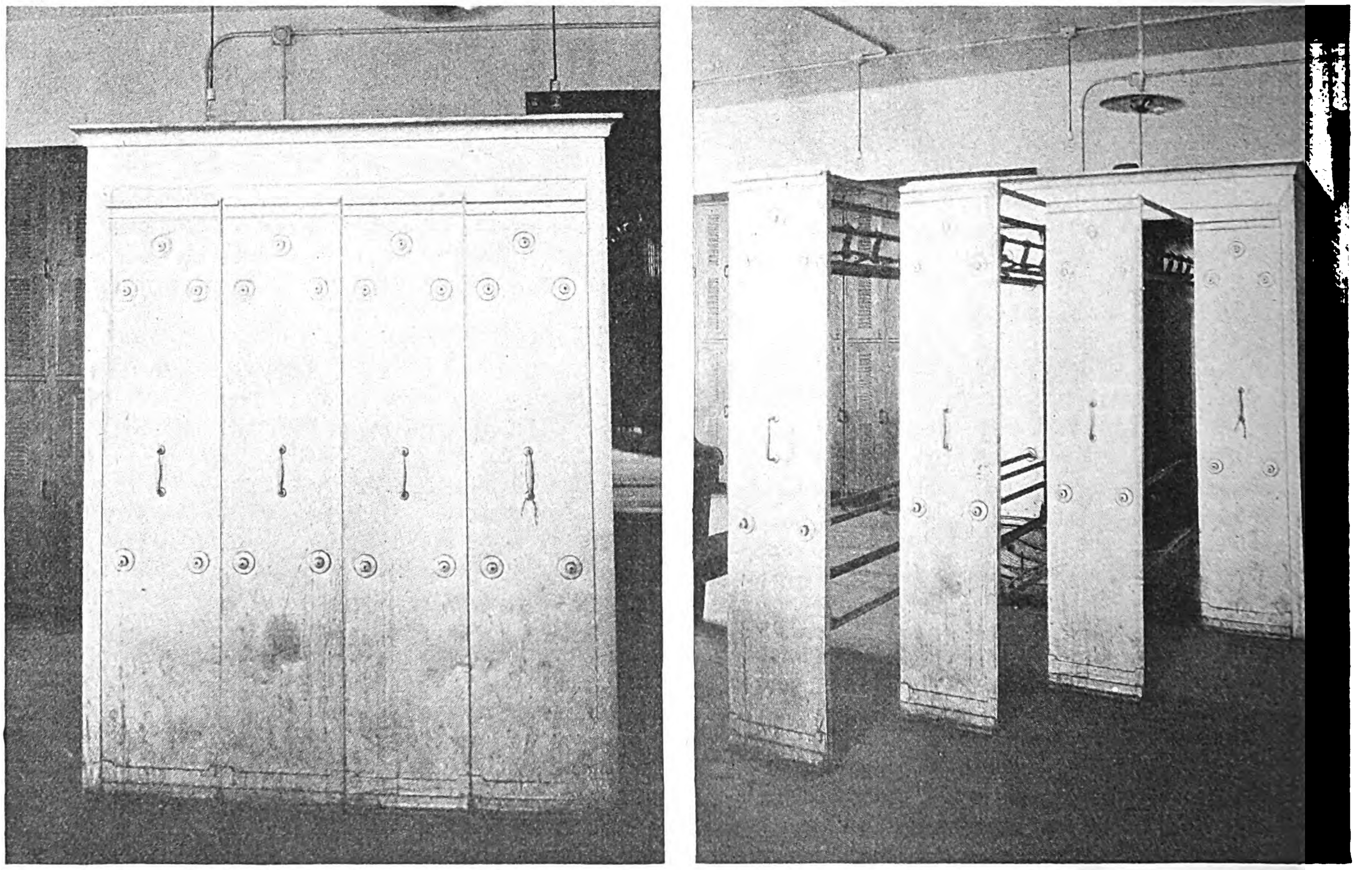
G. W. Welsh, T. H. Shaughnessy, Michael O'Brien, F. J. O'Brien, R. M. Stewart, R. Doyle, H. A. Barbero, G. F. Dougall, J. B. Barton, H. H. Lytle, Clarence Brown, George A. Bendel, B. E. Keifer, Wm. C. Naegel, H. C. Maddux, Harold E. Larsen, W. G. Norris, George E. Fox, N. R. Brownyer, W. L. Love, Charles F. Dahlquist, Lewis M. Williams, C. W. Gifford, F. S. Thomas, H. H. Adams, C. W. Young, S. M. Nahikian, D. C. Evans, C. L. Van Auken, R. S. Bull, R. H. Parker, Fred P. Biggs, Fred A. Morgan, H. H. Chapman, John S. Y. Fralich, L. C. Datz, C. W. Young, Wm. Bonn, George Watts, A. P. Jenks, Bert Collett, W. C. Wheeler, D. S. Owens, R. Sonnalind, J. D. Roberts, M. Murphy, J. R. Blackhall, George A. LeRiche, W. H. Heun, A. W. Baumgarten, C. E. Rogers, S. L. Vaughn, Mr. Nielson.



More than 50 railway officials, engineers and manufacturers attended the test

Laundry Drier for Wet Uniforms

EIGHT of the division headquarters of the Brooklyn City Railroad are equipped with clothes driers so that wet uniforms of transportation men can be dried quickly, if necessary. This equipment was installed several years ago and has proved very useful, particularly for car crews employed on open cars in summer, of which Brooklyn still operates a considerable number. With sudden rainstorms the crews are apt often to get thoroughly drenched. With the growing use on this property of closed equipment throughout the year and the consequent abandonment of open cars there is not so much call for this drying equipment. However, it is also used by inspectors and other transportation employees who are exposed to the weather and so is still kept in the carhouse. Similar equipment will be of interest to other companies where operating conditions make the drying of uniforms at carhouses a matter of considerable convenience.



With this apparatus, used on the Brooklyn City Railroad, wet uniforms can be dried quickly. The view at the left shows the drier closed, that at the right shows the drier with three of the four sections open

The drier is one which was really built for use in laundries and consists of four movable sections with frames for supporting clothes. The ends of these sections are mounted on rollers so that they can be moved in and out easily. Each section is equipped with several rows of horizontal rods, the upper rods carrying clothes hangers, on which the uniforms can be placed, and the lower rod wire netting for supporting shoes and underclothing. When closed, the drier occupies a floor space of 6 ft. x 14 ft.

The rear of the drier is equipped with a fan and ¼-hp. motor. This fan draws in air through louvers near the bottom of the drier and blows across an electric heater, after which it passes around the wet clothing. The air escapes through a ventilator at the top of the drier. A considerable number of uniforms can be dried quickly in this device in a very short time.

Consolidation of Dispatching Towers Boon to North Shore Service

WITH the recent completion of a new dispatcher's office and tower at the North Chicago Junction station, dispatching points on the Chicago, North Shore & Milwaukee Railroad systems formerly located at Harrison Street, Milwaukee, and at Highwood, Ill., have been centralized in the new unified dispatch tower. The building, which houses the dispatchers who control all main line train movements between Milwaukee and Howard Street, Chicago, is built at the south end of the station platform at North Chicago Junction. This is a strategic position, from a dispatching standpoint, as the Waukegan line, the Old Shore line, the Skokie Valley route, as well as the main line to Milwaukee, all converge at this point. The relocation tends to facilitate train operation, inasmuch as the men who route the trains are posted at the most important junction of the system.

J. W. Simmons, superintendent of transportation, states that through the use of the tower greater coordination is possible between the new train schedule recently put into effect and the facilities afforded through unified control.

The Readers' Forum

Intent of Chicago Traffic Code Explained

CHICAGO SURFACE LINES

CHICAGO, May 18, 1927.

To the Editor:

In the ELECTRIC RAILWAY JOURNAL of May 14 there is an editorial that misstates the intent of the new traffic code that has been adopted in Chicago.

The code as adopted at present is essentially the same as is printed in the report of the Metropolitan Street Traffic Survey, prepared under the direction of the street traffic committee of the Association of Commerce by Miller McClintock, except for three items which were left for further consideration by the Council after the Council could be reorganized following the election. These items covering parking, turning in the middle of the block and the creation of loading zones have not yet been fully decided. Otherwise the code was adopted substantially as presented in the report from the street traffic committee.

The code now reads as follows:

SECTION 11. *Pedestrian's Limited Right of Use of Roadway.*—At no place shall a pedestrian cross any roadway other than by the most direct route to the opposite curbing, and when crossing at any place other than a crosswalk shall yield the right of way to all vehicles upon the roadway.

SECTION 12. *Pedestrians to Obey Signals.*—At intersections where traffic is directed by a police officer or by a signal commonly known as a stop and go signal, it shall be unlawful for any pedestrian to cross the roadway other than with released traffic, if such crossing interferes with the movement of traffic.

From these sections you will note that there is no intent to eliminate crossing at points other than at intersections, nor is complete regulation of pedestrians by signals intended.

Forcing pedestrians to move only with signals has not been considered by the committee to be desirable, necessary or in the best interests of the traffic movements on the street. Such regulation may be applicable some time, some where, but there is much valid argument against such regulation in business areas of large cities. In fact, due consideration resulted in the opinion that there is an overwhelming proportion of the arguments in favor of the interpretation as written in the Chicago code as above quoted.

I hope you will find some adequate way of correcting the impression that Chicago did adopt what is usually termed "pedestrian control."

E. J. MCILRAITH,
Staff Engineer.

Master Mechanics Are Working for Progress

CHICAGO, SOUTH BEND & NORTHERN INDIANA RAILWAY COMPANY

SOUTH BEND, IND., May 23, 1927.

To the Editor:

On behalf of the Central Electric Railway Association Master Mechanics, I wish to thank you for the fine articles which appeared in the May 21 issue of EECTRIC RAILWAY JOURNAL covering the meeting in Pittsburgh on May 11 and 12.

It is through the fine co-operation that you are giving the industry through the pages of ELECTRIC RAILWAY JOURNAL that the industry is finding itself and is starting to forge ahead. I am sure that from these articles every electric railway operating official will fully realize that the C.E.R.A. Master Mechanics are not holding meetings of play, but are actually trying to accomplish something for the industry as a whole.

GEORGE R. GREEN,
President C.E.R.M.M.A.

Hazards of Street Work Increasing

DENVER TRAMWAY CORPORATION

DENVER, COL., March 26, 1927.

To the Editor:

Your editorial on page 564 of the Oct. 2, 1926, issue of ELECTRIC RAILWAY JOURNAL on the increasing hazard that attaches to street work impressed me as timely, and ever since I have been on the watch for something more on the subject.

I am aware that the subject has been touched on before this, also handled not so long ago in the A.E.R.A. questionnaire, but to my mind it has only been scratched.

It was again brought to my mind very forcibly through the death of one of our track foremen on the night of March 16 at 9 o'clock, while engaged with a helper in cleaning out and salting switches, curves, etc., just after a snowstorm. The street intersection was well lighted, also a full moon helped to indicate objects ahead.

In view of the seriousness of the subject and the increasing number of injuries and fatalities I for one would be very much pleased to see this matter kept alive through the columns of the JOURNAL in some way until we can at least learn what method or practice has been found to give the best protection to the men who have to make repairs and do other routine work in the streets in connection with ordinary track maintenance, especially between sundown and daylight.

In checking back over the records I find that between February, 1923, and March 16, 1927, inclusive, our experience has been seventeen men seriously injured, two of whom died, as a result of being struck by automobiles while engaged in trackwork in the street.

W. G. MATTHEWS,
Superintendent Way and Structures.

Improved Employment Conditions in St. Louis

DATA comparing the wages paid by the United Railways, St. Louis, Mo., in different years in their relationship with changes in personnel or annual turnover have been prepared by Richard J. Lockwood, assistant manager. In 1913 the carmen averaged 25 cents an hour and the turnover was 34 per cent. Now the average wage is 64 cents an hour and the annual turnover only 13 per cent. More stable employment conditions also prevail in the mechanical departments, where, with 1,000 men employed, not one was hired or discharged from April to July, 1926.

This more stable condition in the company's personnel is believed to have had a marked effect on the number of accidents. During the year 1926 11 per cent of all traffic accidents on the car system involved men who had been employed only one year or less, although these men comprised only 9 per cent of the total number of trainmen employed.

Maintenance Notes

Crane on Flat Car Solves Pole-Setting Problem

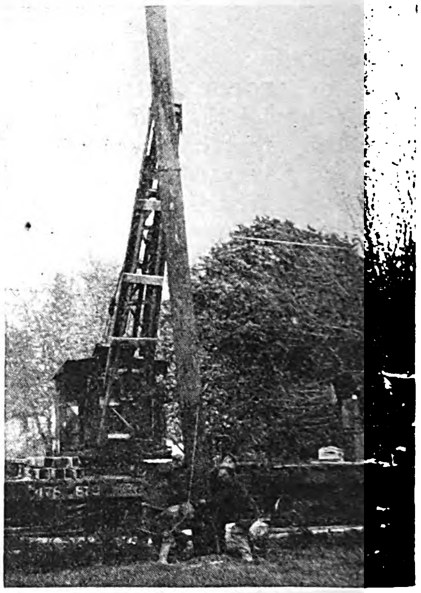
WHEN the Cleveland Electric Illuminating Company recently took over the light and power lines in Avon, Avon Lake and Bay Village, Ohio, formerly owned and operated by the local electric interurban railroad, it was confronted with the necessity of reconstructing the line to bring the service to a higher standard. The work presented a number of problems, not the least of which was rebuilding the main feeder for the territory so as to make it a 33,000-volt line along the right-of-way acquired from the Lake Shore Electric Railroad. This ran close to an 18,000-volt feeder in use by the interurban line, which made the job highly hazardous.

The program called for setting more than 9 miles of poles ranging in height from 45 to 64 ft. and stringing wires on them.

From the standpoint of weather, no more unfortunate time for this work could have been chosen. Rain was almost incessant, windstorms were frequent and much of the ground along the right-of-way was a quagmire. Service requirements made it necessary that the work go forward with all possible speed despite obstacles.

For a number of years the line department had relied on its hole-digging and pole-setting machines, which were installed on motor trucks. The engineers soon found, however, that the trucks were unsuitable for more than half of this job as there were no roads and the fields were impassable for caterpillar tractors. Setting by manual labor, of course, was a slow process and the urgent need for service made speed necessary.

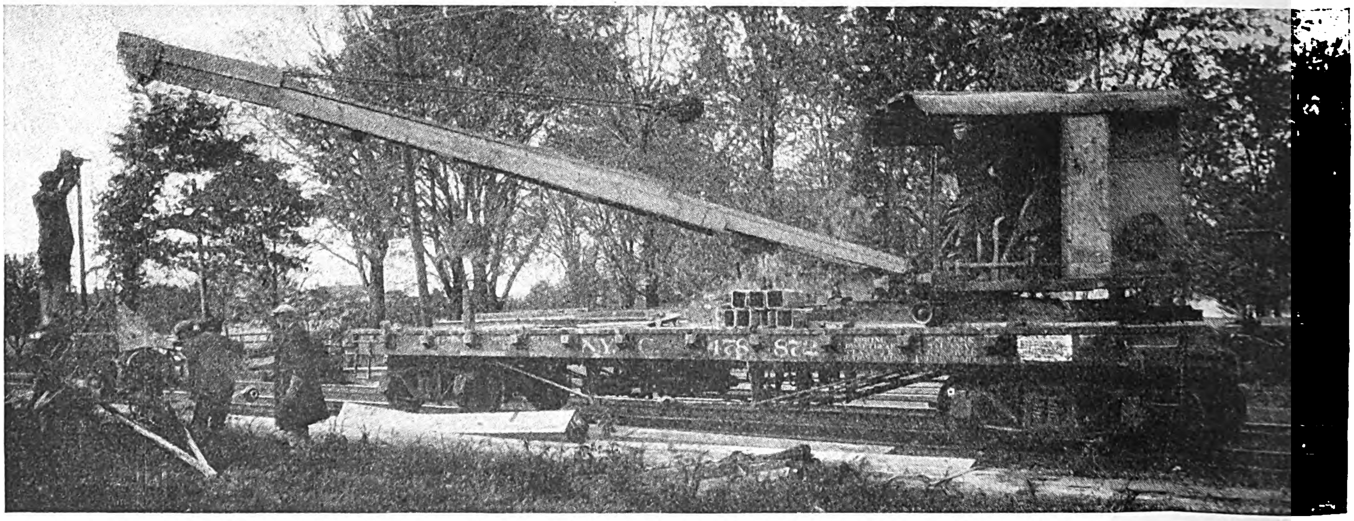
The company had two Universal cranes which were mounted on White trucks. These were used for general construction, such as digging conduit trenches, backfilling, handling surplus materials, transporting cable reels, loading, unloading and setting poles, dipping poles into creosote pits, erecting substation steel, erecting transmission towers and moving transformers. A flat car was obtained from the New York Central Railroad and one of the cranes was readily removed from its motor truck and mounted above the truck at one end of a flat car. This equipment, hauled by an electric locomotive, made a handy means for distributing the poles along the interurban right-of-way and for placing them in the holes when dug.



Setting a pole in position after the hole has been dug

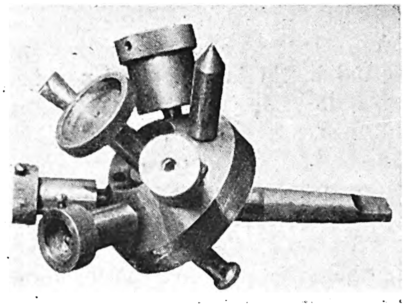
For the hole-digging operation the line department used a new type of portable hole borer built by the Buda Company. This is a special type of unit built for use with the Universal crane with a bale which enables the crane to pick it up and swing it into place. An artillery leg style tripod provided quick adjustment in position over the hole as soon as the crane set it down.

When the equipment came to the site for a pole the crane lifted the borer off the car and set it over the



Placing the hole borer in position for digging a hole spot where the hole was to be dug. A gasoline engine on the borer was cranked and in an instant the dirt was flying. In this way 185 poles were set in less than half the time that it would have taken by hand. A good day's run averaged thirteen set-ups, which included digging the post holes, moving time and setting 55-ft. poles in the holes. Linemen followed up the pole-setting crews closely, stringing, sagging and tying ¾ mile of wire per day.

Turret Tool Holder for Tailstock of Small Lathe



Turret head used to hold six tools in the tailstock of an ordinary lathe

In electric railway repair work it is sometimes necessary to make small parts, such as special screws, pins, bushings or studs, which require several tools for the complete finishing. For such work a turret tool holder which can be placed in the tailstock of an ordinary lathe has been devised and is in use in the 39th Street repair shop of the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y. The holder shown in the accompanying illustration is arranged for attaching six different tools—three holders for dies or hollow mills, a drill, a drill chuck and a center.

Provision is made for attaching such tools to the conical surface of the turret, which is at an angle of 45 deg. with the circular face which fits against the bottom retaining portion of the turret head. This bottom circular retaining portion is mounted at an angle of 45 deg. to the axis of a tapered shank of size and shape to fit into the lathe tailstock. It will be seen that when a tool is rotated to the bottom position of the turret head it will line up accurately with the supporting shank and so in effect be an extension of the shank.

The knurled knob in the center of the device is for rotating the tools to their proper positions. Headless set screws on the inside conical surface clamp the various tools securely in position. At the back of the stationary face of the turret head is a coned projection which contains a pawl, which is pressed into holes in the rotating part of the turret head by a spring. This pawl can be released by pulling a small knurled knob seen on the back, and then the turret head can be rotated until the desired too is in position and locked securely.

Win One of the

Maintenance Prizes

Did the seven short items published in last week's Maintenance Data Sheet section of Electric Railway Journal suggest any improved methods or devices that you are using, which should be entered in the Maintenance Competition? Look them over carefully. They illustrate the class of material that will win the prizes.

Three Capital Prizes

First	$200
Second	$100
Third	$ 50

Any one who wins one of the prizes will be recognized as a leader in improved maintenance. Here is a chance to win the recognition you deserve.

Equipment men are off to a flying start, as is evidenced by the large number of items received from equipment departments. Line and track maintenance men are urged to send in descriptions of some of the useful things they are doing.

In addition to the capital prizes, $25 will be paid each month to the winner of the monthly contest.

Condensed Rules for the Contest

Any employee of an operating electric railway or electric railway bus subsidiary may compete for the prizes to be given by Electric Railway Journal for short maintenance items. Full information is given in the April 16, 1927, issue, pages 700-701.

The author does not necessarily have to be the originator of the idea or device. An article may be submitted by several persons or by a department and need not be written by the person in whose name it is submitted.

Articles may treat of any maintenance practice or device used by any department of an electric railway and should be preferably 100 to 200 words in length and accompanied by one illustration. Brevity consistent with a proper presentation of information will be given weight in judging articles. In no event should they be longer than 400 words with more than two illustrations.

Manuscripts should be mailed to the editor of Electric Railway Journal, Tenth Avenue at 36th Street, New York, N. Y. To be eligible for the capital prizes, the envelope must bear a postmark dated before Aug. 1, 1927.

In addition, a prize of $25 each will be awarded each month, beginning with the May 21, 1927, issue. Articles submitted will be published in the Maintenance Data Section of Electric Railway Journal.

If sketches accompany the manuscripts they may be in pencil, or blueprints will be accepted. Each item submitted should bear the name or names of the individual or individuals by whom it is submitted and to whom awards are to be made.

The announcement of the winner of each monthly contest will be made in the issue devoted to maintenance and construction, the third issue of the month, following the one containing the item.

The winners of the capital prizes will be announced in the Annual Convention Number of Electric Railway Journal, to be published in September, 1927.

New Equipment Available

Large Welding Rods

"DIPPED" welding rods of a new type are now obtainable from the Lincoln Electric Company, Cleveland, Ohio. This dipped steel rod is the result of several years study in the company's research laboratories and will be known as "Stable-Arc" welding rod. With this new rod it is possible to go to considerably larger diameters than has been customary in welding rods for metal electrode welding and is being carried in all sizes up to ½ in.

It is claimed that this rod permits of much higher currents than has been used heretofore, with the resulting greater speed. As labor is by far the greatest factor in welding costs, increased speed means a substantial decrease in welding cost. Not only does the greater heat give greater speed and less cost but also better penetration and a much smoother finished bead. In addition the greater heat obtainable by the higher currents results in an annealing action which increases the ductility of the weld and gives a greater elongation. Current densities of 15,000 amp. and more per square inch can be used.

The claimed decrease in the "splutter" of the arc gives less spattered metal and therefore more actual metal is deposited per pound of rod. The higher currents, it is claimed, give a remarkably clean finished weld and on heavy welds of more than one layer very little brushing is necessary between beads.

"Stable-Arc" welding rod is obtainable in standard 50-lb. bundles wrapped in burlap and in lengths of 14 in. It can also be secured in longer lengths if desired.

Electric Railway Wrecker

FOR use on the trolley system of Cologne, Germany, a crane mounted on a car has recently been constructed by the Linke-Hofmann Werke Gesellschaft of that city. It is used for removing motor vehicles which break down on the track and so interfere with traffic and also for handling electric railway supplies, such as rails, ballast, etc.

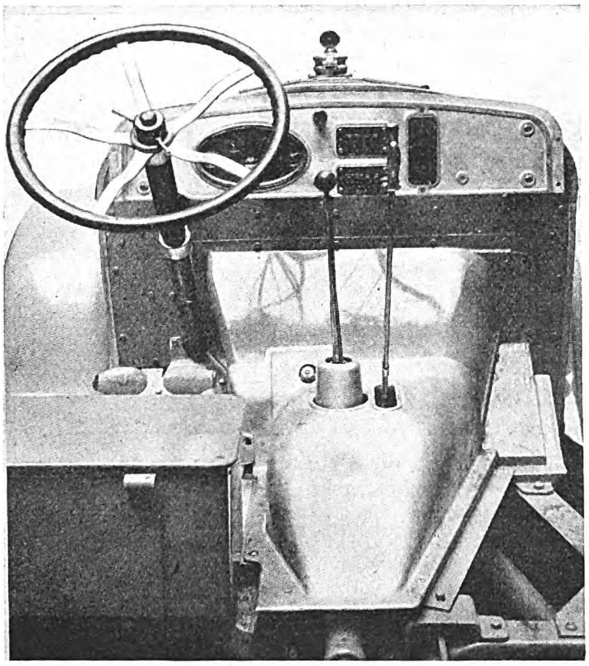
The crane is mounted on a double-truck car equipped for motor drive from the trolley circuit arranged for control from either end. The crane, which is mounted on a turntable in the center of the car, has capacity to lift loads up to 1¾ tons. The electrical equipment was manufactured by the Allgemeine Electricitäts Gesellschaft and includes two 60-hp., 600-volt motors for driving the car, an 8-hp. shunt-wound motor for the lifting load and a 4-hp. series motor for rotating the crane about the turntable.

Improved Bus Chassis

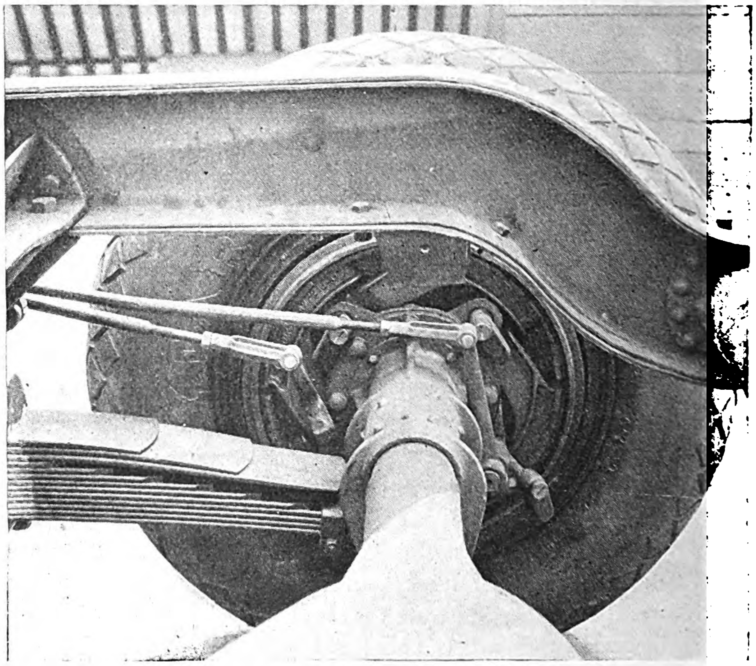
SEVERAL interesting improvements have been incorporated in the latest type of chassis marketed by the Six-Wheel Company, Philadelphia, Pa. These include a permanent dash with the instrument panel and all instruments grouped under glass. The hood is fitted at the factory to a ledge on the permanent dash and all chassis wiring is completed to junction boxes and to the instrument panel. A cast-aluminum transmission cover and aluminum floor covers are also installed. The metal battery box forms a permanent base for the driver's seat.

Brakes are of the locomotive brake shoe type, four shoes for each wheel being used. All hinge pins and wearing parts of the brake assembly are lubricated. Either Westinghouse air brakes or the B-K vacuum booster brake system is furnished for service use and an entirely separate B-K booster is employed for the hand brake. Each system acts independently of the other and provides 530 sq.in. of brake area.

The exhaust is carried to the extreme left rear of the chassis and the heating system used in the body is connected to the exhaust line of the power plant. The 70-gal. gas tank is attached to the frame by spring trunnions. The crankcases are of duralumin. Counterbalanced crankshafts, vibration dampeners and ventilated clutches help to increase the efficiency.



A permanent dash with instrument panel is provided



Brakes are of the locomotive brakeshoe type, four shoes for each wheel

RULES COVERING

The Condition and Repair of Freight Cars for Interchange Service

Central Electric Railway Master Mechanics Association

Adopted May 11, 1927 **Effective Jan. 1, 1928**

These rules are formulated as a guide to the fair and proper adjustment of all questions arising between car owner and handling company with the intent of:

1. Making car owners responsible for and, therefore, chargeable with, the repairs to their cars necessitated by ordinary wear and tear in fair service and by the safety requirements of the United States safety appliance standards as applied to electric railways, and by the standards of the Central Electric Railway Association.
2. Placing responsibility and providing a means of settlement for damage to any car occurring through unfair usage or improper protection by the handling company.
3. Inspection of freight cars for interchange and a uniform system on which acceptance or rejection of cars offered in interchange are based.

Care of Foreign Freight Cars

Rule 1. Each railroad is responsible for the condition of all cars on its line, and must give to all equal care in handling and inspection.

Rule 2. Cars having defects for which delivering company is responsible must be properly carded when offered in interchange, as per Form 1. Empty cars offered in interchange must be accepted if in safe condition and serviceable for some commodity that can be loaded in the car, the receiving road to be the judge. Owners must receive their own cars, when offered home for repairs at any point on their line, subject to the provisions of these rules. Empty cars furnished on orders for specific lading must be in serviceable condition for such lading, the receiving road to be the judge. If not acceptable they must be carded with return card Form 2.

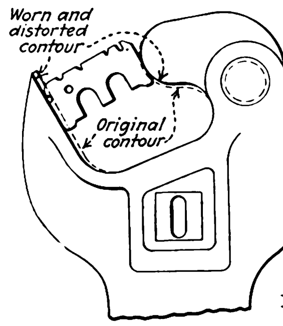

Fig. 1

Rule 3. Loaded cars offered in interchange must be accepted when in safe operating condition and when meeting the allowable clearances and permissible weight as determined by track, bridges and structures, with the following exceptions:

(*a*) Cars (whether loaded or empty) having defects in violation of the Safety Appliance Acts, will not be accepted in interchange.

(*b*) Cars loaded with explosives must be handled in accordance with regulations of the Interstate Commerce Commission. Cars containing inflammable liquid which is leaking must be repaired or transferred without any unnecessary movement or at nearest available point.

(*c*) Cars improperly loaded when transfer or rearrangement of lading is necessary.

(*d*) Lading of open cars when dimensions of lading are in excess of clearances of roads over which the shipment is destined, the receiving road to be the judge.

(*e*) When cars can not pass third rail or overhead clearances for electrical conductors.

(*f*) Where roads require radial M.C.B. couplers, the rigid type will not be accepted in interchange.

Will be received at any point on this company's line with the following defects:

______________________ INSPECTOR AT ______________

NOTE: Fill in defects on both sides with ink or black indelible pencil. Attach this card with four tacks on outside face of intermediate sill between cross-tie timbers.

FORM 1

NOTE: Make 3½ in. x 8 in. Form also to be duplicated on back of card.

Electric Railway Journal Maintenance Data Sheet

ROLLING STOCK—STANDARDS—4

C.E.R.A. Inspection Rules (Continued)

Rule 4. The following defects must be repaired by receiving line while car is under load:

(*a*) Journals are to be lubricated or repacked when necessary; when bearings are required, the same kind are to be used when possible.

(*b*) All brake rods, levers, pins, brake beams and brake shoes.

(*c*) All air hose, cocks, valves and piping.

(*d*) Couplers, worn and distorted knuckles, chains and levers used for coupling and uncoupling.

(*e*) Temporary repairs to roof when condition of same endangers lading and when such repair does not exceed 25 per cent of the roof covering.

(*f*) Missing or defective side or end doors when same endangers lading from weather or theft.

Rule 5. A bad order foreign car delivered under load, if load is transferred or unloaded within switching district, may be returned to delivering line properly side-carded on both sides showing the defects for which the car was transferred or returned, in which case it must be accepted unless the receiving line has a direct physical connection with the car owner at that point, car to be carded as per Form 3.

Rule 6. In rejecting cars because of defects in violation of rule 3, all of the defects objected to must be designated with ink or black indelible pencil on return cards Form 2 and placed on both sides of car.

Rule 7. No car will be accepted in interchange unless properly equipped with United States safety appliance standards as applied to electric railways.

Rule 8. If a foreign car has defects, the receiving line shall require that a defect card be securely attached to the car, as per rule 2. Defect card shall not be required for any slight damage (new or old), that of itself does not require repairs before reloading of car. Defect cards shall not be required for raked or cornered sheathing, roof canvas, bent or cornered end sill if defects are old.

At points where joint inspection is not in effect, the matter will be left to the judgment of the receiving line. Where joint interchange inspectors are employed, the decision will be made by them.

Rule 9. All cards must be of the form specified in these rules and must plainly specify each item, indicating location of defects, as provided in these rules.

Rule 10. Any car having defects which render it unsafe to run, unsafe to trainmen or any lading suitable to car, must be repaired and be made safe to return to owner, billing repair card Form 4 to be used.

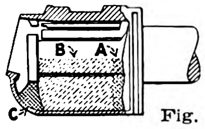

Fig. 2

Rule 11. The end of the car toward which the cylinder push rod travels shall be known as —*B*— end and the opposite end shall be known as —*A*— end. Facing —*B*— end of car, in their order on the right side of car, wheels, journal boxes and contained parts, shall be known as R1, R2, R3, R4, and similarly those on the left side of car shall be known as L1, L2, L3, L4. The same order of numbers shall be used for designating corresponding location of brake beams. In any case where right or left side is designated on defect, billing repair or joint evidence cards for other parts of cars, the same uniform order of location shall govern.

Rule 12. Cars must be maintained within the limits of standard height for couplers, measured from top of rail to center line of coupler head. As far as possible, cars should be adjusted when empty. When construction of car and trucks precludes the common methods of adjusting coupler heights, the application of metal shims between journal boxes and arch bars will be permissible. The use of liners between male and female portions of center plates is prohibited where the vertical bearing surfaces are reduced. The limits of height from top of rail to center of couplers shall not be less than 31½ in. and not more than 34½ in. under any condition of loading. When bill is rendered the height of car before and after altering must be shown in billing repair card Form 4.

Rule 13. Bills may be rendered against car owners for applying temporary transverse tie rods to cars with sides spread or bulged beyond the clearance limits of the handling line.

Rule 14. Couplers that exceed the distance of 5¼ in. between point of knuckle and guard arm, measured perpendicularly to guard arm, must have the defective part or parts renewed to bring coupler within gage, in which case owner is responsible (see accompanying Fig. 1). When couplers of another make are applied to a car, the uncoupling arrangement shall be made operative at expense of the company making repairs. But in no case shall such changes be made that will destroy the original design providing the owner wishes to change again to meet their standard.

Locking device must come within 2 in.

C.E.R.A. Inspection Rules (Continued)

of knuckles. Anchor must not be loose and no anchor bolts missing. No cracks or defects on knuckles or drawbars or anchors are permitted.

Rule 15. *Wheels.* (*a*) Tread thickness measured 1 in. from edge of rim shall not be less than ¾ in. (*b*) No wheels must have over ⅛ in. hollow tread. (*c*) Flanges not less than 11/16 in. thick. (*d*) Treads not to be over 3⅞ in. wide or under 3 in. at any point. (*e*) Must not have chipped flanges more than ⅜ in. wide x 1½ in. long. (*f*) Steel wheels must not have a flat spot over 2 in. long and cast iron wheels must not have a spot over 1 in. long. (*g*) Wheels must not be less than 54 in. inside measurement at gage line.

Rule 16—*Brakes.* (*a*) Not less than 6 in. or more than 8 in. piston travel under load. (*b*) Heads, beams, pins, rods, hangers, etc., must be in good repair. (*c*) Hand brake must be efficient and in good repair.

Rule 17—*Trucks.* (*a*) Side bearings to have at least 1/16 in. clearance under load. (*b*) Center bearings must be O. K. and well lubricated.

Rule 18—*Axles.* (*a*) The total weight of car and its lading must not exceed weight given in column "A." Column "B" is the nominal capacity stenciled on all cars. Axles must be removed from service when less than the prescribed limits in columns "C," "D," "E," in table of C.E.R.A. standard axles or when the condemning limits in columns "F" and "H" are reached.

(*b*) Standard A.E.R.E.A., axles must be used in replacing A.E.R.E.A. standard axles, subject to the condemning limits for such axles.

(*c*) When second hand axles are applied, the diameter of wheel seats and centers must not be less than the limiting dimensions shown, and the diameter of the journals must be at least ⅛ in. greater than the limiting dimensions. The length of journals must not exceed ⅜ in. over standard length, the collar must not be less than 5/16 in. thick and the fillet at back end of journals on axles of 40,000 lb. capacity cars must not be less than ⅛ in. radius, axles of 50,000 and 60,000 lb. capacity cars not less than 5/16 in. radius, nor less than ⅜ in. radius on axles of greater capacity.

Rule 19—No cast iron wheels will be accepted in interchange after Jan. 1, 1930.

Rule 20—All coupling hose must be 1⅜ in. x 18 in. with F.P.5 coupling and all flexible drawbar hose must be 1⅜ in. Other sizes will not be accepted in interchange after Jan. 1, 1930.

Rule 21—*Journal.* (See accompanying sketch.) Application of packing (*a*) Inner —In packing a journal box, twist somewhat tightly a rope of packing and place it in the extreme back part of the box, as shown at "A" in the accompanying Fig. 2. Make sure that it is well up against the journal so as properly to lubricate the fillet on the journal and keep out the dust.

(*b*) Main—Apply sufficient packing (preferably in one piece) to fill the space shown at "B." Take care to have this packing bear evenly along full length of the lower half of the journal. The packing should not be too tight but should be tight enough to overcome any tendency to settle away from the journal. The packing should extend to approximately the center line of the journal but not above at any point, and should be pressed down evenly at sides that no loose ends may work up under the journal bearings.

(*c*) Outer—Apply a third piece of firmly twisted packing as shown at "C," and pack tightly in order to prevent displacement of the main packing. There should be no loose ends hanging out of the box as they would tend to draw out the oil.

Rule 22. In no case shall car owner be charged for the second or subsequent applications of journal bearings if applied within 30 days from initial application at the same journal location on same road, except when renewed within such period account change of wheels or axle at same journal location, in case the application of wheels is chargeable to the owner.

Rule 23. Companies shall promptly furnish to each other, upon requisition, and forward, freight or express charges collect from point of shipment, material for repairs of their cars on foreign lines. If material is for repairs of car owner's defects, the foreign company may bill car owner for the entire freight charges, and in such case the car owner may reclaim freight charges for that portion of the movement over its own lines. If the material is for repairs of user's defects, the foreign line may reclaim only for that portion of the movement over its line.

A separate bill, with copy of freight, express or due bill attached, should be rendered for the freight or express charges showing reference to bill covering repairs.

Requisitions for such material shall specify that same is for repairs of car, giving car number and initial of such car, together with pattern number, sketch or other data to enable correct filling of requisition.

Rule 24. Repairs to foreign cars shall be promptly made, and the work shall conform in detail to the original construction, and with the quality of material originally used.

Rule 25. Any foreign road making partial or full repairs of defects on a car which is covered by a defect card, will have the defects repaired, crossed off the

original card with ink or indelible pencil and card replaced on car. A copy of the card so marked should accompany the bill.

Rule 26. When repairs are made to a foreign car, card Form 4 shall be used embodying the required information and reason why such repairs were required. Heads of mechanical departments will exchange memorandums in duplicate of labor and material charge plus 15 per cent applied to foreign cars during month for the purpose of having same approved so billing can be made by auditing department.

Rule 27. When repairs are made to a foreign car for which a bill will be rendered, immediately upon completion of such work a notice must be sent to the owner or Form 4.

Rule 28. Defect cards and joint evidence cards must be securely attached to both sides of car with at least four tacks.

Rule 29. No labor to be charged for the inspection of cars, testing or adjusting brakes, adjusting angle cocks, tightening unions, bolts, bolt nuts, lag screws or spreading cotters, sill steps, and hand bolts or straightening on car, brake shafts, uncoupling levers or carrier irons when not removed from car. No charge to be made for the material or labor of lubrication except when renewals are made due to defects.

Rule 30. On the first of each month, the operator will promptly forward to the owner a statement of the individual mileage operated by such owner's cars, for its information in connection with maintaining mileage records of cars and equipment of cars.

Rule 31. Delivering company is responsible for any of the following when happening on their line:

(*a*) Removing or cutting out parts of car so as to facilitate loading or unloading.

(*b*) Known theft of parts of car occurring on its lines.

(*c*) Damage to any car if caused by: (1) Derailment; (2) cornering; (3) sidewiping; (4) collision; (5) colliding with or shoving over bumping posts or other fixed obstructions; (6) overloading; (7) collapsing buildings or other structures on right of way; (8) unconcealed fire damage; (9) failure to close hoppers or drop doors before moving car; (10) improper coupling of cars; (11) improper coupling of cars at excessive speed; (12) unfair usage of equipment.

Rule 32. Damages to foreign car for which the delivering company is responsible should be repaired at once unless such damaged car is under load and can proceed to destination in conformity to rules as herein prescribed. The company responsible for the damage shall at once notify the owner and arrange how or by whom the repairs shall be made.

Rule 33. When a car having damage for which delivering line is responsible is found with other defects which are ordinarily the owner's responsibility and are not associated with delivering line defects, such fair usage defects may be repaired at car owner's expense. Reported on billing repair card Form 4.

Rule 34. When a foreign car is destroyed or badly damaged, the owner shall upon request, furnish depreciated reproduction value of car complete, and the company responsible shall have the option of repairing or settling under the depreciated reproduction value. Depreciations to be figured from the date that the car was built or if built or acquired prior to when the road came under the acts of the Interstate Commerce Commission, its value as there fixed should be used to figure from.

Rule 35. For the mutual advantage of railway companies interested, the settlement for a car owned or controlled by a railway company, when damaged or destroyed upon a private track, shall be assumed by the railway company delivering the car upon such tracks.

When a car owned or controlled by a railway company is damaged or destroyed on the tracks of a road which is not a member of the per diem rules agreement of the Central Electric Railway Association or not a subscriber to these rules, the road responsible for the per diem while in the possession of the non-subscriber shall be responsible to the owner for damages to or for the destruction of the car.

Rule 36. If the company on whose lines the car is destroyed elects to rebuild the car, the original plan of construction must be followed, and the original kind and quality of material used. No allowance shall be made for betterments not authorized by car owner.

Rule 37. When a foreign car requires general repairs such as wheels, truck frames, bolsters, broken axles, etc., for which the owner is responsible and its condition will not permit its return home, it shall be inspected by the handling line and an inspection certificate made, using Form 5 (except the joint inspection will not be necessary) covering all defects found on car, and estimated cost of repairs, total labor and total material separately.

The inspection certificate shall be forwarded promptly to car owner together with list of material required to be furnished by the owner, with shipping directions. The car owner shall promptly inspect, if he so desires. If plans or specifications are required they shall also be requested. Standard safety appliances must be completely applied.

Association News & Discussions

Reproduction Cost Unsatisfactory as Basis for Rate Making[*]

By Hon. Lewis Goldberg
Commissioner Massachusetts Department of Public Utilities

NOWADAYS the reproduction theory is sweeping the minds of the utility owners of the country and making them feel that at last the panacea has come if they only can have rates established on a reproduction cost basis. As generally understood, the reproduction theory is that, in determining what the base rate for a utility should be, you determine the value of the plant on a reproduction basis, with costs of labor and materials projected into the reasonable future, minus observed depreciation; guess whether the plateau of prices will remain more or less on a level or whether they will go up or down; take into consideration the original cost and the historical cost; add assumed costs of organization, engineering and supervision; add theoretical costs of financing and interest during construction; and take into consideration such other factors as may seem to be pertinent. Just take all of these factors and such other factors as may be pertinent and jumble them all together and assume that this reproduction theory will furnish what you would like to have the rate base to be; and if it doesn't give you the desired result, get a new theory.

Is Not Sound Business

Now, as business men, if someone told you that the value of your respective plants was based on any such scheme as that, you would laugh them to scorn. The fact is that when plants are sold, the managers and owners of the utility selling out do not give the slightest thought to what the reproduction cost would be; nor do the managers or owners of the combination buying the utility give any thought to what the reproduction value would be. It may be, from an economic viewpoint, that is a fair test as to whether the reproduction theory has any value.

You look at your book assets, you inspect your earnings sheet, you examine your operating expenses, you want to know how depreciation has been taken care of, and you look at the plant as it is and not at some fanciful theoretical plant which might be reproduced in exactly the same manner as this plant now exists. It is unsound because it is not businesslike from that point of view, and further because it is not true to fact, because never in this business world would any plant be reproduced as it is if you were going to build it from the ground up. There is no plant that would ever be reproduced from the ground up just as that plant exists today. To say that it would, involves the supposition that since the inception, or rather since the formation of your business, since the beginning of the construction of your individual plant, there has been no improvement in the art of that utility. It would be rather a sad confession to make for any utility to say that since its inception there has been no improvement, and it would not be true.

Untenable Assumptions Made

Let us take the electric utility for example. Is there any electric plant existing anywhere in this commonwealth today that would be produced stone for stone, foundation for foundation, building for building, generator for generator, transformer for transfomer, just as that plant exists today? Why, of course, everybody knows it would not, and so your theory calls for the reproduction of something which would never be reproduced and involves taking into consideration the value of that which you would never buy today if rebuilding your plant.

For example, you have a garage which you use and which used to be a power house, and you have foundations for a power house. Under this theory you reproduce that garage with those foundations. You have a generator or a transformer which is almost passé so far as style and bodily improvement are considered. You are using it because it is still serviceable, but if you were going to buy another you would never purchase that type. Under the reproduction theory you would add the cost of reproducing that obsolete part of your plant and deduct observed depreciation, and observed depreciation is a very elastic term. I have heard experts testify that so long as the machinery is doing its work there is no depreciation, even though, if you were going to buy a new machine tomorrow, you never in this world would buy a machine like that; and that a building which is 50 years old is only 5 per cent depreciated for a rate case; for the payment of taxes its depreciation is about 90 per cent.

The reproduction theory, recognizing that there are certain things that can't be reproduced, is inconsistent with itself. It does not attempt to reproduce land, but it says we will take land at its present market value and not project it into the future as you do when you build your plant; not project it over a period of eighteen months or 24 months, whatever the period required for building a plant is, but your present market value, and we will take the prices of labor and materials and project them over this 24-month period needed for construction. Where is the consistency? Where is the consistency of taking one item on one basis and taking the plant on another basis? If a person is going to be inconsistent, he ought to be consistently inconsistent.

There is still one other inconsistency in the theory. They not only take the land at present market prices, they not only take the plant at a reproduction price projected into the future and attempt to calculate the labor and materials that go into that plant, and what the probable cost of that material will be over the period necessary for construction, and what the probable tendency of labor prices will be over that period, but with respect to certain of the assets they will determine a substitute for them, capitalize the cost of creating and operating this imaginary substitute for that particular part of the plant, and add this capitalized figure to the reproduction value. They say it would cost so much money to construct the substitute, the cost of operating it would be so much, and capitalizing this cost of operation and adding to it the cost of constructing the imaginary substitute, the result represents the reproduction value of that portion of the plant actually in use.

Cannot Determine Fair Rate

How does this theory work out in fact? Is it ever possible easily to determine whether a rate is fair or unfair? How can it be if under this theory the rate base is determined by the reproduction value, which in turn depends among numerous other factors on the future plateau of prices of both labor and materials? And so every rate case in such a situation involves an army of experts, involves intensive and expensive study, involves a considerable amount of time and a tremendous expenditure of money. And after you get all of that you haven't a collection of facts, but a collection of judgments of men, a collection of their guesses as to what is going to happen in the future.

This has been what the utility has to undergo in the ordinary rate case. Of course, the ratepayers have to pay for it. It is a part of the operating expense of the utility. How is the public going to meet such a case? Who of the public can afford or will undertake to expend the amount of money necessary to hire experts on the other side to make that same sort of a reproduction valuation? If that theory were carried out to its logical conclusion, there would in effect be no such thing as regulation of rates because the rates under such a rate base would be higher than those the utility could possibly charge the public and sell their commodity.

---

[*] Abstract of address presented before the New England Street Railway Club, Boston, Mass., May 12, 1927.

Now, some utility men may say "Fine. You can't hurt our feelings by abolishing all regulation of prices." But you must have the public good will for the success of your business. No matter what the utility is, whether or not it is a monopoly, whether it is without any competition or whether it has some form of competition, if the public finds itself helpless to prevent constantly increasing rates in that utility, it will find a remedy for itself in other ways. The remedy for one thing will be a diminished use of the commodity; so diminished that the utility will receive less gross income under the enhanced rates than it would have received under the lower rates.

UNSOUND RATES BREED TROUBLE

But secondly, and what is perhaps more important, the public is a long suffering animal, it will endure a certain amount of, and perhaps a great amount of goading and prodding, but goaded too much and prodded too much, yoked to the utility that it is dragging, it will kick out its hind heels and smash that utility. The public is not helpless against constantly increasing rates. Monopolies exist in the utilities solely by virtue of the consent of the public; they are not inherent in the business. What is inherent in the business is the desirability of monopoly; the nature of the utility is such that from the viewpoint of efficiency and economic operation, it ought to have a monopoly. But if the aim or policy of the monopoly is exorbitant rates, that monopoly will cease to exist. Parallel or duplicate plants will arise by virtue of the repeal of the statutory laws which prohibit competition and municipalities will enter the field. That is not an untried feature, as you know. In Massachusetts we have some 44 municipal electric plants operated by the municipalities and operated profitably, and generally speaking the electric current sold by these municipal plants is sold at a rate less than the electricity which is sold by the private companies in the surrounding territory. Now if the utility should insist on reproduction value and demand rates upon that basis which will result, naturally will and must result, in rates which are very much in excess of those now complained of as being too high, and if the public is faced with the necessity of paying exorbitant rates or itself going into the business, do you, as business men visualizing the future, think for one moment that the public, having before it the example in our commonwealth of 44 municipal plants operating profitably and successfully, would hesitate to go into that business through the medium of its municipalities? Not for a single minute; and if you think for a moment that any legislature would dare to refuse the demand of the people to be permitted to enter into that business, you are mistaken. In view of that situation, the utilities should go rather slow before crying and cheering loudly for a reproduction theory valuation as a base rate.

COMING MEETINGS OF

Electric Railway and Allied Associations

May 31-June 1-2—Canadian Electric Railway Association, annual convention, Winnipeg, Man.

June 6-8—American Association of Engineers, annual convention, Tulsa, Okla.

June 9-11—Midwest Electric Railway Association, annual meeting, Hotel Chase, St. Louis, Mo.

June 13-16—National Association of Cost Accountants, annual convention, Palmer House, Chicago, Ill.

June 15-16—American Automobile Association, Motor Bus Division, Ritz Carlton Hotel, Philadelphia, Pa.

June 19-23—International Street and Interurban Railway Association, annual conference, Copenhagen, Denmark.

June 20-24—American Society for Testing Materials, 30th annual meeting, French Lick Springs Hotel, French Lick, Ind.

June 20-24—American Institute Electrical Engineers, convention, Book-Cadillac Hotel, Detroit, Mich.

June 24-25—New York Electric Railway Association, annual meeting, Hotel Champlain, Bluff Point, N. Y.

June 29-July 1—Central Electric Railway Association, summer meeting, Book-Cadillac Hotel, Detroit, Mich.

June 30-July 1—Tramways and Light Railways Association, annual meeting, Bath, England.

July 22-23—Central Electric Railway Accountants' Association, Tuller Hotel, Detroit, Mich.

July 27-29—Association of Equipment Men, Southern Properties, 12th semi-annual meeting, Atlanta, Ga.

Sept. 8—Central Electric Railway Master Mechanics Association, South Bend, Ind.

Oct. 3-7—American Electric Railway Association, annual convention, and exhibit, Public Auditorium, Cleveland, Ohio. Exhibits open at noon of Oct. 1.

It is not always wise to insist on your rights. Utilities must be careful about insisting upon all their rights. They should take an object lesson from the epitaph which appeared on the tombstone in a certain cemetery. Inscribed on the tombstone was the following:

Here lies the body of old John Gray,
Who died maintaining his right-of-way.
He was right, dead right, as he rode along;
But he's just as dead as if he were wrong.

And we recall studying in our school days, in the subject of ancient history, about a chap named Pyrrhus who led an army against Rome. He defeated the Romans, but in doing so he succeeded in annihilating his own army. Some victories destroy the victor.

There is another economic angle. Take a plant that was built in the peak of high prices in 1918, 1919, 1920 and 1921, when we had the highest plateau of prices since the inception of the country, particularly the years 1919 and 1920, when the prices reached the top of the figure. Consider, for instance, a plant built during that period, and in 1935, if prices are then considerably lower and it is asking for certain rates, we say to that utility, "You will get rates based on your reproduction value, less observed depreciation. You built your plant at the peak of high prices. Your reproduction value today is 25 or 50 per cent less than what you paid for it, and therefore you will only be entitled to a rate based on half the capital which you invested in that plant rather than on your prudent investment."

What is going to happen to that utility if the theory is enforced? Can a plant in which is invested $10,000,000 operate if it is going to be allowed a return on only $5,000,000 of its capital stock? You know and I know it would not take very long for that utility to be in the hands of a receiver, and yet, under a strict adherence to the reproduction theory, all it would be entitled to would be a return on $5,000,000 instead of the $10,000,000 invested.

Or, consider a utility, and we have many such, that built the major portion of its plant since the war at high prices. Just now we have prices that are high, but what may happen ten years from now if there should be another downward tendency? Will that utility then be able to operate or to furnish adequate service? The reproduction theory would then cut its rates in half, which would mean a return on only half of its capital invested. But still more important, would it be fair to say to the shareholders of the utility, "You can't get a fair return on the money which you honestly and prudently and reasonably invested in your plant. You will get a return on only half of your cost because you can now build another plant for half."

It is merely the present moment with its high prices which makes the reproduction theory seem advantageous to utility owners. If in the future there should be a decided drop in prices, the utility owners will clamor just as loudly against the reproduction theory as they did in 1893 when it was first promulgated and they fought it tooth and nail. The reproduction theory creates an unstable situation, and a most unsatisfactory and unsound economic condition, because neither capital nor the public can look forward with certainty to the future.

It is not a fanciful situation that I have pictured. In 1914 there was a rate case involving a street railway before the department, and the reproduction theory was then discussed. Had the reproduction theory been put into effect in that case, the street railway, instead of obtaining an increase in rates which it sorely needed, would have had a reduction in rates, because the plant could have been produced for a great deal less than the actual investment therein; and it was only by the application of the so-called prudent investment theory that that street railway was enabled to receive higher rates and pull through. It would have had to close its doors and go out of business if the reproduction theory had been logically applied.

In this commonwealth, whatever might be said of some of the Western states, practically from the inception of public utilities there has been regulation with respect to investment in the utility.[*] The company has received, generally speaking, dollar for dollar on its investment. There has been no water put into the stock; and so in this commonwealth, whatever may be the situation anywhere else, absolute fairness and equality of treatment both toward capital and toward the public require that, on the economic basis, the reproduction theory should be discarded and the prudent investment theory followed.

We have written into our law various things from time to time; we are endeavoring to write social justice into our law. Just now there seems to be the most vital need for writing into the law economic justice.

Causes of Radio Interference Analyzed[*]

By James Thompson

Signal Department, United Electric Railways,
Providence, R. I.

About a year and a half ago our first radio complaints were beginning to arrive at our office. For the first six months of that period we made no decided organized effort to eliminate this interference; in other words, we took the first man who was available and sent him out on the trouble. Results were rather indefinite as we made no check to find out if we had entirely eliminated the disturbance, and at that time we kept no complete records of these complaints.

During the past year, however, we have put our work on an organized basis. Complaints are received by letter, telephone and through the radio departments of other local utilities. The data obtained is immediately put on a regular "radio form" and a number assigned to this report. It is then forwarded to the inspector who has charge of this department and he takes up the complaints in that order. He is supplied with the necessary help and equipment to clear up any trouble which may be found in our transmission or distribution systems or communication apparatus, such as automatic signals, contactors, hand signals, switch lights, etc.

Test Apparatus Simple

The outfit used consists of a sectional bamboo pole with lead-in wire attached, voltmeter, ammeter and copper plate for grounding. With this equipment voltage or current readings are taken on spans, pull-offs or any other aerial apparatus which may be suspected of causing a leak to ground.

If you were to ask some of the good folks who live along our trolley system what station they receive strongest they would look at you with mournful eyes and say "The trolley! We can't get a thing on our set when the cars go by. Why, mister, we hear the car as soon as it leaves Jacks' Corners until it gets away down to Job's T.C. There it passes another trolley, which immediately starts back, and after it leaves Jacks' Corners we get about five minutes to hear our set, when another car starts from the corners." There you are—it's the same old story in the same old way. The only difference is the tone of voice of the complaint.

To date we have received no complaint that could be traced to our a.c. lines or substations. This, we believe, is because our lines are so well insulated and effectively maintained. Therefore, it is to be understood that the sources of interferences will be confined to the d.c. distribution circuits and the rolling equipment.

We have a simple theory by which to picture how this interference exists. It has been proved that an alternating current of electricity flowing through a conductor sends out lines of force which can be transmitted to another conductor insulated from it and cause a current to flow in the second conductor. This fact is made use of in the transformer when a current, flowing through the primary coils, induces a current in the secondary coils. This same effect can be produced in the second coil by interrupting a direct current passing through the first coil. Thus, we find that in order to have induction, it is not necessary to have an alternating current, but merely one that fluctuates; that is, one whose current and voltage values are constantly changing. For instance, if you have a grounded wire on a d.c circuit in an underground cable, or concealed in trunking where it is not very handy to get at, in order to locate this ground you would take one of the old type exploring coils and insert an interrupter, such as a common doorbell or buzzer, in this circuit. This would cause induction that could be easily picked up with the exploring coil and traced by carrying the coil parallel with the cable until the short was reached, at which time the fluctuations in this exploring coil would cease and you would know that you had found the particular spot where the short was.

The point is that the buzzer or interrupter in this circuit is analogous to the arc in the ground of our feeder, trolley wire or d.c. wires which may be found bare in trees or leaking through defective insulators to poles and then to ground. This sets up an oscillating current of a high frequency which travels along the line for a considerable distance and is a disturbance to radio sets which lie within 1,500 ft.

This arcing condition is not necessarily constant, but is more or less intermittent, and in most cases which have come within our experiences is aggravated by the presence of cars in the vicinity of the arc. This may be due to vibrations in the overhead construction or to the increased power consumed by the cars. Many times we find that it is worse when several cars travel close together or cars are pulling up grade rather than down.

Noises broadcast from the moving car we have termed "trolley pick-up." That may be a local expression, but, nevertheless, it serves the purpose of defining this particular type of noise. We have found this "trolley pick-up" due to three different causes.

First, we found that the moving car, drawing power, would be heard in the set while approaching several blocks away with a continual "crackling" noise. This noise would immediately cease as soon as the controller was thrown off and would start again with the application of power. This is affected by the type of roadbed and the amount of topsoil of this roadbed being tracked onto the rail by other vehicles. This tends to act as an insulation and causes the interruption of the return from the wheel to rail, causing an invisible arc which broadcasts. The same type of noise is also broadcast when several open bonds are in a given section.

Second, we have the "crackling" noise, as stated before, with approaching car under the same condition, but added to that "crackling" noise will be the hum of the motor pick-up from a low pitch to a high pitch, gradually ascending to a peak, and will stop immediately with the shutting off of power. This we find is caused by the combination of accumulation of dirt on rail with arcing brushes and poor rail bonding.

Depends on Type of Car

Third, when an approaching car is heard with just the pick-up hum of the motor or commutator, from a low noise, gradually ascending to a peak as the car gathers headway and no serious "crackling" with it. We found this type of noise to be confined to certain cars. All cars do not broadcast in this manner. Some of the older type of cars seem to give the most trouble.

To date we have not made any specific tests to remedy this type of trouble which we term "trolley pick-up." We believe the only remedy for this would be to equip the cars with condensers or some special apparatus made for that purpose.

We have had only 76 radio complaints to date and feel very proud of this fact in view of the large number of radio complaints received by the local lighting companies which also cover the territory. Of the 76 complaints investigated, we found that 40 per cent were due to leaking insulators and bare feed wire in trees, 25 per cent leaking caps and cones, 20 per cent trolley pick-up, 5 per cent local lighting companies and 10 per cent in owners' sets. You will note the very low percentage of set troubles found. This is because the local lighting companies receive most of the complaints of this nature and they have the trouble cleared up before the complaint reaches us.

Too much care cannot be exercised in

---

[*] Abstract of a discussion presented before the New England Street Railway Club, Boston, Mass., May 12, 1927.

the selection of the man for this type of work. He must have at his command more than a technical knowledge of the situation. He must keep in mind, first and foremost, that he is building good will for his company through these relations and must be able to handle the public in a diplomatic and patient manner. He must be electrically inclined, with a good sound working knowledge of radio principles, and must be thorough and sincere.

Accidental and Intentional Radio Interference*

By E. F. Bickford
Electrical Engineer Eastern Massachusetts Street Railway

Sources of radio interference seem to be disruptive discharges of two sorts: (1) Accidental, such as are produced by sparking commutators and the many types of leaks or grounds and circuit interruptions, where characteristic "spark phenomena" are produced. These seem to consist principally of grounds on feeder wires in trees, broken rail bonds, defective contacts for automatic electric track switches and signals, and (2) intentional, such as the various kinds of vibrating contacts and rotating devices used for interrupting circuits according to some design or plan, such as sign flashers, automatic heating pads, mechanical storage battery chargers, ignition systems, electric auxiliaries to oil heating plants, etc.

In either case, these disruptive discharges may not only send out direct radiation, but may also cause high frequency current to be propagated along the connecting wires of the circuits, and they may set up oscillations in parts of connected circuits, which will radiate in the same way as an antenna. Extensive tests made by the American Electric Railway Association would seem to indicate that so far as street railway operation is concerned the class of disruptive discharges referred to above as intentional will not have any effect at a distance greater than 50 ft., and in many cases this effect is limited to 20 ft. or less with loop sets.

The greatest amount of interference to radio reception in the above classes is caused by the interruption of small currents; that is, currents of such small intensity that their interruption causes sparks rather than arcs. Interference from the ordinary heavy current flows over wires and tracks, if the circuits are in good condition, should be negligible.

The operators of radio sets in the vicinity of our turnouts are able to detect by the sound in the receivers when automatic track switches are thrown or signals are lighted and when they are put out, and in view of the fact that the lights in the signals are highly visible at night, whereas other electrical disturbances are not as evident, the radio "fan" has immediately jumped to the conclusion that our signals were the cause of all his difficulty. The actual disturbance, however, due to the signal, itself, is of an instantaneous character and should not cause the radio operator any more disturbance than the ordinary switching on and off of the light circuits in his house, which is accepted as a matter of course.

The so-called disruptive discharges under the head of accidental are, of course, avoidable or subject to immediate remedy. As soon as any defects in our system come to our attention, whether it is signals, arcing motors, trolley wheels or tree grounds, broken bonds, etc., they are immediately corrected, and if we are maintaining our equipment in a reasonably good condition it is then strictly up to the radio fan to put in a type of apparatus and to so install, maintain and operate it that it will give him the quality of service he feels entitled to.

At a recent conference with a representative of one of the larger local lighting companies I was advised that its investigations disclosed that most of the sources of complaints originated on the premises of the complainant, either in his local house wiring or in his radio outfit or in the various household electric utilities, the final remedy for which was strictly up to the property owner or the owner of the radio set.

One of the principal causes of trouble to the radio fan is the lack of precaution on his own part to use proper equipment and see that the same is installed in such a manner as to give him the greatest freedom from outside interference. Some of the older types of radio outfits, often referred to as "squeal sets," used generally for long-distance work, not only cause disturbances to themselves and their neighbors, but they are very sensitive to any disturbances, particularly as most of these sets are operated with head receivers.

Recently many people have tried with more or less success to increase their distance by using some form of "superhet," either factory made or of home construction. It is stated that less than 20 per cent of the attempts to construct this type of set result in satisfaction to the builder, principally on account of noise and interference, which cannot be cleared up, primarily originating in the set, but in part due to greater sensitiveness.

Where a broadcast listener attempts, through highly oscillating systems and extremely sensitive sets and an extensive outdoor antenna, to obtain great distance, he must expect to receive a much greater amount of noise and interference from the operations of other radio "fans," modern electric household devices and from the legitimate operations of the public utilities, who are giving a public service through their distributing circuits.

All complaints received are investigated and if we find anything wrong with our system it is promptly remedied, but in case we find nothing wrong or if nothing we can do clears up the situation, we advise the radio "fan" to that effect, and expect him to make such changes in his equipment as he may see fit to remedy the situation.

We keep notes on complaints received from the various divisions and we are often able to eliminate this company's responsibility entirely. For instance, if we have a complaint and at the same time we can find other persons who are in the same location who are having no trouble whatever, it is quite clear that the difficulty is not due to the public utilities or the broadcasting station, but is probably due entirely to the equipment of the complainant. I believe a large part of the difficulties now encountered, particularly with modern sets, is because the manufacturers, to please the general radio public, have reduced the controls to such an extent that the "fan" is often unable to make necessary adjustments in his equipment which would eliminate the difficulty.

C.E.R.A. Delegates to Travel by Boat

The good ship *South American*, of the Chicago, Duluth & Georgian Bay Transit Company, is scheduled to leave Chicago on her first trip of the 1927 season on Saturday afternoon, June 25. After making her usual stop of several hours on Sunday morning at Mackinac and at Perry Sound in Georgian Bay on Monday, she is scheduled to reach Detroit about 9 o'clock on the morning of Tuesday, June 28. This will be just one day in advance of the Central Electric Railway Association convention, which begins on June 29 at Detroit. A number of delegates from Chicago and vicinity are planning to travel to the convention by this ship, familiar to all members of the association from previous cruises.

Development of Electric Car

In a paper given before the Birney Club, St. Louis, on May 2, 1927, A. D. McWhorter, general superintendent Memphis Street Railway, outlined the development of car bodies from the time of the early horse-drawn vehicles up to the present.

In speaking of the use of steel car bodies, Mr. McWhorter said that the introduction of steel was not accomplished without serious opposition. First from those who were directly interested in the manufacture of wooden cars, and second, from those who were skeptical as to the advisability of adopting steel as a vehicle of transportation exposed to the action of injurious elements which might cause a rapid deterioration of the metal and a constant reduction of strength. Up to the present time no serious deterioration or reduction in strength has been noticed in the steel cars now in service. If proper attention is given to the method of construction, to the weight of metal used and to painting all parts thoroughly at the time of manufacture to protect them from corrosion, it is reasonable to expect an average length of service of at least 20 to 30 years from steel car bodies.

The latest development in cars provides for low-level entrance and exit, light weight, double trucks, a semi-noiseless construction and various refinements incorporated to provide comfort, convenience and safety to passengers. Comfortable and in many instances upholstered seats provide a measure of luxurious travel comparable to that afforded by the automobile; high candlepower lights also add to the pleasing appearance. Probably the most important part of present-day electric car operation is that of making car riding more popular by providing more attractive and comfortable transportation.

Efforts to Reduce Radio Interference Successful at Concord*

By J. B. Crawford
General Superintendent Concord Electric Railways

In our experiences for the past few years with reference to radio interference the greatest difficulty we have found has been separating the wheat from the chaff. In other words, about 90 per cent of the radio troubles for which we have been blamed should not have been laid at our door.

During the winter of 1925 and 1926 radio reception was very poor and consequently irritating to the radio fans. The international transatlantic test scheduled for the last week in January was a complete failure. Static had seldom been worse. The telegraph companies reported an unusual number of natural electrical disturbances that at times put their long-distance lines out of commission. Some of this was blamed, with much plausibility, on the northern lights, which were unusually active that winter. No less an authority than W. D. Tyrrell, chief radio supervisor of the Department of Commerce, says that radio conditions were worse that winter than any winter since radio began. Mr. Tyrrell states that the real cause of these disturbances was sun spots. During January and February, he goes on to say, "several of these great spots, each of them large enough to engulf a dozen earths, could be seen on the sun's face with the naked eye. Still others were visible with telescopes." Mr. Tyrrell believes that this condition will probably continue for a year or two.

In Concord, as in other cities, the condition of apparent radio interference became so pronounced that a radio club was organized, and shortly after two experts were sent there by one of the radio manufacturing companies to assist in locating the troubles. Three autos, a large number of interested fans and radio dealers scoured the city in an effort to locate the elusive radio bug. This test was so unproductive that even the newspapers made fun of it, as witnessed by the following account:

"The trip included the various points of the city, but nothing definite was said concerning any discoveries. There seemed to be a vague aura of mystery surrounding everything. Typical of the testing is the following: Motor cars run up to a place, come to a stop. Business of general exodus from the cars. The portable set is carried to some point in the vicinity while everybody gathers around. The buzz is unmistakable.

First Man—"Sounds like the real thing."

Second Man—"That's just a natural disturbance from the motors."

Fourth Man—"Hear the little wave —ooom-ooom—like that?"

Fifth Man—"Sure. What is it?"

Fourth Man—"That's it."

Third Man—"It's local disturbance."

Sixth Man—"That's just the engineer inside shifting from one motor to another."

Second Man—"Hey, Charlie, what do you think of Northern Lights? Do they have any effect on radio?"

Seventh Man—"Possibly, but that doesn't cause this kind of disturbance."

First Man—"What would you say is the matter here?"

Fourth Man—"Oh, this is partly a local disturbance. The commutator and the carburetor probably set up an arc which sends out radio frequency waves. It's d.c., all right."

Reporter — "Just what does that mean?"

Fourth Man— "Not much."

Reporter—"But there is something that is causing a general disturbance?"

Fourth Man—"Oh, yes, indeed."

First Man—"Let's move down the road away and try it."

Everybody moves.

"When the survey is complete it is expected that it will be but a short while after that the noise which has been the bugbear of Concord radio fans will be eliminated."

It is my belief that most street railways are making every possible effort to eliminate causes of radio interference. At first it seemed rather a hopeless task. During the winter referred to we were very diligent in running down all troubles of this nature brought to our attention. In fact, we started in the fall of 1925 testing all rail bonds and replacing them with welded bonds where they failed to meet a selected standard. All trolley wires and feeders were cleared of ground leaks and poor connections. The high-tension lines were closely watched and all leaking insulators were immediately replaced. Graphite brushes were installed on our older rotary converters. In spite of all this, we still frequently have troubles causing real radio interference but difficult to locate.

Once we had a very bad a.c. disturbance which was finally located in an isolated transformer house. Some one had broken in during the summer months when the transformers there were not being used and had thrown in one switch of a three-phase circuit, thereby causing a current to jump across a telltale that had been installed to give information as to whether or not all three phases were working. This created a terrific roar. Of course the trouble was rectified immediately and there has been no trace of any disturbance from this source since.

Last fall we had a case of interference that was not so easy to locate. By a series of tests we eventually found the disturbance to be originating in a modern 500-kw. rotary converter. The armature of this converter had burned out last spring and been rewound. The machine was in excellent running condition with almost perfect commutation and we were unable to discover what was causing the disturbance. Therefore, we called on the manufacturer. He sent us one of his service men, who was also familiar with radio troubles and who finally located this noise. He found that by touching a grounded wire to the rotating shaft of the machine the interference was stopped. A copper leaf brush was rigged up and connected to ground through the frame. It was placed so as to touch the rotating shaft at all times. This has been an absolute remedy for the trouble and no further complaints have been made. The theory advanced by the engineer was that in some obscure manner a potential was built up in the rotating shaft. This potential increased until it reached a point where it could break through the oil film of the bearing and discharge to ground. This condenser action produced oscillations of radio frequency which were impressed on the windings of the machine and so transmitted over the system.

Electrical Engineers Elect Officers

Bancroft Gherardi, vice-president and chief engineer American Telephone & Telegraph Company, New York City, was elected president of the American Institute of Electrical Engineers at the annual business meeting held in the Engineering Societies Building, New York, on Friday, May 20. Other officers elected were: Vice-presidents: J. L. Beaver, Bethlehem, Pa.; C. O. Bickelhaupt, Atlanta, Ga.; O. J. Ferguson, Lincoln, Neb.; E. R. Northmore, Los Angeles, Cal.; A. B. Cooper, Toronto, Ont. Managers: F. C. Hanker, East Pittsburgh, Pa.; H. P. Liversidge, Philadelphia, Pa.; E. B. Meyer, Newark, N. J. National treasurer, George A. Hamilton, Elizabeth, N. J. (re-elected).

These officers, together with the following hold-over officers, will constitute the board of directors for the next administrative year, beginning Aug. 1: C. C. Chesney, Pittsfield, Mass.; M. T. Pupin, New York City; H. M. Hobart, Schenectady, N. Y.; B. G. Jamieson, Chicago, Ill.; George L. Knight, Brooklyn, N. Y.; H. H. Schoolfield, Portland, Ore.; A. E. Bettis, Kansas City, Mo., John B. Whitehead, Baltimore, Md.; J. M. Bryant, Austin, Tex.; E. B. Merriam, Schenectady, N. Y.; M. M. Fowler, Chicago, Ill.; H. A. Kidder, New York City; E. C. Stone, Pittsburgh, Pa. I. E. Moultrop, Boston, Mass.; H. C. Don Carlos, Toronto, Ont.; F. J. Chesterman, Pittsburgh, Pa.

The annual report of the board of directors, presented at the meeting, showed a net increase in the member during the year of 186, the total membership on April 30 being 18,344. In addition to the three national conventions of the institute and five regional meetings, there were 1,273 meetings held by the local organizations.

American Association News

Committee on Bus Operation

AN ANALYSIS of the progress made on sub-committee reports and to a discussion of the basis of bus fares occupied a large part of the time during a meeting of the committee on bus operation, held at association headquarters in New York on May 23. The following members were present: Paul E. Wilson, sponsor; A. R. Meyers, sponsor; C. H. Chapman, S. W. Greenland, and Adrian Hughes, Jr.

There was some difference of opinion as to whether bus rates should be established so that the costs of operation would be borne directly by those using the service or whether it should be merged with the total cost of transportation in the city and carried by the system as a whole.

Mr. Wilson was of the opinion that the situation regarding the proper basis for bus fares is rapidly changing and that a new conception of this matter should be brought out. He held that bus rates when originally established were designed to meet emergency conditions; that they were not fixed by the economics of operation but by the exigencies of the conditions encountered, such as the threat of competition and the general lack of knowledge regarding operating costs. He held, further, that the very flexibility of the bus increases the pressure which is exerted for extension, and that unless bus operation is put on a sound economic basis, where at least a large part of the service will stand on its own feet financially, there is danger of burdening any given company with a constantly growing financial load that tends toward a general rise in the fare level. He did not consider it fair to burden the established car rider whose place of residence and business were selected so as to be convenient to existing transportation facilities with the cost of establishing new transportation to undeveloped communities where property values are considerably lower.

Mr. Hughes was of the opinion that any effort to establish new bus routes on a basis to make them carry entirely the costs of operation was impracticable. He felt that the extension of service by buses is part of a given company's responsibility to render a complete service to its community and considered that the extension of service by buses is comparable to the extension of rail service, and costs should be carried in the uniform fare.

Other members of the committee joined in the discussion of various angles of this subject and it was felt by the committee that the inclusion of such a fundamental discussion in its report would be timely and of great value to the industry. Mr. Wilson asked Mr. Hughes to outline his views on the subject in writing in order that they may be available in the preparation of the report.

Way and Structures

A FINAL meeting of the way and structures committee will be held on June 9 and 10 at A.E.R.A. headquarters, New York City, at 10:30 a.m., Eastern daylight saving time. Chairmen of all special committees are invited to attend this meeting. The importance of having as many reports as possible in shape for submission at that time is urged upon each chairman.

New Engineering Manual Out

THE second republication of the Manual of the American Electric Railway Engineering Association in bound-book form has just been sent out. This is revised to Dec. 31, 1926, and follows the general arrangement of the 1923 edition in bound-book form. Previous to 1923 the Manual was published as a loose-leaf volume.

Material is grouped into eight general divisions which follow the principal phases of the Engineering Association's work and in each division the manual sections are classified according to three grades: standards, recommendations, and miscellaneous methods and practices. The title page and table of contents is divided so as to make each division complete in itself. Each division is published separately.

Under the system put into effect in 1923 the manual is completely republished in bound-book form at the end of every three-year period. Any new sections which may be approved in the two years immediately following such republication are printed in full in the supplements of these years.

Co-operation with Manufacturers

A MEETING of the committee on co-operation with manufacturers was held at association headquarters in New York on May 13, 1927. The following members were present; E. F. Wickwire, chairman; M. B. Lambert, vice-chairman; F. L. Blanchard, Mr. McCormick representing H. B. Doyle, George Frey, Mr. Bodine representing H. J. Kenfield, G. R. Rowland, L. F. Stoll and E. P. Waller. J. W. Welsh and Labert St. Clair of the association staff also attended the meeting.

The chairman reported the figures on the distribution of the traffic congestion booklet, and after discussion it was decided to send another follow-up letter, each member co-operating by sending out a letter to an assigned list of names. The advertising section was authorized to offer manufacturer members two posters and two stickers which have been prepared for use on freight and express packages. Other posters and stickers dealing with safety and traffic congestion were approved.

It was decided to issue two booklets some time before the annual convention, one of which will deal with the influence that modernized equipment, courtesy and other details have on the sale of car rides. The other will be written for salesmen in the industry to show how they can be helpful to operators in the way of getting business. The advertising section will also be requested to prepare some interviews for the use of salesmen on the general local transportation situation throughout the country.

The committee plans to make a special effort before and at the convention to interest visitors in the electric car exhibit. All manufacturer members will be asked to visit the car exhibit and to take visitors with them. In addition, editors of trade papers will be asked to run editorials prior to the convention urging every one to visit the car exhibit.

Special Reports in Preparation

FOLLOWING is a list of special reports being prepared by the Bureau of Information and Service of the American Electric Railway Association. They will be available to member companies upon request:

Bulletin No. 138.—*Electric Railway Operations,* 1926.—Contains a combined statement of the revenues, expenses, net revenue, passenger traffic and car miles operated of 353 electric railways and 138 affiliated bus undertakings in 1926 compared with 1925. It also gives a complete comparative income statement and analysis of operations of 231 railway companies, classified into city, interurban and combination city and interurban companies and each group is further classified into three smaller groups according to the size of the companies. For each group there is shown a complete income statement, detailed operating expenses, operating statistics and derived ratios and unit figures for comparison.

Bulletin No. 139.—*Bus Operations of Electric Railways in* 1926.—A summary and analysis of the bus operations of 135 electric railways. The reports of the individual companies are tabulated, and certain of the more important items are shown on a unit basis to permit a more accurate comparison. The reports tabulated include a complete income statement, details of operating expenses, statistics of operations and complete data on the number, types and seating capacities of buses operated.

Bulletin No. 140.—*Promotion of Safety by Awards to Trainmen.*—A study of the methods adopted by various companies to promote safety by means of the payment of a bonus, or the granting of some other award or distinction, to trainmen for good accident records. All of the methods adopted for this purpose have been examined and classified into certain types, and a complete list of companies that have established systems of awards to trainmen has been prepared and classified under the several types of awards. A complete description of the system in effect on each property is also given, together with statistics on their accident records to indicate what, if any, effect the system of awards has had upon the number and cost of their accidents. There is also included expressions of opinion by executives as to the value of award systems on their respective properties.

Bulletin No. 141.—*Miscellaneous Factors Affecting the Working Conditions of Electric Railway Trainmen.*—A compilation of information covering a number of miscellaneous provisions, such as insurance and sick benefits provided, period of training required for motormen, conductors and one-man car operators, pay received during period of training, number of trainmen, total payroll and labor turnover in 1926 and also the proportion of trainmen belonging to the union.

Bulletin No. 142.—*Miscellaneous Factors Affecting the Working Conditions of Electric Railway Bus Men.*—Gives for bus operations of some 132 companies the same information regarding life insurance, sick benefits, period of training required, pay received during training and statistics of employees, as is given for electric railway trainmen in Bulletin No. 141.

In addition to the above the following supplements have been prepared, bringing the information they cover down to May 1:

Supplement No. 20 to City and Interurban Fare Bulletins Nos. 41 and 42.

Supplement No. 2 to Bulletin No. 129, Wages of Trainmen.

Supplement No. 2 to Bulletin No. 130, Wages of Bus Men.

Cost of Living Studies (Bulletin No. 143).

The News of the Industry

Pennsylvania's Newark Plans Announced

Mayor Thomas L. Raymond of Newark, N. J., received on May 24 the Pennsylvania Railroad's plans for its proposed improvements in that city. These include the construction of a new passenger station on the north side of the Pennsylvania Railroad tracks between Market and Canal Streets. Upon the completion of these new facilities Manhattan Transfer will be abandoned. The railroad agrees to make these improvements in connection with arrangements between the city and Public Service Corporation, providing adequate transit facilities.

The western half of the Pennsylvania's new station will be used by passengers for local and main line trains and the eastern part will be used by passengers for the rapid transit service to Jersey City and downtown New York, provided jointly by the Pennsylvania and the Hudson & Manhattan.

The station will be served by eight tracks, six for Pennsylvania Railroad trains and two for the rapid transit trains. There will be six platforms. Seven of the tracks and five of the platforms will be placed approximately at the level of the present tracks, and one track and one large platform will be constructed about 18 ft. above the present track level. This upper track will be used by westbound rapid transit trains. The unloading platform will be 50 ft. wide, to accommodate the large number of passengers arriving from downtown New York. Two ramps will lead from this platform to the street level and other ramps will descend to the westbound main line island platform immediately below. This will provide easy access to the proper platform for westbound Pennsylvania Railroad passengers.

The main station area, including the new building on the north side of the elevated railroad, will extend under the tracks and platforms.

$250,000,000 of Property Involved in California Rate Cases

The California Railroad Commission now has pending before it an extraordinary number of important proceedings relating to service and rate conditions on transportation utilities in California, and especially those involving local and interurban transportation in the larger cities. In this respect the state body is confronted with serious problems of this nature in every large city of the state, and the value of the railroad properties involved totals upward of $250,000,000.

As a result the commission has decided to investigate the manner in which cities in other states, and their transportation utilities, have met these problems and has directed A. G. Mott, its chief engineer, to go East for the purpose of studying these and other important public utility matters. Mr. Mott left on this mission on May 23 for an extensive tour and is expected to return during the first week of July.

The chief engineer will study the local transportation conditions in all of the cities that he visits. He will also study steam railroad freight and passenger terminal situations in such cities as Chicago, Washington, Philadelphia and New York.

Under instructions of the commission, Mr. Mott will also inquire about the practices and service of some of the more important electric power utilities.

Among the major transportation cases pending before the Railroad Commission at this time are the applications for rate and fare increases on the Key System Transit Company, Pacific Electric Railway, Los Angeles Railway, San Jose Railroad, Peninsular Railway, Sacramento Street Railway and Stockton Electric Railway.

Unification Inquiry Under Way

Commission Starts Public Hearings After Failure of Private Conferences—Counsel for State Body and Head of Brooklyn Corporation in Disagreement Over Reasons for Failure of Negotiations

NEW YORK'S new transit inquiry has got under way. As was to be expected, Samuel Untermyer, special counsel for the Transit Commission, has succeeded in making first page news out of the proceedings not so much by what has been brought out as by the way it has been brought out.

The inquiry, of course, purports to be a fact-finding proceeding on the part of the commission, conducted in open form fashion for the purpose, apparently now submerged, of discovering ways toward traction unification. It has been ushered in with the obviously irrelevant question of the ownership of stock of the Interborough Rapid Transit Company and comments from counsel on the stock as a football of speculation.
